Signs and symptoms of Kawasaki disease include the following:

Irritability that may last for 2 months after the onset of symptoms.

Peeling of the hands and feet may occur.

Pain in the joints may persist for several weeks.

Stiffness in the morning, after naps, and in cold temperatures may occur.

Record the temperature (because fever is expected) until the child has been afebrile for several days.

Notify the physician if the temperature is 101° F or higher.

Salicylates such as acetylsalicylic acid (aspirin) may be prescribed.

Signs of aspirin toxicity include tinnitus, headache, vertigo, and bruising; do not administer aspirin or aspirin-containing products if the child has been exposed to chickenpox or the flu.

Signs and symptoms of bleeding include epistaxis (nosebleeds), hemoptysis (coughing up blood), hematemesis (vomiting up blood), hematuria (blood in urine), melena (blood in stool), and bruises on the body.

Signs and symptoms of cardiac complications include chest pain or tightness (older children), cool and pale extremities, abdominal pain, nausea and vomiting, irritability, restlessness, and uncontrollable crying.

The child should avoid contact sports, if age appropriate, if taking aspirin or anticoagulants.

Avoid administration of measles, mumps, and rubella (MMR) or varicella vaccine to the child for 11 months after intravenous immunoglobulin therapy, if appropriate.

2. Subacute stage
  - a. Cracking lips and fissures
  - b. Desquamation of the skin on the tips of the fingers and toes
  - c. Joint pain
  - d. Cardiac manifestations
  - e. Thrombocytosis
3. Convalescent stage: Child appears normal, but signs of inflammation may be present.

#### C. Interventions

1. Monitor temperature frequently.
2. Assess heart sounds and heart rate and rhythm.
3. Assess extremities for edema, redness, and desquamation.
4. Examine eyes for conjunctivitis.
5. Monitor mucous membranes for inflammation.
6. Monitor strict intake and output.
7. Administer soft foods and liquids that are neither too hot nor too cold.
8. Weigh child daily.
9. Provide passive range-of-motion exercises to facilitate joint movement.

10. Administer acetylsalicylic acid (aspirin) as prescribed for its antipyretic and antiplatelet effects (additional anticoagulation may be necessary if aneurysms are present).
11. Administer immunoglobulin intravenously as prescribed to reduce the duration of the fever and the incidence of coronary artery lesions and aneurysms; intravenous immunoglobulin is a blood product, so blood precautions when administering it are warranted.
12. Parent education (Box 39-10)

### MORE QUESTIONS ON THE CD!

#### Practice Questions

397. A nurse caring for an infant with congenital heart disease is monitoring the infant closely for signs of congestive heart failure (CHF). The nurse assesses the infant for which early sign of CHF?
  1. Pallor
  2. Cough
  3. Tachycardia
  4. Slow and shallow breathing
398. A nurse is caring for a child with a suspected diagnosis of rheumatic fever. The nurse reviews the laboratory results, knowing that which laboratory study would assist in confirming the diagnosis?
  1. Immunoglobulin
  2. Red blood cell count
  3. White blood cell count
  4. Antistreptolysin O titer
399. A nurse is preparing for the admission of a child with a diagnosis of acute-stage Kawasaki disease. On assessment of the child, the nurse expects to note which clinical manifestation of the acute stage of the disease?
  1. Cracked lips
  2. Normal appearance
  3. Conjunctival hyperemia
  4. Desquamation of the skin
400. A nurse provides home care instructions to the parents of a child with congestive heart failure regarding the procedure for administration of digoxin (Lanoxin). Which statement made by the parent indicates the need for further instructions?
  1. "I will not mix the medication with food."
  2. "If more than one dose is missed, I will call the physician."
  3. "I will take the child's pulse before administering the medication."
  4. "If the child vomits after medication administration, I will repeat the dose."

- 401.** A physician has prescribed oxygen as needed for an infant with congestive heart failure. In which situation should the nurse administer the oxygen to the infant?
1. During sleep
  2. When changing the infant's diapers
  3. When the mother is holding the infant
  4. When drawing blood for electrolyte level testing
- 402.** An infant with congestive heart failure is receiving diuretic therapy, and a nurse is closely monitoring the intake and output. The nurse uses which most appropriate method to assess the urine output?
1. Weighing the diapers
  2. Inserting a Foley catheter
  3. Comparing intake with output
  4. Measuring the amount of water added to formula
- 403.** A clinic nurse reviews the record of a child just seen by a physician and diagnosed with suspected aortic stenosis. The nurse expects to note documentation of which clinical manifestation specifically found in this disorder?
1. Pallor
  2. Hyperactivity
  3. Exercise intolerance
  4. Gastrointestinal disturbances
- 404.** A nurse has provided home care instructions to the mother of a child who is being discharged after cardiac surgery. Which statement made by the mother indicates a need for further instructions?
1. "A balance of rest and exercise is important."
  2. "I can apply lotion or powder to the incision if it is itchy."
  3. "Activities in which my child could fall need to be avoided for 2 to 4 weeks."
  4. "Large crowds of people need to be avoided for at least 2 weeks after surgery."

- 405.** A nurse receives a telephone call from the admitting office and is told that a child with rheumatic fever will be arriving in the nursing unit for admission. On admission, the nurse prepares to ask the mother which question to elicit assessment information specific to the development of rheumatic fever?
1. "Has the child complained of back pain?"
  2. "Has the child complained of headaches?"
  3. "Has the child had any nausea or vomiting?"
  4. "Did the child have a sore throat or fever within the last 2 months?"

### Alternate Item Format: Figure/Illustration

- 406.** Assessment findings of an infant admitted to the hospital reveal a machinery-like murmur on auscultation of the heart and signs of congestive heart failure. The nurse reviews congenital cardiac anomalies and identifies the infant's condition as which of the following? Refer to the circled area in the figure to determine the condition.
1. Aortic stenosis
  2. Atrial septal defect
  3. Patent ductus arteriosus
  4. Ventricular septal defect

(From Hockenberry, M., & Wilson, D. [2007]. *Wong's nursing care of infants and children* [8th ed.]. St. Louis: Saunders.)

## ANSWERS

### 397. 3

**Rationale:** Congestive heart failure (CHF) is the inability of the heart to pump a sufficient amount of oxygen to meet the metabolic needs of the body. The early signs of CHF include tachycardia, tachypnea, profuse scalp sweating, fatigue and irritability, sudden weight gain, and respiratory distress. A cough may occur in CHF as a result of mucosal swelling and irritation, but is not an early sign. Pallor may be noted in an infant with CHF, but is not an early sign.

**Test-Taking Strategy:** Note the strategic word *early*. Think about the physiology and the effects on the heart when fluid overload occurs. These concepts will assist in directing you to option 3. If you had difficulty with this question, review the early signs of CHF in an infant.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 878). St. Louis: Mosby.

### 398. 4

**Rationale:** Rheumatic fever is an inflammatory autoimmune disease that affects the connective tissues of the heart, joints, subcutaneous tissues, and blood vessels of the central nervous system. A diagnosis of rheumatic fever is confirmed by the presence of two major manifestations or one major and two minor manifestations from the Jones criteria. In addition, evidence of a recent streptococcal infection is confirmed by a positive antistreptolysin O titer, Streptozyme assay, or anti-DNase B assay. Options 1, 2, and 3 would not help to confirm the diagnosis of rheumatic fever.

**Test-Taking Strategy:** Use the process of elimination. Recalling that rheumatic fever characteristically is associated with streptococcal infection will direct you to option 4. If you had difficulty with this question, review the Jones criteria and diagnostic tests for rheumatic fever.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 893). St. Louis: Mosby.

### 399. 3

**Rationale:** Kawasaki disease is also known as mucocutaneous lymph node syndrome and is an acute systemic inflammatory illness. In the acute stage, the child has a fever, conjunctival hyperemia, red throat, swollen hands, rash, and enlargement of the cervical lymph nodes. In the subacute stage, cracking lips and fissures, desquamation of the skin on the tips of the fingers and toes, joint pain, cardiac manifestations, and thrombocytosis occur. In the convalescent stage, the child appears normal, but signs of inflammation may be present.

**Test-Taking Strategy:** Use the process of elimination. Option 2 can be eliminated first because a normal appearance is not likely in the acute stage. From the remaining options, focusing on the strategic words *acute stage* in the question will assist in directing you to option 3. Review the clinical manifestations associated with each stage of Kawasaki disease if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1269). St. Louis: Saunders.

### 400. 4

**Rationale:** Digoxin is a cardiac glycoside. The parents need to be instructed that if the child vomits after digoxin is administered, they are not to repeat the dose. Options 1, 2, and 3 are accurate instructions regarding the administration of this medication. In addition, the parents should be instructed that

if a dose is missed and is not identified until 4 hours later, the dose should not be administered.

**Test-Taking Strategy:** Note the strategic words *need for further instructions*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. General knowledge regarding digoxin administration will assist in eliminating option 3. Principles related to administering medications to children will assist in eliminating option 1. From the remaining options, select option 4 because if the child vomits, it would be difficult to determine whether the medication also was vomited or was absorbed by the body. Review home care instructions regarding the administration of digoxin if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1242). St. Louis: Mosby.

### 401. 4

**Rationale:** Congestive heart failure (CHF) is the inability of the heart to pump a sufficient amount of oxygen to meet the metabolic needs of the body. Crying exhausts the limited energy supply, increases the workload of the heart, and increases the oxygen demands. Oxygen administration may be prescribed for stressful periods, especially during bouts of crying or invasive procedures. Options 1, 2, and 3 are not likely to produce crying in the infant.

**Test-Taking Strategy:** Use the process of elimination. Recall the situations that would place stress and an increased workload on the heart; this should direct you to option 4. Drawing blood is an invasive procedure, which would likely cause the infant to cry. Review care of a child with CHF if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., pp. 878–879, 883). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1240). St. Louis: Saunders.

### 402. 1

**Rationale:** Congestive heart failure is the inability of the heart to pump a sufficient amount of oxygen to meet the metabolic needs of the body. The most appropriate method for assessing urine output in an infant receiving diuretic therapy is to weigh the diapers. Comparing intake with output would not provide an accurate measure of urine output. Measuring the amount of water added to formula is unrelated to the amount of output. Although Foley catheter drainage is most accurate in determining output, it is not the most appropriate method in an infant and places the infant at risk for infection.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 3 and 4 first because they will not provide an

indication of urine output. Note the words *most appropriate* in the question. These words will direct you to option 1 from the remaining options. Review care of an infant receiving diuretic therapy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1240). St. Louis: Saunders.

#### 403. 3

**Rationale:** Aortic stenosis is a narrowing or stricture of the aortic valve, causing resistance to blood flow in the left ventricle, decreased cardiac output, left ventricular hypertrophy, and pulmonary vascular congestion. A child with aortic stenosis shows signs of exercise intolerance, chest pain, and dizziness when standing for long periods. Pallor may be noted, but is not specific to this type of disorder alone. Options 2 and 4 are not related to this disorder.

**Test-Taking Strategy:** Use the process of elimination, focusing on the disorder. Options 2 and 4 can be eliminated first because they are not associated with a cardiac disorder. From the remaining options, noting the word *specifically* in the question will direct you to option 3. Review the manifestations associated with aortic stenosis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1250). St. Louis: Saunders.

#### 404. 2

**Rationale:** The mother should be instructed that lotions and powders should not be applied to the incision site after cardiac surgery. Lotions and powders can irritate the surrounding skin, which could lead to skin breakdown and subsequent infection of the incision site. Options 1, 3, and 4 are accurate instructions regarding home care after cardiac surgery.

**Test-Taking Strategy:** Note the strategic words *indicates a need for further instructions*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Using general principles related to postoperative incisional site care will direct you to option 2. Review home care instructions after cardiac surgery if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1260). St. Louis: Saunders.

#### 405. 4

**Rationale:** Rheumatic fever is an inflammatory autoimmune disease that affects the connective tissues of the heart, joints, subcutaneous tissues, and blood vessels of the central nervous system. Rheumatic fever characteristically manifests 2 to 6 weeks after an untreated or partially treated group A beta-hemolytic streptococcal infection of the upper respiratory tract. Initially, the nurse determines whether the child had a sore throat or an unexplained fever within the past 2 months. Options 1, 2, and 3 are unrelated to rheumatic fever.

**Test-Taking Strategy:** Use the process of elimination and note the similarity between the words *rheumatic fever* in the question and the word *fever* in the correct option. If you had difficulty with this question, review the etiology related to rheumatic fever.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 893). St. Louis: Mosby.

### ALTERNATE ITEM FORMAT: FIGURE/ILLUSTRATION

#### 406. 3

**Rationale:** A patent ductus arteriosus is failure of the fetal ductus arteriosus (artery connecting the aorta and the pulmonary artery) to close. A characteristic machinery-like murmur is present, and the infant may show signs of congestive heart failure. Aortic stenosis is a narrowing or stricture of the aortic valve. Atrial septal defect is an abnormal opening between the atria. Ventricular septal defect is an abnormal opening between the right and left ventricles.

**Test-Taking Strategy:** Focus on the figure and the location of the defect. Recalling the anatomical locations in the heart will direct you to option 3. Review congenital heart defects if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 1245–1246). St. Louis: Saunders.

# Gastrointestinal Disorders

## I. VOMITING

### A. Description

1. The major concerns when a child is vomiting are the risk of dehydration, the loss of fluid and electrolytes, and the development of metabolic alkalosis.
2. Additional concerns include aspiration and the development of atelectasis or pneumonia.
3. Causes of vomiting include acute infectious diseases, increased intracranial pressure, toxic ingestions, food intolerance, mechanical obstruction of the gastrointestinal tract, metabolic disorders, and psychogenic disorders.

### B. Assessment

1. Character of vomitus
2. Signs of aspiration
3. Presence of pain and abdominal cramping
4. Signs of dehydration
5. Signs of fluid and electrolyte imbalances
6. Signs of metabolic alkalosis

### C. Interventions

1. Maintain a patent airway.
2. Position the child on the side to prevent aspiration.
3. Monitor vital signs.
4. Monitor the character, amount, and frequency of vomiting.
5. Assess the force of the vomiting; projectile vomiting indicates pyloric **stenosis** or increased intracranial pressure.
6. Monitor strict intake and output.
7. Monitor for signs and symptoms of dehydration, such as a sunken fontanel (age-appropriate), nonelastic skin turgor, dry mucous membranes, decreased tear production, and oliguria.
8. Monitor electrolyte levels.
9. Provide oral rehydration therapy as tolerated and as prescribed; begin feeding slowly, with small amounts of fluid at frequent intervals.
10. Assess for abdominal pain or diarrhea.
11. Advise the parents to inform the physician if signs of dehydration, blood in vomitus, forceful vomiting, or abdominal pain are present.

## II. DIARRHEA

### A. Description

1. Acute diarrhea is a cause of dehydration, particularly in children younger than 5 years.
2. Causes of acute diarrhea include acute infectious disorders of the gastrointestinal tract, antibiotic therapy, and parasitic infestation.
3. Causes of chronic diarrhea include rotavirus, malabsorption syndromes, inflammatory bowel disease, immunodeficiencies, food intolerances, and nonspecific factors.
4. Rotavirus is a cause of serious gastroenteritis and is a nosocomial (hospital-acquired) pathogen that is most severe in children 3 to 24 months old; children younger than 3 months have some protection because of maternally acquired anti-bodies.

### B. Assessment

1. Character of stools
2. Presence of pain and abdominal cramping
3. Signs of dehydration
4. Signs of fluid and electrolyte imbalances
5. Signs of metabolic acidosis

### C. Interventions

1. Monitor vital signs.
2. Monitor character, amount, and frequency of diarrhea.
3. Provide enteric isolation as required; instruct the parents in effective handwashing technique (the child should be taught this technique also).
4. Monitor skin integrity.
5. Monitor strict intake and output.
6. Monitor electrolyte levels.
7. Monitor for signs and symptoms of dehydration.
8. For mild to moderate dehydration, provide oral rehydration therapy with Pedialyte or a similar rehydration solution as prescribed; avoid carbonated beverages because they are gas-producing and fluids that contain high amounts of sugar, such as apple juice.
9. For severe dehydration, maintain NPO status to place the bowel at rest and provide fluid and electrolyte replacement by the intravenous

(IV) route as prescribed; if potassium is prescribed for IV administration, ensure that the child has voided before administering and has adequate renal function.

10. Reintroduce a normal diet when rehydration is achieved.

**!** The major concerns when a child is having diarrhea are the risk of dehydration, the loss of fluid and electrolytes, and the development of metabolic acidosis.

### III. CLEFT LIP AND CLEFT PALATE

#### A. Description

1. Cleft lip and cleft palate are congenital anomalies that occur as a result of failure of soft tissue or bony structure to fuse during embryonic development.
2. The defects involve abnormal openings in the lip and palate that may occur unilaterally or bilaterally and are readily apparent at birth.
3. Causes include **hereditary**, and environmental factors—exposure to radiation or rubella virus, chromosome abnormalities, and teratogenic factors.
4. Closure of cleft lip defect precedes closure of the cleft palate and is usually performed by age 3 to 6 months.

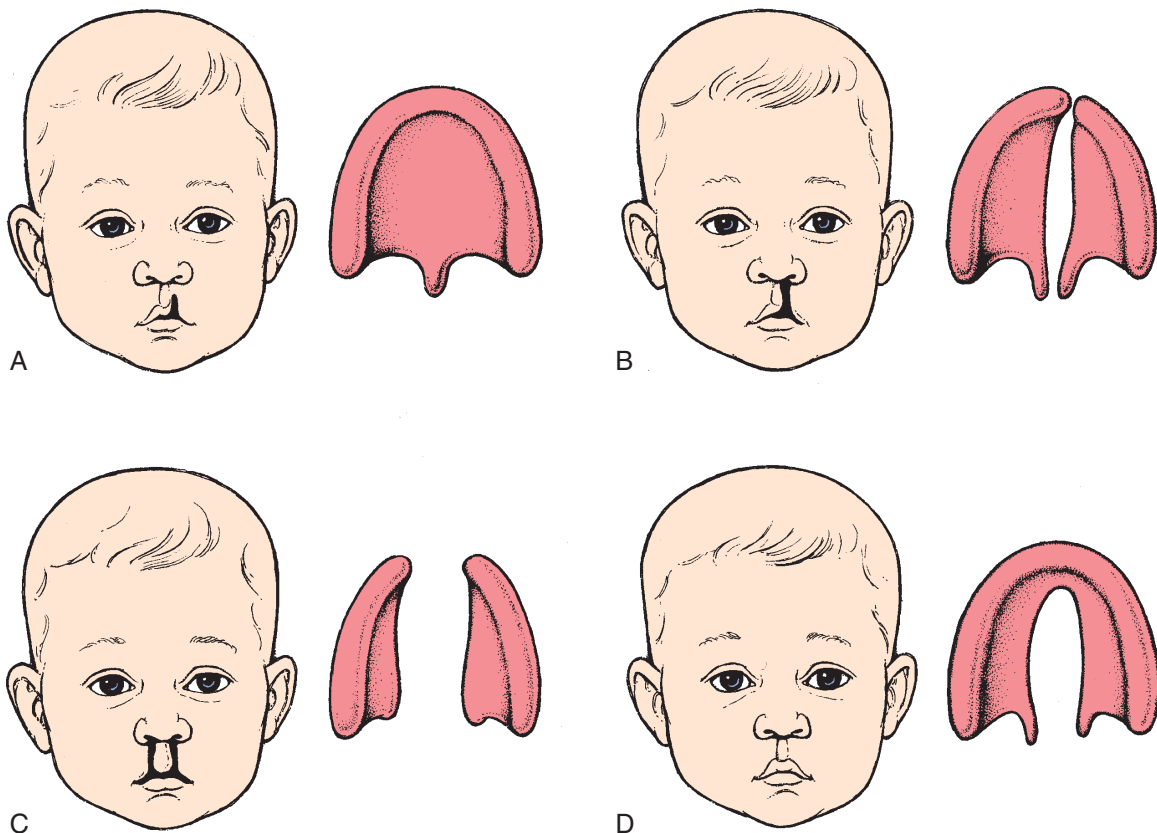

5. Cleft palate repair is performed sometime between 6 and 24 months of age to allow for the palatal changes that occur with normal **growth**; a cleft palate is closed as early as possible to facilitate speech development.
6. A child with cleft palate is at risk for developing frequent otitis media; this can result in hearing loss.
7. A multidisciplinary team approach, including audiologists, orthodontists, plastic surgeons, and occupational and speech therapists, is taken to address the many needs of the child.

#### B. Assessment (Fig. 40-1)

1. Cleft lip can range from a slight notch to a complete separation from the floor of the nose.
2. Cleft palate can include nasal distortion, midline or bilateral cleft, and variable extension from the uvula and soft and hard palate.

#### C. Interventions

1. Assess the ability to suck, swallow, handle normal secretions, and breathe without distress.
2. Assess fluid and calorie intake daily.
3. Monitor daily weight.
4. Modify feeding techniques; plan to use specialized feeding techniques, obturators, and special nipples and feeders.

**▲ FIGURE 40-1** Variations in clefts of lip and palate at birth. **A**, Notch in vermillion border. **B**, Unilateral cleft lip and palate. **C**, Bilateral cleft lip and palate. **D**, Cleft palate. (From Hockenberry, M., & Wilson, D. [2009]. *Wong's essentials of pediatric nursing* [8th ed.]. St. Louis: Mosby.)

5. Hold the infant in an upright position and direct the formula to the side and back of the mouth to prevent aspiration.
  6. Feed small amounts gradually and burp frequently.
  7. Keep suction equipment and a bulb syringe at the bedside.
  8. Teach the parents special feeding or suctioning techniques.
  9. Teach the parents the *ESSR* method of feeding—enlarge the nipple, stimulate the sucking reflex, swallow, rest to allow the infant to finish swallowing what has been placed in the mouth.
  10. Encourage parents to express their feelings about the disorder.
  11. Encourage parental bonding with the infant, including holding the infant and calling the infant by name.
- D. Postoperative interventions**
1. Cleft lip repair
    - a. Provide lip protection; a metal appliance or adhesive strips may be taped securely to the cheeks to prevent trauma to the suture line.
    - b. Avoid positioning the infant on the side of the repair or in the prone position because these positions can cause rubbing of the surgical site on the mattress (position on the back upright and position to prevent airway obstruction by secretions, blood, or the tongue).
    - c. Keep the surgical site clean and dry; after feeding, gently cleanse the suture line of formula or serosanguineous drainage with a solution such as normal saline or as designated by agency procedure.
    - d. Apply antibiotic ointment to the site as prescribed.
    - e. Elbow restraints should be used to prevent the infant from injuring or traumatizing the surgical site.
  2. Cleft palate repair
    - a. Feedings are resumed by bottle, breast, or cup per surgeon preference; some surgeons prescribe the use of an Asepto syringe for feeding or a soft cup such as a Sippy cup.
    - b. Oral packing may be secured to the palate (usually removed in 2 to 3 days).
    - c. Do not allow the child to brush his or her teeth.
    - d. Instruct the parents to avoid offering hard food items to the child, such as toast or cookies.
  3. Soft elbow or jacket restraints may be used (check agency policies and procedures) to keep the child from touching the repair site; remove restraints at least every 2 hours (or per agency procedure) to assess skin integrity and circulation and to allow for exercising the arms.
  4. Avoid the use of oral suction or placing objects in the mouth such as a tongue depressor, thermometer, straws, spoons, forks, or pacifiers.
  5. Provide analgesics for pain as prescribed.
  6. Instruct the parents in feeding techniques and in the care of the surgical site.
  7. Instruct the parents to monitor for signs of infection at the surgical site, such as redness, swelling, or drainage.
  8. Encourage the parents to hold the child.
  9. Initiate appropriate referrals such as a dental referral and speech therapy referral.

#### IV. ESOPHAGEAL ATRESIA AND TRACHEOESOPHAGEAL FISTULA (Fig. 40-2)

##### A. Description

1. The esophagus terminates before it reaches the stomach, ending in a blind pouch, or a fistula is present that forms an unnatural connection with the trachea.

**▲ FIGURE 40-2** Congenital atresia of esophagus and tracheoesophageal fistula. **A**, Upper and lower segments of esophagus end in blind sac (occurring in 5% to 8% of such infants). **B**, Upper segment of esophagus ends in atresia and connects to trachea by fistulous tract (occurring rarely). **C**, Upper segment of esophagus ends in blind pouch; lower segment connects with trachea by small fistulous tract (occurring in 80% to 95% of such infants). **D**, Both segments of esophagus connect by fistulous tracts to trachea (occurring in <1% of such infants). Infant may aspirate with first feeding. **E**, Esophagus is continuous, but connects by fistulous tract to trachea—known as H-type. (From Hockenberry, M., & Wilson, D. [2007]. *Wong's nursing care of infants and children* [8th ed.]. St. Louis: Mosby.)

2. The condition causes oral intake to enter the lungs or a large amount of air to enter the stomach, presenting a risk of coughing and choking; severe abdominal distention can occur.
3. Aspiration pneumonia and severe respiratory distress may develop, and death is likely to occur without surgical intervention.
4. Treatment includes maintenance of a patent airway, prevention of aspiration pneumonia, gastric or blind pouch decompression, supportive therapy, and surgical repair.

#### B. Assessment

1. Frothy saliva in the mouth and nose and excessive drooling
2. The “3 C’s”—coughing and choking during feedings and unexplained **cyanosis**
3. **Regurgitation** and vomiting
4. Abdominal distention
5. Increased respiratory distress during and after feeding

#### C. Preoperative interventions

1. The infant may be placed in an incubator or radiant warmer in which humidified oxygen is administered (intubation and mechanical ventilation may be necessary if respiratory distress occurs).
2. Maintain NPO status.
3. Maintain IV fluids as prescribed.
4. Monitor respiratory status closely.
5. Suction accumulated secretions from the mouth and pharynx.
6. Maintain in a supine upright position (at least 30 degrees upright) to facilitate drainage and prevent aspiration of gastric secretions.
7. Keep the blind pouch empty of secretions by intermittent or continuous suction as prescribed; monitor its patency closely because clogging from mucus can easily occur.
8. If a gastrostomy tube is inserted, it may be left open so that air entering the stomach through the fistula can escape, minimizing the risk of **regurgitation** of gastric contents into the trachea.
9. Broad-spectrum antibiotics may be prescribed because of the high risk for aspiration pneumonia.

#### D. Postoperative interventions

1. Monitor vital signs and respiratory status.
2. Maintain IV fluids, antibiotics, and parenteral nutrition as prescribed.
3. Monitor strict intake and output.
4. Monitor daily weight; assess for dehydration and possible fluid overload.
5. Assess for signs of pain.
6. Maintain chest tube if present.
7. Inspect the surgical site for signs and symptoms of infection.
8. Monitor for anastomotic leaks as evidenced by purulent drainage from the chest tube, increased temperature, and increased white blood cell count.

9. If a gastrostomy tube is present, it is usually attached to gravity drainage until the infant can tolerate feedings and the anastomosis is healed (usually postoperative day 5 to 7); then feedings are prescribed.
10. Before oral feedings and removal of the chest tube, prepare for an esophagogram as prescribed to check the integrity of the esophageal anastomosis.
11. Before feeding, elevate the gastrostomy tube and secure it above the level of the stomach to allow gastric secretions to pass to the duodenum and swallowed air to escape through the open gastrostomy tube.
12. Administer oral feedings with sterile water, followed by frequent small feedings of formula as prescribed.
13. Assess the cervical esophagostomy site, if present, for redness, breakdown, or exudate; remove accumulated drainage frequently, and apply protective ointment, barrier dressing, or a collection device as prescribed.
14. Provide non-nutritive sucking using a pacifier for infants who remain NPO for extended periods (a pacifier should not be used if the infant is unable to handle secretions).
15. Instruct the parents in the techniques of suctioning, gastrostomy tube care and feedings, and skin site care as appropriate.
16. Instruct the parents to identify behaviors that indicate the need for suctioning, signs of respiratory distress, and signs of a constricted esophagus (e.g., poor feeding, dysphagia, drooling, coughing during feedings, regurgitated undigested food).

## V. GASTROESOPHAGEAL REFLUX DISEASE

### A. Description

1. Gastroesophageal reflux is backflow of gastric contents into the esophagus as a result of relaxation or incompetence of the lower esophageal or cardiac sphincter.
2. Most infants with gastroesophageal reflux have a mild problem that improves in about 1 year and requires medical therapy only.
3. Gastroesophageal reflux disease occurs when gastric contents reflux into the esophagus or oropharynx and produce symptoms.
4. Treatment (Box 40-1)

#### Box 40-1 Treatment for Gastroesophageal Reflux Disease

Diet  
Positioning  
Medications  
Surgery: Performed when severe complications occur

-  **B. Assessment**
1. Passive **regurgitation** or emesis
  2. Poor weight gain
  3. Irritability
  4. Hematemesis
  5. Melena
  6. Heartburn (in older children)
  7. Anemia from blood loss
-  **C. Interventions**
1. Assess amount and characteristics of emesis.
  2. Assess the relationship of vomiting to the times of feedings and infant activity.
  3. Monitor breath sounds before and after feedings.
  4. Assess for signs of aspiration, such as drooling, coughing, or dyspnea, after feeding.
  5. Place suction equipment at the bedside.
  6. Monitor intake and output.
  7. Monitor for signs and symptoms of dehydration.
  8. Maintain IV fluids as prescribed.
-  **Complications of gastroesophageal reflux disease include esophagitis, esophageal strictures, aspiration of gastric contents, and aspiration pneumonia.**
-  **D. Positioning**
1. The infant is placed in the supine position during sleep (to reduce the incidence of sudden infant death syndrome) unless the risk of death from aspiration or other serious complications of gastroesophageal reflux disease greatly outweighs the risks associated with the prone position (check physician's prescription); otherwise, the prone position is acceptable only while the infant is awake and can be monitored.
  2. In children older than 1 year, position with the head of the bed elevated.
- E. Diet**
1. Provide small, frequent feedings with predigested formula to decrease the amount of **regurgitation**.
  2. Nutrition via nasogastric tube feedings may be prescribed if severe **regurgitation** and poor **growth** are present.
  3. For infants, formula may be thickened by adding rice cereal to the formula (follow agency procedure); cross-cut the nipple.
  4. Breast-feeding may continue, and the mother may provide more frequent feeding times or express milk for thickening with rice cereal.
  5. Burp the infant frequently when feeding and handle the infant minimally after feedings; monitor for coughing during feeding and other signs of aspiration.
  6. For toddlers, feed solids first, followed by liquids.
  7. Instruct the parents to avoid feeding the child fatty foods, chocolate, tomato products, carbonated liquids, fruit juices, citrus products, and spicy foods.
  8. Instruct the parents that the child should avoid vigorous play after feeding and avoid feeding just before bedtime.
- F. Medications**
1. Antacids for symptom relief
  2. Proton pump inhibitors and histamine 2 (H<sub>2</sub>)-receptor antagonists to decrease gastric acid secretion
  3. Prokinetics to accelerate gastric emptying
- G. Surgery**
1. Fundoplication, in which a wrap to the stomach fundus is made around the distal esophagus (restores the competence of the lower esophageal sphincter), is performed.
  2. A gastrostomy may be performed at the same time as fundoplication for decompression of the stomach postoperatively.
  3. Fundoplication may be combined with pyloroplasty in children with gastroesophageal reflux who also have delayed gastric emptying.
  4. Postoperative care is similar to care after other types of abdominal surgery.
  5. Instruct the parents about potential postoperative problems, such as bloating symptoms or discomfort after consuming large, solid meals.
- VI. HYPERTROPHIC PYLORIC STENOSIS** (Fig. 40-3)
- A. Description**
1. Hypertrophy of the circular muscles of the pylorus causes narrowing of the pyloric canal between the stomach and the duodenum.
  2. The **stenosis** usually develops in the first few weeks of life, causing projectile vomiting, dehydration, metabolic alkalosis, and failure to thrive.
- B. Assessment**
1. Vomiting that progresses from mild **regurgitation** to forceful and projectile vomiting; it usually occurs after a feeding.
  2. Vomitus contains gastric contents such as milk or formula, may contain mucus, may be blood-tinged, and does not usually contain bile.
  3. The child exhibits hunger and irritability.
  4. Peristaltic waves are visible from left to right across the epigastrium during or immediately after a feeding.
  5. An olive-shaped mass is in the epigastrium just right of the umbilicus.
  6. Dehydration and malnutrition can occur.
  7. Electrolyte imbalances can occur.
  8. Metabolic alkalosis can occur.
- C. Interventions**
1. Monitor vital signs.
  2. Monitor strict intake and output.
  3. Monitor vomiting episodes and stools.
  4. Obtain daily weights.
  5. Monitor for signs of dehydration and electrolyte imbalances.
  6. Prepare the child and parents for pyloromyotomy if prescribed.

**▲ FIGURE 40-3** Hypertrophic pyloric stenosis. **A**, Enlarged muscular area nearly obliterates pyloric channel. **B**, Longitudinal surgical division of muscle down to submucosa establishes adequate passageway. (From Hockenberry, M., & Wilson, D. [2009]. *Wong's essentials of pediatric nursing* [8th ed.]. St. Louis: Mosby.)

- d. Feed the infant slowly, burping frequently and handle the infant minimally after feedings.
- e. Monitor for abdominal distention.
- f. Monitor the surgical wound and for signs of infection.
- g. Instruct the parents about wound care and feeding.

## VII. LACTOSE INTOLERANCE

- A. Description:** Inability to tolerate lactose as a result of an absence or deficiency of lactase, an enzyme found in the secretions of the small intestine that is required for the digestion of lactose
- B. Assessment**
  1. Symptoms occur after the ingestion of milk products.
  2. Abdominal distention
  3. Crampy, abdominal pain; colic
  4. Diarrhea and excessive flatus
- C. Interventions**
  1. Eliminate the offending dairy product, or administer an enzyme tablet replacement.
  2. Provide information to the parents about enzyme tablets that predigest the lactose in milk or supplement the body's own lactase.
  3. Substitute soy-based formulas for cow's milk formula or human milk.
  4. Limit milk consumption to one glass at a time.
  5. Instruct the child and family that the child should drink milk with other foods rather than by itself.
  6. Encourage consumption of hard cheese, cottage cheese, and yogurt, which contain the inactive lactase enzyme.
  7. Encourage consumption of small amounts of dairy foods daily to help colonic bacteria adapt to ingested lactose.
  8. Instruct the parents about the foods that contain lactose, including hidden sources.

**▲** A child with lactose intolerance can develop calcium and vitamin D deficiency. Instruct the parents about the importance of providing these supplements.

## VIII. CELIAC DISEASE

- A. Description**
  1. Celiac disease also is known as gluten enteropathy or celiac sprue.
  2. Intolerance to gluten, the protein component of wheat, barley, rye, and oats, is characteristic.
  3. Celiac disease results in the accumulation of the amino acid glutamine, which is toxic to intestinal mucosal cells.
  4. Intestinal villous atrophy occurs, which affects absorption of ingested nutrients.
  5. Symptoms of the disorder occur most often between the ages of 1 and 5 years.

## D. Pyloromyotomy

1. **Description:** An incision through the muscle fibers of the pylorus; may be performed by laparoscopy
2. **Preoperative interventions**
  - a. Monitor hydration status by daily weights, intake and output, and urine for specific gravity.
  - b. Correct fluid and electrolyte imbalances; administer fluids intravenously as prescribed for rehydration.
  - c. Maintain NPO status as prescribed.
  - d. Monitor the number and character of stools.
  - e. Maintain patency of the nasogastric tube placed for stomach decompression.
3. **Postoperative interventions**
  - a. Monitor intake and output.
  - b. Begin small, frequent feedings postoperatively as prescribed.
  - c. Gradually increase amount and interval between feedings until a full feeding schedule has been reinstated.

**Box 40-2 Basics of a Gluten-Free Diet****Foods Allowed**

Meat such as beef, pork, poultry, and fish; eggs; milk and dairy products; vegetables, fruits, rice, corn, gluten-free flour, puffed rice, cornflakes, cornmeal, and pre-cooked gluten-free cereals are allowed.

**Foods Prohibited**

Commercially prepared ice cream; malted milk; prepared puddings; and grains, including anything made from wheat, rye, oats, or barley, such as breads, rolls, cookies, cakes, crackers, cereal, spaghetti, macaroni noodles, beer, and ale, are prohibited.

6. There is usually an interval of 3 to 6 months between the introduction of gluten in the diet and the onset of symptoms.
7. Strict dietary avoidance of gluten minimizes the risk of developing malignant lymphoma of the small intestine and other gastrointestinal malignancies.

**B. Assessment**

1. Acute or insidious diarrhea
2. Steatorrhea
3. Anorexia
4. Abdominal pain and distention
5. Muscle wasting, particularly in the buttocks and extremities
6. Vomiting
7. Anemia
8. Irritability

**C. Celiac crisis**

1. Precipitated by infection, fasting, or ingestion of gluten
2. Causes profuse watery diarrhea and vomiting
3. Can lead to electrolyte imbalance, rapid dehydration, and severe acidosis

**D. Interventions**

1. Maintain a gluten-free diet, substituting corn, rice, and millet as grain sources.
2. Instruct the parents and child about lifelong elimination of gluten sources such as wheat, rye, oats, and barley.
3. Administer mineral and vitamin supplements, including iron, folic acid, and fat-soluble vitamins A, D, E, and K.
4. Teach the child and parents about a gluten-free diet and about reading food labels carefully for hidden sources of gluten (Box 40-2).
5. Instruct the parents in measures to prevent celiac crisis.
6. Inform the parents about the Celiac Sprue Association.

**IX. APPENDICITIS****A. Description**

1. Inflammation of the appendix

2. When the appendix becomes inflamed or infected, perforation may occur within a matter of hours, leading to peritonitis, sepsis, septic shock, and potentially death.
3. Treatment is surgical removal of the appendix before perforation occurs.

**B. Assessment**

1. Pain in periumbilical area that descends to the right lower quadrant
2. Abdominal pain that is most intense at McBurney's point
3. Referred pain indicating the presence of peritoneal irritation
4. Rebound tenderness and abdominal rigidity
5. Elevated white blood cell count
6. Side-lying position with abdominal guarding (legs flexed) to relieve pain
7. Difficulty walking and pain in the right hip
8. Low-grade fever
9. Anorexia, nausea, and vomiting after pain develops
10. Diarrhea

**C. Peritonitis**

1. Description: Results from a perforated appendix
2. Assessment
  - a. Increased fever
  - b. Progressive abdominal distention
  - c. Tachycardia and tachypnea
  - d. Pallor
  - e. Chills
  - f. Restlessness and irritability

 An indication of a perforated appendix is the sudden relief of pain and then a subsequent increase in pain accompanied by right guarding of the abdomen.

**D. Appendectomy**

1. Description: Surgical removal of the appendix
2. Interventions preoperatively
  - a. Maintain NPO status.
  - b. Administer IV fluids and electrolytes as prescribed to prevent dehydration and correct electrolyte imbalances.
  - c. Monitor for changes in the level of pain.
  - d. Monitor for signs of a ruptured appendix and peritonitis.
  - e. Avoid the use of pain medications so as not to mask pain changes associated with perforation.
  - f. Administer antibiotics as prescribed.
  - g. Monitor bowel sounds.
  - h. Position in a right side-lying or low to semi-Fowler's position to promote comfort.
  - i. Apply ice packs to the abdomen for 20 to 30 minutes every hour if prescribed.
  - j. Avoid the application of heat to the abdomen.
  - k. Avoid laxatives or enemas.

3. Postoperative interventions
  - a. Monitor vital signs, particularly temperature.
  - b. Maintain NPO status until bowel function has returned, advancing the diet gradually as tolerated and as prescribed when bowel sounds return.
  - c. Assess the incision for signs of infection, such as redness, swelling, drainage, and pain.
  - d. Monitor drainage in Penrose drain, which may be inserted if perforation occurred.
  - e. Position the child in a right side-lying or low to semi-Fowler's position with the legs slightly flexed to facilitate drainage.
  - f. Change the dressing as prescribed, and record the type and amount of drainage.
  - g. Perform wound irrigations if prescribed.
  - h. Maintain nasogastric tube suction and patency of the tube if present.
  - i. Administer antibiotics and analgesics as prescribed.

## X. HIRSCHSPRUNG'S DISEASE (Fig. 40-4)

### A. Description

1. Hirschsprung's disease is a congenital anomaly also known as congenital aganglionosis or aganglionic megacolon.
2. The disease occurs as the result of an absence of ganglion cells in the rectum and other areas of the affected intestine.
3. Mechanical obstruction results because of inadequate motility in an intestinal segment.
4. The disease may be a familial congenital defect or may be associated with other anomalies, such as Down syndrome and genitourinary abnormalities.
5. A rectal biopsy specimen shows histological evidence of the absence of ganglionic cells.

▲ **FIGURE 40-4** Hirschsprung's disease. (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed.]. St. Louis: Mosby.)

6. The most serious complication is enterocolitis; signs include fever, severe prostration, gastrointestinal bleeding, and explosive watery diarrhea.
7. Treatment for mild or moderate disease is based on relieving the chronic constipation with stool softeners and rectal irrigations; however, many children require surgery.
8. Treatment for moderate to severe disease involves a two-step surgical procedure.
  - a. Initially, in the neonatal period, a temporary colostomy is created to relieve obstruction and allow the normally innervated, dilated bowel to return to its normal size.
  - b. When the bowel returns to its normal size, a complete surgical repair is performed via a pull-through procedure to excise portions of the bowel; at this time, the colostomy is closed.

### B. Assessment

1. Newborn infants
  - a. Failure to pass meconium stool
  - b. Refusal to suck
  - c. Abdominal distention
  - d. Bile-stained vomitus
2. Children
  - a. Failure to gain weight and delayed growth
  - b. Abdominal distention
  - c. Vomiting
  - d. Constipation alternating with diarrhea
  - e. Ribbon-like and foul-smelling stools

### C. Interventions: Medical management

1. Maintain a low-fiber, high-calorie, high-protein diet; parenteral nutrition may be necessary in extreme situations.
2. Administer stool softeners as prescribed.
3. Administer daily rectal irrigations with normal saline to promote adequate elimination and prevent obstruction as prescribed.

### D. Surgical management: Preoperative interventions

1. Assess bowel function.
2. Administer bowel preparation as prescribed.
3. Maintain NPO status.
4. Monitor hydration and fluid and electrolyte status; provide fluids intravenously as prescribed for hydration.
5. Administer antibiotics or colonic irrigations with an antibiotic solution as prescribed to clear the bowel of bacteria.
6. Monitor strict intake and output.
7. Obtain daily weight.
8. Measure abdominal girth daily
9. Avoid taking the temperature rectally.
10. Monitor for respiratory distress associated with abdominal distention.

### E. Surgical management: Postoperative interventions

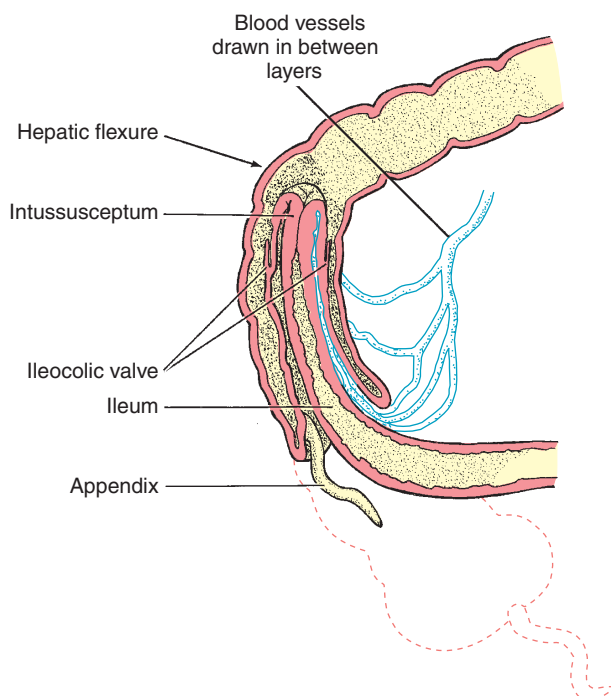

1. Monitor vital signs, avoiding taking the temperature rectally.
2. Measure abdominal girth daily and PRN.

3. Assess the surgical site for redness, swelling, and drainage.
4. Assess the stoma if present for bleeding or skin breakdown (stoma should be red and moist).
5. Assess the anal area for the presence of stool, redness, or discharge.
6. Maintain NPO status as prescribed and until bowel sounds return or flatus is passed, usually within 48 to 72 hours.
7. Maintain nasogastric tube to allow intermittent suction until peristalsis returns.
8. Maintain IV fluids until the child tolerates appropriate oral intake, advancing the diet from clear liquids to regular as tolerated and as prescribed.
9. Assess for dehydration and fluid overload.
10. Monitor strict intake and output.
11. Obtain daily weight.
12. Assess for pain and provide comfort measures as required.
13. Provide the parents with instructions regarding colostomy care and skin care.
14. Teach the parents about the appropriate diet and the need for adequate fluid intake.

## XI. INTUSSUSCEPTION (Fig. 40-5)

### A. Description

1. Telescoping of one portion of the bowel into another portion
2. The condition results in obstruction to the passage of intestinal contents.

▲ **FIGURE 40-5** Ileocolic intussusception. (From Hockenberry, M., & Wilson, D. [2009]. *Wong's essentials of pediatric nursing* [8th ed.]. St. Louis: Mosby.)

### B. Assessment

1. Colicky abdominal pain that causes the child to scream and draw the knees to the abdomen, similar to the fetal position
2. Vomiting of gastric contents
3. Bile-stained fecal emesis
4. Currant jelly–like stools containing blood and mucus
5. Hypoactive or hyperactive bowel sounds
6. Tender distended abdomen, possibly with a palpable sausage-shaped mass in the upper right quadrant

### C. Interventions

1. Monitor for signs of perforation and shock as evidenced by fever, increased heart rate, changes in level of consciousness or blood pressure, and respiratory distress, and report immediately.
2. Antibiotics, IV fluids, and decompression via nasogastric tube may be prescribed.
3. Monitor for the passage of normal, brown stool, which indicates that the intussusception has reduced itself.
4. Prepare for hydrostatic reduction as prescribed, if no signs of perforation or shock occur (in hydrostatic reduction, air or fluid is used to exert pressure on area involved to lessen, diminish, or rid the intestine of prolapse).
5. Posthydrostatic reduction
  - a. Monitor for the return of normal bowel sounds, for the passage of barium, and the characteristics of stool.
  - b. Administer clear fluids, and advance the diet gradually as prescribed.
6. If surgery is required, postoperative care is similar to care after any abdominal surgery.

## XII. ABDOMINAL WALL DEFECTS

### A. Omphalocele

1. Omphalocele refers to herniation of the abdominal contents through the umbilical ring, usually with an intact peritoneal sac.
2. The protrusion is covered by a translucent sac that may contain bowel or other abdominal organs.
3. Rupture of the sac results in evisceration of the abdominal contents.
4. Immediately after birth, the sac is covered with sterile gauze soaked in normal saline to prevent drying of abdominal contents; a layer of plastic wrap is placed over the gauze to provide additional protection against moisture loss.
5. Monitor vital signs frequently (every 2 to 4 hours), particularly temperature, because the infant can lose heat through the sac.
6. Preoperatively: Maintain NPO status, administer IV fluids as prescribed to maintain hydration and electrolyte balance, monitor for signs of

infection, and handle the infant carefully to prevent rupture of the sac.

7. Postoperatively: Control pain, prevent infection, maintain fluid and electrolyte balance, and ensure adequate nutrition.

#### B. Gastroschisis

1. Gastroschisis occurs when the herniation of the intestine is lateral to the umbilical ring.
2. No membrane covers the exposed bowel.
3. The exposed bowel is covered loosely in saline-soaked pads, and the abdomen is loosely wrapped in a plastic drape; wrapping directly around the exposed bowel is contraindicated because if the exposed bowel expands, wrapping could cause pressure and necrosis.
4. Preoperatively: Care is similar to that for omphalocele; surgery is performed within several hours after birth because no membrane is covering the sac.
5. Postoperatively: Most infants develop prolonged ileus, require mechanical ventilation, and need parenteral nutrition; otherwise, care is similar to that for omphalocele.

### XIII. UMBILICAL HERNIA

#### A. Description

1. A hernia is a protrusion of the bowel through an abnormal opening in the abdominal wall.
2. In children, hernias most commonly occur at the umbilicus and through the inguinal canal.
3. A hydrocele is the presence of abdominal fluid in the scrotal sac.

#### B. Assessment

1. Umbilical hernia: Soft swelling or protrusion around the umbilicus that is usually reducible with the finger
2. Inguinal hernia
  - a. Inguinal hernia refers to painless inguinal swelling that is reducible.
  - b. Swelling may disappear during periods of rest and is most noticeable when the infant cries or coughs.
3. Incarcerated hernia
  - a. Incarcerated hernia occurs when the descended portion of the bowel becomes tightly caught in the hernial sac, compromising blood supply.
  - b. This represents a medical emergency requiring surgical repair.
  - c. Assessment findings include irritability, tenderness at site, anorexia, abdominal distention, and difficulty defecating.
  - d. Complete intestinal obstruction and gangrene may occur.
4. Noncommunicating hydrocele
  - a. Noncommunicating hydrocele occurs when residual peritoneal fluid is trapped with no communication to the peritoneal cavity.
  - b. Hydrocele usually disappears by age 1 year.

#### 5. Communicating hydrocele

- a. Communicating hydrocele is associated with a hernia that remains open from the scrotum to the abdominal cavity.
- b. Assessment includes a bulge in the inguinal area or the scrotum that increases with crying or straining and decreases when the infant is at rest.

#### C. Postoperative interventions (hernia)

1. Monitor vital signs.
2. Assess for wound infection.
3. Monitor for redness or drainage.
4. Monitor input and output and hydration status.
5. Advance the diet as tolerated.
6. Administer analgesics as prescribed.

#### D. Postoperative interventions (hydrocele)

1. Provide ice bags and a scrotal support to relieve pain and swelling.
2. Instruct the child and parents to avoid tub bathing until the incision heals.
3. Instruct the child and parents to avoid strenuous physical activities.

### XIV. CONSTIPATION AND ENCOPRESIS

#### A. Description

1. Constipation is the infrequent and difficult passage of dry, hard stools.
2. Encopresis is constipation with fecal incontinence; children often complain that soiling is involuntary and occurs without warning.
3. If the child does not have a neurological or anatomical disorder, encopresis is usually the result of fecal impaction and an enlarged rectum caused by chronic constipation.

#### B. Assessment

1. Constipation
  - a. Abdominal pain and cramping without distention
  - b. Palpable movable fecal masses
  - c. Normal or decreased bowel sounds
  - d. Malaise and headache
  - e. Anorexia, nausea, and vomiting
2. Encopresis
  - a. Evidence of soiling of clothing
  - b. Scratching or rubbing of the anal area
  - c. Fecal odor
  - d. Social withdrawal

#### C. Interventions

1. Maintain a diet high in fiber and fluids for simple constipation (Box 40-3).
2. Monitor treatment regimen for severe encopresis for 3 to 6 months.
3. Decrease sugar and milk intake.
4. Administer enemas as prescribed until impaction is cleared.
5. Monitor for hypernatremia or hyperphosphatemia when administering repeated enemas.

**Box 40-3 High-Fiber Foods**

## Bread, grains

- Whole-grain bread or rolls
- Whole-grain cereals
- Bran
- Pancakes, waffles, and muffins with fruit or bran
- Unrefined (brown) rice

## Vegetables

- Raw vegetables, especially broccoli, cabbage, carrots, cauliflower, celery, lettuce, and spinach
- Cooked vegetables including those listed above and asparagus, beans, Brussels sprouts, corn, potatoes, rhubarb, squash, string beans, and turnips

## Fruits

- Prunes, raisins, or other dried fruits
- Raw fruits, especially those with skins or seeds, other than ripe banana or avocado

## Miscellaneous

- Legumes (beans), popcorn, nuts, and seeds
- High-fiber snack bars

From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1391). St. Louis: Mosby.

- a. Signs of hypernatremia include increased thirst; dry, sticky mucous membranes; flushed skin; increased temperature; nausea and vomiting; oliguria; and lethargy.
  - b. Signs of hyperphosphatemia include tetany, muscle weakness, dysrhythmias, and hypotension.
6. Administer stool softeners or laxatives as prescribed.
  7. Encourage the child to sit on the toilet for 5 to 10 minutes approximately 20 to 30 minutes after breakfast and dinner to assist with defecation.

**XV. IRRITABLE BOWEL SYNDROME****A. Description**

1. Irritable bowel syndrome results from increased motility, which can lead to spasm and pain.
2. The diagnosis is based on the elimination of pathological conditions.
3. The syndrome is a self-limiting, intermittent problem with no definitive treatment.
4. Stress and emotional factors may contribute to its occurrence.

**B. Assessment**

1. Diffuse abdominal pain unrelated to meals or activity
2. Alternating constipation and diarrhea with the presence of undigested food and mucus in the stool

 **C. Interventions**

1. Reassure the parents and child that the problem is self-limiting and intermittent and will resolve.
2. Anticholinergics may be prescribed (antidepressants may be needed in severe cases).

**Box 40-4 Assessment Findings: Imperforate Anus**

Failure to pass meconium stool  
Absence or stenosis of the anal rectal canal  
Presence of an anal membrane  
External fistula to the perineum

3. Encourage the maintenance of a healthy, well-balanced, moderate-fiber, and low-fat diet.
4. Encourage health promotion activities such as exercise and school activities.
5. Inform the parents of psychosocial resources if required.

**XVI. IMPERFORATE ANUS**

**A. Description:** Incomplete development or absence of the anus in its normal position in the perineum

**B. Types**

1. A membrane is noted over the anal opening, with a normal anus just above the membrane.
2. There is complete absence of the anus (anal agenesis) with a rectal pouch ending some distance above.
3. Rectum ends blindly or has a fistula connection to the perineum, urethra, bladder, or vagina.

**C. Assessment (Box 40-4)****D. Preoperative interventions**

1. Determine patency of the anus.
2. Monitor for the presence of stool in the urine and vagina (indicates a fistula) and report immediately.
3. Administer IV fluids as prescribed.
4. Prepare the child and parents for the surgical procedures, including the potential for colostomy.

**E. Postoperative interventions**

1. Monitor the skin for signs of infection.
2. The preferred position is a side-lying prone position with the hips elevated or a supine position with the legs suspended at a 90-degree angle to the trunk to reduce edema and pressure on the surgical site.
3. Keep the anal surgical incision clean and dry, and monitor for redness, swelling, or drainage.
4. Maintain NPO status and nasogastric tube if in place.
5. Maintain IV fluids until gastrointestinal motility returns.
6. Provide care for colostomy, if present, as prescribed.
7. A new colostomy stoma is red and edematous, but this should decrease with time.
8. Instruct the parents to perform anal dilation if prescribed to achieve and maintain bowel patency.
9. Instruct the parents to use only dilators supplied by the physician and a water-soluble lubricant and to insert the dilator no more than 1 to 2 cm into the anus to prevent damage to the mucosa.

## XVII. HEPATITIS

- A.** This section contains specific information regarding hepatitis as it relates to infants and children; see also Chapters 25 and 56.
- B.** Description: An acute or chronic inflammation of the liver that may be caused by a virus, a medication reaction, or another disease process
- C.** Hepatitis A (HAV) 
1. Highest incidence of HAV infection occurs among preschool or school-age children younger than 15 years.
  2. Many infected children are asymptomatic, but mild nausea, vomiting, and diarrhea may occur.
  3. Infected children who are asymptomatic still can spread HAV to others.
- D.** Hepatitis B (HBV) 
1. Most HBV infection in children is acquired perinatally.
  2. Newborn infants are at risk if the mother is infected with HBV or was a carrier of HBV during pregnancy.
  3. Possible routes of maternal-fetal (infant) transmission include leakage of the virus across the placenta late in pregnancy or during labor, ingestion of amniotic fluid or maternal blood, and breast-feeding, especially if the mother has cracked nipples.
  4. The severity in the infant varies from no liver disease to fulminant (severe acute course) or chronic active disease.
  5. In children and adolescents, HBV occurs in specific high-risk groups, including children with hemophilia or other disorders requiring multiple blood transfusions, children or adolescents involved in IV drug **abuse**, institutionalized children, preschool children in endemic areas, and children who have had heterosexual activity or sexual activity with homosexual men.
  6. Infection with HBV can cause a carrier state and lead to eventual cirrhosis or hepatocellular carcinoma in adulthood.
- E.** Hepatitis C (HCV) 
1. Transmission of HCV is primarily by the parenteral route.
  2. Some children may be asymptomatic, but HCV often becomes a chronic condition and can cause cirrhosis and hepatocellular carcinoma.
- F.** Hepatitis D 
1. Infection occurs in children already infected with HBV.
  2. Acute and chronic forms tend to be more severe than HBV and can lead to cirrhosis.
  3. Children with hemophilia are more likely to be infected, as are children who are IV drug users.
- G.** Hepatitis E 
1. Infection is uncommon in children.
  2. Infection is not a chronic condition, does not cause chronic liver disease, and has no carrier state.
- H.** Hepatitis G 
1. Hepatitis G virus is blood-borne and is similar to HCV.
  2. High-risk groups include transfusion recipients, IV drug users, and individuals infected with HCV.
  3. Individuals are often asymptomatic, and most infections are chronic.
- I.** Assessment (Box 40-5) 
- J.** Diagnostic evaluation: See Chapter 11.
- K.** Prevention 
1. Immunoglobulin provides **passive immunity** and may be effective for pre-exposure prophylaxis to prevent HAV infection.
  2. Hepatitis B immunoglobulin provides **passive immunity** and may be effective in preventing infection after a one-time exposure (should be given immediately after exposure), such as an accidental needle puncture or other contact of contaminated material with mucous membranes; immunoglobulin should also be given to newborns whose mothers are positive for hepatitis B surface antigen.
  3. Hepatitis A **vaccine** and hepatitis B **vaccine**: See Chapter 48.
-  Proper handwashing and standard precautions can prevent the spread of viral hepatitis.
- L.** Interventions 
1. Strict handwashing is required.
  2. Hospitalization is required in the event of coagulopathy or fulminant hepatitis.
  3. Standard precautions and enteric precautions are followed during hospitalization.
  4. Provide enteric precautions for at least 1 week after the onset of jaundice with HAV.

### Box 40-5 Assessment Findings: Hepatitis

#### Prodromal or Anicteric Phase

Lasts 5 to 7 days

Absence of jaundice

Anorexia, malaise, lethargy, easy fatigability

Fever (especially in adolescents)

Nausea and vomiting

Epigastric or right upper quadrant abdominal pain

Arthralgia and rashes (more likely with hepatitis B virus)

Hepatomegaly

#### Icteric Phase

Jaundice, which is best assessed in the sclera, nail beds, and mucous membranes

Dark urine and pale stools

Pruritus

5. The hospitalized child usually is not isolated in a separate room unless he or she is fecally incontinent and items are likely to become contaminated with feces.
6. Children are discouraged from sharing toys.
7. Instruct the child and parents in effective hand-washing techniques.
8. Instruct the parents to disinfect diaper-changing surfaces thoroughly with a solution of 1/4 cup bleach in 1 gallon of water.
9. Maintain comfort, and provide adequate rest and sleep.
10. Provide a low-fat, well-balanced diet.
11. Inform the parents that because HAV is not infectious 1 week after the onset of jaundice, the child may return to school at that time if he or she feels well enough.
12. Inform the parents that jaundice may appear worse before it resolves.
13. Caution the parents about administering any medications to the child; explain the role of the liver in detoxification and excretion of medications in understandable terms.
14. Instruct the parents about the signs of the child's condition worsening, such as changes in neurological status, bleeding, and fluid retention.

### XVIII. INGESTION OF POISONS (see Priority Nursing Actions)

#### PRIORITY NURSING ACTIONS!

##### Actions to Take in the Emergency Department in the Event of a Poisoning

1. Assess the child.
2. Terminate exposure to the poison.
3. Identify the poison.
4. Take measures to prevent absorption of the poison.
5. Document the occurrence, assessment findings, poison ingested, treatment measures, and the child's response.

In the event of a poisoning, the nurse treats the child first, not the poison. The ABCs—airway, breathing, and circulation—and vital signs are assessed. Cardiopulmonary resuscitation is initiated immediately if necessary. Exposure to the poison is terminated next, such as emptying the mouth of pills or other materials or flushing the skin or other body area. The poison is identified next by questioning the parents or witnesses of the event to determine the appropriate treatment. The nurse administers the antidote or takes other measures as prescribed by the physician, such as administering activated charcoal. The nurse documents the occurrence, assessment findings, poison ingested, treatment measures, and the child's response.

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 1427-1430). St. Louis: Mosby.

- A. Lead poisoning
  1. Description: Excessive accumulation of lead in the blood
  2. Causes
    - a. The pathway for exposure may be food, air, or water.
    - b. Dust and soil contaminated with lead may be a source of exposure.
    - c. Lead enters the child's body through ingestion or inhalation or through placental transmission to an unborn child when the mother is exposed; the most common route is hand to mouth from contaminated objects, such as loose paint chips, pottery, or ceramic ware coupled with the inhalation of lead dust in the environment.
    - d. When lead enters the body, it affects the erythrocytes, bones and teeth, and organs and tissues, including the brain and nervous system; the most serious consequences are the effects on the central nervous system.
  3. Universal screening
    - a. Screening is recommended for children 1 to 2 years old; children at high risk should be screened earlier.
    - b. Any child between the ages of 3 and 6 years who has not been screened should be tested.
  4. Targeted screening
    - a. Targeted screening is acceptable in low-risk areas.
    - b. A child at the age of 1 to 2 years (or a child between the ages of 3 and 6 years who has not been screened) may be targeted for screening if determined to be at risk.
  5. Blood lead level test: Used for screening and diagnosis (Table 40-1)
  6. Erythrocyte protoporphyrin test
    - a. Indicator of anemia
    - b. Normal value for a child: 35 mcg/100 mL of whole blood or lower
  7. Chelation therapy
    - a. Chelation therapy removes lead from the circulating blood and from some organs and tissues.
    - b. Therapy does not counteract any effects of the lead.
    - c. Medications include calcium disodium edetate (CaNa<sub>2</sub>EDTA), and succimer (Chemet), an oral preparation; British anti-Lewisite (BAL, dimer-caprol) is used in conjunction with EDTA.
    - d. British anti-Lewisite is administered by the IV route or via deep intramuscular route and is contraindicated in children with an allergy to peanuts because the medication is prepared in a peanut oil solution; it is also contraindicated in children with glucose 6-phosphate dehydrogenase (G6PD) deficiency and should not be given with iron.

**TABLE 40-1** Blood Lead Level Test Results and Intervention

| Level (mcg/dL) | Intervention  |
|----------------|---|
| <10            | Reassess or rescreen in 1 yr or sooner if exposure status changes   |
| 10-14          | Provide family lead education, follow-up testing, and social service referral for home assessment if necessary  |
| 15-19          | Provide family lead education, follow-up testing, and social service referral if necessary; on follow-up testing, initiate actions for blood lead level of 20-44 mcg/dL   |
| 20-44          | Provide coordination of care and clinical management, including treatment, environmental investigation, and lead-hazard control   |
| 45-69          | Provide coordination of care and clinical management within 48 hr, including treatment, environmental investigation, and lead-hazard control (the child must not remain in a lead-hazardous environment if resolution is necessary) |
| ≥70            | Medical treatment is provided immediately, including coordination of care, clinical management, environmental investigation, and lead-hazard control  |

Modified from Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1436). St. Louis: Mosby.

- e. The function of the renal, hepatic, and hematological systems must be monitored closely.
- f. Ensure adequate urinary output before administering the medication, and monitor the output and pH of the urine closely during and after therapy.
- g. Provide adequate hydration and monitor kidney function for nephrotoxicity when the medication is given because the medication is excreted via the kidneys.
- h. Follow-up of lead levels needs to be done to monitor progress.
- i. Provide instructions to parents about safety from lead hazards, medication administration, and the need for follow-up.
- j. Confirm that the child will be discharged to a home without lead hazards.

## B. Acetaminophen (Tylenol)

1. Description
  - a. Seriousness of ingestion is determined by the amount ingested and the length of time before intervention
  - b. Toxic dose is 150 mg/kg or higher in children.
2. Assessment
  - a. First 2 to 4 hours: Malaise, nausea, vomiting, sweating, pallor, weakness

- b. Latent period: 24 to 36 hours; child improves
- c. Hepatic involvement: May last 7 days and may be permanent; right upper quadrant pain, jaundice, confusion, stupor, elevated liver enzyme and bilirubin levels, prolonged prothrombin time

## 3. Interventions

- a. Administer antidote: *N*-acetyl cysteine (Mucomyst)
- b. Dilute antidote in juice or soda because of its offensive odor.
- c. Loading dose is followed by maintenance doses.
- d. In an unconscious child, prepare to administer gastric lavage with activated charcoal to decrease the absorption of acetaminophen.
- e. If using activated charcoal with lavage, do not also use *N*-acetyl cysteine because activated charcoal inactivates the antidote.

## C. Acetylsalicylic acid (aspirin)

### 1. Description

- a. Overdose may be caused by acute ingestion or chronic ingestion.
- b. Acute: Severe toxicity with 300 to 500 mg/kg
- c. Chronic: Ingestion of more than 100 mg/kg per day for 2 days or more, which can be more serious than acute ingestion

### 2. Assessment

- a. Gastrointestinal effects: Nausea, vomiting, and thirst from dehydration
- b. Central nervous system effects: Hyperpnea, confusion, tinnitus, convulsions, coma, respiratory failure, circulatory collapse
- c. Renal effects: Oliguria
- d. Hematopoietic effects: Bleeding tendencies
- e. Metabolic effects: Diaphoresis, fever, hyponatremia, hypokalemia, dehydration, hypoglycemia, metabolic acidosis

### 3. Interventions

- a. Prepare to administer activated charcoal to decrease absorption of salicylate.
- b. Emesis or cathartic measures may be prescribed.
- c. Administer IV fluids; sodium bicarbonate may be prescribed to correct metabolic acidosis.
- d. Other interventions include external cooling, anticonvulsants, vitamin K (if bleeding), and oxygen.
- e. Prepare the child for dialysis as prescribed if the child is unresponsive to the therapy.

## D. Corrosives

### 1. Description

- a. Items that can cause poisoning include household cleaners, detergents, bleach, paint or paint thinners, or batteries.
- b. Liquid corrosives can cause more damage to the victim than other types of corrosives, such as granular.

2. Assessment
  - a. Severe burning in the mouth, throat, or stomach
  - b. Edema of the mucous membranes, lips, tongue, and pharynx
  - c. Vomiting
  - d. Drooling and inability to clear secretions
3. Interventions
  - a. Dilute corrosive with water or milk as prescribed (usually no more than 4 oz)
  - b. Inducing vomiting is contraindicated because vomiting redamages the mucous membranes.
  - c. Neutralization of the ingested corrosive is not done because it can cause a reaction producing heat and burns.

 Educate parents to call the poison control center immediately in the event of poisoning. The parents need to be instructed to post the poison control center telephone number near each phone in the house.

## XIX. INTESTINAL PARASITES

- A. Description: Common infections in children are giardiasis and pinworm infestation.
  1. Giardiasis is caused by protozoa and is prevalent among children in crowded environments, such as classrooms or day care centers.
  2. Pinworms (enterobiasis) are universally present in temperate climate zones and are easily transmitted in crowded environments.
- B. Assessment
  1. Giardiasis
    - a. Diarrhea and vomiting
    - b. Anorexia
    - c. Failure to thrive
    - d. Abdominal cramps with intermittent loose stools and constipation
    - e. Steatorrhea
    - f. Resolves in 4 to 6 weeks spontaneously
    - g. Stool specimens from three or more collections are used for diagnosis.
  2. Pinworms
    - a. Intense perianal itching
    - b. Irritability, restlessness
    - c. Poor sleeping
    - d. Bed wetting
- C. Interventions
  1. Giardiasis
    - a. Medications that may be prescribed include metronidazole (Flagyl), tinidazole (Tindamax), nitazoxanide (Alinia), or albendazole (Albenza).
    - b. Caregivers should wash hands meticulously.
    - c. Provide education to family and caregivers regarding sanitary practices.
  2. Pinworms

- a. Perform a visual inspection of the anus with a flashlight 2 to 3 hours after sleep.
- b. The tape test is the most common diagnostic test.
- c. Educate the family and caregivers regarding the tape test. A loop of transparent tape is placed firmly against the child's perianal area; it is removed in the morning and placed in a glass jar or plastic bag and transported to the primary care provider for analysis.
- d. Medications that may be prescribed include mebendazole (Vermox), pyrantel pamoate (Pin-Rid, Antiminth), and albendazole (Albenza); these medications are not used in children younger than 2 years.
- e. The medication regimen may be repeated in 2 weeks to prevent reinfection.
- f. All members of the family are treated for the infection.
- g. Teach the family and caregivers about the importance of meticulous handwashing and about washing all clothes and bed linens in hot water.

## MORE QUESTIONS ON THE CD!

### Practice Questions

407. A nurse is preparing to care for a child with a diagnosis of intussusception. The nurse reviews the child's record and expects to note which symptom of this disorder documented?
  1. Watery diarrhea
  2. Ribbon-like stools
  3. Profuse projectile vomiting
  4. Bright red blood and mucus in the stools
408. A clinic nurse reviews the record of an infant and notes that the physician has documented a diagnosis of suspected Hirschsprung's disease. The nurse reviews the assessment findings documented in the record, knowing that which symptom most likely led the mother to seek health care for the infant?
  1. Diarrhea
  2. Projectile vomiting
  3. Regurgitation of feedings
  4. Foul-smelling ribbon-like stools
409. An infant has just returned to the nursing unit after a surgical repair of a cleft lip on the right side. The nurse places the infant in which best position at this time?
  1. Prone position
  2. On the stomach
  3. Left lateral position
  4. Right lateral position

- 410.** A nurse reviews the record of a newborn infant and notes that a diagnosis of esophageal atresia with tracheoesophageal fistula is suspected. The nurse expects to note which most likely sign of this condition documented in the record?
1. Incessant crying
  2. Coughing at nighttime
  3. Choking with feedings
  4. Severe projectile vomiting
- 411.** A nurse provides feeding instructions to a mother of an infant diagnosed with gastroesophageal reflux disease. To assist in reducing the episodes of emesis, the nurse tells the mother to:
1. Provide less frequent, larger feedings.
  2. Burp the infant less frequently during feedings.
  3. Thin the feedings by adding water to the formula.
  4. Thicken the feedings by adding rice cereal to the formula.
- 412.** A child is hospitalized because of persistent vomiting. The nurse monitors the child closely for:
1. Diarrhea
  2. Metabolic acidosis
  3. Metabolic alkalosis
  4. Hyperactive bowel sounds
- 413.** A nurse is caring for a newborn infant with a suspected diagnosis of imperforate anus. The nurse monitors the infant, knowing that which of the following is a clinical manifestation associated with this disorder?
1. Bile-stained fecal emesis
  2. The passage of currant jelly-like stools
  3. Failure to pass meconium stool in the first 24 hours after birth
  4. Sausage-shaped mass palpated in the upper right abdominal quadrant
- 414.** A nurse admits a child to the hospital with a diagnosis of pyloric stenosis. On admission assessment, which data would the nurse expect to obtain when asking the mother about the child's symptoms?
1. Watery diarrhea
  2. Projectile vomiting
  3. Increased urine output
  4. Vomiting large amounts of bile
- 415.** A nurse provides home care instructions to the parents of a child with celiac disease. The nurse teaches the parents to include which food item in the child's diet?
1. Rice
  2. Oatmeal
  3. Rye toast
  4. Wheat bread

### Alternate Item Format: Multiple Response

- 416.** Which interventions would a nurse include when preparing a care plan for a child with hepatitis? **Select all that apply.**
- 1. Providing a low-fat, well-balanced diet.
  - 2. Notifying the physician if jaundice is present.
  - 3. Teaching the child effective handwashing techniques.
  - 4. Scheduling playtime in the playroom with other children.
  - 5. Instructing the parents to avoid administering medications unless prescribed.
  - 6. Arranging for indefinite home schooling because the child will not be able to return to school.

## ANSWERS

### 407. 4

**Rationale:** Intussusception is a telescoping of one portion of the bowel into another. The condition results in an obstruction to the passage of intestinal contents. A child with intussusception typically has severe abdominal pain that is crampy and intermittent, causing the child to draw in the knees to the chest. Vomiting may be present, but is not projectile. Bright red blood and mucus are passed through the rectum and commonly are described as currant jelly-like stools. Watery diarrhea and ribbon-like stools are not manifestations of this disorder.

**Test-Taking Strategy:** Focus on the diagnosis and think about the pathophysiology that occurs. Recalling that a classic manifestation is currant jelly-like stools will assist in

directing you to option 4. Review the manifestations of intussusception if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., pp. 852–853). St. Louis: Mosby.

### 408. 4

**Rationale:** Hirschsprung's disease is a congenital anomaly also known as congenital aganglionosis or aganglionic megacolon. It occurs as the result of an absence of ganglion cells in the rectum and other areas of the affected intestine. Chronic

constipation beginning in the first month of life and resulting in pellet-like or ribbon-like stools that are foul-smelling is a clinical manifestation of this disorder. Delayed passage or absence of meconium stool in the neonatal period is also a sign. Bowel obstruction especially in the neonatal period, abdominal pain and distention, and failure to thrive are also clinical manifestations. Options 1, 2, and 3 are not associated specifically with this disorder.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the pathophysiology associated with Hirschsprung's disease to direct you to option 4. Remember that chronic constipation beginning in the first month of life and resulting in pellet-like or ribbon-like, foul-smelling stools is a clinical manifestation of this disorder. If you are unfamiliar with the manifestations of Hirschsprung's disease, review these assessment findings.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1392). St. Louis: Mosby.

#### 409. 3

**Rationale:** A cleft lip is a congenital anomaly that occurs as a result of failure of soft tissue or bony structure to fuse during embryonic development. After cleft lip repair, a nurse avoids positioning an infant on the side of the repair or in the prone position because these positions can cause rubbing of the surgical site on the mattress. The nurse positions the infant on the side lateral to the repair or on the back upright and positions the infant to prevent airway obstruction by secretions, blood, or the tongue. From the options provided, placing the infant on the left side immediately after surgery is best to prevent the risk of aspiration if the infant vomits.

**Test-Taking Strategy:** Eliminate options 1 and 2 because they are comparable or alike positions. Consider the anatomical location of the surgical site and note the strategic words *right side* to direct you to the correct option from the remaining options. Review postoperative positioning techniques after cleft lip repair if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1095). St. Louis: Saunders.

#### 410. 3

**Rationale:** In esophageal atresia and tracheoesophageal fistula, the esophagus terminates before it reaches the stomach, ending in a blind pouch, and a fistula is present that forms an unnatural connection with the trachea. Any child who exhibits the "3 C's"—coughing and choking with feedings and unexplained cyanosis—should be suspected to have tracheoesophageal fistula. Options 1, 2, and 4 are not specifically associated with tracheoesophageal fistula.

**Test-Taking Strategy:** Focus on the diagnosis and think about the pathophysiology of the disorder. Recalling the "3 C's" associated with this disorder will assist in directing

you to the correct option. Review the clinical manifestations associated with esophageal atresia and tracheoesophageal fistula if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1098). St. Louis: Saunders.

#### 411. 4

**Rationale:** Gastroesophageal reflux is backflow of gastric contents into the esophagus as a result of relaxation or incompetence of the lower esophageal or cardiac sphincter. Small, more frequent feedings with frequent burping often are prescribed in the treatment of gastroesophageal reflux. Feedings thickened with rice cereal may reduce episodes of emesis. If thickened formula is used, cross-cutting of the nipple may be required.

**Test-Taking Strategy:** Use the process of elimination and basic principles related to feeding an infant to assist in eliminating options 1 and 2. Noting the strategic words *reducing the episodes of emesis* will assist in directing you to select option 4 over option 3. Review therapeutic interventions associated with gastroesophageal reflux disease if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1105). St. Louis: Saunders.

#### 412. 3

**Rationale:** Vomiting causes the loss of hydrochloric acid and subsequent metabolic alkalosis. Metabolic acidosis would occur in a child experiencing diarrhea because of the loss of bicarbonate. Diarrhea might or might not accompany vomiting. Hyperactive bowel sounds are not associated with vomiting.

**Test-Taking Strategy:** Use the process of elimination. Recalling that gastric fluids are acidic and that the loss of these fluids leads to alkalosis will assist you in answering the question. No data in the question support options 1 and 4. Review the manifestations associated with vomiting if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1082). St. Louis: Saunders.

#### 413. 3

**Rationale:** Imperforate anus is the incomplete development or absence of the anus in its normal position in the perineum. During the newborn assessment, this defect should be identified easily on sight. A rectal thermometer or tube may be necessary, however, to determine patency if meconium is not passed in the

first 24 hours after birth. Other assessment findings include absence or stenosis of the anal rectal canal, presence of an anal membrane, and an external fistula to the perineum. Options 1, 2, and 4 are findings noted in intussusception.

**Test-Taking Strategy:** Focus on the newborn's diagnosis. Use the process of elimination and the definition of the word *imperforate* to assist in answering this question. This should direct you to option 3. Review the assessment findings associated with imperforate anus if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Gastrointestinal/Renal

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 854). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 1101–1102). St. Louis: Saunders.

#### 414. 2

**Rationale:** In pyloric stenosis, hypertrophy of the circular muscles of the pylorus causes narrowing of the pyloric canal between the stomach and the duodenum. Clinical manifestations of pyloric stenosis include projectile vomiting, irritability, hunger and crying, constipation, and signs of dehydration including a decrease in urine output.

**Test-Taking Strategy:** Considering the anatomical location of this disorder and its potential effects will assist in eliminating options 1 and 3. Thinking about the pathophysiology of the disorder and recalling that a major clinical manifestation is projectile vomiting will assist in directing you to option 2 from the remaining options. Review the clinical manifestations of pyloric stenosis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., pp. 849–850). St. Louis: Mosby.

#### 415. 1

**Rationale:** Celiac disease also is known as gluten enteropathy or celiac sprue and refers to an intolerance to gluten, the protein component of wheat, barley, rye, and oats. The important factor to remember is that all wheat, rye, barley, and oats should be eliminated from the diet and replaced with corn, rice, or millet. Vitamin supplements—especially the fat-soluble vitamins, iron, and folic acid—may be needed to correct deficiencies. Dietary restrictions are likely to be lifelong.

**Test-Taking Strategy:** Focus on the disorder. Recalling that corn, rice, and millet are substitute food replacements in this disease will direct you to option 1. Review the dietary management in celiac disease if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1423). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 416. 1, 3, 5

**Rationale:** Hepatitis is an acute or chronic inflammation of the liver that may be caused by a virus, a medication reaction, or another disease process. Because hepatitis can be viral, standard precautions should be instituted in the hospital. The child should be discouraged from sharing toys, so playtime in the playroom with other children is not part of the plan of care. The child will be allowed to return to school 1 week after the onset of jaundice, so indefinite home schooling would not need to be arranged. Jaundice is an expected finding with hepatitis and would not warrant notification of the physician. Provision of a low-fat, well-balanced diet is recommended. Parents are cautioned about administering any medication to the child because normal doses of many medications may become dangerous owing to the liver's inability to detoxify and excrete them. Handwashing is the most effective measure for control of hepatitis in any setting, and effective handwashing can prevent the immunocompromised child from contracting an opportunistic type of infection.

**Test-Taking Strategy:** Use the process of elimination. Eliminate any intervention that would be inappropriate for a child with hepatitis. Thinking about the pathophysiology associated with hepatitis and the method of transmission will assist you in answering the question. Playing with other children in the playroom, planning for an indefinite period of home schooling, and notifying the physician of jaundice would not be appropriate interventions. Review care for a child with hepatitis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 841). St. Louis: Mosby.

# Metabolic and Endocrine Disorders

## I. FEVER

### A. Description

1. Fever is an abnormal body temperature elevation.
2. A child's temperature can vary depending on activity, emotional stress, disease processes, medications, type of clothing the child is wearing, and temperature of the environment.
3. Assessment findings associated with the fever provide important indications of the seriousness of the fever.

### B. Assessment

1. Temperature elevation: Normal temperature range for a child is 36.4° C to 37° C (97.5° F to 98.6° F); 38° C (100.4° F) is considered to be fever.
2. Flushed skin, warm to touch
3. Diaphoresis
4. Chills
5. Restlessness or lethargy

### C. Interventions

1. Monitor vital signs; take the temperature via the tympanic or axillary route or per agency procedures.
2. Remove excess clothing and blankets, reduce the room temperature, and increase the air circulation; use other cooling measures such as the application of a cool compress to the forehead if appropriate.
3. Administer a sponge bath with tepid water for 20 to 30 minutes and gently squeeze water from a facecloth over the back and chest, and recheck the temperature 30 minutes after the bath; do not use alcohol because it can cause peripheral vasoconstriction.
4. Administer antipyretics such as acetaminophen (Tylenol) or ibuprofen (Motrin) as prescribed.
5. Aspirin (acetylsalicylic acid) should not be administered, unless specifically prescribed, because of the risk of Reye's syndrome.
6. Retake the temperature 30 to 60 minutes after the antipyretic is administered.
7. Provide adequate fluid intake as tolerated and as prescribed.

8. Monitor for signs and symptoms that indicate dehydration and electrolyte imbalances; monitor laboratory values.
9. Instruct the parents in how to take the temperature, how to medicate the child safely, and when it is necessary to call the physician.

## II. DEHYDRATION (Box 41-1)

### A. Description

1. Dehydration is a common fluid and electrolyte imbalance in infants and children.
2. In infants and children, the organs that conserve water are immature, placing them at risk for fluid volume deficit.
3. Causes can include decreased fluid intake, diaphoresis, vomiting, diarrhea, diabetic ketoacidosis, and extensive burns or other serious injuries.

 **Infants and children are more vulnerable to fluid volume deficit because more of their body water is in the extracellular fluid compartment.**

### B. Assessment (Table 41-1)

### C. Interventions

1. Treat and eliminate the cause of the dehydration.
2. Monitor vital signs.
3. Monitor for signs of dehydration.
4. Monitor weight and monitor for changes, including fluid gains and losses.
5. Monitor intake and output and urine for specific gravity.
6. Monitor level of consciousness.
7. Monitor skin turgor and mucous membranes for dryness.
8. For mild to moderate dehydration, provide oral rehydration therapy with Pedialyte or a similar rehydration solution as prescribed; avoid carbonated beverages because they are gas-producing and fluids that contain high amounts of sugar, such as apple juice.
9. For severe dehydration, maintain NPO status to place the bowel at rest and provide fluid and electrolyte replacement by the intravenous

(IV) route as prescribed; if potassium is prescribed for IV administration, ensure that the child has voided before administering and has adequate renal function.

10. Reintroduce a normal diet when rehydration is achieved.
11. Provide instructions to the parents about the types and amounts of fluid to encourage, signs of dehydration, and indications of the need to notify the physician.

### III. PHENYLKETONURIA

#### A. Description

1. Phenylketonuria is a genetic disorder (autosomal recessive disorder) that results in central nervous system damage from toxic levels of phenylalanine (an essential amino acid) in the blood.

2. It is characterized by blood phenylalanine levels greater than 20 mg/dL (normal level is 1.2 to 3.4 mg/dL in newborns and 0.8 to 1.8 mg/dL thereafter).
3. All 50 states require routine screening of all newborns for phenylketonuria.

#### B. Assessment

1. In all children
  - a. Digestive problems and vomiting
  - b. Seizures
  - c. Musty odor of the urine
  - d. Mental retardation
2. In older children
  - a. Eczema
  - b. Hypertonia
  - c. Hypopigmentation of the hair, skin, and irises
  - d. Hyperactive behavior

#### C. Interventions

1. Screening of newborn infants for phenylketonuria: The infant should have begun formula or breast milk feeding before specimen collection.
2. If initial screening is positive, a repeat test is performed, and further diagnostic evaluation is required to verify the diagnosis.
3. Rescreen infants by 14 days of age if the initial screening was done before 48 hours of age.
4. If phenylketonuria is diagnosed, prepare to implement the following:

#### Box 41-1 Types of Dehydration

Isotonic dehydration: Electrolyte and water deficits occur in approximately balanced proportions

Hypertonic dehydration: Water loss exceeds electrolyte loss

Hypotonic dehydration: Electrolyte loss exceeds water loss

**TABLE 41-1** Evaluating the Extent of Dehydration

| Clinical Signs         | Level of Dehydration    |  |  |
|------------------------|-------------------------|--|--|
|                        | Mild                    | Moderate   | Severe   |
| Weight loss—infants    | 3%-5%                   | 6%-9%  | ≥10%   |
| Weight loss—children   | 3%-4%                   | 6%-8%  | 10%  |
| Pulse                  | Normal                  | Slightly increased                                   | Very increased   |
| Respiratory rate       | Normal                  | Slight tachypnea (rapid)                             | Hyperpnea (deep and rapid)   |
| Blood pressure         | Normal                  | Normal to orthostatic (>10 mm Hg change)             | Orthostatic to shock   |
| Behavior               | Normal                  | Irritable, more thirsty                              | Hyperirritable to lethargic  |
| Thirst                 | Slight                  | Moderate   | Intense  |
| Mucous membranes*      | Normal                  | Dry  | Parched  |
| Tears                  | Present                 | Decreased  | Absent; sunken eyes  |
| Anterior fontanel      | Normal                  | Normal to sunken                                     | Sunken   |
| External jugular vein  | Visible when supine     | Not visible except with supraclavicular pressure     | Not visible even with supraclavicular pressure   |
| Skin*                  | Capillary refill >2 sec | Slowed capillary refill (2-4 sec [decreased turgor]) | Very delayed capillary refill (>4 sec) and tenting; skin cool, acrocyanotic or mottled |
| Urine specific gravity | >1.020                  | >1.020; oliguria                                     | Oliguria or anuria   |

\*These signs are less prominent in the child who has hypernatremia.

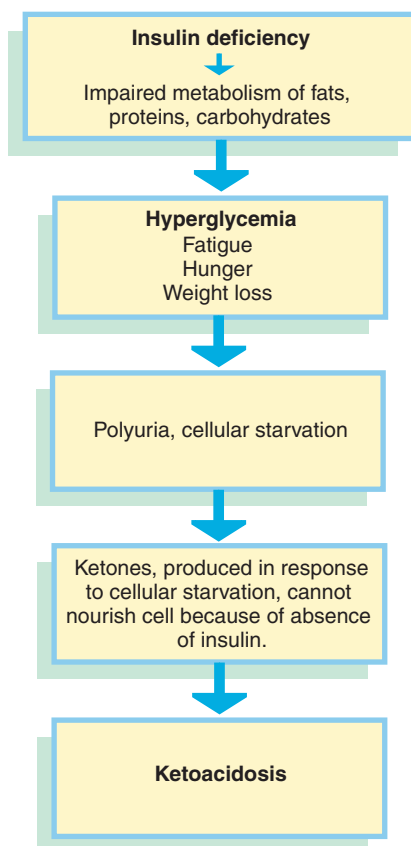

Data from Jospe, N., Forbes, G. Fluids and electrolytes—Clinical aspects, *Pediatrics in Review* 17(11):395-403, 1996; and Steiner, M.J., DeWalt, D.A., Byerley, J.S. Is this child dehydrated? *Journal of the American Medical Association* 291(22):2746-2754, 2004. Table from Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1382). St. Louis: Mosby.

- a. Restrict phenylalanine intake; high-protein foods (meats and dairy products) and aspartame are avoided because they contain large amounts of phenylalanine.
- b. Monitor physical, neurological, and intellectual development.
- c. Stress the importance of follow-up treatment.
- d. Encourage the parents to express their feelings about the diagnosis and discuss the risk of phenylketonuria in future children.
- e. Educate the parents about use of special preparation formulas and about the foods that contain phenylalanine.
- f. Consult with social care services to assist the parents with the financial burdens of purchasing special prepared formulas.

#### IV. DIABETES MELLITUS

##### A. Description (Fig. 41-1)

1. Type 1 diabetes mellitus is characterized by the destruction of the pancreatic beta cells, which produce insulin; this results in absolute insulin deficiency.
2. Type 2 diabetes mellitus usually arises because of insulin resistance, in which the body fails to use insulin properly, combined with relative (rather than absolute) insulin deficiency.

▲ **FIGURE 41-1** Insulin deficiency leading to ketoacidosis. (From McKinney, E., James, S., Murray, S., & Ashwill, J. [2009]. *Maternal-child nursing* [3rd ed.]. St. Louis: Saunders.)

3. Complete insulin deficiency requires the use of exogenous insulin to promote appropriate glucose use and to prevent complications related to elevated blood glucose levels, such as hyperglycemia, diabetic ketoacidosis, and death.
4. Diagnosis is based on the presence of classic symptoms and an elevated blood glucose level (normal blood glucose level is 70 to 110 mg/dL).
5. Children may need to be admitted directly to the pediatric intensive care unit because of the manifestations of diabetic ketoacidosis, which may be the initial occurrence leading to diagnosis of diabetes mellitus.

##### B. Assessment

1. Polyuria, polydipsia, polyphagia
2. Hyperglycemia
3. Weight loss
4. Unexplained fatigue or lethargy
5. Headaches
6. Stomachaches
7. Occasional enuresis in a previously toilet-trained child
8. Vaginitis in adolescent girls (caused by *Candida*, which thrives in hyperglycemic tissues)
9. Fruity odor to breath
10. Dehydration
11. Blurred vision
12. Slow wound healing
13. Changes in level of consciousness

##### C. Long-term effects

1. Failure to grow at a normal rate
2. Delayed maturation
3. Recurrent infections
4. Neuropathy
5. Cardiovascular disease
6. Retinal microvascular disease
7. Renal microvascular disease

##### D. Complications

1. Hypoglycemia
2. Hyperglycemia
3. Diabetic ketoacidosis
4. Coma
5. Hypokalemia
6. Hyperkalemia
7. Microvascular changes
8. Cardiovascular changes

▲ **For a child with diabetes mellitus, plan to initiate a consultation with the diabetic specialist to plan the child's care.**

##### E. Diet

1. Normal healthy nutrition is encouraged, and the total number of calories is individualized based on the child's age and **growth** expectations.
2. As prescribed by the physician, the child may be instructed to follow the dietary guidelines

(MyPyramid) issued by the U.S. Departments of Agriculture and Health and Human Services or the food exchange diet from the American Diabetic Association.

3. Dietary intake should include three well-balanced meals per day, eaten at regular intervals, plus a midafternoon snack and a bedtime snack; a consistent intake of the prescribed protein, fats, and carbohydrates at each meal and snack is needed (concentrated sweets are discouraged).
4. Instruct the child and parents that the child should carry a source of glucose, such as glucose tablets, with him or her at all times to treat hypoglycemia if it occurs.
5. Incorporate the diet into the individual child's needs, likes and dislikes, lifestyle, and cultural and socioeconomic patterns.
6. Allow the child to participate in making food choices to provide a sense of control.

#### F. Exercise

1. Instruct the child in dietary adjustments when exercising.
2. Extra food needs to be consumed for increased activity, usually 10 to 15 g of carbohydrates for every 30 to 45 minutes of activity.
3. Instruct the child to monitor the blood glucose level before exercising.
4. Plan an appropriate exercise regimen with the child, taking the developmental stage into account.

#### G. Insulin

1. Diluted insulin may be required for some infants to provide small enough doses to avoid hypoglycemia; diluted insulin should be labeled clearly to avoid dosage errors.
2. Laboratory evaluation of glycosylated hemoglobin should be performed every 3 months.
3. Illness, infection, and stress increase the need for insulin, and insulin should not be withheld during illness, infection, or stress because hyperglycemia and ketoacidosis can result.
4. When the child is not receiving anything by mouth for a special procedure, verify with the physician the need to withhold the morning insulin, and when food, fluids, and insulin are to be resumed.
5. Instruct the child and parents in the administration of insulin.
6. Instruct the child and parents to recognize symptoms of hypoglycemia and hyperglycemia.
7. Instruct the parents in the administration of glucagon intramuscularly or subcutaneously if the child has a hypoglycemic reaction and is unable to consume anything orally (if semi-conscious or unconscious).
8. Instruct the child and parents always to have a spare bottle of insulin available.

9. Advise the parents to obtain a Medic-Alert bracelet indicating the type and daily insulin dosage prescribed for the child.
10. See Chapter 55 for information on insulin types, administration sites, and administration procedure.

#### H. Blood glucose monitoring

1. Results provide information needed to maintain good glycemic control.
2. Blood glucose monitoring is more accurate than urine testing.
3. Monitoring requires that the child prick himself or herself several times a day as prescribed (Box 41-2).
4. Instruct the child and parents about the proper procedure for obtaining the blood glucose level.
5. Inform the child and parents that the procedure must be done precisely to obtain accurate results.
6. Stress the importance of handwashing before and after performing the procedure to prevent infection.
7. Stress the importance of following the manufacturer's instructions for the blood glucose monitoring device.
8. Instruct the child and parents to calibrate the monitor as instructed by the manufacturer.
9. Instruct the child and parents to check the expiration date on the test strips used for blood glucose monitoring.
10. Instruct the child and parents that if the blood glucose results do not seem reasonable, reread the instructions, reassess technique, check the expiration date of the test strips, and perform the procedure again to verify results.

#### I. Urine testing

1. Instruct the parents and child in the procedure for testing urine for ketones and glucose.

### Box 41-2 Lessening the Pain of Blood Glucose Monitoring

Hold the finger under warm water for a few seconds before puncture (enhances blood flow to the finger).

Use the ring finger or thumb to obtain a blood sample because blood flows more easily to these areas; puncture the finger just to the side of the finger pad because there are more blood vessels in this area and fewer nerve endings.

Use lancet devices with adjustable-depth tips and begin using the shallowest setting.

Press the lancet device lightly against the skin to prevent a deep puncture.

Use glucose monitors that require very small blood samples for measurement.

Modified from Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1627). St. Louis: Mosby.

2. Teach the child that the second voided urine specimen is most accurate.
3. The presence of ketones may indicate impending ketoacidosis.

 **Urine glucose testing is an unreliable method of monitoring the glucose level; however, the urine should be tested for ketones when the child is ill or when the blood glucose level is greater than 240 mg/dL.**

#### J. Hypoglycemia

1. Description
  - a. Hypoglycemia is a blood glucose level less than 70 mg/dL.
  - b. Hypoglycemia results from too much insulin, not enough food, or excessive activity.
2. Signs include headache, nausea, sweating, tremors, lethargy, hunger, confusion, slurred speech, tingling around the mouth, and anxiety.
3. Interventions (Boxes 41-3 and 41-4; see also Priority Nursing Actions)

### PRIORITY NURSING ACTIONS!

#### Actions to Take When a Hospitalized Child With Diabetes Mellitus Experiences Hypoglycemia

1. Check the child's blood glucose level.
2. Give the child  $\frac{1}{2}$  cup of fruit juice or other acceptable item.
3. Take the child's vital signs.
4. Retest the blood glucose level.
5. Give the child a small snack of carbohydrate and protein.
6. Document the child's complaints, actions taken, and outcome.

If a child with diabetes mellitus experiences hypoglycemia, the nurse first would check the child's blood glucose level to verify that the child is experiencing hypoglycemia. When this is verified, the nurse gives the child 10 to 15 g of carbohydrates. The nurse retests the blood glucose level in 15 minutes. In the meantime, the nurse checks the child's vital signs. If the child's symptoms of hypoglycemia do not resolve, the nurse gives the child another 10- to 15-g carbohydrate food item. Otherwise, the nurse provides a small snack of carbohydrates and protein if the child's next scheduled meal is more than 1 hour away from the time of the occurrence. After treatment and resolution of the hypoglycemic event, the nurse documents the occurrence, actions taken, and outcome.

Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 1621, 1624). St. Louis: Mosby.

#### K. Hyperglycemia

1. Description: Elevated blood glucose level ( $>250$  mg/dL, or as specified by the physician)
2. Signs include polydipsia, polyuria, polyphagia, blurred vision, weakness, weight loss, and syncope.
3. Interventions (Box 41-5)
4. Sick day rules (Box 41-6)

#### L. Diabetic ketoacidosis

1. Description
  - a. Diabetic ketoacidosis is a complication of diabetes mellitus that develops when a severe insulin deficiency occurs.

#### Box 41-3 Interventions for Hypoglycemia

If possible, confirm hypoglycemia with a blood glucose reading.

Administer glucose immediately; rapid-releasing glucose is followed by a complex carbohydrate and protein, such as a slice of bread or a peanut butter cracker.

Give an extra snack if the next meal is not planned for more than 30 minutes or if activity is planned.

If the child becomes unconscious, squeeze cake frosting or glucose paste onto the gums and retest the blood glucose level if the child does not improve within 15 to 20 minutes; if the reading remains low, administer additional glucose.

If the child remains unconscious, the administration of glucagon may be necessary.

In the hospital, prepare to administer dextrose intravenously if the child is unable to consume an oral glucose product.

#### Box 41-4 Food Items to Treat Hypoglycemia

$\frac{1}{2}$  cup orange juice or sugar-sweetened carbonated beverage

8 oz of milk

1 small box of raisins

3 to 4 hard candies

4 sugar cubes (1 tbsp of sugar)

3 to 4 LifeSavers candies

1 candy bar

1 tsp honey

2 or 3 glucose tablets

#### Box 41-5 Interventions for Hyperglycemia

Instruct the parents to notify the physician when the following occur:

- Blood glucose results remain elevated (usually  $>240$  mg/dL)
- Moderate or high ketonuria is present
- Child is unable to take food or fluids
- Child vomits more than once
- Illness persists

- b. Diabetic ketoacidosis is a life-threatening condition.
- c. Hyperglycemia that progresses to metabolic acidosis occurs.
- d. Diabetic ketoacidosis develops over several hours to days.
- e. The blood glucose level is greater than 300 mg/dL, and urine and serum ketone tests are positive.

 Manifestations include signs of hyperglycemia, Kussmaul's respirations, acetone (fruity) breath odor, increasing lethargy, and decreasing level of consciousness.

## 2. Interventions

- a. Restore circulating blood volume, and protect against cerebral, coronary, or renal hypoperfusion.
- b. Correct dehydration with IV infusions of 0.9% or 0.45% saline as prescribed.
- c. Correct hyperglycemia with IV regular insulin administration as prescribed.
- d. Monitor vital signs, urine output, and mental status closely.
- e. Correct acidosis and electrolyte imbalances as prescribed.
- f. Administer oxygen as prescribed.
- g. Monitor blood glucose level frequently.
- h. Monitor potassium level closely because when the child receives insulin to reduce the blood glucose level, the serum potassium level changes; if the potassium level decreases, potassium replacement may be required.
- i. The child should be voiding adequately before administering potassium; if the child does not have an adequate output, hyperkalemia may result.

- j. Monitor the child closely for signs of fluid overload.
- k. IV dextrose is added as prescribed when the blood glucose reaches an appropriate level.
- l. Treat the cause of hyperglycemia.

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 417.** A school-age child with type 1 diabetes mellitus has soccer practice three afternoons a week. The school nurse provides instructions regarding how to prevent hypoglycemia during practice. The school nurse tells the child to:
1. Eat twice the amount normally eaten at lunch time.
  2. Take half the amount of prescribed insulin on practice days.
  3. Take the prescribed insulin at noontime rather than in the morning.
  4. Eat a small box of raisins or drink a cup of orange juice before soccer practice.
- 418.** The mother of a 6-year-old child who has type 1 diabetes mellitus calls a clinic nurse and tells the nurse that the child has been sick. The mother reports that she checked the child's urine and it was positive for ketones. The nurse instructs the mother to:
1. Hold the next dose of insulin.
  2. Come to the clinic immediately.
  3. Administer an additional dose of regular insulin.
  4. Encourage the child to drink calorie-free liquids.
- 419.** A physician prescribes an IV solution of 5% dextrose and half-normal saline (0.45%) with 40 mEq of potassium chloride for a child with hypotonic dehydration. The nurse performs which priority assessment before administering this IV prescription?
1. Obtains a weight
  2. Takes the temperature
  3. Takes the blood pressure
  4. Checks the amount of urine output
- 420.** An adolescent client with type 1 diabetes mellitus is admitted to the emergency department for treatment of diabetic ketoacidosis. Which assessment findings should the nurse expect to note?
1. Sweating and tremors
  2. Hunger and hypertension
  3. Cold, clammy skin and irritability
  4. Fruity breath odor and decreasing level of consciousness

### Box 41-6 Sick Day Rules for a Diabetic Child

Always give insulin, even if the child does not have an appetite, or contact the physician for specific instructions.

Test blood glucose levels at least every 4 hours.

Test for urinary ketones with each voiding.

Notify the physician if moderate or large amounts of urinary ketones are present.

Follow the child's usual meal plan.

Encourage calorie-free liquids to aid in clearing ketones.

Encourage rest, especially if urinary ketones are present.

Notify the physician if vomiting, fruity odor to the breath, deep rapid respirations, decreasing level of consciousness, or persistent hyperglycemia occurs.

- 421.** A mother brings her 3-week-old infant to a clinic for a phenylketonuria rescreening blood test. The test indicates a serum phenylalanine level of 1 mg/dL. The nurse interprets this result as:
1. Positive
  2. Negative
  3. Inconclusive
  4. Requiring rescreening at age 6 weeks
- 422.** A child has fluid volume deficit. The nurse performs an assessment and determines that the child is improving and the deficit is resolving if:
1. The child has no tears.
  2. Urine specific gravity is 1.030.
  3. Urine output is less than 1 mL/kg/hr.
  4. Capillary refill is less than 2 seconds.
- 423.** A child with type 1 diabetes mellitus is brought to the emergency department by the mother, who states that the child has been complaining of abdominal pain and has a fruity odor of the breath. Diabetic ketoacidosis is diagnosed. Anticipating the plan of care, the nurse prepares to administer:
1. Potassium IV infusion.
  2. NPH insulin IV infusion.
  3. 5% dextrose IV infusion.
  4. Normal saline IV infusion.
- 424.** A nurse has just administered acetaminophen (Tylenol) to a child with a temperature of 38.8° C (102° F). The nurse should also take which action?
1. Withhold oral fluids for 8 hours.
  2. Sponge the child with cold water.
  3. Plan to administer salicylate (aspirin) in 4 hours.
  4. Remove excess clothing and blankets from the child.

### Alternate Item Format: Multiple Response

- 425.** The nurse would implement which interventions for a child older than 2 years with type 1 diabetes mellitus who has a blood glucose level of 60 mg/dL? **Select all that apply.**
- 1. Administer regular insulin.
  - 2. Encourage the child to ambulate.
  - 3. Give the child a teaspoon of honey.
  - 4. Provide electrolyte replacement therapy intravenously.
  - 5. Wait 30 minutes and confirm the blood glucose reading.
  - 6. Prepare to administer glucagon subcutaneously if unconsciousness occurs.

## ANSWERS

### 417. 4

**Rationale:** Hypoglycemia is a blood glucose level less than 70 mg/dL and results from too much insulin, not enough food, or excessive activity. An extra snack of 15 to 30 g of carbohydrates eaten before activities such as soccer practice would prevent hypoglycemia. A small box of raisins or a cup of orange juice provides 15 to 30 g of carbohydrates. The child or parents should not be instructed to adjust the amount or time of insulin administration. Meal amounts should not be doubled.

**Test-Taking Strategy:** Use general medication guidelines to eliminate options 2 and 3 first because insulin doses and times should not be adjusted. From the remaining options, recalling the definition of hypoglycemia and the manifestations and treatment associated with hypoglycemia will direct you to option 4. Review treatment to prevent hypoglycemia if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Metabolic/Endocrine

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 1052). St. Louis: Mosby.

### 418. 4

**Rationale:** When the child is sick, the mother should test for urinary ketones with each voiding. If ketones are present, liquids are essential to aid in clearing the ketones. The child should be

encouraged to drink calorie-free liquids. Bringing the child to the clinic immediately is unnecessary. Insulin doses should not be adjusted or changed.

**Test-Taking Strategy:** Use general medication guidelines. Eliminate options 1 and 3 first because insulin doses should not be adjusted or changed. From the remaining options, note the words *positive for ketones*. Recalling that liquids are essential to aid in clearing the ketones will direct you to the correct option. Review home care instructions for a sick diabetic child if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Metabolic/Endocrine

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1451). St. Louis: Saunders.

### 419. 4

**Rationale:** In hypotonic dehydration, electrolyte loss exceeds water loss. The priority assessment before administering potassium chloride intravenously would be to assess the status of the urine output. Potassium chloride should never be administered in the presence of oliguria or anuria. If the urine output is less than 1 to 2 mL/kg/hr, potassium chloride should not be administered. Although options 1, 2, and 3 are appropriate assessments for a child with dehydration, these assessments are not related specifically to the IV administration of potassium chloride.

**Test-Taking Strategy:** Focus on the IV prescription. Recalling that the kidneys play a key role in the excretion and reabsorption of potassium will direct you to option 4. Review the nursing considerations when administering potassium chloride if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Metabolic/Endocrine

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1076). St. Louis: Saunders.

#### 420. 4

**Rationale:** Diabetic ketoacidosis is a complication of diabetes mellitus that develops when a severe insulin deficiency occurs. Hyperglycemia occurs with diabetic ketoacidosis. Signs of hyperglycemia include fruity breath odor and a decreasing level of consciousness. Hunger can be a sign of hypoglycemia or hyperglycemia, but hypertension is not a sign of diabetic ketoacidosis. Hypotension occurs because of a decrease in blood volume related to the dehydrated state that occurs during diabetic ketoacidosis. Cold clammy skin, irritability, sweating, and tremors all are signs of hypoglycemia.

**Test-Taking Strategy:** Focus on the subject, the signs of diabetic ketoacidosis, and recall that in this condition the blood glucose level is elevated. Eliminate options 1, 2, and 3 because these signs do not occur with hyperglycemia. Recall that fruity breath odor and a change in the level of consciousness can occur during diabetic ketoacidosis. Review the signs and symptoms of hypoglycemia and hyperglycemia and the signs of diabetic ketoacidosis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Metabolic/Endocrine

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 387). St. Louis: Mosby.

#### 421. 2

**Rationale:** Phenylketonuria is a genetic disorder (autosomal recessive disorder) that results in central nervous system damage from toxic levels of phenylalanine (an essential amino acid) in the blood. It is characterized by blood phenylalanine levels greater than 20 mg/dL (normal level is 1.2 to 3.4 mg/dL in newborns and 0.8 to 1.8 mg/dL thereafter). A result of 1 mg/dL is a negative test result.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 3 and 4 first because they are comparable or alike. Note that the level identified in the question is a low level; this should assist in directing you to option 2. Review the phenylketonuria screening test if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Metabolic/Endocrine

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1425). St. Louis: Saunders.

#### 422. 4

**Rationale:** Indicators that fluid volume deficit is resolving would be capillary refill less than 2 seconds, specific gravity of 1.002 to 1.025, urine output of at least 1 mL/kg/hr, and adequate tear production. A capillary refill time less than 2 seconds is the only indicator that the child is improving. Urine output of less than 1 mL/kg/hr, a specific gravity of 1.030, and no tears would indicate that the deficit is not resolving.

**Test-Taking Strategy:** Focus on the subject, that the fluid volume deficit is resolving. Recall the parameters that indicate adequate hydration status. The only option that indicates an improving fluid balance is option 4. The other options indicate fluid imbalance. Review the normal parameters for fluid balance if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Child Health—Metabolic/Endocrine

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1073). St. Louis: Saunders.

#### 423. 4

**Rationale:** Diabetic ketoacidosis is a complication of diabetes mellitus that develops when a severe insulin deficiency occurs. Hyperglycemia occurs with diabetic ketoacidosis. Rehydration is the initial step in resolving diabetic ketoacidosis. Normal saline is the initial IV rehydration fluid. NPH insulin is never administered by the IV route. Dextrose solutions are added to the treatment when the blood glucose level decreases to an acceptable level. Intravenously administered potassium may be required, depending on the potassium level, but would not be part of the initial treatment.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 3, knowing that dextrose would not be administered in a hyperglycemic state. Eliminate option 2 next, knowing that NPH insulin is never administered by the IV route. Recalling that hydration is the initial treatment in diabetic ketoacidosis will direct you to option 4. Review the treatment for diabetic ketoacidosis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Child Health—Metabolic/Endocrine

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1452). St. Louis: Saunders.

#### 424. 4

**Rationale:** After administering acetaminophen, excess clothing and blankets should be removed. The child can be sponged with tepid water, but not cold water because the cold water can cause shivering, which increases metabolic requirements above those already caused by the fever. Aspirin is not administered to a child with fever because of the risk of Reye's syndrome. Fluids should be encouraged to prevent dehydration, so oral fluids should not be withheld.

**Test-Taking Strategy:** Use the process of elimination and remember that cooling measures such as removing excess clothing should be done when a child has a fever. Options

1, 2, and 3 would not be done if a child has a fever. Review interventions to reduce an elevated temperature if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Metabolic/Endocrine

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 704). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 425. 3, 6

**Rationale:** Hypoglycemia is defined as a blood glucose level less than 70 mg/dL. Hypoglycemia occurs as a result of too much insulin, not enough food, or excessive activity. If possible, the nurse should confirm hypoglycemia with a blood glucose reading. Glucose is administered orally immediately; rapid-releasing glucose is followed by a complex carbohydrate and protein, such as a slice of bread or a peanut butter cracker. An extra snack is given if the next meal is not planned for more than 30 minutes or if activity is planned. If the child becomes unconscious, cake frosting or glucose paste is

squeezed onto the gums, and the blood glucose level is retested if the child does not improve in 15 minutes; if the reading remains low, additional glucose is administered. If the child remains unconscious, administration of glucagon may be necessary, and the nurse should be prepared for this intervention. Encouraging the child to ambulate and administering regular insulin would result in a lowered blood glucose level. Providing electrolyte replacement therapy intravenously is an intervention to treat diabetic ketoacidosis. Waiting 30 minutes to confirm the blood glucose level delays necessary intervention.

**Test-Taking Strategy:** Focus on the information in the question. Think about the pathophysiology associated with hypoglycemia. Recalling that a blood glucose level of 60 mg/dL indicates hypoglycemia will assist in determining the correct interventions. Review the interventions for hypoglycemia if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Metabolic/Endocrine

# Renal and Urinary Disorders

## I. GLOMERULONEPHRITIS

### A. Description

1. Glomerulonephritis refers to a group of kidney disorders characterized by inflammatory injury in the glomerulus, most of which are caused by an immunological reaction.
2. The disorder results in proliferative and inflammatory changes within the glomerular structure.
3. Destruction, inflammation, and sclerosis of the glomeruli of the kidneys occur.
4. Inflammation of the glomeruli results from an antigen-antibody reaction produced by an infection elsewhere in the body.
5. Loss of kidney function develops.

### B. Causes

1. Immunological diseases
2. Autoimmune diseases
3. Antecedent group A beta-hemolytic streptococcal infection of the pharynx or skin
4. History of pharyngitis or tonsillitis 2 to 3 weeks before symptoms

### C. Types (Box 42-1)

### D. Complications

1. Renal failure
2. Hypertensive encephalopathy
3. Pulmonary edema
4. Heart failure

### E. Assessment

1. Periorbital and facial edema that is more prominent in the morning
2. Anorexia
3. Decreased urinary output
4. Cloudy, smoky, brown-colored urine (hematuria)
5. Pallor, irritability, lethargy
6. In an older child: Headaches, abdominal or flank pain, dysuria
7. Hypertension
8. Proteinuria that produces a persistent and excessive foam in the urine
9. Azotemia
10. Increased blood urea nitrogen and creatinine levels

11. Increased antistreptolysin O titer (used to diagnose disorders caused by streptococcal infections)

### F. Interventions

1. Monitor vital signs, weight, intake and output, and characteristics of urine.
2. Limit activity; provide safety measures.
3. Provide high-quality nutrient foods.
  - a. Restrictions depend on the stage and severity of the disease, especially the extent of the edema.
  - b. In uncomplicated cases, a regular diet is permitted, but sodium is restricted to a “no added salt to foods” diet.
  - c. Moderate sodium and fluid restriction is prescribed for a child with hypertension or edema.
  - d. Foods high in potassium are restricted during periods of oliguria.
  - e. Protein is restricted if the child has severe azotemia resulting from prolonged oliguria.
4. Monitor for complications (e.g., renal failure, hypertensive encephalopathy, seizures, pulmonary edema, heart failure).
5. Administer diuretics (if significant edema and fluid overload are present), antihypertensives (for hypertension), and antibiotics (to a child with evidence of persistent streptococcal infections) as prescribed.
6. Initiate seizure precautions and administer anticonvulsants as prescribed for seizures associated with hypertensive encephalopathy.
7. Instruct parents to report signs of bloody urine, headache, or edema.
8. Instruct parents that the child needs to obtain appropriate adequate treatment for infections, specifically for sore throats, upper respiratory infections, and skin infections.

 Measuring the daily weight and assessing for changes is the most useful and effective measure for determining fluid balance.

## II. NEPHROTIC SYNDROME

### A. Description

1. Nephrotic syndrome is a kidney disorder characterized by massive proteinuria, hypoalbuminemia (hypoproteinemia), and edema (Fig. 42-1).
2. The primary objectives of therapeutic management are to reduce the excretion of urinary protein, maintain protein-free urine, reduce edema, prevent infection, and minimize complications.

### B. Assessment (Box 42-2)

**!** The classic manifestations of nephrotic syndrome are massive proteinuria, hypoalbuminemia, and edema.

### C. Interventions

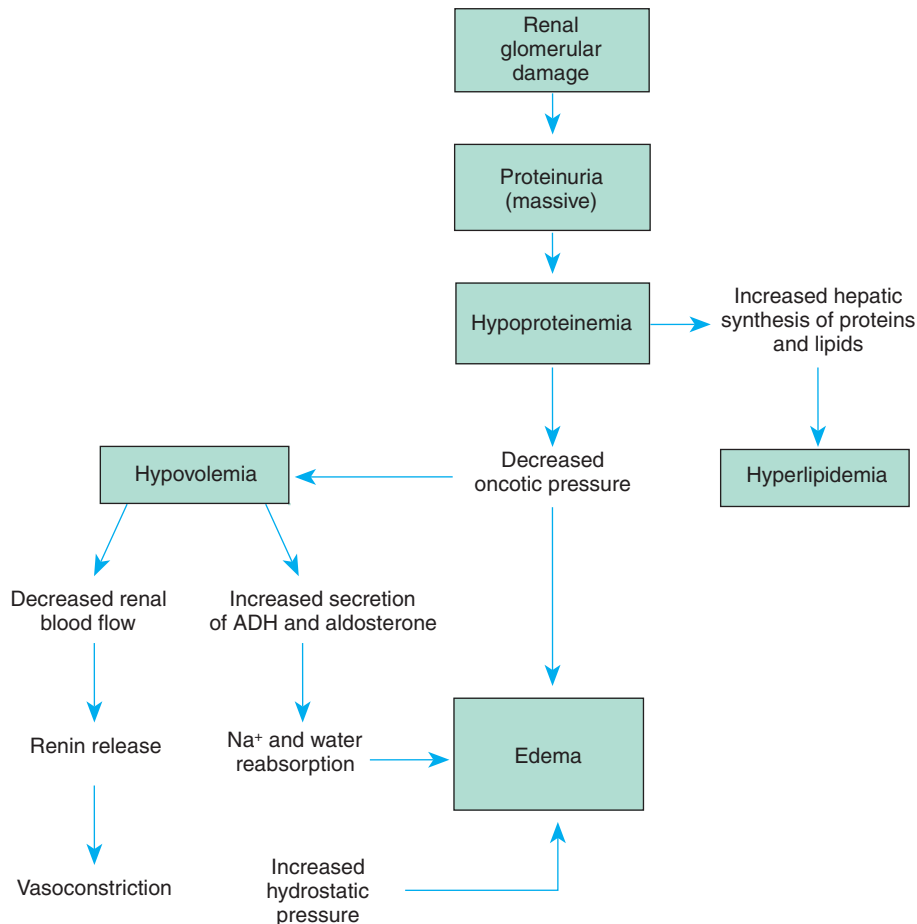

1. Monitor vital signs, intake and output, and daily weights.
2. Monitor urine for specific gravity and protein.
3. Monitor for edema.
4. Nutrition: A regular diet without added salt may be prescribed if the child is in remission; sodium is restricted during periods of massive edema (fluids may also be restricted).

#### Box 42-1 Types of Glomerulonephritis

|         |   |
|---------|---|
| Acute   | Occurs 2 to 3 weeks after a streptococcal infection |
| Chronic | Can occur after the acute phase or slowly over time |

#### Box 42-2 Assessment Findings in Nephrotic Syndrome

Child gains weight  
Periorbital and facial edema most prominent in the morning  
Leg, ankle, labial, or scrotal edema  
Urine output decreases; urine dark and frothy  
Ascites (fluid in abdominal cavity)  
Blood pressure normal or slightly decreased  
Lethargy, anorexia, and pallor  
Massive proteinuria  
Decreased serum protein (hypoproteinemia) and elevated serum lipid levels

**▲ FIGURE 42-1** Sequence of events in nephrotic syndrome. (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed.]. St. Louis: Mosby.)

5. Corticosteroid therapy is prescribed as soon as the diagnosis has been determined; monitor the child closely for signs of infection and other adverse effects (Box 42-3).
6. Immunosuppressant therapy may be prescribed to reduce the relapse rate and induce long-term remission, or, if the child is nonresponsive to corticosteroid therapy, therapy may be administered along with the corticosteroid.
7. Diuretics may be prescribed to reduce edema.
8. Plasma expanders such as salt-poor human albumin may be prescribed for a severely edematous child.
9. Instruct parents about testing the urine for protein, medication administration, side effects of medications, and general care of the child.
10. Instruct parents regarding the signs of infection and the need to avoid contact with other children who may be infectious.

### III. HEMOLYTIC-UREMIC SYNDROME

#### A. Description

1. Hemolytic-uremic syndrome is thought to be associated with bacterial toxins, chemicals, and viruses that cause acute renal failure in children.
2. It occurs primarily in infants and small children 6 months to 5 years old.
3. Clinical features include acquired hemolytic anemia, thrombocytopenia, renal injury, and central nervous system symptoms.

#### B. Assessment

1. Triad of anemia, thrombocytopenia, and renal failure (Box 42-4)
2. Proteinuria, hematuria, and presence of urinary casts

#### Box 42-3 Adverse Effects of Corticosteroid Therapy

|                         |                    |
|-------------------------|--------------------|
| Impaired wound healing  | Emotional lability |
| Hyperglycemia           | Hirsutism          |
| Skin fragility          | Moon facies        |
| Abnormal fat deposition | Osteoporosis       |

#### Box 42-4 Manifestations of Hemolytic-Uremic Syndrome

|  |
|--|
| Vomiting   |
| Irritability   |
| Lethargy   |
| Marked pallor  |
| Hemorrhagic manifestations: Bruising, petechiae, jaundice, bloody diarrhea |
| Oliguria or anuria   |
| Central nervous system involvement: Seizures, stupor, coma                 |

3. Blood urea nitrogen and serum creatinine levels elevated; hemoglobin and hematocrit levels decreased.
- C. Interventions**
1. Hemodialysis or peritoneal dialysis may be prescribed if a child is anuric.
    - a. Hemodialysis requires venous access (e.g., an arteriovenous fistula), and treatment is usually 3 to 8 hours in length (three times per week); peritoneal dialysis requires surgical placement of an abdominal catheter (correction of fluid and electrolyte imbalance is slower with peritoneal dialysis than hemodialysis).
    - b. Dialysate solution is prescribed to meet the child's electrolyte needs.
  2. Strict monitoring of fluid balance is necessary; fluid restrictions may be prescribed if the child is anuric.
  3. Institute measures to prevent infection.
  4. Provide adequate nutrition.
  5. Other treatments include medications to treat manifestations and the administration of blood products to treat severe anemia (administered with caution to prevent fluid overload).

### IV. ENURESIS

#### A. Description

1. Enuresis refers to a condition in which a child is unable to control bladder function, even though the child has reached an age at which control of voiding is expected or the child has successfully completed a bladder control program.
2. By age 5, most children are aware of bladder fullness and are able to control voiding.

#### B. Primary nocturnal enuresis

1. Primary nocturnal enuresis is bed-wetting in a child who has never been dry for extended periods.
2. The condition is common in children, and most children eventually outgrow bed-wetting without therapeutic intervention.
3. The child is unable to sense a full bladder and does not awaken to void.
4. The child may have delayed maturation of the central nervous system.
5. The child should be evaluated for any pathological causes before the diagnosis of primary nocturnal enuresis is made.

#### C. Secondary or acquired enuresis

1. The onset of wetting occurs after a period of established urinary continence.
2. Secondary enuresis may occur during nighttime sleep (nocturnal), only during the waking hours (diurnal), or during daytime and nighttime.
3. The child may complain of dysuria, urgency, or frequency.
4. The child should be assessed for urinary tract infections.

- D. Assessment:** History of bed-wetting with no extended period of dryness in a child older than age 5 years
- E. Interventions**
1. Perform urinalysis and urine culture as prescribed to rule out infection or an existing disorder.
  2. Assist the family with identifying a treatment plan that best fits the needs of the child.
  3. Limit fluid intake at night, and encourage the child to void just before going to bed.
  4. Involve the child in caring for the wet sheets and changing the bed to assist the child to take ownership of the problem.
  5. Provide reward systems as appropriate for the child.
  6. Incorporate behavioral conditioning techniques.
  7. Encourage follow-up to determine the effectiveness of the treatment.

## V. CRYPTORCHIDISM

**A. Description:** Cryptorchidism is a condition in which one or both testes fail to descend through the inguinal canal into the scrotal sac.

**B. Assessment:** Testes are not palpable or easily guided into the scrotum.

**C. Interventions**

1. Monitor during the first 12 months of life to determine whether spontaneous descent occurs.
2. After age 1 year, medical or surgical treatment may be instituted.
3. Human chorionic gonadotropin, a pituitary hormone that stimulates the production of testosterone, may be prescribed for an older child.
4. Surgical correction, if needed, is done by orchiopexy before the child's second birthday (preferably between 1 and 2 years of age) if the testes do not descend spontaneously.
5. Monitor for bleeding and infection postoperatively.
6. Instruct parents in postoperative home care measures, including preventing infection, pain control, and activity restrictions.
7. Provide an opportunity for parental counseling if the parents are concerned about the future fertility of the child.

## VI. EPISPADIAS AND HYPOSPADIAS (Fig. 42-2)

**A. Description**

1. Epispadias and hypospadias are congenital defects involving abnormal placement of the urethral orifice of the penis.
2. These anatomical defects can lead to the easy entry of bacteria into the urine.

**B. Assessment**

1. Epispadias: Urethral orifice is located on the dorsal surface of the penis; the condition often occurs with exstrophy of the bladder.

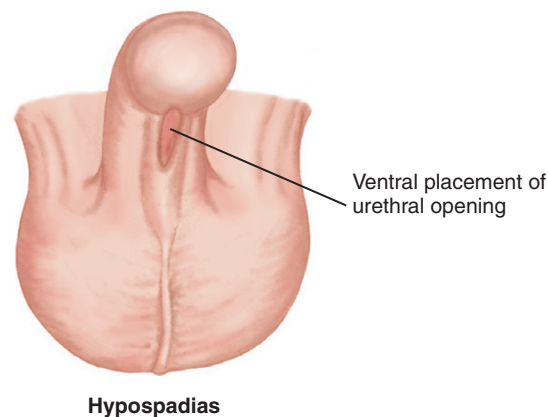

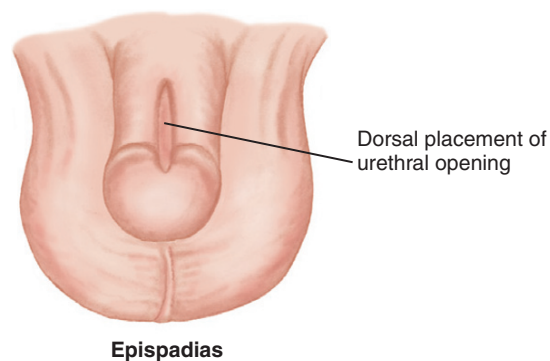

2. Hypospadias: Urethral orifice is located below the glans penis along the ventral surface.

- C. Surgical interventions:** Surgery is done before the age of toilet training, preferably between 16 and 18 months of age.

**! Circumcision is not performed on a newborn with epispadias or hypospadias because the foreskin may be used in surgical reconstruction of the defect.**

**D. Postoperative interventions**

1. The child has a pressure dressing and may have some type of urinary diversion or a urinary stent (used to maintain patency of the urethral opening) while the meatus is healing.
2. Monitor vital signs.
3. Encourage fluid intake to maintain adequate urine output and maintain patency of the stent.
4. Monitor intake and output and the urine for cloudiness or a foul odor.
5. Notify the physician if there is no urinary output for 1 hour because this may indicate kinks

**▲ FIGURE 42-2** Epispadias and hypospadias are genital anomalies in which the urethral opening is above or below its normal location on the glans of the penis. (From James, S., Ashwill, J., & Droske, S. [2007]. *Nursing care of children: Principles and practice* [3rd ed.]. St. Louis: Saunders.)

in the urinary diversion or stent or obstruction by sediment.

6. Provide pain medication or medication to relieve bladder spasms (anticholinergic) as prescribed.
7. Administer antibiotics as prescribed.
8. Instruct parents in the care of the child who has a urinary diversion or stent.
9. Instruct parents to avoid giving the child a tub bath until the stent, if present, is removed.
10. Instruct parents about fluid intake, medication administration, signs and symptoms of infection, and need for physician follow-up for dressing removal after surgery as prescribed.

## VII. BLADDER EXSTROPHY

### A. Description

1. Bladder exstrophy is a congenital anomaly characterized by extrusion of the urinary bladder to the outside of the body through a defect in the lower abdominal wall.
2. The cause is unknown.
3. Treatment requires surgical management and occurs in a series of staged reconstructions.
4. Initial surgery for closure of the abdominal defect should occur within the first few days of life.
5. The goal of subsequent surgeries is to reconstruct the bladder and genitalia and enable the child to achieve urinary continence.

### B. Assessment

1. Exposed bladder mucosa
2. Widened symphysis pubis
3. Defects of the external genitalia

### C. Interventions

1. Monitor urinary output.
2. Monitor for signs of urinary tract or wound infection.
3. Maintain the integrity of the exposed bladder mucosa.
4. Prevent the bladder tissue from drying, while allowing the drainage of urine, until surgical closure is performed; the bladder is covered loosely with sterile, nonadherent clear plastic wrap or a sterile thin film dressing without adhesive.
5. Monitor laboratory values and urinalysis to assess for renal function.
6. Administer antibiotics as prescribed.
7. Provide emotional support to the parents, and encourage verbalization of their fears and concerns.

 Applying petroleum jelly to the bladder mucosa is avoided because it tends to dry out, adhere to the bladder mucosa, and damage the delicate tissues when the dressing is removed.

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 426.** A nurse is assigned to care for a child suspected to have glomerulonephritis. The nurse reviews the child's record and notes that which finding is associated with the diagnosis of glomerulonephritis?
1. Hypotension
  2. Brown-colored urine
  3. Low urinary specific gravity
  4. Low blood urea nitrogen level
- 427.** A nurse is performing an admission assessment on a 2-year-old child who has been diagnosed with nephrotic syndrome. The nurse understands that the most common characteristic associated with nephrotic syndrome is:
1. Hypertension
  2. Generalized edema
  3. Increased urinary output
  4. Frank, bright red blood in the urine
- 428.** A nurse is planning care for a child with hemolytic-uremic syndrome. The child has been anuric and will be receiving peritoneal dialysis treatment. The nurse plans to:
1. Restrict fluids as prescribed.
  2. Encourage foods high in potassium.
  3. Administer analgesics as prescribed.
  4. Care for the arteriovenous fistula.
- 429.** A 7-year-old child is seen in a clinic, and the primary health care provider documents a diagnosis of primary nocturnal enuresis. When the mother asks a nurse about the diagnosis, the nurse plans to respond knowing that:
1. Primary nocturnal enuresis does not respond to treatment.
  2. Primary nocturnal enuresis is caused by a psychiatric problem.
  3. Primary nocturnal enuresis requires surgical intervention to improve the problem.
  4. Most children outgrow the bed-wetting problem without therapeutic intervention.
- 430.** A nurse has provided discharge instructions to the mother of a 2-year-old child who had an orchiopexy to correct cryptorchidism. Which statement by the mother of the child indicates that further teaching is necessary?
1. "I'll check his temperature."
  2. "I'll give him medication so he'll be comfortable."

3. "I'll check his voiding to be sure there's no problem."
  4. "I'll let him decide when to return to his play activities."
- 431.** A nurse collects a urine specimen preoperatively from a child with epispadias who is scheduled for surgical repair. When the nurse is analyzing the results of the urinalysis, which of the following would the nurse most likely expect to note?
1. Hematuria
  2. Proteinuria
  3. Bacteriuria
  4. Glucosuria
- 432.** A nurse is reviewing a treatment plan with the parents of a newborn infant with hypospadias. Which statement by the parents indicates their understanding of the plan?
1. "Caution should be used when straddling the infant on a hip."
  2. "Vital signs should be taken daily to check for bladder infection."
  3. "Catheterization will be necessary when the infant does not void."
  4. "Circumcision has been delayed to save tissue for surgical repair."
- 433.** A nurse is caring for an infant with a diagnosis of bladder exstrophy. To protect the exposed bladder tissue, the nurse plans to:
1. Cover the bladder with petroleum jelly gauze.
  2. Cover the bladder with a nonadhering plastic wrap.
  3. Apply sterile distilled water dressings over the bladder mucosa.
  4. Keep the bladder tissue dry by covering it with dry sterile gauze.
- 434.** A nurse interviews the parents of a child recently diagnosed with glomerulonephritis. The nurse understands that which information collected during the assessment most often is associated with the diagnosis of glomerulonephritis?
1. Child fell off a bike onto the handlebars
  2. Nausea and vomiting for the last 24 hours
  3. Urticaria and itching for 1 week before diagnosis
  4. Streptococcal throat infection 2 weeks before diagnosis

### Alternate Item Format: Multiple Response

- 435.** A nurse is performing an assessment on a child admitted to the hospital with a probable diagnosis of nephrotic syndrome. What assessment findings would the nurse expect to observe?  
**Select all that apply.**

- 1. Pallor
- 2. Edema
- 3. Anorexia
- 4. Proteinuria
- 5. Weight loss
- 6. Decreased serum lipids

## ANSWERS

### 426. 2

**Rationale:** Glomerulonephritis refers to a group of kidney disorders characterized by inflammatory injury in the glomerulus. Gross hematuria, resulting in dark, smoky, cola-colored or brown-colored urine, is a classic symptom of glomerulonephritis. Hypertension is also common. Blood urea nitrogen levels may be elevated. A moderately elevated to high urinary specific gravity is associated with glomerulonephritis.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 3 first because hypertension and a high specific gravity are most likely to occur in this kidney disorder. Recalling that this is a renal disorder and that blood urea nitrogen levels increase will assist in directing you to option 2. If you had difficulty with this question, review the clinical manifestations associated with glomerulonephritis.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 961). St. Louis: Mosby.

### 427. 2

**Rationale:** Nephrotic syndrome is defined as massive proteinuria, hypoalbuminemia, hyperlipemia, and edema. Other manifestations include weight gain; periorbital and facial edema that is most prominent in the morning; leg, ankle, labial, or scrotal edema; decreased urine output and urine that is dark and frothy; abdominal swelling; and blood pressure that is normal or slightly decreased.

**Test-Taking Strategy:** Recall the pathophysiology associated with nephrotic syndrome. Associate edema with nephrotic syndrome. This will help you answer questions similar to this one. If you had difficulty with this question, review the manifestations of nephrotic syndrome.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1537). St. Louis: Mosby.

### 428. 1

**Rationale:** Hemolytic-uremic syndrome is thought to be associated with bacterial toxins, chemicals, and viruses that cause

acute renal failure in children. Clinical manifestations of the disease include acquired hemolytic anemia, thrombocytopenia, renal injury, and central nervous system symptoms. A child with hemolytic-uremic syndrome undergoing peritoneal dialysis because of anuria would be on fluid restriction. Pain is not associated with hemolytic-uremic syndrome, and potassium would be restricted, not encouraged, if the child is anuric. Peritoneal dialysis does not require an arteriovenous fistula (only hemodialysis).

**Test-Taking Strategy:** Focus on the child's diagnosis and recall knowledge about the care of a client with acute renal failure. Also focus on the data in the question. Noting the word *peritoneal* will assist in eliminating option 4. From the remaining options, remember that because the child is anuric, fluids will be restricted. Review care of the child with hemolytic-uremic syndrome if this question was difficult.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1163). St. Louis: Saunders.

#### 429. 4

**Rationale:** Primary nocturnal enuresis occurs in a child who has never been dry at night for extended periods. The condition is common in children, and most children eventually outgrow bed-wetting without therapeutic intervention. The child is unable to sense a full bladder and does not awaken to void. The child may have delayed maturation of the central nervous system. The condition is not caused by a psychiatric problem.

**Test-Taking Strategy:** Use the process of elimination, noting the relationship between the words *enuresis* in the question and *bed-wetting* in the correct option. If you had difficulty with this question, review the characteristics associated with enuresis.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 537). St. Louis: Mosby.

#### 430. 4

**Rationale:** Cryptorchidism is a condition in which one or both testes fail to descend through the inguinal canal into the scrotal sac. Surgical correction may be necessary. All vigorous activities should be restricted for 2 weeks after surgery to promote healing and prevent injury. This prevents dislodging of the suture, which is internal. Normally, 2-year-olds want to be active; allowing the child to decide when to return to his play activities may prevent healing and cause injury. The parent should be taught to monitor the temperature, provide analgesics as needed, and monitor the urine output.

**Test-Taking Strategy:** Note the strategic words *further teaching is necessary*. These words indicate a negative event query and ask you to select an option that is an incorrect statement.

Option 1 is an important action to recognize signs of infection. Option 2 is appropriate to keep pain to a minimum. Option 3 monitors voiding pattern, which is also important after this type of surgery. If you had difficulty with this question, review the discharge instructions after surgical correction of cryptorchidism.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 958). St. Louis: Mosby.

#### 431. 3

**Rationale:** Epispadias is a congenital defect involving abnormal placement of the urethral orifice of the penis. The urethral opening is located anywhere on the dorsum of the penis. This anatomical characteristic facilitates entry of bacteria into the urine. Options 1, 2, and 4 are not characteristically noted in this condition.

**Test-Taking Strategy:** Visualize the anatomical characteristics of epispadias and use the process of elimination to answer the question. Options 1, 2, and 4 do not relate to the potential for infection, which can be associated with epispadias. If you had difficulty with this question, review the diagnostic findings associated with epispadias.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Gastrointestinal/Renal

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 953). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 1143, 1152–1153). St. Louis: Saunders.

#### 432. 4

**Rationale:** Hypospadias is a congenital defect involving abnormal placement of the urethral orifice of the penis. In hypospadias, the urethral orifice is located below the glans penis along the ventral surface. The infant should not be circumcised because the dorsal foreskin tissue will be used for surgical repair of the hypospadias. Options 1, 2, and 3 are unrelated to this disorder.

**Test-Taking Strategy:** Note the strategic words *indicates their understanding*. Recalling that hypospadias is a congenital defect involving abnormal placement of the urethral orifice of the penis will direct you to option 4. Review the treatment plan related to the repair of the hypospadias if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Child Health—Gastrointestinal/Renal

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 226). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 549). St. Louis: Saunders.

**433. 2**

**Rationale:** In bladder exstrophy, the bladder is exposed and external to the body. In this disorder, one must take care to protect the exposed bladder tissue from drying, while allowing the drainage of urine. This is accomplished best by covering the bladder with a nonadhering plastic wrap. The use of petroleum jelly gauze should be avoided because this type of dressing can dry out, adhere to the mucosa, and damage the delicate tissue when removed. Dry sterile dressings and dressings soaked in solutions (that can dry out) also damage the mucosa when removed.

**Test-Taking Strategy:** Focus on the diagnosis and visualize this disorder. Noting the strategic word *nonadhering* in option 2 will direct you to this option. If you had difficulty with this question, review care of an infant with bladder exstrophy.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 958). St. Louis: Mosby.

**434. 4**

**Rationale:** Glomerulonephritis refers to a group of kidney disorders characterized by inflammatory injury in the glomerulus. Group A beta-hemolytic streptococcal infection is a cause of glomerulonephritis. Often, a child becomes ill with streptococcal infection of the upper respiratory tract and then develops symptoms of acute poststreptococcal glomerulonephritis after an interval of 1 to 2 weeks. The assessment data in options 1, 2, and 3 are unrelated to a diagnosis of glomerulonephritis.

**Test-Taking Strategy:** Use the process of elimination. Option 1 relates to a kidney injury, not an infectious process. From

the remaining options, recalling a streptococcal infection 1 to 2 weeks before the development of glomerulonephritis is the classic assessment finding will assist in directing you to option 4. If you had difficulty with this question, review the causes of glomerulonephritis.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1538). St. Louis: Mosby.

**ALTERNATE ITEM FORMAT:  
MULTIPLE RESPONSE****435. 1, 2, 3, 4**

**Rationale:** Nephrotic syndrome is a kidney disorder characterized by massive proteinuria, hypoalbuminemia, edema, elevated serum lipids, anorexia, and pallor. The child gains weight.

**Test-Taking Strategy:** Note the child's diagnosis. Thinking about the pathophysiology associated with this disorder and recalling the assessment findings for nephrotic syndrome will direct you to the correct options. Review the clinical manifestations associated with nephrotic syndrome if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Gastrointestinal/Renal

# Integumentary Disorders

## I. ECZEMA (ATOPIC DERMATITIS)

### A. Description

1. Superficial inflammatory process involving primarily the epidermis
2. Associated with family history of the disorder, allergies, asthma, or allergic rhinitis
3. The major goals of management are to relieve pruritus, lubricate the skin, reduce inflammation, and prevent or control secondary infections.

### B. Forms of eczema (Box 43-1)

### C. Assessment

1. Redness
2. Scaliness
3. Itching
4. Minute papules (firm elevated circumscribed lesions <1 cm in diameter) and vesicles (similar to papules, but fluid-filled)
5. Weeping, oozing, and crusting of lesions
6. Adolescent and early adult forms: Commonly occur in antecubital and popliteal areas

### D. Interventions

1. Avoid exposure to skin irritants such as soaps, detergents, fabric softeners, diaper wipes, and powder.
2. Avoid excessive bathing and washing of affected areas; bathing water should be tepid, and the skin should be lubricated immediately after the bath.
3. Intermittently apply cool, wet compresses for short periods to soothe the skin and alleviate itching; pat skin dry between cooling treatments.
4. Administer antihistamines and topical corticosteroids as prescribed; corticosteroids are applied in a thin layer and are rubbed into the area thoroughly.
5. Administer immunomodulator medications as prescribed.
6. Administer prescribed antibiotics if secondary infections occur.
7. Prevent or minimize scratching; keep nails short and clean, and place gloves or cotton socks over the hands.
8. Eliminate conditions that increase itching, such as wet diapers, excessive bathing, ambient heat,

woolen clothes or blankets, and proximity to rough fabrics or furry stuffed animals; exposure to latex should also be avoided.

9. Instruct parents to wash clothing in a mild detergent and rinse thoroughly; putting the clothes through a second complete wash cycle without detergent minimizes the residue remaining on the fabric.
10. Instruct parents about measures to prevent skin infections.
11. Instruct parents to monitor lesions for signs of infection (honey-colored crusts with surrounding erythema) and to seek immediate medical intervention if such signs are noted.

 A child with an integumentary disorder needs to be monitored for signs of either a skin infection or a systemic infection.

## II. IMPETIGO

### A. Description

1. Impetigo is a contagious bacterial infection of the skin caused by beta-hemolytic streptococci or staphylococci, or both; it occurs most commonly during hot, humid months.
2. Impetigo can occur because of poor hygiene; it can be a primary infection or occur secondarily at a site that has been injured or at a site that was originally a rash, such as caused by exposure to poison ivy or poison oak.
3. The most common sites of infection are on the face and around the mouth, and then on the hands, neck, and extremities.
4. The lesions begin as vesicles or pustules surrounded by edema and redness (a pustule is similar to a vesicle except its fluid content is purulent).
5. The lesions progress to an exudative and crusting stage; after the crusting of the lesions, the initially serous vesicular fluid becomes cloudy, and the vesicles rupture, leaving honey-colored crusts covering ulcerated bases.

### B. Assessment (Fig. 43-1)

1. Lesions
2. Erythema

**Box 43-1 Forms of Eczema**

**Infantile:** Usually begins at 2 to 6 months of age and decreases in incidence with aging; spontaneous remission may occur by 3 years

**Childhood:** May follow the infantile form; occurs at 2 to 3 years of age

**Preadolescent and adolescent:** Begins at about 12 years of age and may continue into the early adult years or indefinitely

▲ **FIGURE 43-1** Impetigo contagiosa. (From Hockenberry, M., Wilson, D., Winkelstein, M., & Kline, N. [2007]. *Wong's nursing care of infants and children* [8th ed.]. St. Louis: Mosby.)

3. Pruritus
4. Burning
5. Secondary lymph node involvement

**C. Interventions**

1. Institute contact isolation; use standard precautions and implement agency-specific isolation procedures for the hospitalized child; strict hygiene practices are important because impetigo is a highly contagious condition.
2. Allow lesions to dry by air exposure.
3. Assist the child with daily bathing with antibacterial soap, as prescribed.
4. Apply warm saline or other prescribed compresses to the lesions two or three times daily, followed by a mild soap and water to remove crusts and allow for healing; Burow's solution may also be prescribed to soften the crusts.
5. Apply topical antibiotic ointments and instruct parents in their use; the infection is still communicable for 48 hours beyond initiation of antibiotic treatment.
6. Administer oral antibiotics, which may be prescribed if there is no response to topical

antibiotic treatment; it is extremely important to comply with the prescribed antibiotic regimen because secondary infections such as glomerulonephritis may result if the infectious agent is of a streptococcal type that can affect the nephrons.

7. To prevent skin cracking, apply emollients and instruct parents in the use of emollients.
8. Instruct parents in the methods to prevent the spread of the infection, especially careful handwashing.
9. Inform parents that the child needs to use separate towels, linens, and dishes.
10. Inform parents that all linens and clothing used by the child should be washed with detergent in hot water separately from linens and clothing of other household members.

**III. PEDICULOSIS CAPITIS (LICE)****A. Description**

1. Pediculosis capitis refers to an infestation of the hair and scalp with lice.
2. The most common sites of involvement are the occipital area, behind the ears at the nape of the neck, and occasionally the eyebrows and eyelashes.
3. The female louse lays her eggs (nits) on the hair shaft, close to the scalp; the incubation period is 7 to 10 days.
4. Lice can survive for 48 hours away from the host; nits shed in the environment can hatch in 7 to 10 days.
5. Head lice live and reproduce only on humans and are transmitted by direct and indirect contact, such as sharing of brushes, hats, towels, and bedding.
6. All contacts of the infested child, especially siblings, should be examined for lice infestation and referred for treatment as appropriate.

**B. Assessment (Box 43-2 and Fig. 43-2)****C. Interventions**

1. Use a pediculicide product (usually permethrin 1% cream rinse [Nix]) as prescribed; follow package instructions for timing the application and for contraindications for use in children.
2. Daily removal of nits with an extra-fine-tooth metal nit comb should be done as a control measure after use of the pediculicide product (gloves should be worn for removal of nits); hairbrushes or combs should be discarded or soaked in boiling water for 10 minutes or in a commercially available lice-killing product for 1 hour.
3. Instruct parents that siblings may also need treatment; grooming items should not be shared, and a single comb or brush should be used for each individual child.

4. Instruct parents that bedding and clothing used by the child should be changed daily, laundered in hot water with detergent, and dried in a hot dryer for 20 minutes; this process should continue for 1 week.
5. Instruct parents that nonessential bedding and clothing can be stored in a tightly sealed bag for 2 weeks and then washed.
6. Instruct parents to seal toys that cannot be washed or dry-cleaned in a plastic bag for 2 weeks.
7. Instruct parents that furniture and carpets need to be vacuumed frequently and that the dust bag from the vacuum should be discarded after vacuuming.
8. Teach the child not to share clothing, headwear, brushes, and combs.
9. Lice of the eyelashes or eyebrows may need to be removed manually.

#### IV. SCABIES

##### A. Description

1. Scabies is a parasitic skin disorder caused by an infestation of *Sarcoptes scabiei* (itch mite) (see Chapter 50).

#### Box 43-2 Assessment Findings: Pediculosis Capitis

Child scratches scalp excessively.

Pruritus is caused by the crawling insect and insect saliva on the skin.

Nits (white eggs) are observable on the hair shaft (it is important to differentiate nits from lint or dandruff, which flakes away easily).

Adult lice are difficult to see and appear as small tan or grayish specks, which may crawl fast.

▲ **FIGURE 43-2** Viable nits. (From Morse, S., Ballard, R., Holmes, K., Moreland, A. [2003]. *Atlas of sexually transmitted diseases and AIDS* [3rd ed]. London: Mosby.)

2. Scabies is endemic among schoolchildren and institutionalized populations as a result of close personal contact.
3. Incubation period
  - a. The female mite burrows into the epidermis, lays eggs, and dies in the burrow after 4 to 5 weeks.
  - b. The eggs hatch in 3 to 5 days, and larvae mature and complete their life cycle.
4. Infectious period: During the entire course of the infestation

##### B. Assessment (Box 43-3 and Fig. 43-3)

▲ **Scabies is transmitted by close personal contact with an infected person. Household members and contacts of an infected child need to be treated simultaneously.**

##### C. Interventions

1. Topical application of a scabicide such as permethrin (Elimite) kills the mites.
2. Lindane, an alternative product that may be prescribed, should not be used in children younger than 2 years because of the risk of neurotoxicity and seizures.
3. Instruct parents in the application of the scabicide.
4. When permethrin is used, it is applied to cool dry skin at least 30 minutes after bathing, the cream is massaged thoroughly and gently into all skin surfaces (not just the areas that have the rash) from the head to the soles of

#### Box 43-3 Assessment Findings: Scabies

Pruritic papular rash

Burrows on the skin (fine grayish red lines that may be difficult to see)

▲ **FIGURE 43-3** Scabies rash on an infant. (From Mosby's dictionary of medicine, nursing, & health professions [8th ed.]. [2009]. St. Louis: Mosby.)

the feet (avoid contact with the eyes), left on the skin for 8 to 14 hours, and then removed by bathing; a repeat treatment may be necessary.

5. Instruct the parents about the importance of frequent handwashing.
6. Instruct the parents that all clothing, bedding, and pillowcases used by the child need to be changed daily, washed in hot water with detergent, dried in a hot dryer, and ironed before reuse; this process should continue for 1 week.
7. Instruct parents that nonwashable toys and other items should be sealed in plastic bags for at least 4 days.
8. Anti-itch topical treatment may be necessary, and antibiotics may be prescribed if a secondary infection develops.

## V. BURN INJURIES (see Priority Nursing Actions)

### PRIORITY NURSING ACTIONS!

#### Actions to Take in the Event of a Major Burn Injury

1. Stop the burning process.
2. Assess the ABCs—assess for an adequate airway, breathing, and circulation.
3. Begin resuscitation if the child is not breathing.
4. Remove burned clothing and jewelry.
5. Cover the wound with a clean cloth.
6. Keep the child warm.
7. Transport the child to the emergency department.

The initial management of the burn injury begins at the scene of the injury. The first priority is to stop the burning process; this must be done before other interventions. To stop the burning process, flames should be smothered. The child should be placed in a horizontal position because a vertical position may cause the hair to ignite or the inhalation of flames, heat, or smoke. The child should be rolled in a blanket or other article taking care not to cover the face and head because of the danger of inhaling smoke and fumes. As soon as the flames are extinguished, the child is assessed for adequate airway, breathing, and circulation. Measures are taken immediately if resuscitation is necessary. Burned clothing and jewelry are removed to prevent further burning of the skin and disruption of skin integrity, and then the burn is covered with a clean cloth, which prevents contamination of the wound, reduces pain by eliminating air contact, and prevents hypothermia. The child is also kept warm to prevent hypothermia and is immediately transported to the nearest emergency facility.

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 1664-1665). St. Louis: Mosby.

## A. Pediatric considerations

1. Very young children who have been burned severely have a higher mortality rate than older children and adults with comparable burns.
2. Lower burn temperatures and shorter exposure to heat can cause a more severe burn in a child than in an adult because a child's skin is thinner.
3. The degree of pain experienced by the child and the ability to communicate it are different than in an adult with the same exposure.
4. Severely burned children are at increased risk for fluid and heat loss, dehydration, and metabolic acidosis compared with adults.
5. The higher proportion of body fluid to mass in children increases the risk of cardiovascular problems.
6. Burns involving more than 10% of the total body surface area require some form of fluid resuscitation.
7. Infants and children are at increased risk for protein and calorie deficiency because they have smaller muscle mass and less body fat than adults.
8. Scarring is more severe in a child; disturbed body image is a distinct issue for a child or adolescent, especially as **growth** continues.
9. An immature immune system presents an increased risk of infection for infants and young children.
10. A delay in **growth** may occur after a burn.

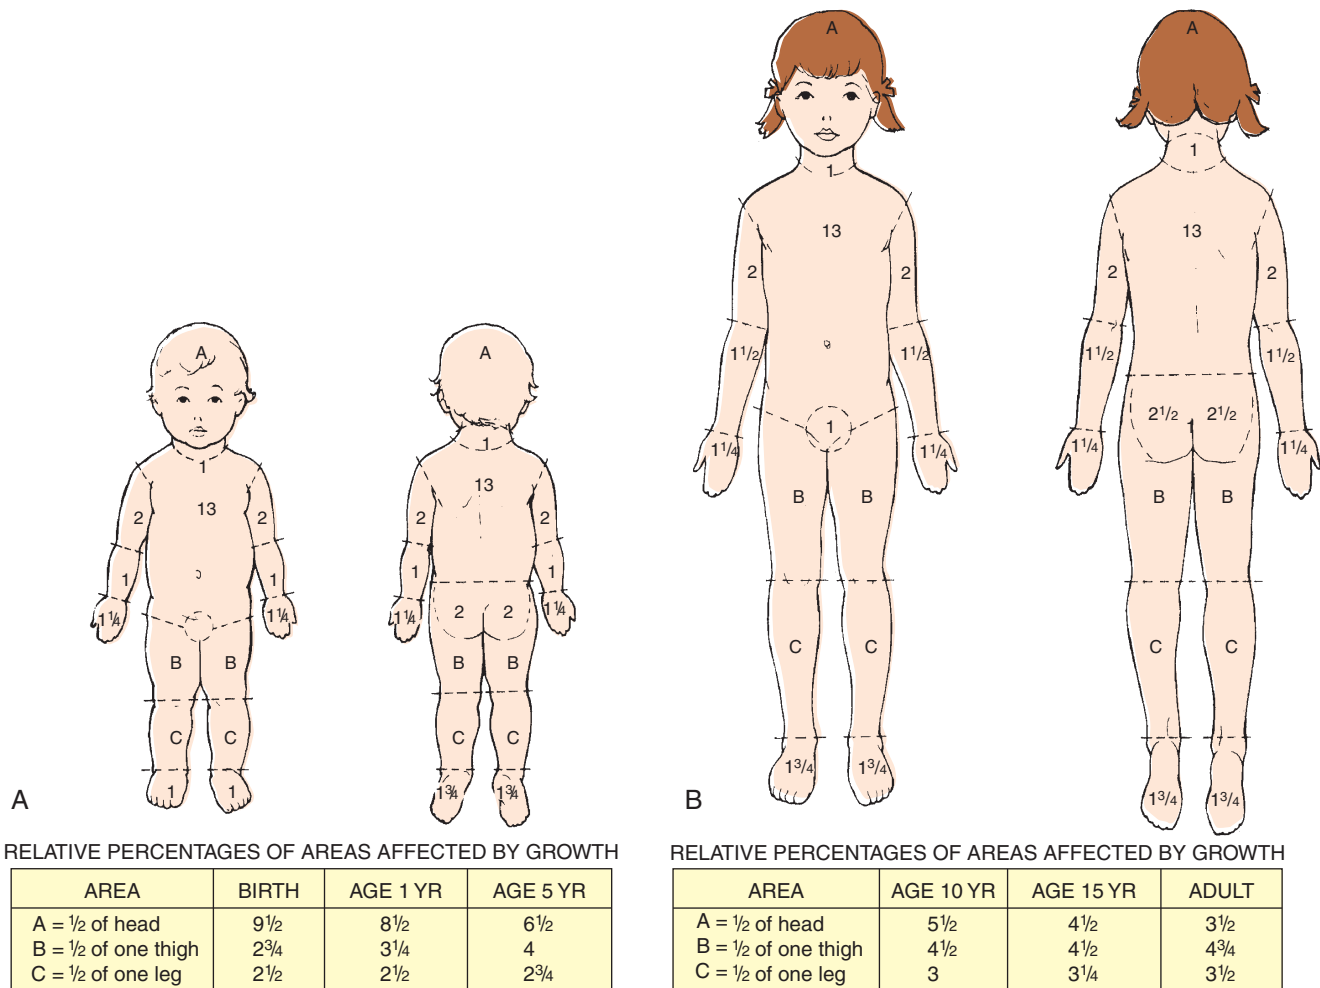

## B. Extent of burn injury

1. The rule of nines, used for adults with burn injuries, gives an inaccurate estimate in children because of the difference in body proportions between children and adults.
2. In a pediatric client, the extent of the burn is expressed as a percent of the total body surface area using age-related charts (Fig. 43-4).

## C. Fluid replacement therapy

 To determine adequacy of fluid resuscitation, vital signs (especially heart rate), urine output, adequacy of capillary filling, and sensorium status are assessed.

1. Fluid replacement is necessary during the initial 24-hour period after burn injury because of the fluid shifts that occur as a result of the injury.
2. Several formulas are available to calculate the child's fluid needs, and the formula used depends on the physician's preference.

**▲ FIGURE 43-4** Estimation of distribution of burns in children. **A**, Children from birth to age 5 years. **B**, Older children. (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed.]. St. Louis: Mosby.)

- Crystalloid solutions are used during the initial phase of therapy; colloid solutions such as albumin, Plasma-Lyte (combined electrolyte solution), or fresh-frozen plasma are useful in maintaining plasma volume.
- See also Chapter 50.

- Level of edema at burn site
- Quality of peripheral pulses

**437.** A mother of a 3-year-old child arrives at a clinic and tells a nurse that the child has been scratching the skin continuously and has developed a rash. The nurse assesses the child and suspects the presence of scabies. The nurse bases this suspicion on which finding noted on assessment of the child's skin?

- Fine grayish red lines
- Purple-colored lesions
- Thick, honey-colored crusts
- Clusters of fluid-filled vesicles

**438.** Permethrin (Elimite) is prescribed for a 4-year-old child with a diagnosis of scabies. A clinic nurse instructs the mother regarding the use of this treatment and tells the mother:

### MORE QUESTIONS ON THE CD!

#### Practice Questions

**436.** A nurse is monitoring a child with burns during treatment for burn shock. The nurse understands that which of the following assessments provides the most accurate guide to determining the adequacy of fluid resuscitation?

- Skin turgor
- Neurological assessment

1. Apply the lotion and leave it on for 6 hours.
  2. Apply the lotion to areas of the rash only.
  3. Avoid putting clothes on the child over the lotion.
  4. Apply the lotion to cool, dry skin at least 30 minutes after bathing.
- 439.** A school nurse has provided an instructional session about impetigo to parents of the children attending the school. Which statement, if made by a parent, indicates a need for further instructions?
1. "It is extremely contagious."
  2. "It is most common in humid weather."
  3. "Lesions most often are located on the arms and chest."
  4. "It might show up in an area of broken skin, such as an insect bite."
- 440.** A clinic nurse is reviewing the physician's prescription for a child who has been diagnosed with scabies. Lindane has been prescribed for the child. The nurse questions the prescription if which of the following is noted in the child's record?
1. The child is 18 months old.
  2. The child is being bottle-fed.
  3. A sibling is using lindane for the treatment of scabies.
  4. The child has a history of frequent respiratory infections.
- 441.** A school nurse is conducting pediculosis capitis (head lice) assessments. A child with a "positive" head check would have:
1. Maculopapular lesions behind the ears
  2. Lesions in the scalp that extend to the hairline or neck
  3. White flaky particles throughout the entire scalp region
  4. White sacs attached to the hair shafts in the occipital area
- 442.** A topical corticosteroid is prescribed by a physician for a child with atopic dermatitis (eczema). A nurse instructs the mother in how to apply the cream and tells the mother to:
1. Apply the cream over the entire body.
  2. Apply a thick layer of cream to affected areas only.
  3. Avoid cleansing the area before application of the cream.
  4. Apply a thin layer of cream and rub it into the area thoroughly.

### Alternate Item Format: Multiple Response

- 443.** A nurse caring for a child who sustained a burn injury plans care based on which pediatric considerations associated with this injury? **Select all that apply.**
- 1. Scarring is less severe in a child than in an adult.
  - 2. A delay in growth may occur after a burn injury.
  - 3. Fluid resuscitation is unnecessary unless the burned area is more than 25% of the total body surface area.
  - 4. An immature immune system presents an increased risk of infection for infants and young children.
  - 5. The lower proportion of body fluid to mass in a child increases the risk of cardiovascular problems.
  - 6. Infants and young children are at increased risk for protein and calorie deficiency because they have smaller muscle mass and less body fat than adults.

## ANSWERS

### 436. 2

**Rationale:** Sensorium is an accurate guide to determine the adequacy of fluid resuscitation. The burn injury itself does not affect the sensorium, so the child should be alert and oriented. Any alteration in sensorium should be evaluated further. A neurological assessment would determine the level of sensorium in the child. Options 1, 3, and 4 would not provide an accurate assessment of the adequacy of fluid resuscitation.

**Test-Taking Strategy:** Note the strategic words *most accurate* in the event query. Although options 1, 3, and 4 may provide some information related to fluid volume, in a burn injury, neurological assessment, is most accurate from the options provided. Review assessments during fluid resuscitation and treatment for burn shock if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 1070, 1374). St. Louis: Saunders.

Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1537). St. Louis: Mosby.

### 437. 1

**Rationale:** Scabies is a parasitic skin disorder caused by an infestation of *Sarcoptes scabiei* (itch mite). Scabies appears as burrows or fine, grayish red, thread-like lines. They may be difficult to see if they are obscured by excoriation and inflammation. Purple-colored lesions may indicate various

disorders, including systemic conditions. Thick, honey-colored crusts are characteristic of impetigo or secondary infection in eczema. Clusters of fluid-filled vesicles are seen in herpesvirus infection.

**Test-Taking Strategy:** Think about the characteristic of this parasitic skin disorder. Recalling that scabies infestation produces burrows will assist in directing you to option 1. If you are unfamiliar with the clinical manifestations associated with scabies, review this content.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1353). St. Louis: Saunders.

#### 438. 4

**Rationale:** Permethrin is massaged thoroughly and gently into all skin surfaces (not just the areas that have the rash) from the head to the soles of the feet. Care should be taken to avoid contact with the eyes. The lotion should not be applied until at least 30 minutes after bathing and should be applied only to cool, dry skin. The lotion should be kept on for 8 to 14 hours, and then the child should be given a bath. The child should be clothed during the 8 to 14 hours of treatment contact time.

**Test-Taking Strategy:** Use the process of elimination. Option 3 can be eliminated because the child should be clothed. Eliminate option 2 next because of the close-ended word *only* in this option. From the remaining options, recalling the procedure for the application of this lotion will direct you to option 4. Review the treatment of scabies using permethrin if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1353). St. Louis: Saunders.

#### 439. 3

**Rationale:** Impetigo is a contagious bacterial infection of the skin caused by beta-hemolytic streptococci or staphylococci, or both. Impetigo is most common during hot, humid summer months. Impetigo may begin in an area of broken skin, such as an insect bite or atopic dermatitis. Impetigo is extremely contagious. Lesions usually are located around the mouth and nose, but may be present on the hands and extremities.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *need for further instructions*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Knowledge regarding the cause and manifestations of impetigo will direct you to option 3. If you are unfamiliar with the manifestations of impetigo, review this content.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1342). St. Louis: Saunders.

#### 440. 1

**Rationale:** Lindane is a pediculicide product that may be prescribed to treat scabies. It is contraindicated for children younger than 2 years because they have more permeable skin, and high systemic absorption may occur, placing the children at risk for central nervous system toxicity and seizures. Lindane also is used with caution in children between the ages of 2 and 10 years. Siblings and other household members should be treated simultaneously. Options 2 and 4 are unrelated to the use of lindane. Lindane is not recommended for use by a breast-feeding woman because the medication is secreted into breast milk.

**Test-Taking Strategy:** Use the process of elimination and recall the concepts related to the body surface area of children and medication administration. These concepts will direct you to option 1. If you are unfamiliar with the use of lindane, review this medication and the contraindications associated with its use.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 1079). St. Louis: Mosby.

Skidmore-Roth, L. (2009). *Mosby's drug guide for nurses* (8th ed., p. 559). St. Louis: Mosby.

#### 441. 4

**Rationale:** Pediculosis capitis is an infestation of the hair and scalp with lice. The nits are visible and attach firmly to the hair shaft near the scalp. The occiput is an area in which nits can be seen. White flaky particles are indicative of dandruff. Maculopapular lesions behind the ears or lesions that extend to the hairline or neck are indicative of an infectious process, not pediculosis.

**Test-Taking Strategy:** Focus on the subject, the characteristics of pediculosis capitis. Option 3 can be eliminated first because white flaky particles are indicative of dandruff. Recalling that in this infestation, nit sacs attach to the hair shaft will direct you to option 4. Review assessment findings with pediculosis capitis if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., pp. 1079–1080). St. Louis: Mosby.

#### 442. 4

**Rationale:** Atopic dermatitis is a superficial inflammatory process involving primarily the epidermis. A topical corticosteroid may be prescribed and should be applied sparingly (thin layer)

and rubbed into the area thoroughly. The affected area should be cleaned gently before application. A topical corticosteroid should not be applied over extensive areas. Systemic absorption is more likely to occur with extensive application.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 3 first because it does not make sense not to clean an affected area. Eliminate option 1 because medicated cream should be applied only to areas that are affected. Eliminate option 2 because of the word *thick*. Review the procedure for the application of a topical corticosteroid if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., pp. 1087–1088). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1355). St. Louis: Saunders.

### ALTERNATE FORMAT ITEM: MULTIPLE RESPONSE

**443. 2, 4, 6**

**Rationale:** Pediatric considerations in the care of a burn victim include the following: Scarring is more severe in a

child than in an adult. A delay in growth may occur after a burn injury. Burns involving more than 10% of total body surface area require some form of fluid resuscitation. An immature immune system presents an increased risk of infection for infants and young children. The higher proportion of body fluid to mass in a child increases the risk of cardiovascular problems. Infants and young children are at increased risk for protein and calorie deficiencies because they have smaller muscle mass and less body fat than adults.

**Test-Taking Strategy:** Focus on the subject, pediatric considerations in the care of a child who sustained a burn injury. To answer correctly, read each option carefully and think about the physiology of a child related to body size. Review the pediatric considerations related to a burn injury if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Child Health—Integumentary (AIDS) Infectious Diseases

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1365). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., pp. 603, 605, 607). St. Louis: Mosby.

# Musculoskeletal Disorders

## I. DEVELOPMENTAL DYSPLASIA OF THE HIP

### A. Description

1. Disorders related to abnormal development of the hip that may develop during fetal life, infancy, or childhood; in these disorders, the head of the femur is seated improperly in the acetabulum, or hip socket, of the pelvis
2. Degrees of developmental dysplasia of the hip (Box 44-1)

### B. Assessment (Fig. 44-1)

1. Neonate: Laxity of the ligaments around the hip
2. Infant
  - a. Shortening of the limb on the affected side (Galeazzi's sign, Allis' sign)
  - b. Restricted abduction of the hip on the affected side when the infant is placed supine with knees and hips flexed
  - c. Unequal gluteal folds when the infant is prone and legs are extended against the examining table
  - d. Positive Ortolani's test: Ortolani's maneuver is a test to assess for hip instability. The examiner abducts the thigh and applies gentle pressure forward over the greater trochanter. A

"clunking" sensation indicates a dislocated femoral head moving into the acetabulum.

- e. Positive Barlow's test: The examiner adducts the hips and applies gentle pressure down and back with the thumbs. In hip dysplasia, the examiner can feel the femoral head move out of the acetabulum.

### 3. Older infant and child

- a. Affected leg is shorter than the other.
- b. The head of the femur can be felt to move up and down in the buttock when the extended thigh is pushed first toward the child's head and then pulled distally.
- c. Positive Trendelenburg's sign: The child stands on one foot and then the other foot, holding onto a support and bearing weight on the affected hip; the pelvis tilts downward on the normal side instead of upward, as it would with normal stability.
- d. Greater trochanter is prominent.
- e. Marked lordosis or waddling gait is noted in bilateral dislocations.

### C. Interventions

1. Birth to 6 months of age: Splinting of the hips with a Pavlik harness to maintain flexion and abduction and external rotation (worn continuously until hip is stable in about 3 to 6 months) (Fig. 44-2)
2. Age 6 to 18 months: Gradual reduction by traction followed by closed reduction or open reduction (if necessary) under general anesthesia; child is then placed in a hip spica cast for 2 to 4 months until the hip is stable, and then a flexion-abduction brace is applied for approximately 3 months
3. Older child: Operative reduction and reconstruction is usually required.
4. Parents are instructed regarding proper care of a Pavlik harness, spica cast, or abduction brace.

### Box 44-1 Degrees of Developmental Dysplasia of the Hip

#### Acetabular Dysplasia (Preluxation)

Mildest form  
Neither subluxation nor dislocation  
Delay in acetabular development occurs  
Femoral head remains in acetabulum

#### Subluxation

Incomplete dislocation of the hip  
Femoral head remains in acetabulum  
Stretched capsule and ligamentum teres causes head of the femur to be partially displaced

#### Dislocation

Femoral head loses contact with acetabulum and is displaced posteriorly and superiorly over fibrocartilaginous rim  
Ligamentum teres is elongated and taut

## II. CONGENITAL CLUBFOOT

### A. Description

1. Complex deformity of the ankle and foot that includes forefoot adduction, midfoot

supination, hindfoot varus, and ankle equinus; defect may be unilateral or bilateral

- The goal of treatment is to achieve a painless plantigrade (able to walk on the sole of the foot with the heel on the ground) and stable foot.
- Long-term interval follow-up care is required until the child reaches skeletal maturity.

**B. Assessment:** Deformities are described based on the position of the ankle and foot.

- Talipes varus: Inversion or bending inward
- Talipes valgus: Eversion or bending outward
- Talipes equinus: Plantar flexion in which the toes are lower than the heel
- Talipes calcaneus: Dorsiflexion in which the toes are higher than the heel

**C. Interventions**

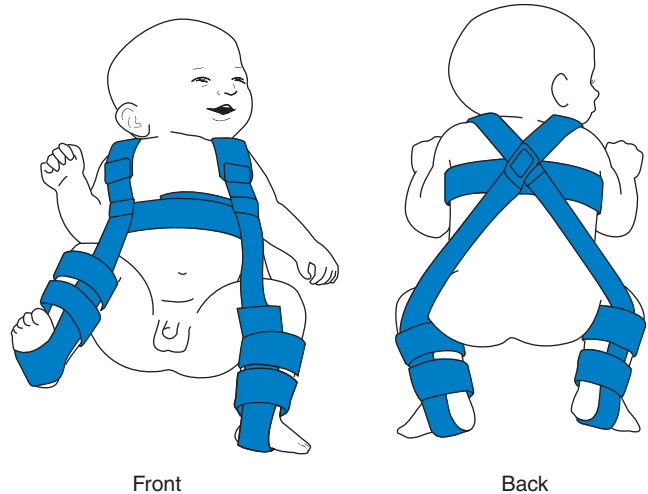

- Treatment begins as soon after birth as possible.
- Manipulation and casting are performed weekly for about 8 to 12 weeks because of the rapid growth of early infancy; a splint is then applied if casting and manipulation are successful.
- Surgical intervention may be necessary if normal alignment is not achieved by about 6 to 12 weeks of age.
- Monitor for pain, and monitor the neurovascular status of the toes.

**!** Contact the physician immediately if signs of neurovascular impairment are noted in a child with a cast or brace.

### III. IDIOPATHIC SCOLIOSIS

**A. Description**

- Three-dimensional spinal deformity that usually involves lateral curvature, spinal rotation

**▲ FIGURE 44-2** Child in Pavlik harness. (From Hockenberry, M., Wilson, S., Winkelstein, M. [2009]. *Wong's essentials of pediatric nursing* [8th ed.]. St. Louis: Mosby.)

**▲ FIGURE 44-1** Signs of development dysplasia of the hip. **A**, Asymmetry of gluteal and thigh folds. **B**, Limited hip abduction, as seen in flexion. **C**, Apparent shortening of the femur, as indicated by the level of the knees in flexion. **D**, Ortolani click (if infant is younger than 4 weeks old). **E**, Positive Trendelenburg's sign or gait (if child is weight bearing). (From Hockenberry, M., Wilson, S., Winkelstein, M. [2009]. *Wong's essentials of pediatric nursing* [8th ed.]. St. Louis: Mosby.)

resulting in rib asymmetry, and hypokyphosis of the thorax (Fig. 44-3)

2. Idiopathic scoliosis usually is diagnosed during the preadolescent growth spurt; screenings are important when growth spurts occur.
3. Surgical (spinal fusion, placement of an instrumentation system) and nonsurgical (bracing) interventions are used; the type of treatment depends on the location and degree of the curvatures, the age of the child, the amount of growth that is yet anticipated, and any underlying disease processes.
4. Long-term monitoring is essential to detect any progression of the curve.

#### B. Assessment

1. Asymmetry of the ribs and flanks is noted when the child bends forward at the waist and hangs the arms down toward the feet (Adams' test).
2. Hip height, rib positioning, and shoulder height are asymmetrical (can be noted when standing behind an undressed child); leg-length discrepancy is also apparent.
3. Radiographs are obtained to confirm the diagnosis.

#### C. Interventions

1. Monitor progression of the curvatures.
2. Prepare the child and parents for the use of a brace if prescribed.

**▲ FIGURE 44-3** Scoliosis in a standing erect posture. (From Lewis, S., Heitkemper, M., & Dirksen, S. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

3. Prepare the child and parents for surgery (spinal fusion, placement of internal instrumentation systems) if prescribed.

The potential for altered role performance, body image disturbance, fear, anger, and isolation exists for a child with a disabling condition and a condition that requires wearing a body brace.

#### D. Braces

1. Braces are not curative, but may slow the progression of the curvature to allow skeletal growth and maturity.
2. Braces usually are prescribed to be worn 16 to 23 hours a day.
3. Inspect the skin for signs of redness or breakdown.
4. Keep the skin clean and dry, and avoid lotions and powders because these cake and lead to skin breakdown.
5. Advise the child to wear soft nonirritating clothing under the brace.
6. Instruct in prescribed exercises (exercises help maintain and strengthen spinal and abdominal muscles during treatment).
7. Encourage verbalization about body image and other psychosocial issues.

#### E. Postoperative interventions

1. Maintain proper alignment; avoid twisting movements.
2. Logroll the child when turning to maintain alignment.
3. Assess extremities for adequate neurovascular status.
4. Encourage coughing and deep breathing and the use of incentive spirometry.
5. Assess pain and administer prescribed analgesics.
6. Monitor for incontinence.
7. Monitor for signs and symptoms of infection.
8. Monitor for superior mesenteric artery syndrome (caused by mechanical changes in the position of the child's abdominal contents during surgery) and notify the physician if it occurs; symptoms include emesis and abdominal distention similar to what occurs with intestinal obstruction or paralytic ileus.
9. Instruct in activity restrictions.
10. Instruct the child how to roll from a side-lying position to a sitting position, and assist with ambulation.
11. Prepare the child for the use of a molded plastic orthosis (brace) to provide external stability of the spine when resuming activities.
12. Address a body image disturbance when formulating a plan of nursing care.

#### IV. JUVENILE IDIOPATHIC ARTHRITIS

##### A. Description

1. Autoimmune inflammatory disease affecting the joints and other tissues, such as articular cartilage, that most often occurs in girls.
2. Treatment is supportive (there is no cure) and directed toward preserving joint function, controlling inflammation, minimizing deformity, and reducing the impact that the disease may have on the development of the child.
3. Treatment includes medications, physical and occupational therapies, and child and family education.
4. Surgical intervention may be implemented if the child has problems with joint contractures and unequal growth of extremities.

##### B. Assessment (Box 44-2)

1. There are no definitive tests to diagnose juvenile idiopathic arthritis.
2. Some laboratory tests, such as an elevated erythrocyte sedimentation rate or determination of the presence of leukocytosis, may support evidence of the disease.
3. Radiographs may show soft tissue swelling and joint space widening from increased synovial fluid in the joint.

##### C. Interventions

1. Facilitate social and emotional development.
2. Instruct parents and child in the administration of medications; medications may be given alone or in combination and are prescribed in a step-like manner depending on the disease response to each level (Box 44-3).
3. Assist the child with range-of-motion exercises and instruct in prescribed exercises.
4. Encourage normal performance of activities of daily living.
5. Instruct parents and child in the use of hot or cold packs, splinting, and positioning the affected joint in a neutral position during painful episodes.
6. Encourage and support prescribed physical and occupational therapy.
7. Instruct in the importance of preventive eye care and reporting visual disturbances.
8. Assess the child's and family's perceptions regarding the chronic illness; plan to discuss the nature of a chronic illness and the associated

life alterations that result from the chronic progression of the disorder.

#### V. MARFAN SYNDROME

##### A. Description

1. Disorder of connective tissue that affects the skeletal system, cardiovascular system, eyes, and skin.
2. Marfan syndrome is caused by defects in the fibrillin-1 gene, which serves as a building block for elastic tissue in the body; also, the disorder may be inherited.
3. There is no cure for the disorder.

##### B. Assessment

1. Tall and thin body structure: slender fingers, long arms and legs, curvature of the spine
2. Presence of visual problems
3. Presence of cardiac problems

##### C. Interventions

1. Monitor for vision problems and obtain visual examinations on a regular schedule.
2. Monitor for curvature of the spine, especially during adolescence.
3. Cardiac medications may be prescribed to slow the heart rate, to decrease stress on the aorta.
4. Instruct parents that the child should avoid participating in competitive athletics and contact sports to avoid injuring the heart.

#### Box 44-2 Assessment Findings: Juvenile Idiopathic Arthritis

Stiffness, swelling, and limited motion occur in affected joints. Affected joints are warm to touch, tender, and painful. Joint stiffness is present on arising in the morning and after inactivity. Uveitis (inflammation of structures in the uveal tract) can occur and cause blindness.

#### Box 44-3 Medications Used in Juvenile Idiopathic Arthritis

##### Nonsteroidal Anti-inflammatory Drugs (NSAIDs)

First medications used

May cause gastrointestinal irritation and easy bruising

##### Methotrexate

Used if NSAIDs are ineffective

Complete blood cell counts and liver function studies are monitored closely

##### Corticosteroids

Potent immunosuppressives used for life-threatening complications, incapacitating arthritis, and uveitis

Administered at lowest effective dose for the shortest time period; discontinued on a tapering schedule

Prolonged use can cause Cushing's syndrome, osteoporosis, increased infection risk, glucose intolerance, hypokalemia, cataracts, growth suppression

##### Tumor Necrosis Factor Receptor Inhibitors

Etanercept (Enbrel)

Infliximab (Remicade)

Adverse effects include allergic reaction at injection site, increased risk for infection, demyelinating disease, pancytopenia

##### Slower Acting Antirheumatic Drugs

Usually prescribed in combination with NSAIDs

Sulfasalazine (Azulfidine), hydroxychloroquine (Plaquenil), gold sodium thiomalate (Myochrysin), penicillamine

5. Instruct parents to inform the dentist of the condition; antibiotics should be taken before dental procedures to prevent endocarditis.
6. Surgical replacement of the aortic root and valve may be necessary.

## VI. FRACTURES

### A. Description (see also Chapter 68)

1. A break in the continuity of the bone as a result of trauma, twisting, or bone decalcification
2. Fractures in children usually occur as a result of increased mobility and inadequate or immature motor and cognitive skills; they may result from trauma or bone diseases such as congenital bone disease or bone tumors.

 **Fractures in infancy are generally rare and warrant further investigation to rule out the possibility of child abuse and to recognize bone structure defects.**

### B. Assessment

1. Pain or tenderness over the involved area
2. Obvious deformity
3. Edema
4. Ecchymosis
5. Muscle spasm
6. Loss of function
7. Crepitation

### C. Initial care of a fracture (see Priority Nursing Actions)

#### **PRIORITY NURSING ACTIONS!**

##### **Actions to Take if a Child Sustains an Extremity Fracture**

1. Assess extent of injury and immobilize the affected extremity.
2. If a compound fracture exists, cover the wound with a sterile dressing (apply a clean dressing if a sterile dressing is unavailable).
3. Elevate the injured extremity.
4. Apply cold to injured area.
5. Continue to monitor neurovascular status.
6. Transport to the nearest emergency department.

If a child sustains a fracture, the extent of the injury is immediately assessed using the five “P’s”—pain and point of tenderness, pulses distal to fracture site, pallor, paresthesia (sensation) distal to the fracture site, and paralysis (movement distal to fracture site). The extremity is immobilized to prevent movement and further injury to soft tissues. If an open wound is present, it is covered to reduce the risk of infection. The extremity is elevated to reduce swelling, and cold packs are applied to assist in reducing the swelling and to reduce the pain. The neurovascular status is monitored closely, and the child is transported to the nearest emergency facility.

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1684). St. Louis: Mosby.

### D. Interventions

#### 1. Reduction

- a. Restoring the bone to proper alignment
- b. Closed reduction: Accomplished by manual alignment of the fragments, followed by immobilization
- c. Open reduction: Surgical insertion of internal fixation devices, such as rods, wires, or pins, that help maintain alignment while healing occurs

#### 2. Retention: Application of traction or a cast to maintain alignment until healing occurs

### E. Traction (see Chapter 68)

#### 1. Russell skin traction

- a. Used to stabilize a fractured femur before surgery
- b. Similar to Buck’s traction, but provides a double pull using a knee sling that pulls at the knee and foot

#### 2. Balanced suspension

- a. Used with skin or skeletal traction to approximate fractures of the femur, tibia, or fibula
- b. Balanced suspension is produced by a counterforce other than the child.
- c. Provide pin care if pins are used with the skeletal traction.

#### 3. 90-degree–90-degree traction

- a. The lower leg is supported by a boot cast or a calf sling.
- b. A skeletal Steinmann pin or Kirschner wire is placed in the distal fragment of the femur, allowing 90-degree flexion at the hip and the knee.

#### 4. Interventions

- a. Maintain correct amount of weight as prescribed.
- b. Ensure that weights hang freely.
- c. Check all ropes for fraying and all knots for tightness; be sure that the ropes are appropriately tracking in the grooves of the pulley wheels.
- d. Monitor neurovascular status of the involved extremity.
- e. Protect the skin from breakdown.
- f. Monitor for signs and symptoms of complications of immobilization, such as constipation, skin breakdown, lung congestion, renal complications, and disuse syndrome of unaffected extremities.
- g. Provide therapeutic and diversional play.

### F. Casts (see Chapter 68)

#### 1. Description

- a. Made of plaster or fiberglass to provide immobilization of bone and joints after a fracture or injury
- b. Fractures of the hip or knee may require a spica cast.

## 2. Interventions

- Examine the cast for pressure areas.
- Ensure that no rough casting material remains in contact with the skin; petal the cast edges as necessary (Fig. 44-4).
- If a hip spica cast is placed, the cast edges around the perineum and buttocks may need to be taped with waterproof tape.
- Monitor the extremity for circulatory impairment, such as pain greater than that expected for the type of injury, edema, rubor, pallor, numbness and tingling, coolness, decreased sensation or mobility, or diminished pulse.
- Notify the physician if circulatory impairment occurs.
- Prepare for bivalving or cutting the cast if circulatory impairment occurs; prepare for emergency fasciotomy if cast removal does not improve the neurocirculatory compromise.
- Instruct parents and child not to stick objects down the cast.
- Teach parents and child to keep the cast clean and dry.
- Instruct parents and child in isometric exercises to prevent muscle atrophy.

**▲ FIGURE 44-4** Petaling edges of a cast with waterproof adhesive strips. **A**, Cast must be thoroughly dry. The nurse trims excess sheet wadding and stretches stockinette over cast edge (when possible). **B**, Several strips (petals) of waterproof adhesive tape (2-inch-wide strips for small areas, each 1 inch long) are made in advance. **C**, Uncut end of tape is placed beneath cast edge. Each succeeding petal overlaps the previous one by  $\frac{1}{2}$  inch, ensuring a smooth cast edge. (From Lewis, S., Heitkemper, M., & Dirksen, S. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

 **MORE QUESTIONS ON THE CD!**
**Practice Questions**

- 444.** A child has a right femur fracture caused by a motor vehicle accident and is placed in skin traction temporarily until surgery can be performed. During assessment, the nurse notes that the dorsalis pedal pulse is absent on the right foot. What action should the nurse take?
- Notify the physician.
  - Administer an analgesic.
  - Release the skin traction.
  - Apply ice to the extremity.
- 445.** A child is placed in skeletal traction for treatment of a fractured femur. The nurse develops a plan of care for the child and includes which intervention in the plan?
- Ensure that all ropes are outside the pulleys.
  - Ensure that the weights are resting lightly on the floor.
  - Restrict diversional and play activities until the child is out of traction.
  - Check the physician's prescriptions for the amount of weight to be applied.
- 446.** A 4-year-old child sustains a fall at home and is brought to the emergency department by the mother. After an x-ray examination, the child is determined to have a fractured arm and a plaster cast is applied. The nurse provides instructions to the mother regarding care for the child's cast. Which statement by the mother indicates a need for further instructions?
- "The cast may feel warm as the cast dries."
  - "I can use lotion or powder around the cast edges to relieve itching."
  - "A small amount of white shoe polish can touch up a soiled white cast."
  - "If the cast becomes wet, a blow drier set on the cool setting may be used to dry the cast."
- 447.** A mother brings her 2-week-old infant to a clinic for treatment after a diagnosis of clubfoot made at birth. Which statement by the mother indicates a need for further teaching regarding this disorder?
- "Treatment needs to be started as soon as possible."
  - "I realize my infant will require follow-up care until full grown."
  - "I need to bring my infant back to the clinic in 1 month for a new cast."
  - "I need to come to the clinic every week with my infant for the casting."

- 448.** The mother of a child with juvenile idiopathic arthritis calls the clinic nurse because the child is experiencing a painful exacerbation of the disease. The mother asks the nurse if the child can perform range-of-motion exercises at this time. The appropriate nursing response is:
1. "Avoid all exercise during painful periods."
  2. "Range-of-motion exercises must be performed every day."
  3. "Have the child perform simple isometric exercises during this time."
  4. "Administer additional pain medication before performing range-of-motion exercises."
- 449.** A nurse is caring for a child after spinal fusion for scoliosis treatment. The child complains of abdominal discomfort and begins to have episodes of vomiting. On further assessment, the nurse notes abdominal distention. Based on these findings, the nurse should take which action?
1. Notify the physician.
  2. Administer an antiemetic.
  3. Increase the intravenous fluids.
  4. Place the child in a Sims' position.
- 450.** A nurse is providing instructions to the parents of a child with scoliosis regarding the use of a brace. Which statement by the parents indicates a need for further instructions?
1. "I will encourage my child to perform prescribed exercises."
  2. "I will have my child wear soft fabric clothing under the brace."
  3. "I should apply lotion under the brace to prevent skin breakdown."
  4. "I should avoid the use of powder because it will cake under the brace."
- 451.** A nurse is assisting a physician during the examination of an infant with developmental dysplasia of the hip. The physician performs an Ortolani maneuver. The nurse is aware that this maneuver is performed to:
1. Assess for hip instability.
  2. Assess for movement of the hips.
  3. Push the femoral head out of the acetabulum.
  4. Ensure that hyperextension and full range of motion exists.
- 452.** A 1-month-old infant is seen in a clinic and is diagnosed with developmental dysplasia of the hip. The nurse assesses the infant, knowing that which of the following findings would be noted in this condition?
1. Limited range of motion in the affected hip
  2. An apparent lengthened femur on the affected side
  3. Asymmetrical adduction of the affected hip when the infant is placed supine with the knees and hips flexed
  4. Symmetry of the gluteal skinfolds when the infant is placed prone and the legs are extended against the examining table

### Alternate Item Format: Multiple Response

- 453.** A nurse prepares a list of home care instructions for the parents of a child who has a plaster cast applied to the left forearm. Which instructions would be included on the list? **Select all that apply.**
- 1. Use the fingertips to lift the cast while it is drying.
  - 2. Keep small toys and sharp objects away from the cast.
  - 3. Contact the physician if the child complains of numbness or tingling in the extremity.
  - 4. Use a padded ruler or another padded object to scratch the skin under the cast if it itches.
  - 5. Place a heating pad on the lower end of the cast and over the fingers if the fingers feel cold.
  - 6. Elevate the extremity on pillows for the first 24 to 48 hours after casting to prevent swelling.

## ANSWERS

### 444. 1

**Rationale:** An absent pulse to an extremity of the affected limb after a bone fracture could mean that the child is developing or experiencing compartment syndrome. This is an emergency situation, and the physician should be notified immediately. Applying ice to an extremity with absent perfusion is incorrect. Ice may be prescribed when perfusion is adequate to decrease swelling. Administering

analgesics would not improve circulation. The skin traction should not be released without a physician's prescription.

**Test-Taking Strategy:** Use the ABCs—airway, breathing, and circulation—to assist in answering this question. Focusing on the data in the question indicates that circulation is impaired. This should direct you to option 1. Review care of the child in traction and the complications of a fracture if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Neurological/Musculoskeletal

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 1120). St. Louis: Mosby.

#### 445. 4

**Rationale:** When a child is in traction, the nurse would check the physician's prescription to verify the prescribed amount of traction weight. The nurse would maintain the correct amount of weight as prescribed, ensure that the weights hang freely, check the ropes for fraying and ensure that they are on the pulleys appropriately, monitor the neurovascular status of the involved extremity, and monitor for signs and symptoms of immobilization. The nurse would provide therapeutic and diversional play activities for the child.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 3 first because of the word *restrict*. Next recall the general principles related to traction, recalling that weights should hang freely and ropes should remain in the pulleys. Review care of the child in traction and the principles of traction care if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Child Health—Neurological/Musculoskeletal

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 1120). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 1384–1385). St. Louis: Saunders.

#### 446. 2

**Rationale:** Teaching about cast care is essential to prevent complications from the cast. The mother needs to be instructed not to use lotion or powders on the skin around the cast edges or inside the cast. Lotions or powders can become sticky or caked and cause skin irritation. Options 1, 3, and 4 are appropriate statements.

**Test-Taking Strategy:** Note the strategic words *indicates a need for further instructions*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Remember that lotions or powders can become sticky or caked and cause skin irritation. Review home care instructions regarding cast care if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Neurological/Musculoskeletal

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1387). St. Louis: Saunders.

#### 447. 3

**Rationale:** Clubfoot is a complex deformity of the ankle and foot that includes forefoot adduction, midfoot supination, hindfoot varus, and ankle equinus; the defect may be unilateral or bilateral. Treatment for clubfoot is started as soon as

possible after birth. Serial manipulation and casting are performed at least weekly. If sufficient correction is not achieved in 3 to 6 months, surgery usually is indicated. Because clubfoot can recur, all children with clubfoot require long-term interval follow-up until they reach skeletal maturity to ensure an optimal outcome.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *indicates a need for further teaching*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. This will assist you in eliminating options 1 and 2. Recalling that serial manipulations and casting are required weekly will assist in directing you to option 3. Review these treatment procedures if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Neurological/Musculoskeletal

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 1126). St. Louis: Mosby.

#### 448. 3

**Rationale:** Juvenile idiopathic arthritis is an autoimmune inflammatory disease affecting the joints and other tissues, such as articular cartilage. During painful episodes of juvenile idiopathic arthritis, hot or cold packs and splinting and positioning the affected joint in a neutral position help reduce the pain. Although resting the extremity is appropriate, beginning simple isometric or tensing exercises as soon as the child is able is important. These exercises do not involve joint movement.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1, 2, and 4 because of the words *all*, *must*, and *additional* in these options. Review pain management and care during exacerbations of juvenile idiopathic arthritis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Neurological/Musculoskeletal

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1409). St. Louis: Saunders.

#### 449. 1

**Rationale:** Scoliosis is a three-dimensional spinal deformity that usually involves lateral curvature, spinal rotation resulting in rib asymmetry, and hypokyphosis of the thorax. A complication after surgical treatment of scoliosis is superior mesenteric artery syndrome. This disorder is caused by mechanical changes in the position of the child's abdominal contents, resulting from lengthening of the child's body. The disorder results in a syndrome of emesis and abdominal distention similar to that which occurs with intestinal obstruction or paralytic ileus. Postoperative vomiting in children with body casts or children who have undergone spinal fusion warrants attention because of the possibility of superior mesenteric artery syndrome. Options 2, 3, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 3 first because it should not be implemented

unless prescribed by the physician. Eliminate option 4 next because this child requires logrolling, and Sims' position may cause injury after surgery. From the remaining options, note the assessment signs and symptoms in the question. These should alert you that notification of the physician is necessary. Review the manifestations of superior mesenteric artery syndrome if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Neurological/Musculoskeletal

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1418). St. Louis: Saunders.

### 450. 3

**Rationale:** A brace may be prescribed to treat scoliosis. Braces are not curative, but may slow the progression of the curvature to allow skeletal growth and maturity. The use of lotions or powders under a brace should be avoided because they can become sticky and cake under the brace, causing irritation. Options 1, 2, and 4 are appropriate interventions in the care of a child with a brace.

**Test-Taking Strategy:** Note the strategic words *need for further instructions* in the question. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Careful reading of the options will assist in directing you to option 3. Also, applying the principles associated with cast care will direct you to the correct option. Review home care instructions regarding the care of a child in a brace if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Neurological/Musculoskeletal

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1417). St. Louis: Saunders.

### 451. 1

**Rationale:** In developmental dysplasia of the hip, the head of the femur is seated improperly in the acetabulum or hip socket of the pelvis. Ortolani's maneuver is a test to assess for hip instability. The examiner abducts the thigh and applies gentle pressure forward over the greater trochanter. A "clunking" sensation indicates a dislocated femoral head moving into the acetabulum. This maneuver does not assess for hip movement or ensure that hyperextension and full range of motion exists. Pushing the femoral head out of the acetabulum is not a purpose of Ortolani's maneuver.

**Test-Taking Strategy:** Use the process of elimination. Options 2 and 4 can be eliminated first because they are comparable or alike. To select from the remaining options, remember that Ortolani's maneuver is an assessment technique. This will direct you to option 1. Review the purpose of Ortolani's maneuver if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Neurological/Musculoskeletal

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., pp. 1122–1123). St. Louis: Mosby.

### 452. 1

**Rationale:** In developmental dysplasia of the hip, the head of the femur is seated improperly in the acetabulum or hip socket of the pelvis. Asymmetrical abduction of the affected hip, when the child is placed supine with the knees and hips flexed, would be an assessment finding in developmental dysplasia of the hip in infants beyond the newborn period. Other findings include an apparent short femur on the affected side, asymmetry of the gluteal skinfolds, and limited range of motion in the affected extremity.

**Test-Taking Strategy:** Note the age of the infant and focus on the infant's diagnosis. Visualizing each of the assessment findings described in the options will direct you to option 1. If you had difficulty with this question, review the assessment findings in developmental dysplasia of the hip.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Neurological/Musculoskeletal

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1390). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 453. 2, 3, 6

**Rationale:** While the cast is drying, the palms of the hands are used to lift the cast. If the fingertips are used, indentations in the cast could occur and cause constant pressure on the underlying skin. Small toys and sharp objects are kept away from the cast, and no objects (including padded objects) are placed inside the cast because of the risk of altered skin integrity. The extremity is elevated to prevent swelling, and the physician is notified immediately if any signs of neurovascular impairment develop. A heating pad is not applied to the cast or fingers. Cold fingers could indicate neurovascular impairment, and the physician should be notified.

**Test-Taking Strategy:** Use of the ABCs—airway, breathing, and circulation—and safety principles related to care of a child with a cast will assist in answering this question. Review the general principles of cast care if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Neurological/Musculoskeletal

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1388). St. Louis: Saunders.

# Hematological Disorders

## I. SICKLE CELL ANEMIA

### A. Description

1. Sickle cell anemia constitutes a group of diseases termed *hemoglobinopathies*, in which hemoglobin A is partly or completely replaced by abnormal sickle hemoglobin S.
2. It is caused by the inheritance of a gene for a structurally abnormal portion of the hemoglobin chain.
3. Risk factors include having parents heterozygous for hemoglobin S or being of African-American descent.
4. Hemoglobin S is sensitive to changes in the oxygen content of the red blood cell.
5. Insufficient oxygen causes the cells to assume a sickle shape, and the cells become rigid and clumped together, obstructing capillary blood flow (Fig. 45-1)
6. The clinical manifestations primarily occur as a result of obstruction caused by sickled red blood cells and increased red blood cell destruction.
7. Situations that precipitate sickling include fever, dehydration, and emotional or physical stress; any condition that increases the need for oxygen or alters the transport of oxygen can result in sickle cell crisis (acute exacerbation).
8. Sickle cell crises are acute exacerbations of the disease, which vary considerably in severity and frequency; these include vaso-occlusive crisis, splenic sequestration, and aplastic crisis.
9. The sickling response is reversible under conditions of adequate oxygenation and hydration; after repeated sickling, the cell becomes permanently sickled.
10. A multidisciplinary approach to care is needed, and care focuses on the prevention (preventing exposure to infection and maintaining normal hydration) and treatment (oxygen, hydration, pain management, and bedrest) of the crisis.

### B. Assessment of the crisis (Box 45-1)

### Box 45-1 Sickle Cell Crisis

#### Vaso-Occlusive Crisis

Caused by stasis of blood with clumping of cells in the microcirculation, ischemia, and infarction  
Manifestations: Fever; painful swelling of hands, feet, and joints; and abdominal pain

#### Splenic Sequestration

Caused by pooling and clumping of blood in the spleen (hypersplenism)  
Manifestations: Profound anemia, hypovolemia, and shock

#### Aplastic Crisis

Caused by diminished production and increased destruction of red blood cells, triggered by viral infection or depletion of folic acid  
Manifestations: Profound anemia and pallor

### C. Interventions

1. Maintain adequate hydration and blood flow through oral and intravenously administered fluids; electrolyte replacement is also provided as needed.
2. Administer oxygen and blood transfusions as prescribed to increase tissue perfusion; exchange transfusions, which reduce the number of circulating sickle cells and the risk of complications, may also be prescribed.
3. Administer analgesics as prescribed (around the clock).
4. Assist the child to assume a comfortable position so that the child keeps the extremities extended to promote venous return; elevate the head of the bed no more than 30 degrees, avoid putting strain on painful joints, and do not raise the knee gatch of the bed.
5. Encourage consumption of a high-calorie, high-protein diet, with folic acid supplementation.
6. Administer antibiotics as prescribed to prevent infection.
7. Monitor for signs of complications, including increasing anemia, decreased perfusion, and shock (mental status changes, pallor, vital sign changes).

▲ **FIGURE 45-1** Differences between effects of (A) normal red blood cells and (B) sickled red blood cells on circulation, with related complications. (From Hockenberry, M., & Wilson, D. [2007]. *Nursing care of infants and children* [8th ed.]. St. Louis: Mosby.)

8. Instruct the child and parents about the early signs and symptoms of crisis and the measures to prevent crisis.
9. Ensure that the child receives pneumococcal and meningococcal **vaccines** and an annual influenza **vaccine** because of susceptibility to infection secondary to functional asplenia.
10. A splenectomy may be necessary for clients who experience recurrent splenic sequestration.
11. Inform parents of the **hereditary** aspects of the disorder.

⚠ Administration of meperidine (Demerol) for pain is avoided because of the risk of normeperidine-induced seizures.

## II. IRON DEFICIENCY ANEMIA

### A. Description

1. Iron stores are depleted, resulting in a decreased supply of iron for the manufacture of hemoglobin in red blood cells.
2. Iron deficiency anemia commonly results from blood loss, increased metabolic demands,

syndromes of gastrointestinal malabsorption, and dietary inadequacy.

### B. Assessment

1. Pallor
2. Weakness and fatigue
3. Irritability
4. Low hemoglobin and hematocrit levels
5. Red blood cells that are microcytic and hypochromic

### C. Interventions

1. Increase oral intake of iron; iron-fortified formula is needed for an infant.
2. Instruct the child and parents in food choices that are high in iron (Box 45-2).
3. Administer iron supplements as prescribed.
4. Intramuscular injections of iron (using Z-track method) or intravenous administration of iron may be prescribed in severe cases of anemia.
5. Teach parents how to administer the iron supplements.
  - a. Give iron supplements between meals for maximum absorption.
  - b. Give iron supplements with a multivitamin or fruit juice because vitamin C increases absorption.

**Box 45-2 Iron-Rich Foods**

|   |              |
|---|--------------|
| Breads and cereals                      | Molasses     |
| Dark green, leafy vegetables            | Nuts         |
| Dried fruits                            | Potatoes     |
| Egg yolks                               | Prune juice  |
| Iron-enriched infant formula and cereal | Raisins      |
| Kidney beans                            | Seeds        |
| Legumes                                 | Shellfish    |
| Liver                                   | Tofu         |
| Meats                                   | Whole grains |

- c. Do not give iron supplements with milk or antacids because these items decrease absorption.
6. Instruct the child and parents about the side effects of iron supplements (black stools, constipation, and foul aftertaste).

 Liquid iron preparation stains the teeth. Teach the parents and child that liquid iron should be taken through a straw and that the teeth should be brushed after administration.

### III. APLASTIC ANEMIA

**A. Description**

1. Aplastic anemia is a deficiency of circulating erythrocytes and all other formed elements of blood, resulting from the arrested development of cells within the bone marrow.
2. It can be primary (present at birth) or secondary (acquired).
3. Several possible causes exist, including chronic exposure to myelotoxic agents, viruses, infection, autoimmune disorders, and allergic states.
4. The definitive diagnosis is determined by bone marrow aspiration (shows conversion of red bone marrow to fatty bone marrow).
5. Therapeutic management focuses on restoring function to the bone marrow and involves immunosuppressive therapy and bone marrow transplantation (treatment of choice if a suitable donor exists).
6. If the cause is a myelotoxic medication that is being administered for another purpose, the medication may be discontinued to improve bone marrow function.

**B. Assessment**

1. Pancytopenia (deficiency of erythrocytes, leukocytes, and thrombocytes)
2. Petechiae, purpura, bleeding, pallor, weakness, tachycardia, and fatigue

**C. Interventions**

1. Prepare the child for bone marrow transplantation if planned.

**Box 45-3 Hemophilia**

Hemophilia A (classic hemophilia): Results from deficiency of factor VIII

Hemophilia B (Christmas disease): Results from deficiency of factor IX

2. Administer immunosuppressive medications as prescribed; antilymphocyte globulin or antithymocyte globulin may be prescribed to suppress the autoimmune response.
3. Colony-stimulating factors may be prescribed to enhance bone marrow production.
4. Corticosteroids and cyclosporine (sandimmune) may be prescribed.
5. Administer blood transfusions if prescribed and monitor for transfusion reactions.
6. Monitor for signs related to the disease and to complications of the treatments and medications administered.

**IV. HEMOPHILIA****A. Description**

1. Hemophilia refers to a group of bleeding disorders resulting from a deficiency of specific coagulation proteins.
2. Identifying the specific coagulation deficiency is important so that definitive treatment with the specific replacement agent can be implemented; aggressive replacement therapy is initiated to prevent the chronic crippling effects from joint bleeding.
3. The most common types are factor VIII deficiency (hemophilia A or classic hemophilia) and factor IX deficiency (hemophilia B or Christmas disease) (Box 45-3).
4. Hemophilia is transmitted as an X-linked recessive disorder (it may also occur as a result of a gene mutation).
5. Carrier females pass on the defect to affected males; female offspring are rarely born with the disorder, but may be if they inherit an affected gene from their mother and are offspring of a father with hemophilia.
6. The primary treatment is replacement of the missing clotting factor; additional medications, such as agents to relieve pain or corticosteroids, may be prescribed depending on the source of bleeding from the disorder.

**B. Assessment**

1. Abnormal bleeding in response to trauma or surgery (sometimes is detected after circumcision)
2. Epistaxis (nosebleeds)
3. Joint bleeding causing pain, tenderness, swelling, and limited range of motion
4. Tendency to bruise easily

- Results of tests that measure platelet function are normal; results of tests that measure clotting factor function may be abnormal.

### C. Interventions

- Monitor for bleeding and maintain bleeding precautions.
- Prepare to administer replacement factors as prescribed.
- DDAVP (1-deamino-8-D-arginine vasopressin), a synthetic form of vasopressin, increases plasma factor VIII and may be prescribed to treat mild hemophilia.
- Monitor for joint pain; immobilize the affected extremity if joint pain occurs.
- Assess neurological status (child is at risk for intracranial hemorrhage).
- Monitor urine for hematuria.
- Control joint bleeding by immobilization, elevation, and application of ice; apply pressure (15 minutes) for superficial bleeding.
- Instruct the child and parents about the signs of internal bleeding.
- Instruct parents in how to control the bleeding.
- Instruct parents regarding activities for the child, emphasizing the avoidance of contact sports and the need for protective devices while learning to walk; assist in developing an appropriate exercise plan.
- Instruct the child to wear protective devices such as helmets and knee and elbow pads when participating in sports such as bicycling and skating.

## V. VON WILLEBRAND'S DISEASE

### A. Description

- von Willebrand's disease is a **hereditary** bleeding disorder that occurs in males and females and is characterized by a deficiency of or a defect in a protein termed *von Willebrand factor*.
- The disorder causes platelets to adhere to damaged endothelium; the von Willebrand factor protein also serves as a carrier protein for factor VIII.
- It is characterized by an increased tendency to bleed from mucous membranes.

### B. Assessment

- Epistaxis
- Gum bleeding
- Easy bruising
- Excessive menstrual bleeding

### C. Interventions

- Treatment and care are similar to measures implemented for hemophilia, including administration of clotting factors.
- Provide emotional support to the child and parents, especially if the child is experiencing an episode of bleeding.

## Box 45-4 Types of $\beta$ -Thalassemia

Thalassemia minor: Asymptomatic silent carrier case

Thalassemia trait: Produces mild microcytic anemia

Thalassemia intermedia: Manifested as splenomegaly and moderate to severe anemia

Thalassemia major: Results in severe anemia requiring transfusion support to sustain life (also known as Cooley's anemia)

A child with a bleeding disorder needs to wear a Medic-Alert bracelet.

## VI. $\beta$ -THALASSEMIA MAJOR

### A. Description (Box 45-4)

- $\beta$ -thalassemia major is an autosomal recessive disorder characterized by the reduced production of one of the globin chains in the synthesis of hemoglobin (both parents must be carriers to produce a child with  $\beta$ -thalassemia major).
- The incidence is highest in individuals of Mediterranean descent, such as Italians, Greeks, Syrians, or their offspring.
- Treatment is supportive; the goal of therapy is to maintain normal hemoglobin levels by the administration of blood transfusions.
- Bone marrow transplantation may be offered as an alternative therapy.
- A splenectomy may be performed in a child with severe splenomegaly who requires repeated transfusions (assists in relieving abdominal pressure and may increase the life span of supplemental red blood cells).

### B. Assessment

- Frontal bossing
- Maxillary prominence
- Wide-set eyes with a flattened nose
- Greenish yellow skin tone
- Hepatosplenomegaly
- Severe anemia
- Microcytic, hypochromic red blood cells

### C. Interventions

- Administer blood transfusions as prescribed; monitor for transfusion reactions.
- Monitor for iron overload; chelation therapy with deferasirox (Exjade) or deferoxamine (Desferal) may be prescribed to treat iron overload and to prevent organ damage from the elevated levels of iron caused by the multiple transfusion therapy.
- If the child has had a splenectomy, instruct parents to report any signs of infection because of the risk of sepsis.

4. Ensure that parents understand the importance of the child receiving pneumococcal and meningococcal **vaccines** in addition to an annual influenza vaccine and the regularly scheduled **vaccines**.
5. Provide genetic counseling to parents.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 454.** A home care nurse is instructing the parents of a child with iron deficiency anemia regarding the administration of a liquid oral iron supplement. The nurse tells the mother to:
1. Administer the iron at mealtimes.
  2. Administer the iron through a straw.
  3. Mix the iron with cereal to administer.
  4. Add the iron to formula for easy administration.
- 455.** A nurse analyzes the laboratory results of a child with hemophilia. The nurse understands that which of the following would most likely be abnormal in this child?
1. Platelet count
  2. Hematocrit level
  3. Hemoglobin level
  4. Partial thromboplastin time
- 456.** A nurse is providing home care instructions to the mother of a 10-year-old child with hemophilia. Which of the following activities should the nurse suggest that the child could participate in safely with peers?
1. Soccer
  2. Basketball
  3. Swimming
  4. Field hockey
- 457.** A nursing student is presenting a clinical conference and discusses the cause of  $\beta$ -thalassemia. The nursing student informs the group that a child at greatest risk of developing this disorder is:
1. A child of Mexican descent
  2. A child of Mediterranean descent
  3. A child whose intake of iron is extremely poor
  4. A breast-fed child of a mother with chronic anemia
- 458.** A child with  $\beta$ -thalassemia is receiving long-term blood transfusion therapy for the treatment of this disorder. Chelation therapy is prescribed to prevent organ damage from the presence of too much iron in the body as a result of the transfusions. Which of the following medications would the nurse anticipate to be prescribed in chelation therapy?
1. Meropenem (Merrem)
  2. Metoprolol (Toprol-XL)
  3. Deferoxamine (Desferal)
  4. Dalteparin sodium (Fragmin)
- 459.** A clinic nurse instructs the mother of a child with sickle cell anemia about the precipitating factors related to sickle cell crisis. Which of the following, if identified by the mother as a precipitating factor, indicates the need for further instructions?
1. Stress
  2. Trauma
  3. Infection
  4. Fluid overload
- 460.** A 10-year-old child with hemophilia A has slipped on the ice and bumped his knee. The nurse should prepare to administer an:
1. Injection of factor X
  2. Intravenous infusion of iron
  3. Intravenous infusion of factor VIII
  4. Intramuscular injection of iron using the Z-track method
- 461.** Laboratory studies are performed for a child suspected to have iron deficiency anemia. The nurse reviews the laboratory results, knowing that which of the following results would indicate this type of anemia?
1. Elevated hemoglobin level
  2. Decreased reticulocyte count
  3. Elevated red blood cell count
  4. Red blood cells that are microcytic and hypochromic

#### Alternate Item Format: Multiple Response

- 462.** A nurse is reviewing a physician's prescriptions for a child with sickle cell anemia who was admitted to the hospital for the treatment of vaso-occlusive crisis. Which prescriptions documented in the child's record should the nurse question? **Select all that apply.**
- 1. Restrict fluid intake.
  - 2. Position for comfort.
  - 3. Avoid strain on painful joints.
  - 4. Apply nasal oxygen at 2 L/min.
  - 5. Provide a high-calorie, high-protein diet.
  - 6. Give meperidine (Demerol), 25 mg intravenously, every 4 hours for pain.
- 463.** Which of the following are characteristics of von Willebrand's disease? **Select all that apply.**
- 1. Easy bruising occurs.

- ❑ 2. Gum bleeding occurs.
- ❑ 3. It is a hereditary bleeding disorder.
- ❑ 4. It is characterized by extremely high creatinine levels.
- ❑ 5. The disorder causes platelets to adhere to damaged endothelium.
- ❑ 6. Treatment and care are similar to that for hemophilia.

## ANSWERS

### 454. 2

**Rationale:** In iron deficiency anemia, iron stores are depleted, resulting in a decreased supply of iron for the manufacture of hemoglobin in red blood cells. An oral iron supplement should be administered through a straw or medicine dropper placed at the back of the mouth because the iron stains the teeth. The parents should be instructed to brush or wipe the child's teeth or have the child brush the teeth after administration. Iron is administered between meals because absorption is decreased if there is food in the stomach. Iron requires an acid environment to facilitate its absorption in the duodenum. Iron is not added to formula or mixed with cereal or other food items.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 3 and 4 first because they are comparable or alike and because medication should not be added to formula and food. Note the strategic word *liquid* in the question. This should assist you in recalling that iron in liquid form stains teeth. Review the teaching points related to the administration of oral liquid iron if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Hematological/Oncological

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1282). St. Louis: Saunders.

### 455. 4

**Rationale:** Hemophilia refers to a group of bleeding disorders resulting from a deficiency of specific coagulation proteins. Results of tests that measure platelet function are normal; results of tests that measure clotting factor function may be abnormal. Abnormal laboratory results in hemophilia indicate a prolonged partial thromboplastin time. The platelet count, hemoglobin level, and hematocrit level are normal in hemophilia.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the laboratory tests used to monitor hemophilia. Recalling the pathophysiology associated with this disorder and recalling that it results from a deficiency of specific coagulation proteins will direct you to option 4. Review these laboratory tests if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Hematological/Oncological

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1292). St. Louis: Saunders.

### 456. 3

**Rationale:** Hemophilia refers to a group of bleeding disorders resulting from a deficiency of specific coagulation proteins. Children with hemophilia need to avoid contact sports and to take precautions such as wearing elbow and knee pads and helmets with other sports. The safe activity for them is swimming.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *safely* in the question. Recalling that bleeding is a major concern in this condition will assist in directing you to option 3. Eliminate options 1, 2, and 4 because these activities present the potential for injury. Review home care and safety instructions for a child with hemophilia if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Hematological/Oncological

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1295). St. Louis: Saunders.

### 457. 2

**Rationale:**  $\beta$ -thalassemia is an autosomal recessive disorder characterized by the reduced production of one of the globin chains in the synthesis of hemoglobin (both parents must be carriers to produce a child with  $\beta$ -thalassemia major). This disorder is found primarily in individuals of Mediterranean descent. Options 1, 3, and 4 are incorrect.

**Test-Taking Strategy:** Think about the pathophysiology of the disorder. Also, recall that this disorder occurs primarily in individuals of Mediterranean descent. If you are unfamiliar with  $\beta$ -thalassemia, review the information associated with its incidence and cause.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Hematological/Oncological

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1289). St. Louis: Saunders.

### 458. 3

**Rationale:**  $\beta$ -thalassemia is an autosomal recessive disorder characterized by the reduced production of one of the globin chains in the synthesis of hemoglobin (both parents must be carriers to produce a child with  $\beta$ -thalassemia major). The major complication of long-term transfusion therapy is hemosiderosis. To prevent organ damage from too much iron, chelation therapy with either deferasirox (Exjade) or deferoxamine (Desferal) may be prescribed. Deferoxamine is classified as an antidote for acute iron toxicity. Dalteparin is

an anticoagulant used as prophylaxis for postoperative deep vein thrombosis. Meropenem is an antibiotic. Metoprolol is a  $\beta$ -blocker used to treat hypertension.

**Test-Taking Strategy:** Specific knowledge regarding the antidote for iron toxicity is needed to answer this question. One way to remember this is to look at the prefix in the generic name of the medication used to treat iron overdose. Remember to associate *defer-* and removal of iron. If you had difficulty with this question, review the medications used for chelation therapy.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Child Health—Hematological/Oncological

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 924). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1290). St. Louis: Saunders.

#### 459. 4

**Rationale:** Sickle cell crises are acute exacerbations of the disease, which vary considerably in severity and frequency; these include vaso-occlusive crisis, splenic sequestration, and aplastic crisis. Sickle cell crisis may be precipitated by infection, dehydration, hypoxia, trauma, or physical or emotional stress. The mother of a child with sickle cell disease should encourage fluid intake of 1½ to 2 times the daily requirement to prevent dehydration.

**Test-Taking Strategy:** Note the strategic words *the need for further instructions*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Recalling that fluids are a main component of treatment in sickle cell anemia to prevent crisis will direct you to option 4. Remember that fluids are required to prevent dehydration. Review the precipitating factors of sickle cell crisis if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Hematological/Oncological

**References:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 1495–1497). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1287). St. Louis: Saunders.

#### 460. 3

**Rationale:** Hemophilia refers to a group of bleeding disorders resulting from a deficiency of specific coagulation proteins. The primary treatment is replacement of the missing clotting factor; additional medications, such as agents to relieve pain, may be prescribed depending on the source of bleeding from the disorder. A child with hemophilia A is at risk for joint bleeding after a fall. Factor VIII would be prescribed intravenously to replace the missing clotting factor and minimize the bleeding. Factor X and iron are not used to treat children with hemophilia A.

**Test-Taking Strategy:** Focus on the child's diagnosis. Eliminate options 2 and 4 because they are comparable or alike. Recalling that a child with hemophilia A is missing clotting

factor VIII will direct you to the correct option from the remaining options. Review the treatment for bleeding episodes for children with hemophilia A if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Child Health—Hematological/Oncological

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1282). St. Louis: Saunders.

Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1503). St. Louis: Mosby.

#### 461. 4

**Rationale:** In iron deficiency anemia, iron stores are depleted, resulting in a decreased supply of iron for the manufacture of hemoglobin in red blood cells. The results of a complete blood cell count in children with iron deficiency anemia show decreased hemoglobin levels and microcytic and hypochromic red blood cells. The red blood cell count is decreased. The reticulocyte count is usually normal or slightly elevated.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 3 first, knowing that the hemoglobin and red blood cell counts would be decreased. From the remaining options, select option 4 over option 2 because of the relationship between anemia and red blood cells. Review the laboratory findings in iron deficiency anemia if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Hematological/Oncological

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1280). St. Louis: Saunders.

### ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

#### 462. 1, 6

**Rationale:** Sickle cell anemia is one of a group of diseases termed *hemoglobinopathies*, in which hemoglobin A is partly or completely replaced by abnormal sickle hemoglobin S. It is caused by the inheritance of a gene for a structurally abnormal portion of the hemoglobin chain. Hemoglobin S is sensitive to changes in the oxygen content of the red blood cell; insufficient oxygen causes the cells to assume a sickle shape, and the cells become rigid and clumped together, obstructing capillary blood flow. Oral and intravenous fluids are an important part of treatment. Meperidine (Demerol) is not recommended for a child with sickle cell disease because of the risk for normeperidine-induced seizures. Normeperidine, a metabolite of meperidine, is a central nervous system stimulant that produces anxiety, tremors, myoclonus, and generalized seizures when it accumulates with repetitive dosing. The nurse would question the prescription for restricted fluids and meperidine for pain control. Positioning for comfort, avoiding strain on painful joints, oxygen, and a high-calorie and high-protein diet are also important parts of the treatment plan.

**Test-Taking Strategy:** Focus on the pathophysiology that occurs in sickle cell disease to assist in identifying the prescriptions that need to be questioned. Recalling that fluids are an important component of the treatment plan will assist in identifying that a fluid restriction prescription would need to be questioned. Recalling the effects of meperidine will assist in identifying that this prescription needs to be questioned. Review care of a child with sickle cell anemia experiencing a crisis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Child Health—Hematological/Oncological

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 921). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1285). St. Louis: Saunders.

**463. 1, 2, 3, 5, 6**

**Rationale:** von Willebrand's disease is a hereditary bleeding disorder characterized by a deficiency of or a defect in a protein termed *von Willebrand factor*. The disorder causes

platelets to adhere to damaged endothelium. It is characterized by an increased tendency to bleed from mucous membranes. Assessment findings include epistaxis, gum bleeding, easy bruising, and excessive menstrual bleeding. An elevated creatinine level is not associated with this disorder.

**Test-Taking Strategy:** Focus on the child's diagnosis. Recalling that this disorder is characterized by an increased tendency to bleed from mucous membranes will direct you to select the correct options. Review the manifestations associated with von Willebrand's disease if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Hematological/Oncological

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., pp. 925–926). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1295). St. Louis: Saunders.

# Oncological Disorders

## I. LEUKEMIA

### A. Description

1. Leukemia (Box 46-1) is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow.
2. Leukemia affects the bone marrow, causing anemia from decreased erythrocytes, infection from neutropenia, and bleeding from decreased platelet production (thrombocytopenia).
3. The cause is unknown; it seems to involve genetic damage of cells, leading to the transformation of cells from a normal state to a malignant state.
4. Risk factors include genetic, viral, immunological, and environmental factors and exposure to radiation, chemicals, and medications.
5. Acute lymphocytic leukemia is the most frequent type of cancer in children; peak onset is age 2 to 6 years.
6. Leukemia is more common in boys than girls after 1 year of age.
7. Prognosis depends on various factors such as age at diagnosis, initial white blood cell count, type of cell involved, and sex of the child.
8. Treatment involves chemotherapy and possibly radiation.
9. The phases of chemotherapy include induction, which achieves a complete remission or disappearance of leukemic cells; intensification or consolidation therapy, which decreases the tumor burden further; central nervous system prophylactic therapy, which prevents leukemic cells from invading the central nervous system;

### Box 46-1 Classification of Leukemia

#### Acute Lymphocytic Leukemia

Mostly lymphoblasts present in bone marrow  
Age of onset younger than 15 years

#### Acute Myelogenous Leukemia

Mostly myeloblasts present in bone marrow  
Age of onset between 15 and 39 years

and maintenance, which serves to maintain the remission phase.

10. Hematopoietic stem cell transplantation also may be performed to treat some children with leukemia.

### B. Assessment

1. Infiltration of the bone marrow by malignant cells causes fever, pallor, fatigue, anorexia, hemorrhage (usually petechiae), and bone and joint pain; pathological fractures can occur as a result of bone marrow invasion with leukemic cells.
2. Signs of infection occur as a result of neutropenia.
3. The child experiences hepatosplenomegaly and lymphadenopathy.
4. The child has a normal, elevated, or low white blood cell count, depending on the presence of infection or of immature versus mature white blood cells.
5. The child has decreased hemoglobin and hematocrit levels.
6. The child has a decreased platelet count.
7. A positive bone marrow biopsy specimen identifies leukemic blast (immature)-phase cells.
8. Signs of increased intracranial pressure, such as severe headache, vomiting, papilledema, irritability, lethargy, and eventually coma, occur as a result of central nervous system involvement.
9. The child shows signs of cranial nerve (cranial nerve VII, or the facial nerve, is most commonly affected) or spinal nerve involvement; clinical manifestations relate to the area involved.
10. Clinical manifestations indicate the invasion of leukemic cells to the kidneys, testes, prostate, ovaries, gastrointestinal tract, and lungs.

### C. Infection (Box 46-2)

1. Infection can occur through self-contamination or cross-contamination.
2. The most common sites for infection are the skin (any break in the skin is a potential site of infection), respiratory tract, and gastrointestinal tract.

-  **D. Bleeding (Box 46-3)**
1. A child with a platelet count less than 20,000 cells/mm<sup>3</sup> may need a platelet transfusion.
  2. Packed red blood cells may be prescribed for a child with severe blood loss.
-  **E. Fatigue and nutrition**
1. Assist the parents and child in selecting a well-balanced diet.
  2. Provide small meals that require little chewing and are not irritating to the oral mucosa.
3. If the child cannot take oral feedings, parenteral nutrition or enteral feedings may be prescribed.
  4. Assist the child in self-care and mobility activities.
  5. Allow adequate rest periods during care.
  6. Do not perform nursing care activities unless they are essential.
- F. Chemotherapy**
1. Monitor for severe bone marrow suppression; during the period of greatest bone marrow
- 

### Box 46-2 Protecting the Child From Infection

Initiate protective isolation procedures.  
 Maintain frequent and thorough handwashing.  
 Maintain the child in a private room with high-efficiency particulate air filtration or laminar air flow system if possible.  
 Ensure that the child's room is cleaned daily.  
 Use strict aseptic technique for all nursing procedures.  
 Limit the number of caregivers entering the child's room, and ensure that anyone entering the child's room wears a mask.  
 Keep supplies for the child separate from supplies for other children.  
 Reduce exposure to environmental organisms by eliminating raw fruits and vegetables from the diet and not allowing fresh flowers in the child's room and by not leaving standing water in the child's room.  
 Assist the child with daily bathing, using antimicrobial soap.  
 Assist the child to perform oral hygiene frequently.  
 Assess for signs and symptoms of infection.  
 Monitor temperature, pulse, and blood pressure.  
 Change wound dressings daily, and inspect wounds for redness, swelling, or drainage.  
 Assess urine for color and cloudiness.  
 Assess the skin and oral mucous membranes for signs of infection.  
 Auscultate lung sounds.

Encourage the child to cough and deep-breathe.  
 Monitor white blood cell and neutrophil counts.  
 Notify the physician if signs of infection are present, and prepare to obtain specimens for culture of open lesions, urine, and sputum.  
 Initiate a bowel program to prevent constipation and rectal trauma.  
 Avoid invasive procedures such as injections, rectal temperatures, and urinary catheterization.  
 Administer antibiotic, antifungal, and antiviral medications as prescribed.  
 Administer granulocyte colony-stimulating factor as prescribed.  
 Instruct parents to keep the child away from crowds and individuals with infections.  
 Instruct parents that the child should not receive immunization with a live virus (measles, mumps, rubella, polio) because if the immune system is depressed, the attenuated virus can result in a life-threatening infection; also, the child should not receive the varicella vaccine.  
 The Salk (inactivated) vaccine for poliomyelitis may be administered.  
 Instruct parents to inform the teacher that they should be notified immediately if a case of a communicable disease occurs in another child at school.

### Box 46-3 Protecting the Child From Bleeding

Examine the child for signs and symptoms of bleeding.  
 Handle the child gently.  
 Measure abdominal girth; an increase can indicate internal hemorrhage.  
 Instruct the child to use a soft toothbrush and avoid dental floss.  
 Provide soft foods that are cool to warm in temperature.  
 Avoid injections, if possible, to prevent trauma to the skin and bleeding.  
 Apply firm and gentle pressure to a needle stick site for at least 10 minutes.  
 Pad side rails and sharp corners of the bed and furniture.  
 Discourage the child from engaging in activities involving the use of objects that can be harmful.

Instruct the child to avoid constrictive or tight clothing.  
 Use caution when taking the blood pressure to prevent skin injury.  
 Instruct the child to avoid blowing his or her nose.  
 Avoid the use of rectal suppositories, enemas, and rectal thermometers.  
 Examine all body fluids and excrement for the presence of blood.  
 Count the number of pads or tampons used if the adolescent girl is menstruating.  
 Instruct the child about the signs and symptoms of bleeding.  
 Instruct parents to avoid administering nonsteroidal anti-inflammatory drugs and products that contain aspirin to the child.

suppression (the nadir), blood cell counts are extremely low.

2. Monitor for infection and bleeding.
3. Protect the child from life-threatening infections.
4. Monitor for nausea, vomiting, and diarrhea.
5. Administer stool softeners as prescribed.
6. Provide rectal hygiene gently as needed.
7. Administer antiemetics as prescribed.
8. Monitor for signs of dehydration.
9. Monitor for signs of hemorrhagic cystitis.
10. Monitor for signs of peripheral neuropathy.
11. Assess oral mucous membranes for mucositis; administer frequent mouth rinses per agency procedure and as prescribed; usually a mixture of normal saline with table salt or sodium bicarbonate is prescribed to promote healing or prevent infection (local oral anesthetics may also be prescribed).
12. Instruct the parents and child in the signs and symptoms to watch for after chemotherapy and when to notify the physician.
13. Inform the parents and child that hair loss may occur from chemotherapy (hair regrows in about 3 to 6 months and may be a slightly different color or texture).
14. Instruct the parents and child about the care of a central venous access device, as necessary (see Chapter 14).
15. Listen to the child and family, and encourage them to verbalize their feelings and express their concerns.
16. Introduce the family to other families of children with cancer.
17. Consult social services and chaplains as necessary.

**▲** Monitor a child receiving chemotherapy closely for signs of infection. Infection is a major cause of death in the immunosuppressed child.

## II. HODGKIN'S DISEASE

### A. Description

1. Hodgkin's disease (a type of lymphoma) is a malignancy of the lymph nodes that originates in a single lymph node or a single chain of nodes (Fig. 46-1).
2. The disease predictably metastasizes to non-nodal or extralymphatic sites, especially the spleen, liver, bone marrow, lungs, and mediastinum.
3. Hodgkin's disease is characterized by the presence of Reed-Sternberg cells noted in a lymph node biopsy specimen.
4. Peak incidence is in midadolescence.
5. Possible causes include viral infections and previous exposure to alkylating chemical agents.
6. The prognosis is excellent with long-term survival rates depending on the stage of the disease.

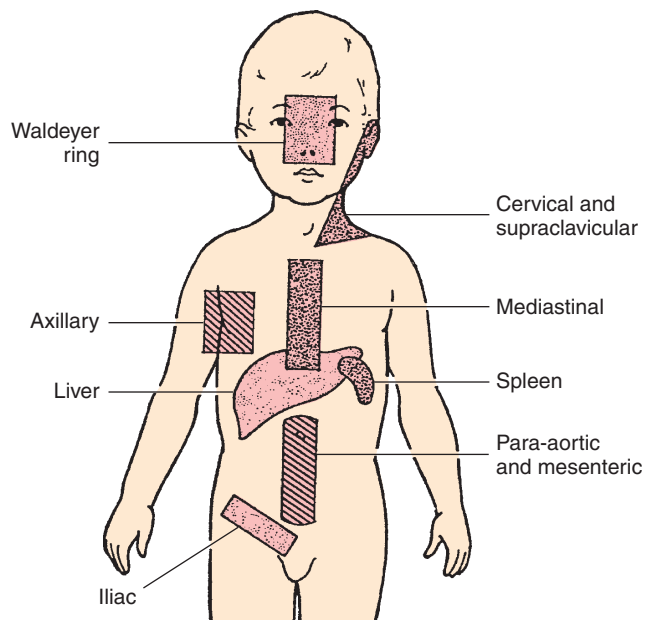

7. The primary treatment modalities are radiation and chemotherapy; each may be used alone or in combination, depending on the clinical stage of the disease.

### B. Assessment

1. Painless enlargement of lymph nodes
2. Enlarged, firm, nontender, movable nodes in the supraclavicular area; in children, the "sentinel" node located near the left clavicle may be the first enlarged node
3. Nonproductive cough as a result of mediastinal lymphadenopathy
4. Abdominal pain as a result of enlarged retroperitoneal nodes
5. Advanced lymph node and extralymphatic involvement that may cause systemic symptoms, such as a low-grade or intermittent fever, anorexia, nausea, weight loss, night sweats, and pruritus
6. Positive biopsy specimen of a lymph node (presence of Reed-Sternberg cells) and positive bone marrow biopsy specimen
7. Computed tomography scan of the liver, spleen, and bone marrow may be done to detect metastasis.

### C. Interventions

1. For early stages without mediastinal node involvement, the treatment of choice is extensive external radiation of the involved lymph node regions.
2. With more extensive disease, radiation and multidrug chemotherapy are used.
3. Monitor for drug-induced pancytopenia and an abnormal depression of all the cellular components

**▲ FIGURE 46-1** Main areas of lymphadenopathy and organ involvement in Hodgkin's disease. (From Hockenberry, M., Wilson, D., & Winkelstein, M. [2009]. *Wong's essentials of pediatric nursing* [8th ed.]. St. Louis: Mosby.)

of the blood, which increases the risk for infection, bleeding, and anemia.

4. Monitor for signs of infection and bleeding.
5. Protect the child from infection.
6. Provide a safe, hazard-free environment.
7. Monitor for side effects related to chemotherapy or radiation; the most common side effect of extensive irradiation is malaise, which can be difficult for older children and adolescents to tolerate physically and psychologically (Table 46-1).

**TABLE 46-1** Side Effects of Radiation Therapy and Nursing Interventions

| Body Area and Side Effects    | Interventions   |
|-------------------------------|---|
| <b>Gastrointestinal Tract</b> |   |
| Anorexia                      | Encourage fluids and foods as best tolerated<br>Provide small, frequent meals<br>Monitor for weight loss  |
| Nausea, vomiting              | Administer antiemetics around the clock<br>Monitor for dehydration  |
| Mucosal ulceration            | Provide soothing oral hygiene and prescribed mouth rinses<br>Topical anesthetic may be prescribed   |
| Diarrhea                      | Administer antispasmodics and antidiarrheal preparations as prescribed<br>Monitor for dehydration   |
| <b>Skin</b>                   |   |
| Alopecia (hair loss)          | Introduce idea of a wig<br>Provide scalp hygiene<br>Stress the need for head covering in cold weather   |
| Dry or moist desquamation     | Keep skin clean<br>Wash skin daily, using a mild soap sparingly<br>Do not remove skin markings for radiation<br>Avoid exposure to the sun and other extreme temperature changes<br>For dryness, apply lubricant as prescribed |
| <b>Urinary Bladder</b>        |   |
| Cystitis                      | Encourage fluid intake and frequent voiding<br>Monitor for hematuria  |
| <b>Bone Marrow</b>            |   |
| Myelosuppression              | Monitor for fever<br>Administer antibiotics as prescribed<br>Avoid use of suppositories, enemas, and rectal temperatures<br>Institute bleeding precautions<br>Monitor for signs of anemia                                     |

Modified from Hockenberry, M., & Wilson, D. (2007). *Wong's nursing care of infants and children* (8th ed.). St. Louis: Mosby; and McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed.). St. Louis: Saunders.

8. Monitor for nausea and vomiting, and administer antiemetics as prescribed.
9. Monitor for skin irritation and breakdown as a result of radiation therapy.

### III. NEPHROBLASTOMA (WILMS' TUMOR)

#### A. Description

1. Wilms' tumor is the most common intra-abdominal and kidney tumor of childhood; it may manifest unilaterally and localized or bilaterally, sometimes with metastasis to other organs (Fig. 46-2).
2. The peak incidence is 3 years of age.
3. Occurrence is associated with a genetic inheritance and with several congenital anomalies.
4. Therapeutic management includes a combined treatment of surgery (partial to total nephrectomy) and chemotherapy with or without radiation, depending on the clinical stage and the histological pattern of the tumor.

#### B. Assessment

1. Swelling or mass within the abdomen (mass is characteristically firm, nontender, confined to one side, and deep within the flank)
2. Abdominal pain
3. Urinary retention or hematuria or both
4. Anemia (caused by hemorrhage within the tumor)
5. Pallor, anorexia, and lethargy (resulting from anemia)
6. Hypertension (caused by secretion of excess amounts of renin by the tumor)
7. Weight loss and fever
8. Symptoms of lung involvement, such as dyspnea, shortness of breath, and pain in the chest, if metastasis has occurred

#### C. Preoperative interventions

1. Monitor vital signs, particularly blood pressure.

**▲ FIGURE 46-2** Wilms' tumor. (From *Mosby's dictionary of medicine, nursing and health professions* [8th ed.]. [2009]. St. Louis: Mosby.)

- 2. Avoid palpation of the abdomen; place a sign at bedside that reads, Do Not Palpate Abdomen.
  - 3. Measure abdominal girth at least once daily.
- D.** Postoperative interventions
- 1. Monitor temperature and blood pressure closely.
  - 2. Monitor for signs of hemorrhage and infection.
  - 3. Monitor strict intake and urine output closely.
  - 4. Monitor for abdominal distention; monitor bowel sounds and other signs of gastrointestinal activity because of the risk for intestinal obstruction.

**!** Avoid palpation of the abdomen in a child with Wilms' tumor and be cautious when bathing, moving, or handling the child. It is important to keep the encapsulated tumor intact. Rupture of the tumor can cause the cancer cells to spread throughout the abdomen, lymph system, and bloodstream.

#### IV. NEUROBLASTOMA

##### A. Description

- 1. Neuroblastoma is a tumor that originates from the embryonic neural crest cells that normally give rise to the adrenal medulla and the sympathetic ganglia.
- 2. Most tumors develop in the adrenal gland or the retroperitoneal sympathetic chain; other sites may be within the head, neck, chest, or pelvis.
- 3. Most children present with neuroblastoma before 10 years of age.
- 4. Most presenting signs are caused by the tumor compressing adjacent normal tissue and organs.
- 5. Diagnostic evaluation is aimed at locating the primary site of the tumor.
- 6. The prognosis is poor because of the frequency of invasiveness of the tumor and because, in most cases, a diagnosis is not made until after metastasis has occurred; the younger the child at diagnosis, the better the survival rate.
- 7. Therapeutic management
  - a. Surgery is performed to remove as much of the tumor as possible and to obtain biopsy specimens; in the early stages, complete surgical removal of the tumor is the treatment of choice.
  - b. Surgery usually is limited to biopsy in the later stages because of extensive metastasis.
  - c. Radiation is used commonly with later stage disease and provides palliation for metastatic lesions in bones, lungs, liver, and brain.
  - d. Chemotherapy is used for extensive local or disseminated disease.

##### B. Assessment

- 1. Firm, nontender, irregular mass in the abdomen that crosses the midline
- 2. Urinary frequency or retention from compression of the kidney, ureter, or bladder
- 3. Lymphadenopathy, especially in the cervical and supraclavicular areas

- 4. Bone pain if skeletal involvement
  - 5. Supraorbital ecchymosis, periorbital edema, and exophthalmos as a result of invasion of retrobulbar soft tissue
  - 6. Pallor, weakness, irritability, anorexia, weight loss
  - 7. Signs of respiratory impairment (thoracic lesion)
  - 8. Signs of neurological impairment (intracranial lesion)
  - 9. Paralysis from compression of the spinal cord
- C.** Preoperative interventions
- 1. Monitor for signs and symptoms related to the location of the tumor.
  - 2. Provide emotional support to the child and parents.
- D.** Postoperative interventions
- 1. Monitor for postoperative complications related to the location (organ) of the surgery.
  - 2. Monitor for complications related to chemotherapy or radiation if prescribed.
  - 3. Provide support to the parents and encourage them to express their feelings; many parents feel guilt for not having recognized signs in the child earlier.
  - 4. Refer parents to appropriate community services.

#### V. OSTEOGENIC SARCOMA

##### A. Description

- 1. Osteogenic sarcoma is the most common bone cancer in children; it is also known as osteosarcoma (Fig. 46-3).
- 2. Cancer usually is found in the metaphysis of long bones, especially in the lower extremities, with most tumors occurring in the femur.
- 3. The peak age of incidence is between 10 and 25 years.

**▲ FIGURE 46-3** Osteosarcoma. (From Mosby's dictionary of medicine, nursing and health professions [8th ed.], [2009]. St. Louis: Mosby.)

4. Symptoms in the earliest stage are almost always attributed to extremity injury or normal growing pains.
5. Treatment may include surgical resection (limb salvage procedure) to save a limb or remove affected tissue, or amputation.
6. Chemotherapy is used to treat the cancer and may be used before and after surgery.

#### B. Assessment

1. Localized pain at the affected site (may be severe or dull) that may be attributed to trauma or the vague complaint of “growing pains”; pain often is relieved by a flexed position.
2. Palpable mass
3. Limping if weight-bearing limb is affected
4. Progressive limited range of motion and the child’s curtailing of physical activity
5. Child may be unable to hold heavy objects because of their weight and resultant pain in the affected extremity.
6. Pathological fractures occur at the tumor site.

#### C. Interventions

1. Prepare the child and family for prescribed treatment modalities, which may include surgical resection by limb salvage to remove affected tissue, amputation, and chemotherapy.
2. Communicate honestly with the child and family and provide support.
3. Prepare for prosthetic fitting as necessary.
4. Assist the child in dealing with problems of self-image.
5. Instruct the child and parents about the potential development of phantom limb pain that may occur after amputation, characterized by tingling, itching, and a painful sensation in the area where the limb was amputated.

## VI. BRAIN TUMORS

### A. Description

1. An infratentorial (below the tentorium cerebelli) tumor, the most common brain tumor, is located in the posterior third of the brain (primarily in the cerebellum or brainstem) and accounts for the frequency of symptoms resulting from increased intracranial pressure (ICP).
2. A supratentorial tumor is located within the anterior two thirds of the brain—mainly the cerebrum.
3. The signs and symptoms of a brain tumor depend on its anatomical location and size and, to some extent, the age of the child.
4. Therapeutic management includes surgery, radiation, and chemotherapy; the treatment of choice is total removal of the tumor without residual neurological damage.

### B. Assessment

1. Headache that is worse on awakening and improves during the day

2. Vomiting that is unrelated to feeding or eating
3. Ataxia
4. Seizures
5. Behavioral changes
6. Clumsiness; awkward gait or difficulty walking
7. Diplopia
8. Facial weakness

Monitor for signs of increased ICP in a child with a brain tumor and after a craniotomy. If signs of increased ICP occur, notify the physician immediately.

### C. Preoperative interventions

1. Perform a neurological assessment at least every 4 hours.
2. Institute seizure precautions and safety measures.
3. Assess weight loss and nutritional status.
4. Shave the child’s head as prescribed (provide a favorite cap or hat for the child); shaving the head may also be done in the surgical suite.
5. Prepare the child as much as possible; tell the child that he or she will wake up with a large head dressing.

### D. Postoperative interventions

1. Assess neurological and motor function and level of consciousness.
2. Monitor temperature closely, which may be elevated because of hypothalamus or brainstem involvement during surgery; maintain a cooling blanket by the bedside.
3. Monitor for signs of respiratory infection.
4. Monitor for signs of meningitis (opisthotonos, Kernig’s and Brudzinski’s signs).
5. Monitor for signs of increased ICP (Box 46-4; see also Chapter 36).
6. Monitor for hemorrhage, checking the back of the head dressing for posterior pooling of blood.
7. Assess pupillary response; sluggish, dilated, or unequal pupils are reported immediately because they may indicate increased ICP and potential brainstem herniation.
8. Monitor for colorless drainage on the dressing or from the ears or nose, which indicates cerebrospinal fluid and should be reported immediately; assess for the presence of glucose in the drainage (dipstick).
9. Assess the physician’s prescription for positioning, including the degree of neck flexion (Box 46-5).
10. Monitor intravenous fluids closely.
11. Promote measures that prevent vomiting (vomiting increases intracranial pressure and the risk for incisional rupture).
12. Provide a quiet environment.
13. Administer analgesics as prescribed.
14. Provide emotional support to the child and parents, and promote optimal **growth** and development.

**Box 46-4 Manifestations of Increased Intracranial Pressure in Infants and Children****Infants**

Tense, bulging fontanel  
 Separated cranial sutures  
 Macewen's sign (cracked-pot sound on percussion)  
 Irritability  
 High-pitched cry  
 Increased head circumference  
 Distended scalp veins  
 Poor feeding  
 Crying when disturbed  
 Setting sun sign (eyes appear to look only downward, with the sclera prominent over the iris)

**Children**

Headache  
 Nausea  
 Forceful vomiting  
 Diplopia; blurred vision  
 Seizures

**Personality and Behavior Signs**

Irritability, restlessness  
 Indifference, drowsiness  
 Decline in school performance  
 Diminished physical activity and motor performance  
 Increased sleeping  
 Inability to follow simple commands  
 Lethargy

**Late Signs**

Bradycardia  
 Decreased motor response to command  
 Decreased sensory response to painful stimuli  
 Alterations in pupil size and reaction  
 Decerebrate (extension) or decorticate (flexion) posturing  
 Cheyne-Stokes respirations  
 Papilledema  
 Decreased consciousness  
 Coma

From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1552). St. Louis: Mosby.

**Box 46-5 Positioning After Craniotomy**

Assess the physician's prescription for positioning, including the degree of neck flexion.

If a large tumor has been removed, the child is not placed on the operative side because the brain may shift suddenly to that cavity.

In an infratentorial procedure, the child usually is positioned flat and on either side.

In a supratentorial procedure, the head usually is elevated above the heart level to facilitate cerebrospinal fluid drainage and to decrease excessive blood flow to the brain to prevent hemorrhage.

Never place the child in Trendelenburg's position because it increases intracranial pressure and the risk of hemorrhage.

**MORE QUESTIONS ON THE CD!****Practice Questions**

**464.** A nurse is monitoring a child for bleeding after surgery for removal of a brain tumor. The nurse checks the head dressing for the presence of blood and notes a colorless drainage on the back of the dressing. Which of the following is the appropriate nursing intervention?

1. Notify the physician.
2. Reinforce the dressing.
3. Document the findings and continue to monitor.
4. Circle the area of drainage and continue to monitor.

**465.** After surgical removal of a brain tumor, the physician writes a prescription to maintain the child in a flat position. During the postoperative period, a nurse is monitoring the child and notes that the child is restless, the pulse rate is elevated, and the blood pressure has decreased significantly from the baseline value. The nurse suspects that the child is in shock. Which of the following would be the appropriate nursing action?

1. Notify the physician.
2. Elevate the head of the bed.
3. Increase intravenous fluids.
4. Place the child in Trendelenburg's position.

**466.** The mother of a 4-year-old child brings the child to a clinic and tells a pediatric nurse specialist that the child's abdomen seems to be swollen. During further assessment of subjective data, the mother tells the nurse that the child is eating well and that the activity level of the child is unchanged. The nurse, suspecting the possibility of Wilms' tumor, would avoid which of the following during the physical assessment?

1. Palpating the abdomen for a mass
2. Assessing the urine for the presence of hematuria
3. Monitoring the temperature for the presence of fever
4. Monitoring the blood pressure for the presence of hypertension

**467.** A pediatric nurse specialist provides a teaching session to the nursing staff regarding osteogenic sarcoma. Which statement by a member of the

nursing staff indicates a need for clarification of the information presented?

1. "The femur is the most common site of this sarcoma."
2. "The child does not experience pain at the primary tumor site."
3. "Limping, if a weight-bearing limb is affected, is a clinical manifestation."
4. "The symptoms of the disease in the early stage are almost always attributed to normal growing pains."

**468.** The nurse analyzes the laboratory values of a child with leukemia who is receiving chemotherapy. The nurse notes that the platelet count is 19,500 cells/mm<sup>3</sup>. Based on this laboratory result, which intervention would the nurse document in the plan of care?

1. Monitor closely for signs of infection.
2. Monitor the temperature every 4 hours.
3. Initiate protective isolation precautions.
4. Use a soft small toothbrush for mouth care.

**469.** A nurse is monitoring a 3-year-old child for signs and symptoms of increased intracranial pressure (ICP) after a craniotomy. The nurse plans to monitor for which early sign or symptom of increased ICP?

1. Excessive vomiting
2. Bulging anterior fontanel
3. Increasing head circumference
4. Complaints of a frontal headache

**470.** A 4-year-old child is admitted to the hospital for abdominal pain. The mother reports that the child has been pale and excessively tired and is bruising easily. On physical examination, lymphadenopathy and hepatosplenomegaly are noted. Diagnostic studies are being performed on the child because acute lymphocytic leukemia is suspected. The nurse understands that which diagnostic study would confirm this diagnosis?

1. Platelet count
2. Lumbar puncture
3. Bone marrow biopsy
4. White blood cell count

**471.** A 6-year-old child with leukemia is hospitalized and is receiving combination chemotherapy. Laboratory results indicate that the child is neutropenic, and protective isolation procedures are initiated. The

grandmother of the child visits and brings a fresh bouquet of flowers picked from her garden and asks the nurse for a vase for the flowers. The nurse responds to the grandmother by telling her:

1. "I have a vase in the utility room, and I will get it for you."
2. "I will get the vase and wash it well before you put the flowers in it."
3. "The flowers from your garden are beautiful, but should not be placed in the child's room at this time."
4. "When you bring the flowers into the room, place them on the bedside stand as far away from the child as possible."

**472.** A diagnosis of Hodgkin's disease is suspected in a 12-year-old child seen in a clinic. Several diagnostic studies are performed to determine the presence of this disease. Which diagnostic test results confirm the diagnosis of Hodgkin's disease?

1. Elevated vanillylmandelic acid urinary levels
2. The presence of blast cells in the bone marrow
3. The presence of Epstein-Barr virus in the blood
4. The presence of Reed-Sternberg cells in the lymph nodes

**473.** A nurse is performing an assessment on a 10-year-old child suspected to have Hodgkin's disease. The nurse understands that which of the following assessment findings is characteristic of this disease?

1. Fever and malaise
2. Anorexia and weight loss
3. Painful, enlarged inguinal lymph nodes
4. Painless, firm, and movable adenopathy in the cervical area

### Alternate Item Format: Multiple Response

**474.** Which specific nursing interventions are implemented in the care of a child with leukemia who is at risk for infection? **Select all that apply.**

- 1. Maintain the child in a private room.
- 2. Reduce exposure to environmental organisms.
- 3. Use strict aseptic technique for all procedures.
- 4. Avoid the use of rectal suppositories and enemas.
- 5. Ensure that anyone entering the child's room wears a mask.
- 6. Apply firm pressure to a needle stick area for at least 10 minutes.

## ANSWERS

### 464. 1

**Rationale:** Colorless drainage on the dressing in a child after craniotomy indicates the presence of cerebrospinal fluid and should be reported to the physician immediately. Options

2, 3, and 4 are inaccurate nursing interventions because they do not address the need for immediate intervention to prevent complications.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 2, 3, and 4 because they are comparable or alike and delay necessary intervention. Note the strategic words

*colorless drainage.* This should alert you quickly to the possibility of the presence of cerebrospinal fluid and direct you to option 1. If you had difficulty with this question, review the significance of the presence of colorless drainage on the surgical dressing after cranial surgery.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Hematological/Oncological

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1324). St. Louis: Saunders.

#### 465. 1

**Rationale:** After craniotomy, a child is never placed in Trendelenburg's position because it increases intracranial pressure (ICP) and the risk of bleeding. In the event of shock, the physician is notified immediately before the nurse changes the child's position or increases intravenous fluids. Increasing intravenous fluids can cause an increase in ICP.

**Test-Taking Strategy:** Recall the complications associated with cranial surgery to answer this question. Eliminate option 2 because this intervention would not assist in alleviating shock. This action could cause harm to the child. Eliminate option 3 because this action could increase ICP. In addition, the nurse should not increase intravenous fluids without a physician's prescription. Eliminate option 4 because this position increases ICP. Review care of a child after surgical removal of a brain tumor if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Hematological/Oncological

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1324). St. Louis: Saunders.

#### 466. 1

**Rationale:** Wilms' tumor is the most common intra-abdominal and kidney tumor of childhood. If Wilms' tumor is suspected, the tumor mass should not be palpated by the nurse. Excessive manipulation can cause seeding of the tumor and spread of the cancerous cells. Fever, hematuria, and hypertension are clinical manifestations associated with Wilms' tumor.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *avoid*. This word indicates a negative event query and asks you to select an option that is an incorrect action. Knowledge that this tumor is an intra-abdominal and kidney tumor will assist in eliminating options 2 and 4 because of the relationship of these options to renal function. Next, thinking about the effect of palpating the tumor will direct you to option 1 from the remaining options. Review the significant assessment procedures in a child with Wilms' tumor if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Hematological/Oncological

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1541). St. Louis: Mosby.

#### 467. 2

**Rationale:** Osteogenic sarcoma is the most common bone cancer in children. Cancer usually is found in the metaphysis of long bones, especially in the lower extremities, with most tumors occurring in the femur. Osteogenic sarcoma is manifested clinically by progressive, insidious, and intermittent pain at the tumor site. By the time these children receive medical attention, they may be in considerable pain from the tumor. Options 1, 3, and 4 are accurate regarding osteogenic sarcoma.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *need for clarification of the information presented* in the question. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Knowledge that osteogenic sarcoma is a malignant tumor of the bone will direct you to option 2. Review the clinical manifestations associated with osteogenic sarcoma if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Hematological/Oncological

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1329). St. Louis: Saunders.

#### 468. 4

**Rationale:** Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow. It affects the bone marrow, causing anemia from decreased erythrocytes, infection from neutropenia, and bleeding from decreased platelet production (thrombocytopenia). If a child is severely thrombocytopenic and has a platelet count less than 20,000 cells/mm<sup>3</sup>, bleeding precautions need to be initiated because of the increased risk of bleeding or hemorrhage. Precautions include limiting activity that could result in head injury, using soft toothbrushes, checking urine and stools for blood, and administering stool softeners to prevent straining with constipation. In addition, suppositories, enemas, and rectal temperatures are avoided. Options 1, 2, and 3 are related to the prevention of infection rather than bleeding.

**Test-Taking Strategy:** Use the process of elimination. Noting that the platelet count is low and that a low platelet count places the child at risk for bleeding will assist in directing you to option 4. In addition, note that options 1, 2, and 3 are comparable or alike because they relate to prevention of and monitoring for infection. Review interventions for a child who is at risk for bleeding if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Child Health—Hematological/Oncological

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 1314–1315). St. Louis: Saunders.

#### 469. 1

**Rationale:** The brain, although well protected by the solid bony cranium, is highly susceptible to pressure that may accumulate within the enclosure. Volume and pressure must remain constant within the brain. A change in the size of

the brain, such as occurs with edema or increased volume of intracranial blood or cerebrospinal fluid without a compensatory change, leads to an increase in intracranial pressure (ICP), which may be life-threatening. Vomiting, an early sign of increased ICP, can become excessive as pressure builds up and stimulates the medulla in the brainstem, which houses the vomiting center. Children with open fontanels (posterior fontanel closes at 2 to 3 months; anterior fontanel closes at 12 to 18 months) compensate for ICP changes by skull expansion and subsequent bulging fontanels. When the fontanels have closed, nausea, excessive vomiting, diplopia, and headaches become pronounced, with headaches becoming more prevalent in older children.

**Test-Taking Strategy:** Note the strategic word *early*, focus on the age of the child, and use age as key to principles of growth and development. Knowing when the fontanels close and focusing on the child's age as 3 years eliminates options 2 and 3. The subjective symptom of headache in option 4 is unreliable in a 3-year-old, so eliminate this option. Review the pathophysiology of increased ICP if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Hematological/Oncological

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1468). St. Louis: Saunders.

#### 470. 3

**Rationale:** Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow. The confirmatory test for leukemia is microscopic examination of bone marrow obtained by bone marrow aspirate and biopsy. A lumbar puncture may be done to look for blast cells in the spinal fluid that indicate central nervous system disease. The white blood cell count may be normal, high, or low in leukemia. An altered platelet count occurs as a result of the disease, but also may occur as a result of chemotherapy and does not confirm the diagnosis.

**Test-Taking Strategy:** Use the process of elimination, and note the strategic word *confirm* in the question. This strategic word and knowledge that the bone marrow is affected in leukemia will direct you to option 3. If you had difficulty with this question, review the significance of the bone marrow biopsy in the diagnosis of leukemia.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Hematological/Oncological

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., pp. 711, 931). St. Louis: Mosby.

#### 471. 3

**Rationale:** Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow. It affects the bone marrow, causing anemia from decreased erythrocytes, infection from neutropenia, and bleeding from decreased platelet production (thrombocytopenia). For a hospitalized neutropenic child, flowers or plants should not be kept in

the room because standing water and damp soil harbor *Aspergillus* and *Pseudomonas aeruginosa*, to which the child is susceptible. In addition, fresh fruits and vegetables harbor molds and should be avoided until the white blood cell count increases.

**Test-Taking Strategy:** Use the process of elimination. Note that options 1 and 2 are comparable or alike and should be eliminated first. From the remaining options, select option 3 over option 4 because this nursing response maintains the protective isolation procedures required. Review protective isolation procedures for the neutropenic child if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Hematological/Oncological

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1315). St. Louis: Saunders.

#### 472. 4

**Rationale:** Hodgkin's disease (a type of lymphoma) is a malignancy of the lymph nodes. The presence of giant, multinucleated cells (Reed-Sternberg cells) is the classic characteristic of this disease. The presence of blast cells in the bone marrow indicates leukemia. Epstein-Barr virus is associated with infectious mononucleosis. Elevated levels of vanillylmandelic acid in the urine may be found in children with neuroblastoma.

**Test-Taking Strategy:** Use the process of elimination and think about the pathophysiology associated with Hodgkin's disease. Remember that the Reed-Sternberg cell is characteristic of Hodgkin's disease. Review the clinical manifestations associated with Hodgkin's disease if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Hematological/Oncological

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1514). St. Louis: Mosby.

#### 473. 4

**Rationale:** Hodgkin's disease (a type of lymphoma) is a malignancy of the lymph nodes. Clinical manifestations specifically associated with Hodgkin's disease include painless, firm, and movable adenopathy in the cervical and supraclavicular areas. Hepatosplenomegaly also is noted. Although fever, malaise, anorexia, and weight loss are associated with Hodgkin's disease, these manifestations are seen in many disorders.

**Test-Taking Strategy:** Use the process of elimination, and note the strategic word *characteristic* in the question. Eliminate options 1 and 2 first because these symptoms are general and vague. Recalling that painless adenopathy is associated with Hodgkin's disease will direct you to option 4. Review the clinical manifestations related to Hodgkin's disease if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Hematological/Oncological

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1514). St. Louis: Mosby.

**ALTERNATE ITEM FORMAT:  
MULTIPLE RESPONSE****474. 1, 2, 3, 4, 5**

**Rationale:** Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow. It affects the bone marrow, causing anemia from decreased erythrocytes, infection from neutropenia, and bleeding from decreased platelet production (thrombocytopenia). A common complication of treatment for leukemia is overwhelming infection secondary to neutropenia. Measures to prevent infection include the use of a private room, strict aseptic technique, restriction of visitors and health care personnel with active infection, strict handwashing, ensuring that anyone entering the child's room wears a mask, and reducing exposure to environmental organisms by eliminating raw fruits and vegetables from the diet and fresh flowers from the child's room and by not leaving standing water in the

child's room. The other interventions listed are measures to prevent bleeding.

**Test-Taking Strategy:** Focus on the subject: preventing infection. Reading each intervention carefully and keeping this subject in mind will assist in answering the question. Applying firm pressure to a needle stick area for at least 10 minutes and avoiding the use of rectal suppositories and enemas are related to preventing bleeding. Review interventions for the child at risk for infection if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Hematological/Oncological

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., pp. 932–933, 935). St. Louis: Mosby.

# Acquired Immunodeficiency Syndrome

## I. ACQUIRED IMMUNODEFICIENCY SYNDROME (AIDS)

### A. Description

1. AIDS is a disorder caused by human immunodeficiency virus (HIV) and characterized by generalized dysfunction of the immune system (Fig. 47-1).
2. HIV infects CD4+ T cells; a gradual decrease in CD4+ T cell count occurs and this results in a progressive immunodeficiency; the risk for opportunistic infections is present.
3. HIV is transmitted through blood, semen, vaginal secretions, and breast milk; the incubation period is months to years.
4. Horizontal transmission occurs through intimate sexual contact or parenteral exposure to blood or body fluids that contain the virus.
5. Vertical (perinatal) transmission occurs from an HIV-infected pregnant woman to her fetus (see Chapter 25).
6. The most common opportunistic infection that occurs in children infected with HIV is *Pneumocystis jiroveci* pneumonia (formerly known as *Pneumocystis carinii* pneumonia); *P. jiroveci* pneumonia most frequently occurs between the ages of 3 and 6 months, when HIV status may be indeterminate.

 An infant or child infected with HIV is at risk for developing a life-threatening opportunistic infection. Monitor the infant or child closely for signs of infection and report these signs immediately if they occur.

### B. Assessment (Boxes 47-1 and 47-2)

**C.** Diagnostic tests: Before testing, counseling should be provided to parents; issues that should be addressed include the causes of HIV, reasons for testing, implications of positive test results, confidentiality issues, and beneficial effects of early intervention (Table 47-1).

## II. CARE OF THE CHILD WITH HIV INFECTION OR AIDS

**A.** A multidisciplinary health care approach is taken; primary goals are to decelerate the replication of the virus, prevent opportunistic infections, provide nutritional support, treat symptoms, and treat opportunistic infections. 

**B.** Prophylaxis (*P. jiroveci* pneumonia and other opportunistic infections)

1. Provide prophylaxis as prescribed against *P. jiroveci* pneumonia and other opportunistic infections, particularly during the first year of life of an infant born to an HIV-infected mother.
2. After 1 year of age, the need for prophylaxis is determined based on the presence and severity of immunosuppression or a history of *P. jiroveci* pneumonia.
3. Continuing prophylaxis is based on the child's HIV status, history of opportunistic infections, and CD4+ counts.

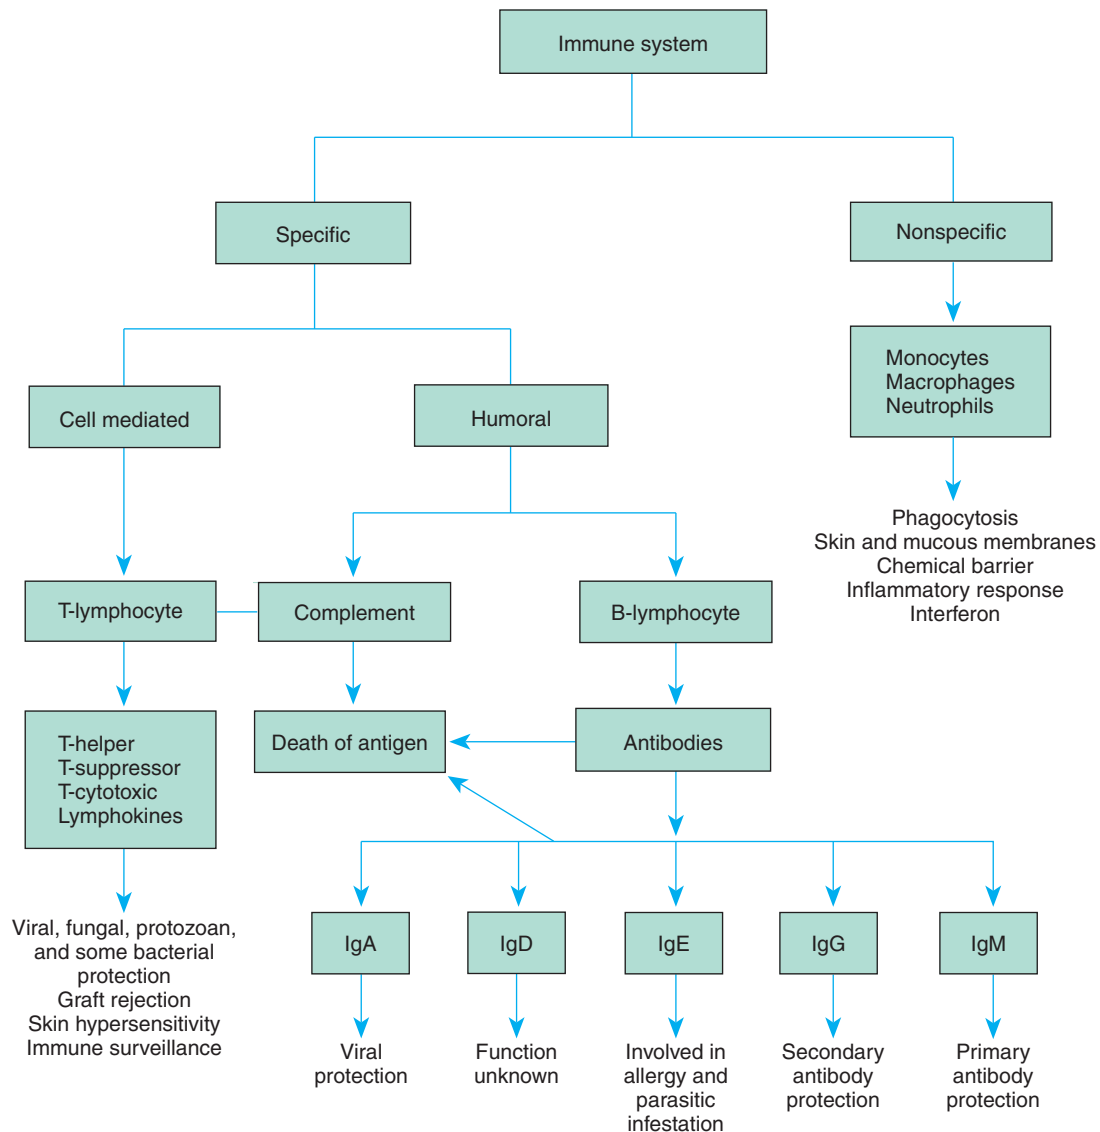

**C.** Antiretroviral medications (Box 47-3) 

 Before administering an antiretroviral medication, ensure that the medication is safe for pediatric administration. Also check the contraindications for use and the adverse effects.

1. The goal of antiretroviral medications is to suppress viral replication to slow the decline in the number of CD4+ cells, preserve immune function, reduce the incidence and severity of opportunistic infections, and delay disease progression.
2. The medications affect different stages of the HIV life cycle to prevent reproduction of new virus particles.
3. Combination therapy may be prescribed and includes the use of more than one antiretroviral medication.

**D.** Immunizations 

 Immunization against childhood diseases is recommended for all children exposed to and infected with HIV.

▲ **FIGURE 47-1** Components of the immune system. (From Hockenberry, M., & Wilson, D. [2007]. *Wong's nursing care of infants and children* [8th ed.]. St. Louis: Mosby.)

### Box 47-1 Common Assessment Findings in Children With Human Immunodeficiency Virus Infection

Chronic cough  
 Chronic or recurrent diarrhea  
 Developmental delay or regression of developmental milestones  
 Failure to thrive  
 Hepatosplenomegaly  
 Lymphadenopathy  
 Malaise and fatigue  
 Night sweats  
 Oral candidiasis  
 Parotitis  
 Weight loss

Modified from Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1517). St. Louis: Mosby.

### Box 47-2 Common Acquired Immunodeficiency Syndrome (AIDS)–Defining Conditions in Children

Candidal esophagitis  
 Cryptosporidiosis  
 Cytomegalovirus disease  
 Herpes simplex disease  
 Human immunodeficiency virus encephalopathy  
 Lymphoid interstitial pneumonitis  
*Mycobacterium avium-intracellulare* infection  
*Pneumocystis jiroveci* pneumonia  
 Pulmonary candidiasis  
 Recurrent bacterial infections  
 Wasting syndrome

From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1517). St. Louis: Mosby.

1. If a child has symptomatic HIV infection or has severe immunosuppression, guidelines are as follows:
    - a. Only the inactivated influenza **vaccine** that is given intramuscularly should be used (influenza vaccine should be given yearly).
    - b. Measles **vaccine** should not be given; immunoglobulin may be prescribed after measles exposure.
    - c. Only the inactivated polio **vaccine** that is given intramuscularly should be used.
    - d. Rotavirus **vaccine** should not be given.
    - e. Varicella-zoster virus **vaccine** should not be given; varicella-zoster immunoglobulin may be prescribed after chickenpox exposure.
    - f. Tetanus immunoglobulin may be prescribed for tetanus-prone wounds.
  2. See also Chapter 48.
- E. Caretaker instructions**
1. Wash hands frequently.
  2. Assess the child for fever, malaise, fatigue, weight loss, vomiting, diarrhea, altered activity level, and oral lesions; notify the physician if any of these occur.

**TABLE 47-1** Diagnostic Tests for Human Immunodeficiency Virus (HIV)

| Test                                      | Age-Appropriate Use | Test Determines  | Special Considerations   |
|---|---------------------|--|--|
| Enzyme-linked immunosorbent assay         | ≥18 mo              | Response of antibodies to HIV                            | If used and found to be positive in infants <18 mo, indicates only that mother is infected because maternal antibodies are transmitted transplacentally; use another diagnostic test   |
| Western blot                              | ≥18 mo              | Presence of HIV antibodies                               | Same as above  |
| Polymerase chain reaction                 | <18 mo              | Presence of proviral DNA                                 | Very accurate for diagnosing infants 1-4 mo of age   |
| p24 antigen                               | <18 mo              | HIV antigen specific                                     | Very accurate for diagnosing infants 1-4 mo of age   |
| CD4+ lymphocyte count, T-lymphocyte count | Infant–13 yr        | Immune system status related specifically to suppression | Age adjustment is essential because normal counts are relatively high in infants and steadily decline until 6 yr of age<br>Severe suppression in all age groups is <15% total lymphocytes (<750 cells/L in infant <12 mo, <500 cells/L in child 1-5 yr, <200 cells/L in child 6-12 yr) |

Data from <http://www.cdc.gov/hiv/topics/index.htm>

### Box 47-3 Antiretroviral Medications

#### Reverse Transcriptase Inhibitors

*Action:* Inhibit enzymes required for human immunodeficiency virus (HIV) replication

#### Nucleoside/Nucleotide Reverse Transcriptase Inhibitors

Abacavir (Ziagen)  
Didanosine (Videx)  
Emtricitabine (Emtriva)  
Lamivudine (Epivir)  
Stavudine (Zerit)  
Tenofovir (Viread)  
Zidovudine (Retrovir)

#### Non-nucleoside/Nucleotide Reverse Transcriptase Inhibitors

Delavirdine (Rescriptor)  
Efavirenz (Sustiva)  
Etravirine (Intelence)  
Nevirapine (Viramune)

#### Integrase Inhibitor

*Action:* Inhibit enzymes required for HIV replication

Raltegravir (Isentress)

#### Protease Inhibitors

*Action:* Inhibit enzymes required for HIV replication

Amprenavir (Agenerase)  
Atazanavir (Reyataz)  
Darunavir (Prezista)  
Fosamprenavir (Lexiva)  
Indinavir (Crixivan)  
Lopinavir/ritonavir (Kaletra)  
Nelfinavir (Viracept)  
Ritonavir (Norvir)  
Saquinavir (Invirase)  
Tipranavir (Aptivus)

#### Fusion Inhibitor

*Action:* Block viral entry into cells  
Enfuvirtide (Fuzeon)

#### Chemokine Receptor 5 (CCR5) Antagonist

*Action:* Block viral entry into cells  
Maraviroc (Selzentry)

3. Assess the child for signs and symptoms of opportunistic infections, such as pneumonia.
  4. Administer antiretroviral medications and other medications to the child as prescribed.
  5. The child needs to be restricted from having contact with persons who have infections or other contagious or potentially contagious illnesses.
  6. Keep the child's immunizations up to date.
  7. Keep the child home when sick.
  8. Avoid direct unprotected contact with the child's body fluids.
  9. Monitor the child's weight.
  10. Provide a high-calorie and high-protein diet to the child.
  11. Administer appetite stimulants to the child as prescribed and as needed.
  12. Do not share eating utensils with the child.
  13. Wash all eating utensils in the dishwasher.
  14. Cover any of the child's unused food and formula and refrigerate (discard unused refrigerated formula and food after 24 hours).
  15. Do not allow the child to eat fresh fruits or vegetables or raw meat or fish (neutropenic diet if immunosuppressed).
  16. Wear gloves for caring for the child, especially when in contact with body fluids and changing diapers.
  17. Change the child's diapers frequently, away from food areas.
  18. Fold the child's soiled disposable diapers inward, close with the tabs, and dispose in a tightly covered plastic-lined container.
  19. Dispose of trash daily.
  20. Clean up any of the child's body fluid spills with a bleach solution (10:1 ratio of water to bleach).
- F. Education for an adolescent infected with HIV**
1. High-risk behaviors and the importance of avoiding high-risk behaviors
  2. Methods of transmission of HIV
  3. The importance of abstinence from sexual contact, such as intercourse
  4. The importance of using safe condoms if intercourse is planned
  5. Resources available for support and other issues
- opportunistic infection of children infected with HIV is:
1. Meningitis
  2. Gastroenteritis
  3. Cytomegalovirus infection
  4. *Pneumocystis jiroveci* pneumonia
- 476.** The nurse provides home care instructions to the parent of a child with acquired immunodeficiency syndrome (AIDS). Which statement by the parent indicates the need for further teaching?
1. "I will wash my hands frequently."
  2. "I will keep my child's immunizations up to date."
  3. "I will avoid direct unprotected contact with my child's body fluids."
  4. "I can send my child to day care if he has a fever, as long as it is a low-grade fever."
- 477.** A clinic nurse is instructing the mother of a child with human immunodeficiency virus (HIV) infection regarding immunizations. The nurse tells the mother that:
1. The hepatitis B vaccine will not be given to the child.
  2. The inactivated influenza vaccine will be given yearly.
  3. The varicella vaccine will be given before 6 months of age.
  4. A Western blot test needs to be performed and the results evaluated before immunizations.
- 478.** A home care nurse provides instructions regarding basic infection control to the mother of an infant with human immunodeficiency virus (HIV) infection. Which statement, if made by the mother, indicates the need for further instructions?
1. "I will wash baby bottles, nipples, and pacifiers in the dishwasher."
  2. "I will clean up any spills from the diaper with full-strength alcohol."
  3. "I will be sure to prepare foods that are high in calories and high in protein."
  4. "I will be sure to wash my hands carefully before and after caring for my infant."
- 479.** A physician prescribes laboratory studies for an infant of a woman positive for human immunodeficiency virus (HIV) to determine the presence of HIV antigen in the infant. The nurse anticipates that which laboratory study will be prescribed for the infant?
1. Chest x-ray
  2. Western blot
  3. CD4+ cell count
  4. p24 antigen assay

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 475.** An infant of a mother infected with HIV is seen in the clinic each month and is being monitored for symptoms indicative of human immunodeficiency virus (HIV) infection. The nurse assesses the infant, knowing that the most common

1. Chest x-ray
2. Western blot
3. CD4+ cell count
4. p24 antigen assay

**480.** A mother with human immunodeficiency virus (HIV) infection brings her 10-month-old infant to the clinic for a routine checkup. The physician has documented that the infant is asymptomatic for HIV infection. After the checkup, the mother tells the nurse that she is so pleased that the infant will not get HIV. The appropriate nursing response to the mother is:

1. "I am so pleased also that everything has turned out fine."
2. "Because symptoms have not developed, it is unlikely that your infant will develop HIV infection."
3. "Everything looks great, but be sure that you return with your infant next month for the scheduled visit."
4. "Most children infected with HIV develop symptoms within the first 9 months of life, and some become symptomatic sometime before they are 3 years old."

**481.** A 6-year-old child with human immunodeficiency virus (HIV) has been admitted to the hospital for pain management. The child asks the nurse if the pain will ever go away. The nurse should make which best response to the child?

1. "The pain will go away if you lie still and let the medicine work."
2. "Try not to think about it. The more you think it hurts, the more it will hurt."
3. "I know it must hurt, but if you tell me when it does, I will try and make it hurt a little less."

4. "Every time it hurts, press on the call button and I will give you something to make the pain go all away."

**482.** A nurse is caring for a 4-year-old child with human immunodeficiency virus (HIV) infection. In planning care to address the child's psychosocial needs, the nurse expects that this child:

1. Will express fear, withdrawal, and denial
2. Begins to understand that something is wrong
3. Is unable to grasp the concept of illness and death
4. Begins to conceptualize the death process as involving physical harm

### Alternate Item Format: Multiple Response

**483.** Which home care instructions would the nurse provide to the mother of a child with acquired immunodeficiency syndrome (AIDS)? **Select all that apply.**

- 1. Monitor the child's weight.
- 2. Frequent handwashing is important.
- 3. The child should avoid exposure to other illnesses.
- 4. The child's immunization schedule will need revision.
- 5. Clean up body fluid spills with bleach solution (10:1 ratio of water to bleach).
- 6. Fever, malaise, fatigue, weight loss, vomiting, and diarrhea are expected to occur and do not require special intervention.

## ANSWERS

### 475. 4

**Rationale:** AIDS is a disorder caused by HIV and characterized by generalized dysfunction of the immune system. The most common opportunistic infection of children infected with HIV is *P. jiroveci* pneumonia, which occurs most frequently between the ages of 3 and 6 months, when HIV status may be indeterminate. Cytomegalovirus infection is also characteristic of HIV infection; however, it is not the most common opportunistic infection. Although gastrointestinal disturbances and neurological abnormalities may occur in a child with HIV infection, options 1 and 2 are not specific opportunistic infections noted in the HIV-infected child.

**Test-Taking Strategy:** Note the strategic words *most common opportunistic infection*. This focus will direct you to option 4. Remember the most common opportunistic infection of children infected with HIV is *P. jiroveci* pneumonia. Review the complications associated with HIV in an infant or child if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 940). St. Louis: Mosby.

### 476. 4

**Rationale:** AIDS is a disorder caused by HIV and characterized by generalized dysfunction of the immune system. A child with AIDS who is sick or has a fever should be kept home and not brought to a day care center. Options 1, 2, and 3 are correct statements and would be actions a caretaker should take when the child has AIDS.

**Test-Taking Strategy:** Note the strategic words *indicates the need for further teaching*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Noting the word *fever* in option 4 will direct you to this option. Review teaching points and home care instructions related to the care of a child with AIDS if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1054). St. Louis: Saunders.

Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1519). St. Louis: Mosby.

#### 477. 2

**Rationale:** Immunizations against common childhood illnesses are recommended for all children exposed to or infected with HIV. The inactivated influenza vaccine that is given intramuscularly will be administered (influenza vaccine should be given yearly). The hepatitis B vaccine is administered according to the recommended immunization schedule. Varicella-zoster virus vaccine should not be given; varicella-zoster immunoglobulin may be prescribed after chickenpox exposure. Option 4 is unnecessary and is inaccurate.

**Test-Taking Strategy:** Use the process of elimination. Option 4 can be eliminated first because the Western blot is a diagnostic test, not an evaluative test. From the remaining options, recalling that the child infected with HIV is at risk for opportunistic infections and that live virus vaccines are not administered to an immunodeficient child will assist in directing you to option 2. Review immunizations in the immunodeficient child if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**References:** Callen, N., & Schutze, G. (n.d.). *Immunizations for children with HIV/AIDS*. Available at: <http://www.bayloraids.org/curriculum/files/20.pdf>. Retrieved January 15, 2010.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1054). St. Louis: Saunders.

#### 478. 2

**Rationale:** HIV is transmitted through blood, semen, vaginal secretions, and breast milk. The mother of an infant with HIV should be instructed to use a bleach solution for disinfecting contaminated objects or cleaning up spills from the child's diaper. Alcohol would not be effective in destroying the virus. Options 1, 3, and 4 are accurate instructions related to basic infection control.

**Test-Taking Strategy:** Note the strategic words *need for further instructions*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Recalling basic infection control measures and the measures to prevent the spread of HIV will direct you to option 2. Review home care measures to prevent the transmission of HIV if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1054). St. Louis: Saunders.

#### 479. 4

**Rationale:** The detection of HIV in infants is confirmed by a p24 antigen assay, virus culture of HIV, or polymerase chain reaction. A Western blot test confirms the presence of HIV antibodies. The CD4+ cell count indicates how well the immune system is working. A chest x-ray evaluates the presence of other manifestations of HIV infection, such as pneumonia.

**Test-Taking Strategy:** Note the strategic word *infant*. Recall the laboratory tests used to determine the presence of HIV infection to answer this question. If you are unfamiliar with the laboratory tests used to detect HIV in infants, review them. Specific laboratory tests to review include enzyme-linked immunosorbent assay, Western blot, CD4+ cell count, and p24 antigen assay.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**References:** Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed., pp. 524–527). St. Louis: Mosby.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., pp. 548–549). St. Louis: Mosby.

#### 480. 4

**Rationale:** AIDS is caused by HIV and characterized by generalized dysfunction of the immune system. Most children infected with HIV develop symptoms within the first 9 months of life. The remaining infected children become symptomatic sometime before age 3 years. With their immature immune systems, children have a much shorter incubation period than adults. Options 1, 2, and 3 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1, 2, and 3 because they are comparable or alike in content. Option 4 is the only option that provides specific and accurate data regarding HIV infection in an infant. Review assessment findings associated with HIV infection in an infant if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1047). St. Louis: Saunders.

#### 481. 3

**Rationale:** The multiple complications associated with HIV are accompanied by a high level of pain. Aggressive pain management is essential for the child to have an acceptable quality of life. A nurse must acknowledge the child's pain and let the child know that everything will be done to decrease the pain. Telling the child that movement or lack thereof would eliminate the pain is inaccurate. Allowing a child to think that he or she can control the pain simply by thinking or not thinking about it oversimplifies the pain cycle associated with HIV. Giving false hope by telling the child that the pain will be taken "all away" is neither truthful nor realistic.

**Test-Taking Strategy:** Recall the general concept of pain and growth and development concepts of a 6-year-old child. Giving the child information about the pain in words that he or she can understand, but without providing false hope or not telling the truth, should guide you to option 3. Options 1 and 2 provide inaccurate information about pain management. Option 4 provides false hope that the pain can be alleviated completely. Review the concepts associated with pain management in a child if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 992, 994). St. Louis: Saunders.

#### 482. 4

**Rationale:** A preschool child begins to conceptualize the death process as involving physical harm. A child from birth to 2 years of age is unable to grasp the concept of illness and death. A school-age child begins to understand that something is wrong. An adolescent expresses fear, withdrawal, and denial.

**Test-Taking Strategy:** Use concepts of growth and development and related psychosocial issues to answer the question. Noting the age of the child will assist in directing you to the correct option. Review growth and development concepts and psychosocial needs for the various age groups if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 483. 1, 2, 3, 5

**Rationale:** AIDS is a disorder caused by HIV and is characterized by a generalized dysfunction of the immune system. Home care instructions include the following: frequent hand-washing; monitoring for fever, malaise, fatigue, weight loss, vomiting, and diarrhea and notifying the physician if these occur; monitoring for signs and symptoms of opportunistic infections; administering antiretroviral medications and other medications as prescribed; avoiding exposure to other illnesses; keeping immunizations up to date; monitoring weight and providing a high-calorie, high-protein diet; washing eating utensils in the dishwasher; and avoiding sharing eating utensils. Gloves are worn for care, especially when in contact with body fluids and changing diapers; diapers are changed frequently and away from food areas, and soiled disposable diapers are folded inward, closed with the tabs, and disposed of in a tightly covered plastic-lined container. Any body fluid spills are cleaned with a bleach solution (10:1 ratio of water to bleach).

**Test-Taking Strategy:** Focus on the subject, care of the child with AIDS. Recalling that AIDS is characterized by a generalized dysfunction of the immune system and recalling the modes of transmission of the virus will assist in selecting the correct home care instructions. Review the home care instructions that will prevent the transmission of AIDS and the measures that will protect the child if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1054). St. Louis: Saunders.

# Infectious and Communicable Diseases

## I. RUBEOLOA (MEASLES)

### A. Description

1. Agent: Paramyxovirus
2. Incubation period: 10 to 20 days
3. Communicable period: From 4 days before to 5 days after rash appears, mainly during **prodromal** stage (pertaining to early symptoms that may mark the onset of disease)
4. Source: Respiratory tract secretions, blood, or urine of infected person
5. Transmission: Airborne particles or direct contact with infectious droplets; transplacental

### B. Assessment (Fig. 48-1)

1. Fever
2. Malaise
3. The three “C’s”—coryza, cough, conjunctivitis
4. Rash appears as red, erythematous maculopapular eruption starting on the face and spreading downward to the feet; blanches easily with pressure and gradually turns a brownish color (lasts 6 to 7 days); may have desquamation
5. Koplik’s spots: Small red spots with a bluish white center and a red base; located on the buccal mucosa and last 3 days

### C. Interventions

1. Use airborne droplet precautions if the child is hospitalized.
2. Restrict child to quiet activities and bedrest.
3. Use a cool mist vaporizer for cough and coryza.
4. Dim lights if photophobia is present.
5. Administer antipyretics for fever.

## II. ROSEOLA (EXANTHEMA SUBITUM)

### A. Description

1. Agent: Human herpesvirus type 6
2. Incubation period: 5 to 15 days
3. Communicable period: Unknown, but thought to extend from the febrile stage to the time the rash first appears
4. Source: Unknown
5. Transmission: Unknown

▲ **FIGURE 48-1** Rubeola (measles). (From Hockenberry, M., & Wilson, D. [2007]. *Wong’s nursing care of infants and children* [8th ed.]. St. Louis: Mosby.)

▲ **FIGURE 48-2** Roseola (exanthema subitum). (From Hockenberry, M., & Wilson, D. [2007]. *Wong’s nursing care of infants and children* [8th ed.]. St. Louis: Mosby.)

### B. Assessment (Fig. 48-2)

1. Sudden high ( $>38.8^{\circ}\text{C}$  [ $>102^{\circ}\text{F}$ ]) fever of 3 to 5 days’ duration in a child who appears well, followed by a rash (rose-pink macules that blanch with pressure)
2. Rash appears several hours to 2 days after the fever subsides and lasts 1 to 2 days.

### C. Interventions: Supportive

### III. RUBELLA (GERMAN MEASLES)

#### A. Description

1. Agent: Rubella virus
2. Incubation period: 14 to 21 days
3. Communicable period: From 7 days before to about 5 days after rash appears
4. Source: Nasopharyngeal secretions; virus is also present in blood, stool, and urine
5. Transmission
  - a. Airborne or direct contact with infectious droplets
  - b. Indirectly via articles freshly contaminated with nasopharyngeal secretions, feces, or urine
  - c. Transplacental

#### B. Assessment (Fig. 48-3)

1. Low-grade fever
2. Malaise
3. Pinkish red maculopapular rash that begins on the face and spreads to the entire body within 1 to 3 days
4. Petechial red, pinpoint spots may occur on the soft palate.

#### C. Interventions

1. Use airborne droplet precautions if the child is hospitalized; provide supportive treatment.
2. Isolate the infected child from pregnant women.

### IV. MUMPS

#### A. Description

1. Agent: Paramyxovirus
2. Incubation period: 14 to 21 days
3. Communicable period: Immediately before and after parotid gland swelling begins
4. Source: Saliva of infected person and possibly urine
5. Transmission: Direct contact or droplet spread from an infected person

▲ **FIGURE 48-3** Rubella (German measles). (From Hockenberry, M., & Wilson, D. [2007]. *Wong's nursing care of infants and children* [8th ed.]. St. Louis: Mosby. Courtesy Dr Michael Sherlock.)

#### B. Assessment

1. Fever
2. Headache and malaise
3. Anorexia
4. Jaw or ear pain aggravated by chewing, followed by parotid glandular swelling
5. Orchitis may occur

#### C. Interventions

1. Institute airborne droplet precautions.
2. Provide bedrest until the parotid gland swelling subsides.
3. Avoid foods that require chewing.
4. Apply hot or cold compresses as prescribed to the neck.
5. Apply warmth and local support with snug-fitting underpants to relieve orchitis.

### V. CHICKENPOX (VARICELLA)

#### A. Description

1. Agent: Varicella-zoster virus
2. Incubation period: 13 to 17 days
3. Communicable period: From 1 to 2 days before the onset of the rash to 6 days after the first crop of vesicles, when crusts have formed
4. Source: Respiratory tract secretions of infected person; skin lesions
5. Transmission: Direct contact, droplet (airborne) spread, and contaminated objects

#### B. Assessment (Fig. 48-4)

1. Slight fever, malaise, and anorexia are followed by a macular rash that first appears on the trunk and scalp and moves to the face and extremities.
2. Lesions become pustules, begin to dry, and develop a crust.
3. Lesions may appear on the mucous membranes of the mouth, the genital area, and the rectal area.

#### C. Interventions

1. In the hospital, ensure strict isolation (contact and droplet precautions).
2. At home, isolate the infected child until the vesicles have dried.
3. Supportive care

▲ **FIGURE 48-4** Chickenpox (varicella). (From Hockenberry, M., & Wilson, D. [2007]. *Wong's nursing care of infants and children* [8th ed.]. St. Louis: Mosby.)

 Isolate high-risk children, such as children who have immunosuppressive disorders, from a child with a communicable disease.

## VI. PERTUSSIS (WHOOPIING COUGH)

### A. Description

1. Agent: *Bordetella pertussis*
2. Incubation period: 5 to 21 days (usually 10 days)
3. Communicable period: Greatest during the catarrhal stage (when discharge from respiratory secretions occurs)
4. Source: Discharge from the respiratory tract of the infected person
5. Transmission: Direct contact or droplet spread from infected person; indirect contact with freshly contaminated articles

### B. Assessment

1. Symptoms of respiratory infection followed by increased severity of cough, with a loud whooping inspiration
2. May experience **cyanosis**, respiratory distress, and tongue protrusion
3. Listlessness, irritability, anorexia

### C. Interventions

1. Isolate child during the catarrhal stage; if the child is hospitalized, institute airborne droplet precautions.
2. Administer antimicrobial therapy as prescribed.
3. Reduce environmental factors that cause coughing spasms, such as dust, smoke, and sudden changes in temperature.
4. Ensure adequate hydration and nutrition.
5. Provide suction and humidified oxygen if needed.
6. Monitor cardiopulmonary status (via monitor as prescribed) and pulse oximetry.
7. Infants do not receive maternal immunity to pertussis.

## VII. DIPHTHERIA

### A. Description

1. Agent: *Corynebacterium diphtheriae*
2. Incubation period: 2 to 5 days
3. Communicable period: Variable, until virulent bacilli are no longer present (three negative cultures of discharge from the nose and nasopharynx, skin, and other lesions); usually 2 weeks, but can be 4 weeks
4. Source: Discharge from the mucous membrane of the nose and nasopharynx, skin, and other lesions of the infected person
5. Transmission: Direct contact with infected person, carrier, or contaminated articles

### B. Assessment

1. Low-grade fever, malaise, sore throat
2. Foul-smelling, mucopurulent nasal discharge

3. Dense pseudomembrane formation of the throat that may interfere with eating, drinking, and breathing.
4. Lymphadenitis, neck edema, "bull neck"

### C. Interventions

1. Ensure strict isolation for the hospitalized child.
2. Administer diphtheria antitoxin as prescribed (after a skin or conjunctival test to rule out sensitivity to horse serum).
3. Provide bedrest.
4. Administer antibiotics as prescribed.
5. Provide suction and humidified oxygen as needed.
6. Provide tracheostomy care if a tracheostomy is necessary.

## VIII. POLIOMYELITIS

### A. Description

1. Agent: Enteroviruses
2. Incubation period: 7 to 14 days
3. Communicable period: Unknown; the virus is present in the throat and feces shortly after infection and persists for about 1 week in the throat and 4 to 6 weeks in the feces
4. Source: Oropharyngeal secretions and feces of the infected person
5. Transmission: Direct contact with infected person; fecal-oral and oropharyngeal routes

### B. Assessment

1. Fever, malaise, anorexia, nausea, headache, sore throat
2. Abdominal pain followed by soreness and stiffness of the trunk, neck, and limbs that may progress to central nervous system paralysis

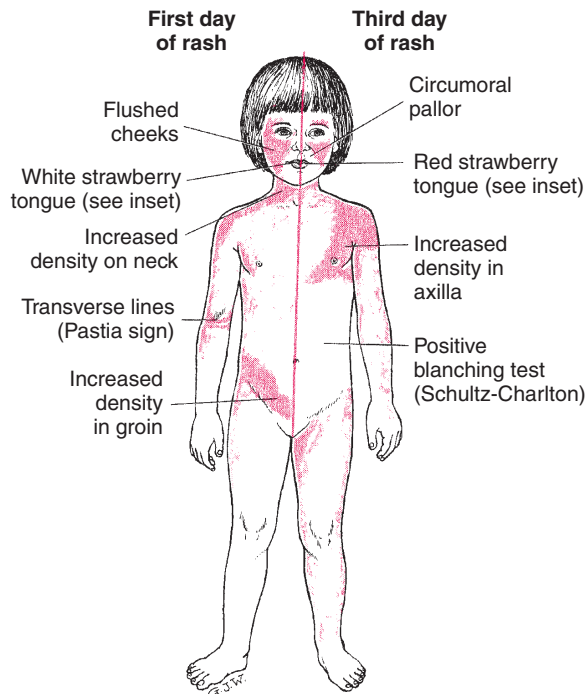

### C. Interventions

1. Enteric precautions
2. Supportive treatment
3. Bedrest
4. Monitoring for respiratory paralysis
5. Physical therapy

## IX. SCARLET FEVER

### A. Description

1. Agent: Group A beta-hemolytic streptococci
2. Incubation period: 1 to 7 days
3. Communicable period: About 10 days during the incubation period and clinical illness; during the first 2 weeks of the carrier stage, although may persist for months
4. Source: Nasopharyngeal secretions of infected person and carriers
5. Transmission: Direct contact with infected person or droplet spread; indirectly by contact with contaminated articles, ingestion of contaminated milk, or other foods

White strawberry tongue

Red strawberry tongue

▲ **FIGURE 48-5** Scarlet fever. (From Hockenberry, M., & Wilson, D. [2007]. *Wong's nursing care of infants and children* [8th ed.]. St. Louis: Mosby.)

#### B. Assessment (Fig. 48-5)

1. Abrupt high fever, flushed cheeks, vomiting, headache, enlarged lymph nodes in the neck, malaise, abdominal pain
2. A red, fine sandpaper-like rash develops in the axilla, groin, and neck that spreads to cover the entire body except the face.
3. Rash blanches with pressure (Schultz-Charlton reaction) except in areas of deep creases and folds of the joints (Pastia's sign).
4. Desquamation, sheet-like sloughing of the skin on palms and soles, appears by weeks 1 to 3.
5. The tongue is initially coated with a white, furry covering with red projecting papillae (white strawberry tongue); by the third to fifth day, the white coat sloughs off, leaving a red swollen tongue (red strawberry tongue).

▲ **FIGURE 48-6** Erythema infectiosum (fifth disease): Slapped-face appearance. (From Hockenberry, M., & Wilson, D. [2007]. *Wong's nursing care of infants and children* [8th ed.]. St. Louis: Mosby.)

6. Tonsils are reddened, edematous, and covered with exudate.
7. Pharynx is edematous and beefy red.

#### C. Interventions

1. Institute respiratory precautions until 24 hours after initiation of antibiotic therapy.
2. Provide supportive therapy.
3. Provide bedrest.
4. Encourage fluid intake

### X. ERYTHEMA INFECTIOSUM (FIFTH DISEASE)

#### A. Description

1. Agent: Human parvovirus B19
2. Incubation period: 4 to 14 days; may be 20 days
3. Communicable period: Uncertain, but before the onset of symptoms in most children
4. Source: Infected person
5. Transmission: Unknown; possibly respiratory secretions and blood

#### B. Assessment

1. Before rash: Asymptomatic or mild fever, malaise, headache, runny nose
2. Stages of rash
  - a. Erythema of the face (slapped-cheek appearance) develops and disappears by 1 to 4 days (Fig. 48-6).
  - b. About 1 day after the rash appears on the face, maculopapular red spots appear, symmetrically distributed on the extremities; the rash progresses from proximal to distal surfaces and may last a week or more.
  - c. The rash subsides, but may reappear if the skin becomes irritated by the sun, heat, cold, exercise, or friction.

#### C. Interventions

1. Child is not usually hospitalized.
2. Pregnant women should avoid the infected individual.
3. Provide supportive care.

4. Administer antipyretics, analgesics, and anti-inflammatory medications as prescribed.

## XI. INFECTIOUS MONONUCLEOSIS

### A. Description

1. Agent: Epstein-Barr virus
2. Incubation period: 4 to 6 weeks
3. Communicable period: Unknown
4. Source: Oral secretions
5. Transmission: Direct intimate contact

### B. Assessment

1. Fever, malaise, headache, fatigue, nausea, abdominal pain, sore throat, enlarged red tonsils
2. Lymphadenopathy and hepatosplenomegaly
3. Discrete macular rash most prominent over the trunk may occur.

### C. Interventions

1. Provide supportive care.
2. Monitor for signs of splenic rupture

 Teach the parents of a child with mononucleosis to monitor for signs of splenic rupture, which include abdominal pain, left upper quadrant pain, and left shoulder pain.

## XII. ROCKY MOUNTAIN SPOTTED FEVER

### A. Description

1. Agent: *Rickettsia rickettsii*
2. Incubation period: 2 to 14 days
3. Source: Tick from a mammal, most often from wild rodents and dogs
4. Transmission: Bite of infected tick

### B. Assessment

1. Fever, malaise, anorexia, vomiting, headache, myalgia
2. Maculopapular or petechial rash primarily on the extremities (ankles and wrists), but may spread to other areas, characteristically on the palms and soles

### C. Interventions

1. Provide vigorous supportive care.
2. Administer antibiotics as prescribed.
3. Teach the child and parents about protection from tick bites (Box 48-1).

## XIII. COMMUNITY-ASSOCIATED METHICILLIN-RESISTANT STAPHYLOCOCCUS AUREUS (MRSA)

### A. Description

1. *Staphylococcus aureus* is a bacterium that is normally located on the skin or in the nose of healthy people; when present without symptoms, it is called colonization, and when symptoms are present, it is called an infection.
2. MRSA is a strain of *S. aureus* that is resistant to methicillin and most often occurs in people

### Box 48-1 Measures to Protect the Child From Tick Bites

Wearing long-sleeved shirts, long pants tucked into long socks (socks should be pulled up over the pant legs), and a hat when walking in tick-infested areas

Wearing light-colored clothing to make ticks more visible if they get onto the child

Checking children for the presence of ticks after being in high-risk or tick-infested areas

Following paths rather than walking in tall grass and shrub areas because these are the places where most ticks are found

Applying insect repellents containing diethyltoluamide (DEET) and permethrin before possible exposure to areas where ticks are found (use with caution in infants and small children)

Keeping yards at home trimmed and free of accumulating leaves and other brush

Applying tick repellent to dogs

Saving the tick for later identification if it is removed from the child's body

who were hospitalized or treated at a health care facility (hospital-acquired MRSA).

3. Community-associated MRSA is a MRSA infection that occurs in a healthy person who has not been hospitalized or had a medical procedure done within the past year.
4. Persons at risk for community-associated MRSA include athletes, prisoners, day care attendees, military recruits, persons who **abuse** intravenous drugs, persons living in crowded settings, persons with poor hygiene practices, persons who use contaminated items, persons who get tattoos, and persons with a compromised immune system.
5. Community-associated MRSA is spread through person-to-person contact, through contact with contaminated items, or through infection of a preexisting cut or wound that is not protected by a dressing.
6. The bacteria can enter the bloodstream through the cut or wound and cause sepsis, cellulitis, endocarditis, osteomyelitis, septic arthritis, toxic shock syndrome, pneumonia, organ failure, and death.

### B. Prevention measures

1. Handwashing and practicing good personal hygiene
2. Avoid sharing personal items
3. Regular cleaning of shared equipment such as athletic equipment, whirlpools, or saunas
4. Cleaning a cut or wound thoroughly

### C. Assessment

1. Appearance of a skin infection: Red, swollen area, warmth around the area, drainage of pus, pain at the site, fever.

2. Symptoms of a more serious infection: Chest pain, cough, fatigue, chills, fever, malaise, headache, muscle aches, shortness of breath, rash

#### D. Interventions

1. Assess skin lesions.
2. Prepare to drain an infected skin site and culture the wound and wound drainage.
3. Prepare to obtain blood cultures, sputum cultures, and urine cultures.
4. Prepare to administer antibiotics as prescribed.
5. Educate the parent and family about the causes and modes of transmission, signs and symptoms, and importance of treatment measures prescribed.

### XIV. H1N1 INFLUENZA

#### A. Description

1. H1N1 is also known as swine flu and is a strain of influenza.
2. It is a viral infection that affects the respiratory system and is highly contagious.
3. Children, pregnant women, persons with preexisting health conditions, and persons with a compromised immune system are at high risk for developing complications.
4. It is caused by contact with an infected person or by touching something such as a toy or tissue that the infected person has touched.

#### B. Prevention

1. H1N1 flu **vaccine**
  - a. Children age 6 months and older need to be vaccinated.
  - b. Children younger than 6 months are not old enough to receive the **vaccine**; family members and caregivers need to get vaccinated.
  - c. Children 9 years and younger need two doses at least 3 weeks apart; children 10 years and older need one dose (it takes about 2 weeks after receiving the second dose or the first dose in children needing only one dose before immunity develops).
  - d. The H1N1 **vaccine** and seasonal flu **vaccine** can be given at the same time.
  - e. A nasal spray version of the H1N1 **vaccine** that contains a weakened live virus may be given to people 2 to 49 years old who do not have a chronic health condition.
2. Wash the child's hands frequently and teach handwashing techniques.
3. Avoid children who are ill.
4. Keep the child home from school or away from others until the child has been fever-free (without the use of antipyretics) for at least 24 hours.

 The signs and symptoms of H1N1 infection are similar to those of seasonal flu and usually last a week. If they last longer, the presence of complications should be suspected.

#### C. Assessment

1. Fever that occurs suddenly and is high
2. Headache, body aches, fatigue, chills, cough, congestion, sore throat, loss of appetite, vomiting, diarrhea

#### D. Interventions

1. Antiviral medications if prescribed, fluids, rest, pain relievers such as acetaminophen (Tylenol) or ibuprofen (Motrin)
2. Family and child teaching about prevention measures

### XV. IMMUNIZATIONS

#### A. Guidelines (see Priority Nursing Actions)

1. In the United States, the recommended age for beginning primary immunizations of infants is at birth.
2. Children who began primary immunizations at the recommended age but failed to receive all the required doses do not need to begin the series again; they need to receive only the missed doses.

#### PRIORITY NURSING ACTIONS!

##### Actions to Take When Administering a Parenteral Vaccine

1. Verify the prescription for the vaccine.
2. Obtain an immunization history from the parents and assess for allergies.
3. Provide information to the parents about the vaccine.
4. Obtain parental consent.
5. Check the lot number and expiration date and prepare the injection.
6. Select the appropriate site for administration.
7. Administer the vaccine.
8. Document the administration and site of administration and lot number and expiration date of the vaccine.
9. Provide a vaccination record to the parents.

The nurse should first verify the prescription and then obtain an immunization history from the parents to ensure that the immunizations are up to date. The nurse should also question the parents about the presence of any allergies in the child because some vaccines contain components to which the child may be allergic. The nurse next provides information to the parents about the vaccine and obtains consent. The expiration date and the lot number (located on the medication vial) of the vaccine should be checked before preparing the vaccine for administration. When the vaccine is prepared, the nurse prepares the child for the procedure, selects an appropriate site, and administers the vaccine. The nurse documents that the vaccination has been administered and provides an updated immunization record to the parents.

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., pp. 359, 363-364). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 68, 70). St. Louis: Saunders.

3. If there is suspicion that the parent will not bring the child to the pediatrician or health care clinic for follow-up immunizations according to the optimal immunization schedule, any of the recommended **vaccines** can be administered simultaneously.
- B. General contraindications and precautions**
1. A **vaccine** is contraindicated if the child experienced an anaphylactic reaction to a previously administered **vaccine** or a component in the **vaccine**.
  2. Live virus **vaccines** generally are not administered to individuals with severely deficient immune systems, individuals with a severe sensitivity to gelatin, or pregnant women.
  3. A **vaccine** is administered with caution to an individual with a moderate or severe acute illness, with or without fever.
  4. See Section XVI, Recommended Childhood and Adolescent Immunizations, for specific information for each type of **vaccine**.
- C. Guidelines for administration (Box 48-2)**
-  Children born prematurely should receive the full dose of each vaccine at the appropriate chronological age.

## XVI. RECOMMENDED CHILDHOOD AND ADOLESCENT IMMUNIZATIONS (Box 48-3)

- A. Hepatitis B vaccine (HepB)**
1. Protects against hepatitis B
  2. Administered by the intramuscular route
  3. First dose of hepatitis B **vaccine** (monovalent) should be administered soon after birth and before hospital discharge (the birth dose can be delayed in rare circumstances if the infant's mother tests negative for hepatitis B surface antigen [HBsAg]).
  4. Monovalent HepB or a combination **vaccine** containing hepatitis B may be used to complete the series.
  5. The second dose is administered at age 1 to 2 months.
  6. The final dose should be given at 24 weeks or older (6 to 18 months of age).
  7. Contraindications: Severe allergic reaction to previous dose or **vaccine** component (components include aluminum hydroxide, yeast protein)
  8. Precautions: An infant weighing less than 2000 g or an infant with moderate or severe acute illness with or without fever.
  9. HBsAg-positive mothers
    - a. Infant should receive HepB **vaccine** and hepatitis B immunoglobulin (HBIG) within 12 hours of birth.
    - b. Infant should be tested for HBsAg and antibody to HBsAg after completion of HepB series (9 to 18 months of age).
  10. Mother whose HBsAg status is unknown
    - a. Infant should receive the first dose of hepatitis **vaccine** series within 12 hours of birth.
    - b. Maternal blood should be drawn as soon as possible to determine the mother's HBsAg status.
    - c. If the mother's HBsAg test result is positive, the infant should receive HBIG as soon as possible (no later than 1 week of age).
- B. Rotavirus vaccine (RV)**
1. Rotavirus is a cause of serious gastroenteritis and is a nosocomial (hospital-acquired) pathogen that is most severe in children 3 to 24 months of age; children younger than 3 months have some protection because of maternally acquired antibodies.

### Box 48-2 Guidelines for Administration of Vaccines

Follow manufacturer's recommendations for route of administration, storage, and reconstitution of the vaccine.

If refrigeration is necessary, store on a center shelf and not on the door; frequent temperature changes from opening the refrigerator door can alter the vaccine's potency.

A vaccine information statement needs to be given to the parents or individual, and informed consent for administration needs to be obtained.

Check the expiration date on the vaccine bottle.

Parenteral vaccines are given in separate syringes in different injection sites.

Vaccines administered intramuscularly are given in the vastus lateralis muscle (best site) or ventrogluteal muscle (the deltoid can be used for children 36 months and older); the dorsogluteal site (buttocks) is avoided.

Vaccines administered subcutaneously are given into the fatty areas in the lateral upper arms and anterior thighs. Adequate needle length and gauge are as follows: intramuscular, 1 inch, 23-25 gauge; subcutaneous, ⅜ inch, 25 gauge (needle length may vary depending on the child's size).

Mild side effects include fever, soreness, swelling, or redness at injection site.

A topical anesthetic may be applied to injection site before the injection.

For painful or red injection sites, advise the parent to apply cool compresses for the first 24 hours, and then use warm or cold compresses as long as needed.

An age-appropriate dose of acetaminophen (Tylenol) or ibuprofen (Motrin) may be administered every 4 to 6 hours for vaccine-associated discomfort.

Maintain an immunization record—document day, month, year of administration; manufacturer and lot number of vaccine; name, address, title of person administering the vaccine; and site and route of administration.

A vaccine adverse event report needs to be filed and the health department needs to be notified if an adverse reaction to an immunization occurs.

### Box 48-3 Recommended Childhood and Adolescent Immunizations

Birth: Hepatitis B vaccine (HepB)

1 month: HepB

2 months: Inactivated poliovirus vaccine (IPV); diphtheria, tetanus, acellular pertussis (DTaP) vaccine; *Haemophilus influenzae* type b conjugate vaccine (Hib); pneumococcal conjugate vaccine (PCV), rotavirus (RV)

4 months: DTaP, Hib, IPV, PCV, RV

6 months: DTaP, Hib, HepB, IPV, PCV, RV (dose may be needed depending on type of vaccine used for first and second doses)

12-15 months: Hib; measles, mumps, rubella (MMR) vaccine; PCV; hepatitis A, first dose (second dose is given 6 months after the first dose); varicella vaccine

15-18 months: DTaP

18-21 months: Hepatitis A, second dose (given 6 months after the first dose)

4-6 years: DTaP, IPV, MMR, varicella vaccine

11-12 years: MMR (if not administered at 4-6 years); diphtheria, tetanus, acellular pertussis adolescent preparation (Tdap); meningococcal vaccine (MCV4); human papillomavirus (HPV) (first dose to girls at age 11 to 12 years, second dose 2 months after first dose, and third dose 6 months after first dose).

*Note:* Influenza vaccine is recommended annually for children age 6 months through 18 years.

From Centers for Disease Control and Prevention (CDC). (2010). *Recommended immunization schedules for persons aged 0 through 18 years—United States, 2010*. Available at <http://www.immunize.org/CDC/schedules/>. Retrieved January 12, 2010.

2. Two **vaccines** are available (RotaTeq and Rotarix) and are administered by the oral route because the **vaccine** must replicate in the infant's gut.
  3. **Vaccine** may be withheld if an infant is experiencing severe vomiting and diarrhea; it is administered as soon as the infant recovers.
  4. RotaTeq: Three doses are needed; the first dose of the **vaccine** needs to be administered at age 6 to 14 weeks, the second is given 4 to 10 weeks after the first dose, and the third is given 4 to 10 weeks after the second dose (no later than 32 weeks of age).
  5. Rotarix: Two doses are needed; the first dose of the **vaccine** needs to be administered at age 6 to 14 weeks, and the second is given 4 weeks after the first dose (series needs to be completed by 24 weeks of age).
- C.** Diphtheria, tetanus, acellular pertussis (DTaP); tetanus toxoid; reduced diphtheria toxoid and acellular pertussis **vaccine** (Tdap adolescent preparation)
1. Protect against diphtheria, tetanus, and pertussis
  2. Administered by intramuscular route
  3. DTaP is administered at 2, 4, and 6 months; between 15 and 18 months; and between 4 and 6 years of age.
  4. The fourth dose of DTaP can be given at 12 months of age if 6 months have elapsed since the third dose and the child might not return for follow-up at 12 to 18 months of age.
5. The fifth (final) dose is administered at age 4 years or older.
  6. The Tdap (adolescent preparation) is recommended at 11 to 12 years of age for children who have completed the recommended childhood DTaP series but have not received a tetanus and diphtheria toxoid (Td) booster dose; children 13 to 18 years old who have not received Tdap should receive a dose.
  7. Td does not provide protection against pertussis; Td is used as a booster every 10 years after Tdap is administered at 11 to 18 years of age.
  8. Encephalopathy is a complication.
  9. Contraindications: Encephalopathy within 7 days of a previous dose or a severe allergic reaction to a previous dose or to a **vaccine** component.
- D.** *Haemophilus influenzae* type b conjugate **vaccine** (Hib)
1. Protects against numerous serious infections caused by *H. influenzae* type b, such as bacterial meningitis, epiglottitis, bacterial pneumonia, septic arthritis, and sepsis
  2. Administered by intramuscular route
  3. Hib is administered at 2, 4, and 6 months of age and between 12 and 15 months of age.
  4. Depending on the brand of Hib **vaccine** used for the first and second doses, a dose at 6 months of age (third dose) may not be needed.
  5. DTaP-Hib combination products should not be used for primary immunization in infants at 2, 4, or 6 months of age, but can be used as the final dose in children 12 months to 4 years of age.
  6. Contraindications: Severe allergic reaction to a previous dose or **vaccine** component
- E.** Influenza **vaccine**
1. **Vaccine** is recommended annually for children 6 months to 18 years of age.
  2. Refer to Section XIV for information on the H1N1 influenza virus and the H1N1 **vaccine**.
- F.** Inactivated poliovirus **vaccine** (IPV)
1. IPV protects against polio.
  2. IPV is administered by the subcutaneous route (may also be given by the intramuscular route)
  3. IPV is administered at 2, 4, and 6 to 18 months and 4 to 6 years of age.
  4. The last dose of the IPV should be administered on or after age 4 years and at least 6 months after the previous dose; additionally, if four doses are administered before age 4 years, a fifth dose should be administered at age 4 to 6 years.
  5. Contraindications: Severe allergic reaction to a previous dose or **vaccine** component; components may include formalin, neomycin, streptomycin, or polymyxin B
- G.** Measles, mumps, rubella (MMR) **vaccine**
1. MMR protects against measles, mumps, and rubella.

2. **Vaccine** is administered by the subcutaneous route.
  3. The first dose of MMR is administered between 12 and 15 months of age; the second dose is recommended at 4 to 6 years of age (the second dose may be administered during any visit as long as at least 4 weeks have elapsed since the first dose).
  4. Children who have not received the second dose previously should complete the schedule at the 11- to 12-year-old pediatric or health care clinic visit.
  5. Contraindications: Severe allergic reaction to a previous dose or **vaccine** component (gelatin, neomycin, eggs), pregnancy, known immunodeficiency
  6. If the child received immunoglobulin, the MMR **vaccine** should be postponed for at least 3 to 6 months (immunoglobulin can inhibit the immune response to the MMR **vaccine**).
- H. Varicella vaccine**
1. Varicella **vaccine** protects against chickenpox.
  2. It is administered by the subcutaneous route.
  3. Varicella **vaccine** is administered at 12 and 15 months of age and again at 4 to 6 years of age.
  4. Children 13 years old and older (who have not had chickenpox or have not been previously vaccinated) need two doses given at least 28 days apart.
  5. Children receiving the **vaccine** should avoid aspirin or aspirin-containing products because of the risk of Reye's syndrome.
  6. Contraindications: Severe allergic reaction to a previous dose or **vaccine** component (gelatin, bovine albumin, neomycin), significant suppression of cellular immunity, pregnancy
- I. Pneumococcal conjugate vaccine (PCV)**
1. PCV prevents infection with *Streptococcus pneumoniae*, which may cause meningitis, pneumonia, septicemia, sinusitis, and otitis media.
  2. It is administered by the intramuscular route.
  3. **Vaccine** can be given concurrently with other childhood **vaccines** at 2, 4, 6, and 12 to 15 months of age (the final dose in the series is given at age 12 months or older).
  4. Pneumococcal polysaccharide **vaccine** (PPSV) is recommended in addition to PCV for certain high-risk groups, such as children with chronic illness specifically associated with increased risk of pneumococcal disease or its complications; anatomical or functional asplenia; hemoglobinopathies; nephrotic syndrome; cerebrospinal fluid leaks; a cochlear implant; and conditions associated with immunosuppression (PPSV is given at least 8 weeks after the last dose of PCV).
  5. Contraindications: Severe allergic reaction to a previous dose or **vaccine** component
- J. Hepatitis A vaccine (HepA)**
1. **Vaccine** protects against hepatitis A.
  2. **Vaccine** is recommended for all children at age 1 year (12 to 23 months); two doses should be administered at least 6 months apart (vaccination of children older than 23 months is allowed for those at increased risk).
  3. It is administered by the intramuscular route.
  4. Contraindications: Severe allergic reaction to a previous dose or **vaccine** component
- K. Meningococcal vaccine (MCV)**
1. **Vaccine** protects against *Neisseria meningitidis*.
  2. Meningococcal (MCV4) **vaccine** is the preferred type of **vaccine** and is given intramuscularly.
  3. MCV4 should be administered to all children at age 11 to 12 years and to unvaccinated adolescents at high school entry (age 15 years); all college freshman living in dormitories should be vaccinated.
  4. Revaccination is recommended for children who remain at increased risk after 3 years (if the first dose was administered at age 2 to 6 years) or after 5 years (if the first dose was administered at age 7 years or older).
  5. It is contraindicated in children with a history of Guillain-Barré syndrome.
- L. Human papillomavirus vaccine (HPV)**
1. Depending on the type of **vaccine** used (HPV2 or HPV4), the HPV **vaccine** guards against diseases that are caused by HPV types 6, 11, 16, and 18, such as cervical cancer, cervical abnormalities that can lead to cervical cancer, and genital warts.
  2. The **vaccine** is most effective for boys and girls if administered before exposure to HPV through sexual contact.
  3. The **vaccine** is administered as three injections over 6 months—first dose to girls at age 11 to 12 years, second dose 2 months after the first dose, and third dose 6 months after the first dose.
  4. A three-dose series may be administered to boys 9 to 18 years old to reduce their likelihood of acquiring genital warts.
  5. The **vaccine** can cause pain, swelling, itching, and redness at the injection site; fever; nausea; and dizziness.
  6. The **vaccine** is contraindicated in individuals with a reaction to a previous injection and in pregnant women.

## XVII. REACTIONS TO A VACCINE

### A. Local reactions

1. Tenderness, erythema, swelling at injection site
2. Low-grade fever
3. Behavioral changes such as drowsiness, unusual crying, decreased appetite

### B. Minimizing local reactions

1. Select a needle of adequate length to deposit **vaccine** deep into the muscle or subcutaneous mass.
2. Inject into the appropriate recommended site.

### C. Anaphylactic reactions

- Goals of treatment are to secure and protect the airway, restore adequate circulation, and prevent further exposure to the antigen.
- For a mild reaction with no evidence of respiratory distress or cardiovascular compromise, a subcutaneous injection of an antihistamine, such as diphenhydramine (Benadryl), and epinephrine (Adrenalin) may be administered.
- For moderate or severe distress, establish an airway; provide cardiopulmonary resuscitation if the child is not breathing; elevate the head; administer epinephrine, fluids, and vasopressors as prescribed; monitor vital signs; and monitor urine output.

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 484.** A nurse provides home care instructions to the parents of a child hospitalized with pertussis. The child is in the convalescent stage and is being prepared for discharge. Which statement by a parent indicates a need for further instructions?
- "We need to encourage our child to drink fluids."
  - "Coughing spells may be triggered by dust or smoke."
  - "Vomiting may occur when our child has coughing episodes."
  - "We need to maintain droplet precautions and a quiet environment for at least 2 weeks."
- 485.** A 6-month-old infant receives a diphtheria, tetanus, and acellular pertussis (DTaP) immunization at a well-baby clinic. The mother returns home and calls the clinic to report that the infant has developed swelling and redness at the site of injection. A nurse tells the mother to:
- Monitor the infant for a fever.
  - Bring the infant back to the clinic.
  - Apply a hot pack to the injection site.
  - Apply an ice pack to the injection site.
- 486.** A child is scheduled to receive inactivated polio vaccine (IPV), and a nurse preparing to administer the vaccine reviews the child's record. The nurse questions the administration of IPV if which of the following is documented in the child's record?
- Recent recovery from a cold
  - A history of frequent respiratory infections
  - A history of an anaphylactic reaction to neomycin
  - A local reaction at the site of injection of a previous IPV
- 487.** A 12-year-old child is scheduled to receive a series of the hepatitis B vaccine. The child arrives at a clinic for the second dose. Before administering the vaccine, a nurse performs an assessment on the child and asks the child and parent about a history of a severe allergy to:
- Eggs
  - Penicillin
  - Sulfonamides
  - A previous dose of hepatitis B vaccine or component
- 488.** A child with rubeola (measles) is being admitted to the hospital. In preparing for the admission of the child, a nurse plans to place the child on which precautions?
- Neutropenic
  - Enteric
  - Airborne
  - Protective
- 489.** A home health nurse visits a child with infectious mononucleosis and provides home care instructions to the parents about the care of the child. The nurse tells the parents to:
- Maintain the child on bedrest for 2 weeks.
  - Maintain respiratory precautions for 1 week.
  - Notify the physician if the child develops a fever.
  - Notify the physician if the child develops abdominal pain or left shoulder pain.
- 490.** A mother brings her 4-month-old infant to a well-baby clinic for immunizations. The child is up to date with the immunization schedule. A nurse would prepare to administer which of the following immunizations to this infant?
- Diphtheria, tetanus, acellular pertussis (DTaP), *Haemophilus influenzae* type b (Hib), inactivated poliovirus vaccine (IPV), pneumococcal vaccine (PCV), rotavirus (RV)
  - Varicella, HepB
  - Measles, mumps, rubella (MMR), Hib, DTaP
  - DTaP, MMR, IPV
- 491.** A clinic nurse prepares to administer a measles, mumps, rubella (MMR) vaccine to a 5-year-old child. The nurse administers this vaccine by which best route and in which best site?
- Intramuscularly in the deltoid muscle
  - Subcutaneously in the gluteal muscle
  - Subcutaneously in the outer aspect of the upper arm
  - Intramuscularly in the anterolateral aspect of the thigh

### Alternate Item Format: Multiple Response

- 492.** A clinic nurse is assessing a child who is scheduled to receive a live virus vaccine (immunization). Which of the following are general

contraindications associated with receiving a live virus vaccine? **Select all that apply.**

- 1. The child has symptoms of a cold.
- 2. The child had a previous anaphylactic reaction to the vaccine.
- 3. Mother reports that the child is having intermittent episodes of diarrhea.

- 4. Mother reports that the child has not had an appetite and has been fussy.
- 5. The child has a disorder that caused a severely deficient immune system.
- 6. Mother reports that the child has recently been exposed to an infectious disease.

## ANSWERS

### 484. 4

**Rationale:** Pertussis is transmitted by direct contact or respiratory droplets from coughing. The communicable period occurs primarily during the catarrhal stage. Respiratory precautions are not required during the convalescent phase. Options 1, 2, and 3 are accurate components of home care instructions.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *convalescent* in the question. Also, note the words *need for further instructions*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Options 1 and 3 can be eliminated because they are generally associated with convalescence. Knowing that 2 weeks of respiratory precautions is not required during the convalescent period will direct you to option 4 from the remaining options. If you had difficulty with this question, review home care instructions for a child with pertussis.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 460). St. Louis: Mosby.

### 485. 4

**Rationale:** Occasionally, tenderness, redness, or swelling may occur at the site of the DTaP injection. This can be relieved with cool packs for the first 24 hours, followed by warm or cold compresses if the inflammation persists. Bringing the infant back to the clinic is unnecessary. Option 1 may be an appropriate intervention, but is not specific to the subject of the question. Hot packs are not applied and can be harmful and cause burning of the skin.

**Test-Taking Strategy:** Use the process of elimination. Option 1 can be eliminated first because it does not relate specifically to the subject of the question. Eliminate option 2 next as an unnecessary intervention. From the remaining options, general principles related to the effects of heat and cold will direct you to option 4. Also noting the word *hot* in option 3 will assist in eliminating this option. Review interventions for redness and swelling at the site of a vaccine injection if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 70). St. Louis: Saunders.

### 486. 3

**Rationale:** Inactivated poliovirus vaccine (IPV) contains neomycin. A history of an anaphylactic reaction to neomycin is considered a contraindication to IPV. The presence of a minor illness such as the common cold is not a contraindication. In addition, a history of frequent respiratory infections is not a contraindication to receiving a vaccine. A local reaction to an immunization is not a contraindication to receiving a vaccine.

**Test-Taking Strategy:** Use the process of elimination. Recalling that a general contraindication to all immunizations is a severe illness (not a mild illness) will assist you in eliminating options 1 and 2. From the remaining options, note that option 4 identifies a local reaction. This will direct you to option 3, the systemic reaction and a potential life-threatening condition. Review the contraindications to receiving immunizations if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 68). St. Louis: Saunders.

### 487. 4

**Rationale:** A contraindication to receiving the hepatitis B vaccine is a previous anaphylactic reaction to a previous dose of hepatitis B vaccine or to a component (aluminum hydroxide or yeast protein) of the vaccine. An allergy to eggs, penicillin, and sulfonamides is unrelated to the contraindication to receiving this vaccine.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the contraindications associated with the administration of vaccines. Note the relationship of the words *hepatitis B vaccine* in the question and option 4. Review receiving the hepatitis B vaccine if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**Reference:** Centers for Disease Control and Prevention (CDC). (n.d.). *Contraindications to vaccines chart*. Available at <http://www.cdc.gov/vaccines/recs/vac-admin/contraindications-vacc.htm>. Retrieved January 10, 2010.

### 488. 3

**Rationale:** Rubeola is transmitted via airborne particles or direct contact with infectious droplets. Airborne droplet precautions are required, and persons in contact with the child should wear masks. The child is placed in a private room if hospitalized, and the hospital room door remains closed. Gowns and gloves are unnecessary, but standard precautions are used. Articles that are contaminated should be bagged and labeled. Special enteric precautions and protective neutropenic isolation are not indicated in rubeola.

**Test-Taking Strategy:** Eliminate options 1 and 4 because they are comparable or alike. Remember that rubeola is transmitted via the airborne route. This will direct you to option 3. Review the route of transmission and therapeutic management of rubeola if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1016). St. Louis: Saunders.

### 489. 4

**Rationale:** Infectious mononucleosis is caused by Epstein-Barr virus. The parents need to be instructed to notify the physician if abdominal pain, especially in the left upper quadrant, or left shoulder pain occurs because this may indicate splenic rupture. Children with enlarged spleens also are instructed to avoid contact sports until splenomegaly resolves. Bedrest is unnecessary, and children usually self-limit their activity. Respiratory precautions are not required, although transmission can occur via direct intimate contact or contact with infected blood. Fever is treated with acetaminophen (Tylenol) or ibuprofen (Motrin).

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the organs affected in mononucleosis. Options 1 and 2 can be eliminated first because they are unnecessary interventions in this disease. From the remaining options, recalling that splenic rupture is a concern will direct you to option 4. Review the complications associated with infectious mononucleosis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 768). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1025). St. Louis: Saunders.

### 490. 1

**Rationale:** Diphtheria, tetanus, acellular pertussis vaccine (DTaP), *Haemophilus influenzae* type b conjugate vaccine

(Hib), inactivated poliovirus vaccine (IPV), pneumococcal vaccine (PCV), and rotavirus vaccine (RV) are administered at 4 months of age. DTaP is administered at 2, 4, and 6 months of age; at 15 to 18 months of age; and at 4 to 6 years of age. Hib is administered at 2, 4, and 6 months of age and at 12 to 15 months of age. IPV is administered at 2, 4, and 6 months of age and at 4 to 6 years of age. PCV is administered at 2, 4, and 6 months of age and at 12 to 15 months of age. The first dose of measles, mumps, rubella (MMR) vaccine is administered at 12 to 15 months of age; the second dose is administered at 4 to 6 years of age (if the second dose was not given by 4 to 6 years of age, it should be given at the next visit). The first dose of hepatitis B vaccine is administered at birth, the second dose is administered at 1 month of age, and the third dose is administered at 6 months of age. Varicella-zoster vaccine is administered at 12 to 15 months of age and again at 4 to 6 years of age.

**Test-Taking Strategy:** Knowledge regarding the immunization schedule for infants and children is required to answer this question. Noting the age of the infant in the question will assist in directing you to option 1. If you are unfamiliar with the immunization schedule for children and adolescents, review this schedule.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**References:** Centers for Disease Control and Prevention (CDC). (2010). *Recommended immunization schedules for persons aged 0 through 18 years—United States, 2010*. Available at <http://www.immunize.org/CDC/schedules/>. Retrieved January 12, 2010.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 69). St. Louis: Saunders.

### 491. 3

**Rationale:** Measles, mumps, rubella (MMR) vaccine is administered subcutaneously in the outer aspect of the upper arm. The gluteal muscle is not recommended for injections. MMR vaccine is not administered by the intramuscular route.

**Test-Taking Strategy:** Use the process of elimination. Recalling that MMR vaccine is administered subcutaneously will assist you in eliminating options 1 and 4. From the remaining options, recalling that the gluteal muscle is not used for injections will assist in directing you to option 3. Review the procedures related to the administration of MMR vaccine if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 364). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 70). St. Louis: Saunders.

**ALTERNATE ITEM FORMAT:  
MULTIPLE RESPONSE****492. 2, 5**

**Rationale:** The general contraindications for receiving live virus vaccines include a previous anaphylactic reaction to a vaccine or a component of a vaccine. Additionally, live virus vaccines generally are not administered to individuals with a severely deficient immune system, individuals with a severe sensitivity to gelatin, or pregnant women. A vaccine is administered with caution to an individual with a moderate or severe acute illness, with or without fever. Options 1, 3, 4, and 6 are not contraindications to receiving a vaccine.

**Test-Taking Strategy:** Note the strategic word *contraindications*. This word indicates that you need to select the situations in which a live virus vaccine cannot be given because doing so can cause harm to the child. Noting the word

*anaphylactic* in option 2 and the words *severely deficient* in option 5 will direct you to these options. Review the contraindications to receiving a live virus vaccine if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**References:** Centers for Disease Control and Prevention (CDC). (n.d.). *Contraindications to vaccines chart*. Available at <http://www.cdc.gov/vaccines/recs/vac-admin/contraindications-vacc.htm>. Retrieved January 10, 2010.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 68, 70). St. Louis: Saunders.

# Pediatric Medication Administration and Calculations

## I. ORAL MEDICATIONS

- A. Most oral pediatric medications are in liquid or suspension form because children usually are unable to swallow a tablet.
-  B. Solutions may be measured by using an oral plastic syringe or other acceptable measurement or administration device; the device used depends on the developmental level of the child (Fig. 49-1).
- C. Medications in suspension settle to the bottom of the bottle between uses, and thorough mixing is required before pouring the medication.
-  D. Suspensions must be administered immediately after measurement to prevent settling and resultant administration of an incomplete dose.
-  E. Administer oral medications with a child sitting in an upright position and with the head elevated to prevent aspiration if the child cries or resists.
-  F. Never pinch an infant or child's nostrils when administering medication.
- G. If a medication is known to have an unpleasant taste, draw the required dose into a small syringe, and place the syringe into the side and toward the back of an infant's mouth; administer the medication slowly, allowing the infant to swallow.
-  H. Place a small child sideways on the lap; the child's closest arm should be placed under the adult's arm and behind the adult's back; cradle the child's head and hold the child's hand, and administer the medication slowly with a plastic spoon, small plastic cup, or syringe.
-  I. If a tablet or capsule has been administered, check the child's mouth to ensure that it has been swallowed; if swallowing is a problem, some tablets can be crushed and given in small amounts of puréed food or flavored syrup (enteric-coated tablets, timed-release tablets, and capsules should not be crushed).
- J. Follow generally accepted medication administration guidelines for children (Box 49-1).

 **Newborns and infants have an immature liver and immature kidneys, so metabolism and elimination of medications is delayed.**

## II. PARENTERAL MEDICATIONS

- A. Subcutaneously and intramuscularly administered medications
  1. Medications most often given via the subcutaneous route are insulin and some immunizations.
  2. Any site with sufficient subcutaneous tissue may be used for subcutaneous injections; common sites include the center third of the lateral aspect of the upper arm, the abdomen, and the center third of the anterior thigh.
  3. The safe use of injection sites is based on normal muscle development and the size of the child; the preferred site for intramuscular injections in infants is the vastus lateralis, but agency policies and procedures need to be followed (Table 49-1 and Fig. 49-2).
  4. The usual needle length and gauge for pediatric clients are  $\frac{1}{2}$  to 1 inch and 22 to 25 gauge; needle length also can be estimated by grasping the muscle between the thumb and forefinger—half the resulting distance would be the needle length.

**▲ FIGURE 49-1** Acceptable devices for measuring and administering oral medication to children (clockwise from bottom left): measuring syringe, plastic syringe, calibrated nipple, plastic medicine cup, calibrated dropper, hollow-handled medicine spoon. (From Hockenberry, M., Wilson, D., & Winkelstein, M. [2005]. *Wong's essentials of pediatric nursing* [7th ed.]. St. Louis: Mosby.)

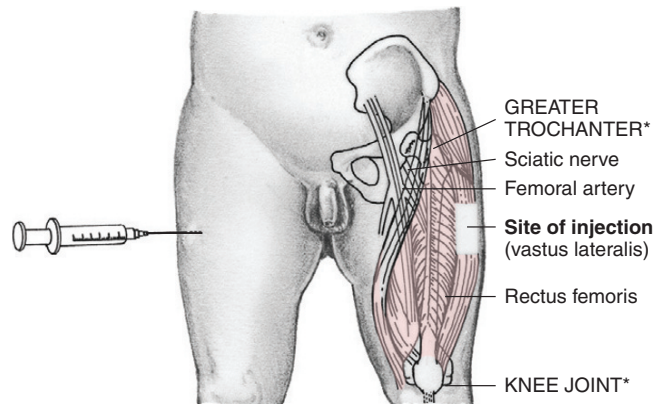

5. Pediatric dosages for subcutaneous and intramuscular administration are calculated to the nearest hundredth and measured by using a tuberculin syringe; always follow agency guidelines.
  6. Place an adhesive bandage or decorated Band-Aid over the puncture site to help the child view the experience in a pleasant way.
- B. Intravenously administered medications**
1. Intravenous (IV) medications are diluted for administration.

**Box 49-1 Medication Administration Guidelines for Children**

Two identifiers are required before medication administration—such as name, medical record number, birth date. Obtain information from parents about successful methods for administering medications to their children. Ask parents about any known allergies. To avoid aspiration, liquid forms of medication are safer to swallow than other forms. Straws often help older children swallow pills. Avoid putting medications in foods such as milk, cereal, or baby food because it may cause an unpleasant taste to the food, and the child may refuse to accept the same food in the future. Additionally, the child may not consume the entire serving and would not receive the required medication dosage. If the taste of the medication is unpleasant, have the child pinch the nose and drink the medication through a straw. Offer juice, a soft drink, or a frozen juice bar after the child swallows a medication. Always read the pharmacological indications for administration. Some items such as fruit syrups can be acidic and should not be used with medications that react negatively in an acid medium. Record the most successful method of administering medications and pertinent nursing prescriptions on the child’s care plan for other nursing staff to follow; this notation also saves the child frustration, fear, and anxiety.

Modified from Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 715). St. Louis: Mosby; and Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal-child nursing care* (4th ed., p. 1274). St. Louis: Mosby.

2. When an infant or child is receiving an IV medication, the IV site needs to be assessed for signs of inflammation and infiltration or extravasation immediately before, during, and after completion of each medication.
3. IV medication may be administered continuously by adding the medication to an IV solution bag and infusing it through a primary infusion line.
4. IV medications may be administered intermittently; several doses may be administered in a 24-hour period.
5. Medications for IV administration are diluted according to the directions accompanying the medication and according to the physician’s prescriptions and agency procedures.
6. Infusion time for IV medications is determined based on the directions accompanying the medication, the physician’s prescription, and agency procedures.
7. Determine agency procedures related to the volume of flush for peripheral IV lines and for central lines.
8. The flush volume (3 to 20 mL) must be included in the child’s intake; the flush is usually

**▲ FIGURE 49-2** Intramuscular injection site—vastus lateralis. Landmarks are indicated by asterisks. (From Hockenberry, M., Wilson, D., & Winkelstein, M. [2009]. *Wong’s essentials of pediatric nursing* [8th ed.]. St. Louis: Mosby.)

**TABLE 49-1** Intramuscular Injections: Amount of Medication (mL) by Muscle Group

| Muscle           | Neonate  | Infant (1-12 mo old) | Toddler (1-2 yr old) | Preschool to Child (3-12 yr old) | Adolescent (12-18 yr old) |
|------------------|----------|----------------------|----------------------|----------------------------------|---------------------------|
| Vastus lateralis | 0.5      | 0.5-1                | 0.5-2                | 2                                | 2                         |
| Rectus femoris   | Not safe | Not safe             | 0.5-1                | 2                                | 2                         |
| Ventrogluteal    | Not safe | Not safe             | Not safe             | 0.5-3                            | 2-3                       |
| Dorsal gluteal   | Not safe | Not safe             | Not safe             | 0.5-2                            | 2-3                       |
| Deltoid          | Not safe | Not safe             | 0.5-1                | 0.5-1                            | 1-1.5                     |

Modified from Kee, J., & Marshall, S. (2009). *Clinical calculations: With applications to general and specialty areas* (6th ed., p. 261). St. Louis: Saunders.

administered before administering an IV medication and after the IV medication is completed and is infused at the same rate as the medication.

**C. Intermittent IV medication administration**

1. Children receiving IV medications intermittently may or may not have a primary IV solution infusing.
2. If a primary IV solution is infusing, the medication may be administered by IV piggyback via a secondary line.
3. If a primary IV solution does not exist, an indwelling infusion catheter is used for medication administration, and the medication may be administered by push, piggyback, or retrograde method; medication administration instructions must be checked for dilution and infusion time procedures.
4. All intermittent medication administrations are preceded and followed by a flush to ensure that the medication has cleared the IV tubing and that the total dose has been administered.
5. Electronic devices such as controllers or pumps are used to regulate and administer IV fluids and intermittent IV medications.

**D. Special IV administration sets**

1. Special IV administration sets, such as a burette, may be used for medication preparation and administration via piggyback.
2. These special sets are all microdrip sets calibrated to deliver 60 gtt/mL.
3. The total capacity of these special IV administration sets is 100 to 150 mL, calibrated in 1-mL increments so that exact measurements of small volumes are possible.
4. The medication is mixed with the appropriate amount of diluent, added to the special IV administration set, and allowed to infuse at the prescribed rate.
5. The special IV administration set needs to be labeled clearly to identify the medication and fluid dosage added.
6. During medication infusion time, a label is attached that indicates that the medication is infusing.
7. During the flush infusion time, a label is attached indicating that the flush is infusing.

**E. Retrograde IV injection**

1. In this method of administration, the medication is mixed with the appropriate amount of diluent in a syringe.
2. The IV tubing is clamped close to the child, the medication is injected through the port in the direction of the burette, the tubing is unclamped, the prescribed rate is set, and the medication is allowed to infuse over the prescribed time.

**F. Syringe pump for IV medication administration**

1. A syringe containing the medication is fitted into a pump that is connected to the IV tubing through a Y connector.

2. The medication is administered over the prescribed time.

 The 24-hour fluid intake must be monitored closely, and all IV fluid amounts including the amount of flush volume need to be documented accurately to prevent overhydration. For children, the maximum amount of IV fluid administered in a 24-hour period varies and is usually based on body weight and other factors. Check the physician's prescription and agency guidelines for the procedures for the administration of IV fluids and medications.

### III. CALCULATION OF MEDICATION DOSAGE BY BODY WEIGHT

**A. Conversion of body weight (Box 49-2)**

**B. Calculation of daily dosages**

1. Abbreviations (Box 49-3)
2. Dosages are expressed in terms of milligrams per kilogram per day, milligrams per pound per day, or milligrams per kilogram per dose.
3. The total daily dosage usually is administered in divided (more than one) doses per day.
4. Express the child's body weight in kilograms or pounds to correlate with the dosage specifications.
5. Calculate the total daily dosage.
6. Divide the total daily dosage by the number of doses to be administered in 1 day.

#### Box 49-2 Conversion of Body Weight

**Measurements**

1 lb = 16 oz  
1 kg = 2.2 lb

**Pounds to Kilograms**

1 kg = 2.2 lb  
When converting from pounds to kilograms, divide by 2.2. Kilograms are expressed to the nearest tenth.

**Kilograms to Pounds**

1 kg = 2.2 lb  
When converting from kilograms to pounds, multiply by 2.2. Pounds are expressed to the nearest tenth.

#### Box 49-3 Abbreviations

|                |                   |
|----------------|-------------------|
| BSA            | body surface area |
| g              | gram(s)           |
| gr             | grain(s)          |
| kg             | kilogram(s)       |
| lb             | pound(s)          |
| m <sup>2</sup> | square meters     |
| mcg            | microgram(s)      |
| mg             | milligram(s)      |
| mL             | milliliter(s)     |
| SA             | surface area      |

#### IV. CALCULATION OF BODY SURFACE AREA (BSA)

- The BSA is determined by comparing body weight and height with averages or norms on a graph called a nomogram.
- Not all children are the same size at the same age; the nomogram is used to determine the BSA of a child.
- Look at the nomogram (Fig. 49-3), and note that the height is on the left-hand side of the chart and the weight is on the right-hand side of the chart.
- Place a ruler across the chart.
- Line up the left side of the ruler on the height and the right side of the ruler on the weight; read the BSA at the point where the straight edge of the ruler intersects the surface area (SA) column.

**▲ FIGURE 49-3** West nomogram for estimation of surface areas in infants and children. First, find height; next, find weight; finally, draw a straight line connecting the height and weight. The body surface area (in square meters [ $m^2$ ]) is indicated where a straight line connecting the height and weight intersects the surface area (SA) column or, if the child is approximately of normal proportion, from weight alone (yellow area). (From Hockenberry, M., Wilson, D., & Winkelstein, M. [2005]. *Wong's essentials of pediatric nursing* [7th ed.]. St. Louis: Mosby.)

- The estimated SA is given in square meters ( $m^2$ ).
- Box 49-4 gives a sample practice question using the nomogram.

#### V. CALCULATION BASED ON BSA

- When dosage recommendations for children specify milligrams, micrograms, or units per square meter, calculating the dosage is simple multiplication (Box 49-5).
- When dosage recommendations are specified only for adults, a formula is used to calculate a child's dosage from the adult dosage (Box 49-6).

##### Box 49-4 How to Use the Nomogram

*Example:* Use the nomogram (see Fig. 49-3) and calculate the body surface area (BSA) for a child whose height is 58 inches and weight is 12 kg.

Look at the nomogram chart and note that the height is on the left-hand side of the chart and the weight is on the right-hand side.

Place a ruler on the chart and line up the left side of the ruler on the height and the right side of the ruler on the weight; read the BSA at the point where the straight edge of the ruler intersects the surface area (SA) column.

The estimated SA is given in square meters.

*Answer:*  $0.66 m^2$

##### Box 49-5 Calculating Medication Dosage

When dosage recommendations for children specify milligrams, micrograms, or units per square meter, calculating the dosage is simple multiplication.

*Example:* The dosage recommendation is  $4 \text{ mg}/m^2$ . The child has a body surface area of  $1.1 m^2$ . What is the dosage to be administered?

*Answer:*  $1.1 \times 4 \text{ mg} = 4.4 \text{ mg}$

##### Box 49-6 Calculating a Child's Dosage From the Adult Dosage

When dosages are specified only for adults, a formula is used to calculate a child's dosage from the adult dosage. The adult dosage is based on a standardized body surface area (BSA) of  $1.73 m^2$ .

*Example:* A physician has prescribed an antibiotic for a child. The average adult dose is 250 mg. The child has a BSA of  $0.41 m^2$ . What is the dose for the child?

*Answer:* 59.24 mg

*Formula:*

$$\frac{\text{BSA of child } (m^2)}{1.73 m^2} \times \text{Adult dose} = \text{Child's dose}$$

$$\frac{0.41}{1.73} \times 250 \text{ mg} = 59.24 \text{ mg}$$

## VI. DEVELOPMENTAL CONSIDERATIONS FOR ADMINISTERING MEDICATIONS

- A. When administering medications to children, **developmental age** must be taken into consideration to ensure safe and effective administration.
- B. General interventions
  1. Always be prepared for the procedure with all necessary equipment and assistance.
  2. For a hospitalized child, ask the parent or child or both if the parent should or should not remain for the procedure.
  3. Determine appropriate preadministration and postadministration comfort measures.
  4. Try to make the event as pleasant as possible.
- C. Box 49-7 lists developmental considerations when giving medications.

### Box 49-7 Developmental Considerations for Administering Medications

#### Infants

Perform procedure quickly; then offer comfort measures, such as holding, rocking, and cuddling.

Allow self-comforting measures, such as the use of a pacifier.

#### Toddlers

Offer a brief, concrete explanation of the procedure and then perform it.

Accept aggressive behavior, within reasonable limits, as a healthy response, and provide outlets for the toddler.

Provide comfort measures immediately after the procedure, such as touch, holding, cuddling, and providing a favorite toy.

#### Preschoolers

Offer a brief, concrete explanation of the procedure and then perform it.

Accept aggressive behavior, within reasonable limits, as a healthy response, and provide outlets for the child.

Provide comfort measures after the procedure, such as touch, holding, or providing a favorite toy.

#### School-Age Children

Explain the procedure, allowing for some control over the body and situation.

Explore feelings and concepts through therapeutic play, drawings of own body and self in the hospital, and the use of books and realistic hospital equipment.

Set appropriate behavior limits, such as it is all right to cry or scream, but not to bite.

Provide activities for releasing aggression and anger.

Use the opportunity to teach about how medication helps the disorder.

#### Adolescents

Explain the procedure, allowing for some control over body and situation.

Explore concepts of self, hospitalization, and illness, and correct any misconceptions.

Encourage self-expression, individuality, and self-care needs.

Encourage participation in the procedure.

Modified from McKenry, L., and Salerno, E. (2003). *Mosby's pharmacology in nursing*. St. Louis: Mosby.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

493. A nurse provides medication instructions to a mother. Which statement by the mother indicates a need for further instructions?
  1. "I should cuddle my child after giving the medication."
  2. "I can give my child a frozen juice bar after he swallows the medication."
  3. "I should mix the medication in the baby food and give it when I feed my child."
  4. "If my child does not like the taste of the medicine, I should encourage him to pinch his nose and drink the medication through a straw."
494. A physician's prescription reads "ampicillin sodium 125 mg IV every 6 hours." The medication label reads "1 g and reconstitute with 7.4 mL of bacteriostatic water." A nurse prepares to draw up how many milliliters to administer one dose?
  1. 1.1 mL
  2. 0.54 mL
  3. 7.425 mL
  4. 0.925 mL
495. A pediatric client with ventricular septal defect repair is placed on a maintenance dosage of digoxin (Lanoxin) elixir. The dosage is 0.07 mg/kg/day, and the client's weight is 7.2 kg. The physician orders the digoxin to be given twice daily. A nurse prepares how much digoxin to administer to the client at each dose?
  1. 0.5 mg
  2. 2.5 mg
  3. 0.25 mg
  4. 0.37 mg

**496.** Sulfisoxazole (Gantrisin), 1 g orally four times daily, is prescribed for an adolescent with a urinary tract infection. The medication label reads “500-mg tablets.” A nurse has determined that the dosage prescribed is safe. The nurse administers how many tablets per dose to the adolescent?

1. ½ tablet
2. 1 tablet
3. 2 tablets
4. 3 tablets

**497.** A nurse prepares to administer an intramuscular injection to a 4-month-old infant. The nurse selects which site to administer the injection?

1. Ventrogluteal
2. Dorsal gluteal
3. Rectus femoris
4. Vastus lateralis

**498.** Penicillin G procaine (Wycillin), 1,000,000 units IM (intramuscularly), is prescribed for a child with an infection. The medication label reads “1,200,000 units per 2 mL.” A nurse has determined that the dose prescribed is safe. The nurse administers how many milliliters per dose to the child?

1. 0.8 mL
2. 1.2 mL
3. 1.44 mL
4. 1.66 mL

### Alternate Item Format: Figure and Fill-in-the-Blank

**499.** Atropine sulfate, 0.6 mg intramuscularly, is prescribed for a child preoperatively. A nurse has determined that the dose prescribed is safe and prepares to administer how many milliliters to the child? See figure.

\_\_\_\_\_ mL

## ANSWERS

### 493. 3

**Rationale:** The nurse would teach the mother to avoid putting medications in foods because it may cause an unpleasant taste to the food, and the child may refuse to accept the same food in the future. Additionally, the child may not consume the entire serving and would not receive the required medication dosage. If the taste of the medication is unpleasant, the child should pinch the nose and drink the medication through a straw. The mother should offer juice, a soft drink, or a frozen juice bar to the child after the child swallows the medication. The mother should provide comfort measures immediately after medication administration, such as touching, holding, cuddling, and providing a favorite toy.

**Test-Taking Strategy:** Note the strategic words *need for further instructions*. These words indicate a negative event query and the need to select the incorrect statement made by the mother. Read each statement carefully and think about the statement that may be unsafe and may not provide an accurate dose to the child. This will direct you to option 3. Review the procedures for administering medication to children if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1274). St. Louis: Mosby.

### 494. 4

**Rationale:** Convert 1 g to milligrams. In the metric system, to convert larger to smaller, multiply by 1000 or move the decimal point three places to the right.

1 g = 1000 mg

**Formula:**

$$\frac{\text{Desired}}{\text{Available}} \times \text{Volume} = \frac{125 \text{ mg}}{1000 \text{ mg}} \times 7.4 \text{ mL} = 0.925 \text{ mL per dose}$$

**Test-Taking Strategy:** Focus on the subject, milliliters per dose. Convert grams to milligrams first. Next, use the formula to determine the correct dose, knowing that 1000 mg = 7.4 mL. Verify the answer using a calculator. Review the formula for calculating medication doses if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental skills—Medications/Blood & IV Therapy

**Reference:** Kee, J., & Marshall, S. (2009). *Clinical calculations: With applications to general and specialty areas* (6th ed., p. 86). St. Louis: Saunders.

### 495. 3

**Rationale:** Calculate the dosage by weight first:

$$0.07 \text{ mg/day} \times 7.2 \text{ kg} = 0.5 \text{ mg/day}$$

The physician prescribes digoxin twice daily; two doses in 24 hours will be administered:

$$\frac{0.5 \text{ mg/day}}{2 \text{ doses}} = 0.25 \text{ mg for each dose}$$

**Test-Taking Strategy:** Read the question carefully, noting that the question states *twice daily* and *each dose*. Calculate the dosage per day by weight first, and then determine the milligrams per each dose. Verify the answer using a calculator. Review the formula for calculating dosage per kg of body weight if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Kee, J., & Marshall, S. (2009). *Clinical calculations: With applications to general and specialty areas* (6th ed., p. 262). St. Louis: Saunders.

#### 496. 3

**Rationale:** Change 1 g to milligrams, knowing that 1000 mg = 1 g. Also, when converting from grams to milligrams (larger to smaller), move the decimal point three places to the right: 1 g = 1000 mg. Next, use the formula for calculating the correct dose.

**Formula:**

$$\frac{\text{Desired}}{\text{Available}} \times \text{Tablet} = \frac{1000 \text{ mg}}{500 \text{ mg}} \times \text{Tablet} = 2 \text{ tablets}$$

**Test-Taking Strategy:** Focus on the subject, tablets per dose. Convert grams to milligrams first. Next, use the formula to determine the correct dose and verify the answer using a calculator. Review the formula for calculating medication doses if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Kee, J., & Marshall, S. (2009). *Clinical calculations: With applications to general and specialty areas* (6th ed., p. 86). St. Louis: Saunders.

#### 497. 4

**Rationale:** Intramuscular injection sites are selected based on the child's age and muscle development of the child. The vastus lateralis is the only safe muscle group to use for intramuscular injection in a 4-month-old infant. The sites identified in options 1, 2, and 3 are unsafe.

**Test-Taking Strategy:** Focus on the age of the child identified in the question and think about the physiological development of the muscle groups in an infant at 4 months of age. This will assist in directing you to option 4. Review the pediatric guidelines for administering intramuscular medications if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Kee, J., & Marshall, S. (2009). *Clinical calculations: With applications to general and specialty areas* (6th ed., p. 261). St. Louis: Saunders.

#### 498. 4

**Rationale:** Use the medication calculation formula.

**Formula:**

$$\frac{\text{Desired}}{\text{Available}} \times \text{Volume} = \frac{1,000,000}{1,200,000} \times 2 \text{ mL} = 1.66 \text{ mL per dose}$$

**Test-Taking Strategy:** Focus on the subject, milliliters per dose. Use the formula to determine the correct dose, and verify the answer using a calculator. Review the formula for calculating medication doses if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Kee, J., & Marshall, S. (2009). *Clinical calculations: With applications to general and specialty areas* (6th ed., p. 86). St. Louis: Saunders.

### ALTERNATE ITEM FORMAT: FIGURE AND FILL-IN-THE-BLANK

#### 499. 1.5 mL

**Rationale:** Use the formula for calculating the medication dose.

**Formula:**

$$\frac{\text{Desired}}{\text{Available}} \times \text{Volume} = \frac{0.6 \text{ mg}}{0.4 \text{ mg}} \times 1 \text{ mL} = 1.5 \text{ mL}$$

**Test-Taking Strategy:** Focus on the subject, the milliliters to be administered. Note that the medication label indicates that there is 0.4 mg per mL. Use the formula to determine the correct dose, and verify the answer using a calculator. Review the formula for calculating medication doses if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Kee, J., & Marshall, S. (2009). *Clinical calculations: With applications to general and specialty areas* (6th ed., p. 86, 271). St. Louis: Saunders.

## UNIT VIII

# The Adult Client With an Integumentary Disorder

### PYRAMID TERMS

**burn** Cell destruction of the layers of the skin resulting in local and systemic disruptions.

**carbon monoxide poisoning** Carbon monoxide is a colorless, odorless, and tasteless gas that has an affinity for hemoglobin 200 times greater than that of oxygen. Oxygen molecules are displaced, and carbon monoxide reversibly binds to hemoglobin to form carboxyhemoglobin. Tissue hypoxia occurs.

**chemical burn** Tissue injury caused by tissue contact with strong acids, alkalis, or organic compounds. Systemic toxicity from cutaneous absorption can occur.

**deep full-thickness burn** Involves injury to the muscle, bone, and tendons. Injured area appears black and eschar is hard and inelastic.

**deep partial-thickness burn** Injury extends into the skin dermis and the wound is red and dry, with white areas in deeper parts; can convert to a full-thickness burn if tissue damage increases with infection, hypoxia, or ischemia.

**electrical burn** Tissue injury caused by heat generated by electrical energy as it passes through the body; results in internal tissue damage.

**full-thickness burn** The injured area appears waxy white, deep red, yellow, brown, or black; injured surface appears dry. Edema is present under eschar.

**herpes zoster (shingles)** An acute viral infection of the nerve structure caused by varicella-zoster. Herpes zoster is contagious to individuals who never had chickenpox and have not been vaccinated against the disease.

**pressure ulcer** Area of tissue damage that occurs as a result of skin and underlying soft tissue compression from pressure between a surface and a bony prominence.

**skin cancer** A malignant lesion of the skin that may or may not metastasize. Overexposure to the sun is a primary cause. Diagnosis is confirmed by a skin biopsy that is positive for cancer cells.

**smoke inhalation injury** Respiratory injury that occurs when the victim is trapped in an enclosed, smoke-filled space.

**superficial-thickness burn** Involves injury to the epidermis. Mild to severe erythema is noted, and the skin blanches with pressure. The burn is painful.

**superficial partial-thickness burn** A mottled red base and broken epidermis and a wet shiny and weeping surface are present. Large blisters can be seen covering an extensive area. Skin is edematous and painful.

**thermal burn** Tissue injury caused by exposure to flames, hot liquids, steam, or hot objects.

### PYRAMID TO SUCCESS

The Pyramid to Success focuses on the concept that the integumentary system provides the first line of defense against infections. Focus on the protective measures necessary to prevent infection, including methicillin-resistant *Staphylococcus aureus* (MRSA). Pyramid Points address the risk factors related to the development of integumentary disorders, and the preventive measures related to skin cancer. Focus on the emergency measures related to a client with a burn, fluid resuscitation, monitoring for complications, and skin grafting. Psychosocial issues relate to the body image disturbances that can occur as a result of the integumentary disorder.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Consulting with members of the health care team regarding treatments
- Establishing priorities of care
- Handling of hazardous and infectious materials
- Instituting standard and other precautions
- Maintaining confidentiality related to the disorder
- Making referrals to appropriate health care providers
- Obtaining informed consent for treatments and procedures
- Practicing asepsis techniques and preventing infection

### Health Promotion and Maintenance

- Implementing disease prevention measures
- Performing physical assessment techniques for the integumentary system
- Promoting health screening and health promotion programs to prevent skin disorders

Providing instructions to the client regarding prevention measures and care of integumentary disorder

### Psychosocial Integrity

- Addressing end-of-life issues
- Discussing unexpected body image changes
- Identifying coping mechanisms
- Identifying situational role changes
- Using support systems

### Physiological Integrity

- Assessing for alterations in body systems
- Providing adequate nutrition for healing
- Providing basic care and comfort
- Providing emergency care
- Monitoring for expected effects of treatments
- Monitoring for fluid and electrolyte imbalances and other complications
- Monitoring laboratory values

# Integumentary System

## I. ANATOMY AND PHYSIOLOGY

- A.** The skin is the largest sensory organ of the body, with a surface area of 15 to 20 square feet and a weight of about 9 lb.
- B.** Functions
  1. Acts as the first line of defense against infections
  2. Protects underlying tissues and organs from injury
  3. Receives stimuli from the external environment; detects touch, pressure, pain, and temperature stimuli; relays information to the nervous system
  4. Maintains normal body temperature
  5. Excretes salts, water, and organic wastes
  6. Protects the body from excessive water loss
  7. Synthesizes vitamin D<sub>3</sub>, which converts to calcitriol, for normal calcium metabolism
  8. Stores nutrients
- C.** Layers
  1. Epidermis
  2. Dermis
  3. Subcutaneous fat (adipose tissue)
- D.** Epidermal appendages
  1. Nails
  2. Hair
  3. Glands
    - a. Sebaceous
    - b. Sweat
- E.** Normal bacterial flora
  1. Types of normal bacterial flora include the following:
    - a. Gram-positive and gram-negative staphylococci
    - b. *Pseudomonas* sp.
    - c. *Streptococcus* sp.
  2. Organisms are shed with normal exfoliation.
  3. A pH of 4.2 to 5.6 halts the growth of bacteria.

## II. RISK FACTORS FOR INTEGUMENTARY DISORDERS

- A.** Exposure to chemical and environmental pollutants
- B.** Exposure to radiation
- C.** Race and age
- D.** Exposure to the sun or use of indoor tanning
- E.** Lack of personal hygiene habits
- F.** Use of harsh soaps or other harsh products

- G.** Some medications, such as long-term glucocorticoid use or herbal preparations
- H.** Nutritional deficiencies
- I.** Moderate to severe emotional stress
- J.** Infection, with injured areas as the potential entry points for infection
- K.** Repeated injury and irritation
- L.** Changes associated with developmental stages and aging
- M.** Inherited genetic mutations
- N.** Systemic illnesses

## III. PSYCHOSOCIAL IMPACT

- A.** Change in body image, decreased general well-being, and decreased self-esteem
- B.** Social isolation and fear of rejection (because of embarrassment about changes in skin appearance)
- C.** Restrictions in physical activity
- D.** Pain
- E.** Disruption or loss of employment
- F.** Cost of medications, hospitalizations, and follow-up care including dressing supplies

## IV. PHASES OF WOUND HEALING

- A.** Phases
  1. Inflammatory: Begins at the time of injury and lasts 3 to 5 days; manifestations include local edema, pain, redness, and warmth.
  2. Fibroblastic: Begins the 4th day after injury and lasts 2 to 4 weeks; scar tissue forms and granulation tissue forms in the tissue bed.
  3. Maturation: begins as early as 3 weeks after the injury and may last for 1 year; scar tissue becomes thinner and is firm and inelastic on palpation.
- B.** Healing by intention
  1. First intention: Wound edges are approximated and held in place (i.e., with sutures) until healing occurs; wound is easily closed and dead space is eliminated.
  2. Second intention: This type of healing occurs with injuries or wounds that have tissue loss and require gradual filling in of the dead space with connective tissue.

3. Third intention: This type of healing involves delayed primary closure and occurs with wounds that are intentionally left open for several days for irrigation or removal of debris and exudates; once debris has been removed and inflammation resolves, the wound is closed by first intention.

## V. SKIN ASSESSMENT

- A. Skin assessment techniques: Refer to Chapter 34 for assessment of the integumentary system and Chapter 35 for skin changes that occur with the aging process.
- B. Dark-skinned client
  1. Cyanosis: Check lips and tongue for a gray color; nail beds, palms, and soles for a blue color; and conjunctiva for pallor.
  2. Jaundice: Check oral mucous membranes for a yellow color; check the sclera nearest to the iris for a yellow color.
  3. Bleeding: Look for skin swelling and darkening and compare the affected side with the unaffected side.
  4. Inflammation: check for warmth, a shiny or taut and pitting skin area, and compare with the unaffected side.

## VI. DIAGNOSTIC TESTS

- A. Skin biopsy
  1. Description
    - a. Skin biopsy is the collection of a small piece of skin tissue for histopathological study.
    - b. Methods include punch, excisional, and shave.
  2. Preprocedure interventions
    - a. Obtain informed consent.
    - b. Cleanse site as prescribed.
  3. Postprocedure interventions
    - a. Place specimen when obtained by the physician in the appropriate container and send to pathology laboratory for analysis.
    - b. Use surgically aseptic technique for biopsy site dressings.
    - c. Assess the biopsy site for bleeding and infection.
    - d. Instruct the client to keep dressing in place for at least 8 hours, and then clean daily and use antibiotic ointment as prescribed (sutures are usually removed in 7 to 10 days).
    - e. Instruct the client to report signs of excessive drainage or redness or other signs of infection.
- B. Skin cultures
  1. A small skin culture sample is obtained using a sterile applicator and the appropriate type of culture tube (e.g., bacterial or viral).
  2. Viral culture is placed immediately on ice.
  3. Sample is sent to laboratory to identify an existing organism.

 Obtain skin culture samples or any other type of culture specimens before instituting antibiotic therapy.

- C. Wood's light examination
  1. Description: Skin is viewed under ultraviolet light through a special glass (Wood's glass) to identify superficial infections of the skin.
  2. Preprocedure intervention: Darken the room before the examination.
  3. Postprocedure intervention: Assist the client during adjustment from the darkened room.
- D. Diascopy
  1. Technique allows clearer inspection of lesions by eliminating the erythema caused by increased blood flow to the area.
  2. A glass slide is pressed over the lesion, causing blanching and revealing the lesion more clearly.

## VII. CANDIDA ALBICANS

- A. Description
  1. A superficial fungal infection of the skin and mucous membranes
  2. Also known as a yeast infection, or *thrush* when it occurs in the mouth
  3. Risk factors include immunosuppression, such as clients with acquired immunodeficiency syndrome; cancer clients receiving chemotherapy; clients on long-term antibiotic therapy; clients with diabetes mellitus; and obese clients.
  4. Common areas of occurrence include the mucous membranes of the mouth, perineum, vagina, axilla, and under the breasts.
- B. Assessment
  1. Skin: Red and irritated appearance that itches and **burns**.
  2. Mucous membranes of the mouth: Red and whitish patches.
- C. Interventions
  1. Teach the client to keep skin fold areas clean and dry.
  2. For the hospitalized client, inspect skin fold areas frequently, turn and reposition the client frequently, and keep the skin and bed linens clean and dry.
  3. Provide frequent mouth care as prescribed and avoid irritating products.
  4. Provide food and fluids that are tepid in temperature and nonirritating to mucous membranes.
  5. Antifungal medications may be prescribed.

## VIII. HERPES ZOSTER (SHINGLES)

- A. Description
  1. With a history of chickenpox, **shingles** is caused by the reactivation of the varicella-zoster virus; **shingles** can occur during any immunocompromised state in a client with a history of chickenpox.

2. The dormant virus is located in the dorsal nerve root ganglion of the sensory cranial and spinal nerves.
  3. **Herpes zoster** eruptions occur in a segmental distribution on the skin area along the infected nerve and show up after several days of discomfort in the area.
  4. Diagnosis is determined by visual examination, and by Tzanck smear and viral culture that identify the organism.
  5. Postherpetic neuralgia (severe pain) can remain after the lesions resolve.
  6. Herpes zoster is contagious to individuals who never had chickenpox and who have not been vaccinated against the disease.
  7. Herpes simplex virus is another type of virus; type 1 infection causes a cold sore (usually on the lip) and type 2 causes genital herpes (both types are contagious).
- B. Assessment: Herpes zoster**
1. Unilaterally clustered skin vesicles along peripheral sensory nerves on the trunk, thorax, or face
  2. Fever, malaise
  3. Burning and pain
  4. Pruritus
  5. Paresthesia
- C. Interventions**
1. Isolate the client because exudate from the lesions contains the virus (maintain standard and other precautions as appropriate, such as contact precautions).
  2. Assess for signs and symptoms of infection, including skin infections and eye infections; skin necrosis can also occur.
  3. Assess neurovascular status and seventh cranial nerve function; Bell's palsy is a complication.
  4. Use an air mattress and bed cradle on the client's bed if hospitalized, and keep the environment cool; warmth and touch aggravate the pain.
  5. Prevent the client from scratching and rubbing the affected area.
  6. Instruct the client to wear lightweight, loose cotton clothing and to avoid wool and synthetic clothing.
  7. Teach the client about the prescribed therapies; astringent compresses may be prescribed to relieve irritation and pain and to promote crust formation and healing.
  8. Teach the client about measures to keep the skin clean to prevent infection.
  9. Teach the client about topical treatment or antiviral medications if prescribed.
  10. Vaccination for **shingles** is recommended for adults 60 years of age and older to reduce the risk of occurrence and the associated long-term pain.
  11. Antiviral medications may include acyclovir (Zovirax), valacyclovir (Valtrex), or famciclovir (Famvir); refer to Chapter 71 for information on antiviral medications.

## IX. METHICILLIN-RESISTANT STAPHYLOCOCCUS AUREUS (MRSA)

- A. Description**
1. Skin or wound becomes infected with methicillin-resistant *Staphylococcus aureus* (MRSA).
  2. Infection can range from mild to severe and can present as folliculitis or furuncles.
  3. Folliculitis is a superficial infection of the follicle caused by *Staphylococcus* and presents as a raised red rash and pustules; furuncles are also caused by *Staphylococcus* and occur deep in the follicle, presenting as very painful large raised bumps that may or may not have a pustule.
  4. If MRSA infects the blood, sepsis, organ damage, and death can occur.

**!** MRSA is contagious and is spread to others by direct contact with infected skin or infected articles; for the client with MRSA, the infection can also be spread to other parts of the body.

- B. Assessment:** A culture and sensitivity test of the skin or wound confirms the presence of MRSA and leads to choice of appropriate antibiotic therapy.
- C. Interventions**
1. Maintain standard precautions and contact or isolation precautions as appropriate to prevent spread of infection to others.
  2. Monitor the client closely for signs of further infection or worsening of the condition, which could indicate organ damage.
  3. Administer antibiotic therapy as prescribed.
  4. For additional information on MRSA, refer to Chapter 48.

## X. ERYSIPELAS AND CELLULITIS

- A. Description**
1. Erysipelas is an acute, superficial, rapidly spreading inflammation of the dermis and lymphatics caused by *Streptococcus* group A, which enters the tissue via an abrasion, bite, trauma, or wound.
  2. Cellulitis is a skin infection into the deeper dermis and subcutaneous fat; the causative organism is usually *Streptococcus pyogenes*.
- B. Assessment**
1. Pain
  2. Itching
  3. Swelling
  4. Redness and warmth
- C. Interventions**
1. Promote rest of the affected area.
  2. Apply warm compresses as prescribed to promote circulation and to decrease discomfort, erythema, and edema.
  3. Clean the skin with an antibacterial type of soap as prescribed.

4. Administer antibiotics as prescribed for an infection; obtain a culture of the area before initiating the antibiotics.

### XI. POISON IVY, POISON OAK, AND POISON SUMAC

**A.** Description: A dermatitis that develops from contact with urushiol from poison ivy, oak, or sumac plants

**B.** Assessment

1. Papulovesicular lesions
2. Severe itching

**C.** Interventions

1. Cleanse the skin of the plant oils immediately.
2. Apply cool, wet compresses to relieve the itching.
3. Apply topical products to relieve the itching and discomfort.
4. Topical or oral glucocorticoids may be prescribed for severe reactions.

### XII. BITES AND STINGS

**A.** Spider bites

1. Almost all types of spider bites are venomous and most are not harmful, but bites or stings from brown recluse spiders, black widow spiders, tarantulas, scorpions, bees, and wasps can produce toxic reactions in humans.
2. Brown recluse spider
  - a. Bite can cause a skin lesion, a necrotic wound, or systemic effects from the toxin (loxoscelism).
  - b. Application of ice to decrease enzyme activity of the venom and limit tissue necrosis should be done immediately and intermittently for up to 4 days after the bite.
  - c. Topical antiseptics and antibiotics may be necessary if the site becomes infected.
3. Black widow spider
  - a. Bite causes a small red papule.
  - b. Venom causes neurotoxicity.
  - c. Ice is applied immediately to inhibit the action of the neurotoxin.
  - d. Systemic toxicity can occur and the victim may require supportive therapy in the hospital.
4. Tarantulas
  - a. Bite causes swelling, redness, numbness, lymph inflammation, and pain at the bite site.
  - b. The tarantula launches its barbed hairs, which penetrate the skin and eyes of the victim, producing a severe inflammatory reaction.
  - c. Tarantula hairs are removed as soon as possible using sticky tape to pull hairs from the skin, and the skin is thoroughly irrigated; saline irrigations are done for eye exposure.
  - d. The involved extremity is elevated and immobilized to reduce pain and swelling.

- e. Antihistamines and topical or systemic corticosteroids may be prescribed; tetanus prophylaxis is necessary.

**B.** Scorpion stings

1. Scorpions inject venom into the victim through a stinging apparatus on their tail.
2. Most stings cause local pain, inflammation, and mild systemic reactions that are treated with analgesics, wound care, and supportive treatment.
3. The bark scorpion can inflict a severe and fatal systemic response; the venom is neurotoxic; the victim is taken to the emergency department immediately (an antivenom is administered for bark scorpion bites).

**C.** Bees and wasps

1. Stings usually cause a wheal and flare reaction.
2. Emergency care involves quick removal of the stinger and application of an ice pack.
3. The stinger is removed by gently scraping or brushing it off with the edge of a needle or similar object; tweezers are not used because there is a risk of pinching the venom sac.
4. If the victim is allergic to the venom of a bee or wasp, a severe allergic response can occur (hives, pruritus, swelling of the lips and tongue) that can progress to life-threatening anaphylaxis; immediate emergency care is required.
5. Individuals who are allergic should carry an EpiPen for self-administration of intramuscular epinephrine if a bee or wasp sting occurs.

**D.** Snake bites

1. Some snakes are venomous and can cause a serious systemic reaction in the victim.
2. The victim should be immediately moved to a safe area away from the snake and should rest to decrease venom circulation; the extremity is immobilized and kept below the level of the heart.
3. Constricting clothing and jewelry are removed before swelling occurs.
4. The victim is kept warm and is not allowed to consume caffeinated or alcoholic beverages, which may speed absorption of the venom.
5. If transport to the emergency department is not done immediately, a constricting band may be applied proximal to the wound to slow the venom circulation; monitor the circulation frequently and loosen the band if edema occurs.
6. The wound is not incised or sucked to remove the venom; ice is not applied to the wound.
7. Emergency care in a hospital is required as soon as possible; an antivenom may be administered along with supportive care.

For spider bites, scorpion bites, or other stings or bites, the Poison Control Center should be contacted as soon as possible to determine the best initial management.

**XIII. FROSTBITE****A. Description**

1. Frostbite is damage to tissues and blood vessels as a result of prolonged exposure to cold.
2. Fingers, toes, face, nose, and ears often are affected.

**B. Assessment**

1. First-degree: Involves hyperemia and edema formation of the involved area
2. Second-degree: Large fluid-filled blisters with partial-thickness skin necrosis
3. Third-degree: Involves the formation of small blisters that contain dark fluid and an affected body part that is cool, numb, blue, or red and does not blanch; full-thickness and subcutaneous tissue necrosis require debridement.
4. Fourth-degree: No blisters or edema noted and the part is numb, cold, and bloodless; full-thickness necrosis extends into muscle and bone and gangrene develops, which may require amputation of the affected part.

**C. Interventions**

1. Rewarm the affected part rapidly and continuously with a warm water bath to thaw the frozen part (hot towels may be used if a warming tub is not available).
2. Handle the part gently and immobilize and elevate the part above heart level.
3. Avoid using dry heat, and never rub or massage the part, which may result in further tissue damage.
4. Rewarming process may be painful; analgesics may be necessary.
5. Avoid compression of the injured tissues and apply only loose and nonadherent sterile dressings.
6. Monitor for signs of compartment syndrome.
7. Tetanus prophylaxis is necessary, and topical and systemic antibiotics may be prescribed.
8. Debridement of necrotic tissue may be necessary; amputation may be necessary in those in whom gangrene develops.

**XIV. ACTINIC KERATOSES**

- A.** Actinic keratoses are caused by chronic exposure to the sun and appear as rough, scaly, red, or brown lesions that are usually found on the face, scalp, arms, and backs of the hands.
- B.** Lesions can progress to squamous cell carcinoma.
- C.** Treatment includes medications, excision, cryotherapy, curettage, and laser therapy.
- D.** Medications include fluorouracil (Carac, Efudex, Fluoroplex), diclofenac sodium (Solaraze), imiquimod 5% cream (Aldara), and aminolevulinic acid (Levulan Kerastick); see Chapter 51 for information on these medications.

**XV. SKIN CANCER****A. Description**

1. **Skin cancer** is a malignant lesion of the skin, which may or may not metastasize.
2. Overexposure to the sun is a primary cause; other causes and conditions that place the individual at risk include chronic skin damage from repeated injury and irritation, an inherited genetic mutation, ionizing radiation, light-skinned race, age older than 60 years, an outdoor occupation, and exposure to chemical carcinogens.
3. Diagnosis is confirmed by skin biopsy.

**B. Types**

1. Basal cell: Basal cell cancer arises from the basal cells contained in the epidermis; metastasis is rare but underlying tissue destruction can progress to organ tissue.
2. Squamous cell: Squamous cell cancer is a tumor of the epidermal keratinocytes and can infiltrate surrounding structures and metastasize to lymph nodes.
3. Melanoma: Melanoma may occur any place on the body, especially where birthmarks or new moles are apparent; it is highly metastatic to the brain, lungs, bone, and liver, with survival depending on early diagnosis and treatment.

**C. Assessment (Box 50-1)**

1. Change in color, size, or shape of preexisting lesion
2. Pruritus
3. Local soreness

 **The client needs to be informed about the risks associated with overexposure to the sun and taught about the importance of performing monthly self-skin assessments.**

**D. Interventions**

1. Instruct the client regarding the risk factors and preventive measures.
2. Instruct the client to perform monthly self-skin assessments and to monitor for lesions that do not heal or that change characteristics.
3. Advise the client to have moles or lesions removed that are subject to chronic irritation.
4. Advise the client to avoid contact with chemical irritants.
5. Instruct the client to wear layered clothing and use sunscreen lotions with an appropriate skin protection factor when outdoors.
6. Instruct the client to avoid sun exposure between 10 AM and 4 PM.
7. Management may include surgical or nonsurgical interventions; if medication is prescribed provide instructions about its use.
8. Assist with surgical management, which may include cryosurgery, curettage and electrodesiccation, or surgical excision of the lesion.

**Box 50-1 Appearance of Skin Cancer Lesions****Basal Cell Carcinoma**

Waxy border  
Papule, red, central crater  
Metastasis is rare

**Squamous Cell Carcinoma**

Oozing, bleeding, crusting lesion  
Potentially metastatic  
Larger tumors associated with a higher risk for metastasis

**Melanoma**

Irregular, circular, bordered lesion with hues of tan, black, or blue  
Rapid infiltration into tissue, highly metastatic

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed.). St. Louis: Saunders.

**XVI. PSORIASIS****A. Description**

1. Psoriasis is a chronic, noninfectious skin inflammation involving keratin synthesis that results in psoriatic patches.
2. Various forms exist, with psoriasis vulgaris being the most common.

3. Possible causes of the disorder include stress, trauma, infection, hormonal changes, obesity, an autoimmune reaction, and climate changes; a genetic predisposition may also be a cause.
4. The disorder may be exacerbated by the use of certain medications.
5. Koebner phenomenon is the development of psoriatic lesions at a site of injury, such as a scratched or sunburned area.
6. In some individuals with psoriasis, arthritis develops that leads to joint changes similar to those seen in rheumatoid arthritis.
7. The goal of therapy is to reduce cell proliferation and inflammation, and the type of therapy prescribed depends on the extent of the disease and the client's response to treatment.

**B. Assessment**

1. Pruritus
2. Shedding: Silvery, white scales on a raised, reddened, round plaque that usually affects the scalp, knees, elbows, extensor surfaces of arms and legs, and sacral regions
3. Yellow discoloration, pitting, and thickening of the nails are noted if they are affected.
4. Joint inflammation with psoriatic arthritis

**C. Pharmacological therapy: Refer to Chapter 51 for medications used to treat psoriasis.****D. Interventions and client education**

1. Provide emotional support to the client with associated altered body image and decreased self-esteem.
2. Instruct the client in the use of prescribed therapies and to avoid over-the-counter medications.
3. Instruct the client not to scratch the affected areas and to keep the skin lubricated as prescribed to minimize itching.
4. Monitor for and instruct the client to recognize the signs and symptoms of infection and to report these signs.
5. Instruct the client to wear light cotton clothing over affected areas.
6. Assist the client to identify ways to reduce stress if stress is a predisposing factor.

**XVII. ACNE VULGARIS****A. Description**

1. Acne is a chronic skin disorder that usually begins in puberty and is more common in males; lesions develop on the face, neck, chest, shoulders, and back.
2. Acne requires active treatment for control until it resolves.
3. The types of lesions include comedones (open and closed), pustules, papules, and nodules.
4. The exact cause is unknown but may include androgenic influence on sebaceous glands, increased sebum production, and proliferation

of *Propionibacterium acnes* (the enzymes reduce lipids to irritating fatty acids).

- Exacerbations coincide with the menstrual cycle in female clients because of hormonal activity; oily skin and a genetic predisposition may be contributing factors.

#### B. Assessment

- Closed comedones are whiteheads and noninflamed lesions that develop as follicles and enlarge, with the retention of horny cells.
- Open comedones are blackheads that result from continuing accumulation of horny cells and sebum, which dilates the follicles.
- Pustules and papules result as the inflammatory process progresses.
- Nodules result from total disintegration of a comedone and subsequent collapse of the follicle.
- Deep scarring can result from nodules.

#### C. Interventions

- Instruct the client in prescribed skin-cleansing methods, with emphasis on not scrubbing the face and using only prescribed topical agents.
- Instruct the client in the administration of topical or oral medications as prescribed.
- Instruct the client not to squeeze, prick, or pick at lesions.
- Instruct the client to use products labeled noncomedogenic and cosmetics that are water-based, and to avoid contact with products with an excessive oil base.
- Instruct the client on the importance of follow-up treatment.
- Refer to Chapter 51 for information on the medications used to treat acne.

### XVIII. STEVENS-JOHNSON SYNDROME

- A drug-induced skin reaction that occurs through an immunological response
- Similar to toxic epidermal necrolysis, another drug-induced skin reaction that results in diffuse erythema and large blister formation
- May be mild or severe, and may cause vesicles, erosions, and crusts on the skin; if severe, systemic reactions occur that involve the respiratory system, renal system, and eyes, resulting in blindness.
- Most commonly occurs in clients with cancer who are receiving chemotherapy or immunotherapy
- Treatment includes immediate discontinuation of the medication causing the syndrome; antibiotics, corticosteroids, and supportive therapy may be necessary.

### XIX. PRESSURE ULCER

#### A. Description

- A **pressure ulcer** causes impairment of skin integrity.

- A **pressure ulcer** can occur anywhere on the body; tissue damage results when the skin and underlying tissue are compressed between a bony prominence and an external surface for an extended period of time.
- The tissue compression restricts blood flow to the skin, which can result in tissue ischemia, inflammation, and necrosis; once a **pressure ulcer** forms, it is difficult to heal.
- Prevention of skin breakdown in any part of the body is a major role of the nurse.

#### B. Risk factors

- Skin pressure and skin shearing and friction
- Immobility
- Malnutrition
- Excessive skin moisture such as that which occurs with incontinence
- Decreased sensory perception

#### C. Assessment and staging (Box 50-2)

#### D. Interventions

 **Avoid direct massage to a reddened skin area because massage can damage the capillary beds and cause tissue necrosis.**

- Identify clients at risk for developing a **pressure ulcer**.
- Institute measures to prevent **pressure ulcers** such as appropriate positioning, using pressure relief devices, ensuring adequate nutrition, and developing a plan for skin cleansing and care.
- Perform frequent skin assessments and monitor for an alteration in skin integrity.
- Keep the client's skin dry and the sheets wrinkle-free; if the client is incontinent, check the client frequently and change pads or any items placed under the client immediately after they are soiled.
- Use creams and lotions to lubricate the skin and a barrier protection ointment for the incontinent client.
- Turn and reposition the immobile client every 2 hours or more frequently if necessary; provide active and passive range of motion exercises at least every 8 hours.
- If a **pressure ulcer** is present, record the location and size of the wound (length, width, depth), monitor and record the type and amount of exudates (a culture of the exudate may be prescribed), and assess for undermining and tunneling.
- Serosanguineous exudate (blood-tinged amber fluid) is expected for the first 48 hours; purulent exudates indicate colonization of the wound with bacteria.
- Use agency protocols for skin assessment and management of a wound.

**Box 50-2 Stages of Pressure Ulcers****Stage I**

Skin is intact.  
Area is red and does not blanch with external pressure.  
Area may be painful, firm, soft, warmer or cooler compared with adjacent tissue.

**Stage II**

Skin is not intact.  
Partial-thickness skin loss of the dermis occurs.  
Presents as a shallow open ulcer with a red-pink wound bed or as intact or open/ruptured serum-filled blister.

**Stage III**

Full-thickness skin loss extends into the dermis and subcutaneous tissues, and slough may be present.  
Subcutaneous tissue may be visible.  
Undermining and tunneling may or may not be present.

**Stage IV**

Full-thickness skin loss is present with exposed bone, tendon, or muscle.  
Slough or eschar may be present.  
Undermining and tunneling may develop.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed.). St. Louis: Saunders.

10. Treatment may include wound dressings and debridement; skin grafting may be necessary (Tables 50-1 and 50-2).
11. Other treatments may include electrical stimulation to the wound area (increases blood vessel growth and stimulates granulation), vacuum-assisted wound closure (removes infectious material from the wound and promotes

granulation), hyperbaric oxygen therapy (administration of oxygen under high pressure raises tissue oxygen concentration), and the use of topical growth factors (biologically active substances that stimulate cell growth).

**XX. BURN INJURIES** (see Priority Nursing Actions)

**TABLE 50-1** Types of Dressings and Mechanism of Action

| Dressing Type                      | Mechanism Of Action  |
|------------------------------------|--|
| Wet-to-damp saline-moistened gauze | Mechanically removes necrotic debris.  |
| Continuous wet gauze               | Wound is continually bathed with a prescribed solution; promotes dilution of exudates and softens dry eschar.  |
| Topical enzyme preparations        | Provides a proteolytic action on thick and adherent eschar; this causes breakdown of the denatured protein and more rapid separation of necrotic tissue. |
| Moisture-retentive dressing        | Spontaneous separation of necrotic tissue is promoted by autolysis.  |

Modified from Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 493). St. Louis: Saunders.

**TABLE 50-2** Types of Dressing Materials

| Type                      | Indications, Uses, Considerations  | Frequency of Dressing Changes  |
|---------------------------|--|--|
| Alginate                  | Provides hemostasis, debridement, absorption, and protection.<br>Can be used as packing for deep wounds and for infected wounds.<br>Requires a secondary dressing for securing.  | When dressing is saturated (every 3 to 5 days) or more frequently                                |
| Biological                | Provides protection, and debridement after eschar removal.<br>May be used for dormant and nonhealing wounds that do not respond to other topical therapies.<br>May be used for burns or before pigskin and cadaver skin grafts.<br>Conforms to uneven wound surfaces; reduces pain.<br>Requires a secondary dressing for securing. | Topical growth factors: changed daily.<br>Skin substitutes: the need for dressing change varies. |
| Cotton gauze              | Continuous dry dressing provides absorption and protection.<br>Continuous wet dressing provides protection, a means for the delivery of topical treatment, and debridement.<br>Wet to damp dressing provides atraumatic mechanical debridement.<br>May be painful on removal.  | Clean base: every 12 to 24 hours.<br>Necrotic base: every 4 to 6 hours.                          |
| Foam                      | Provides absorption, protection, insulation, and debridement.<br>Conforms to uneven wound surfaces.<br>Requires a secondary dressing for securing.   | When dressing is saturated or more frequently  |
| Hydrocolloidal            | Provides absorption, protection, and debridement.<br>Is waterproof and is painless on removal.   | Clean base: on leakage of exudates.<br>Necrotic base: every 24 hours.                            |
| Hydrogel                  | Provides absorption, protection, and debridement.<br>Conducive to use with topical agents.<br>Conforms to uneven wound surfaces but allows only partial wound visualization.<br>Requires a secondary dressing for securing.<br>Can promote the growth of <i>Pseudomonas</i> and other microorganisms.                              | Clean base: every 24 hours.<br>Necrotic base: every 6 to 8 hours.                                |
| Adhesive transparent film | Provides protection for partial-thickness lesions, debridement, and serves as a secondary (cover) dressing.<br>Provides good wound visualization.<br>Is waterproof and reduces pain.<br>Use is limited to superficial lesions.<br>Is nonabsorbent, adheres to normal and healing tissue.<br>Dressing may be difficult to apply.    | Clean base: on leakage of exudates.<br>Necrotic base: every 24 hours.                            |

Modified from Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 494-495). St. Louis: Saunders.

- A.** Description: Cell destruction of the layers of the skin that results in local and systemic disruptions
- B.** **Burn size**
  1. Small **burns**: The response of the body to injury is localized to the injured area
  2. Large or extensive **burns**
    - a. Large **burns** consist of 25% or more of the total body surface area.
    - b. The response of the body to the injury is systemic.
    - c. The **burn** affects all major systems of the body.

### PRIORITY NURSING ACTIONS!

#### Actions to Take in the Emergency Department for a Client With a Burn Injury

1. Assess for airway patency.
2. Administer oxygen as prescribed.
3. Obtain vital signs.
4. Initiate an intravenous (IV) line and begin fluid replacement as prescribed.
5. Elevate the extremities if no fractures are obvious.
6. Keep the client warm and place the client on an NPO status.

The primary goal for a burn injury is to maintain a patent airway, administer IV fluids to prevent hypovolemic shock, and preserve vital organ functioning. Therefore the priority action is to assess for airway patency and to maintain a patent airway. The nurse then prepares to administer oxygen. The type of oxygen delivery system is prescribed by the physician. Oxygen is necessary to perfuse tissues and organs. Vital signs should be assessed so that a baseline is obtained, which is needed for comparison of subsequent vital signs once fluid resuscitation is initiated. The nurse then initiates an IV line and begins fluid replacement as prescribed. The extremities are elevated (if no obvious fractures are present) to assist in preventing shock. The client is kept warm (using sterile linens) and is placed on NPO status because of the altered gastrointestinal function that occurs as a result of the burn injury. A Foley catheter may be inserted so that the response to the fluid resuscitation can be carefully monitored. Once these actions are taken the nurse performs a complete assessment, stays with the client, and monitors the client closely. Additionally, tetanus toxoid may be prescribed for prophylaxis.

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 528). St. Louis: Saunders.

### Box 50-3 Method to Estimate Extent of Burn Injury

#### Rule of Nines (Adult)

|                  |     |
|------------------|-----|
| Head:            | 9%  |
| Anterior trunk:  | 18% |
| Posterior trunk: | 18% |
| Arms (9% each):  | 18% |
| Legs (18% each): | 36% |
| Perineum:        | 1%  |

The rule of nines provides a rapid method for calculating the size of the injury but overestimation of the total body surface area can occur with this method. Follow agency protocols for estimating the extent of the burn injury.

▲ **FIGURE 50-1** The rule of nines for estimating burn percentage. (Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care*. [6th ed.]. St. Louis: Saunders.)

**C.** Estimating the extent of injury (Box 50-3; Fig. 50-1)

**D. Burn** depth

1. **Superficial-thickness burn** (Fig. 50-2)
  - a. Involves injury to the epidermis; the blood supply to the dermis is still intact.
  - b. Mild to severe erythema (pink to red) is present, but no blisters.
  - c. Skin blanches with pressure.
  - d. **Burn** is painful, with tingling sensation, and the pain is eased by cooling.
  - e. Discomfort lasts about 48 hours; healing occurs in about 3 to 6 days.
  - f. No scarring occurs and skin grafts are not required.
2. **Superficial partial-thickness burn** (Fig. 50-3)
  - a. Involves injury deeper into the dermis; the blood supply is reduced.
  - b. Large blisters may cover an extensive area.
  - c. Edema is present.

- d. Mottled pink to red base and broken epidermis, with a wet, shiny, and weeping surface is characteristic.
- e. **Burn** is painful and sensitive to cold air.
- f. Heals in 10 to 21 days with no scarring, but some minor pigment changes may occur.
- g. Grafts may be used if the healing process is prolonged.

Superficial burns damage only the top layer of the skin—the epidermis. Healing occurs in 3-6 days.

▲ **FIGURE 50-2** Tissues involved in superficial burns. (Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

▲ **FIGURE 50-3** Typical appearance of superficial partial-thickness burn injury. (Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

3. **Deep partial-thickness burn** (Fig. 50-4)

- Extends deeper into the skin dermis
- Blister formation usually does not occur because the dead tissue layer is thick and sticks to underlying viable dermis.
- Wound surface is red and dry with white areas in deeper parts.
- May or may not blanch and edema is moderate
- Can convert to **full-thickness burn** if tissue damage increases with infection, hypoxia, or ischemia.
- Generally heals in 3 to 6 weeks, but scar formation results, and skin grafting may be necessary.

4. **Full-thickness burn** (Fig. 50-5)

- Involves injury and destruction of the epidermis and the dermis; the wound will not heal by re-epithelialization and grafting may be required.
- Appears as a dry, hard, leathery eschar (**burn crust** or dead tissue must slough off or be removed from the wound before healing can occur).

▲ **FIGURE 50-4** Typical appearance of deep partial-thickness burn injury. (Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

▲ **Figure 50-5** Typical appearance of full-thickness burn injury. (Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

c. Appears waxy white, deep red, yellow, brown, or black.

d. Injured surface appears dry.

e. Edema is present under the eschar.

f. Sensation is reduced or absent because of nerve ending destruction.

g. Healing may take weeks to months and depends on establishing an adequate blood supply.

h. **Burn** requires removal of eschar and split- or full-thickness skin grafting.

i. If not prevented, scarring and wound contractures are likely to develop.

5. **Deep full-thickness burn** (Fig. 50-6)

a. Injury extends beyond the skin into underlying fascia and tissues, and muscle, bone, and tendons are damaged.

b. Injured area appears black and sensation is completely absent.

c. Eschar is hard and inelastic.

d. Healing time takes months and grafts are required.

**E.** Age and general health

- Mortality rates are higher for children younger than 4 years of age, particularly for children from birth to 1 year of age, and for clients older than 65 years.

**▲ FIGURE 50-6** Typical appearance of deep full-thickness burn injury. (Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

2. Debilitating disorders, such as cardiac, respiratory, endocrine, and renal disorders, negatively influence the client's response to injury and treatment.
3. Mortality rate is higher when the client has a pre-existing disorder at the time of the **burn** injury.

#### F. **Burn** location

1. **Burns** of the head, neck, and chest are associated with pulmonary complications.
2. **Burns** of the face are associated with corneal abrasion.
3. **Burns** of the ear are associated with auricular chondritis.
4. Hands and joints require intensive therapy to prevent disability.
5. The perineal area is prone to autocontamination by urine and feces.
6. Circumferential **burns** of the extremities can produce a tourniquet-like effect and lead to vascular compromise (compartment syndrome).
7. Circumferential thorax **burns** lead to inadequate chest wall expansion and pulmonary insufficiency.

## XXI. TYPES OF BURNS

**A. Thermal burns** are caused by exposure to flames, hot liquids, steam, or hot objects.

### **B. Chemical burns**

1. **Burns** are caused by tissue contact with strong acids, alkalis, or organic compounds.
2. Systemic toxicity from cutaneous absorption can occur.

### **C. Electrical burns**

1. **Burns** are caused by heat generated by electrical energy as it passes through the body.
2. **Electrical burns** result in internal tissue damage.
3. Cutaneous **burns** cause muscle and soft tissue damage that may be extensive, particularly in high-voltage electrical injuries.
4. The voltage, type of current, contact site, and duration of contact are important to identify.

5. Alternating current is more dangerous than direct current because it is associated with cardiopulmonary arrest, ventricular fibrillation, tetanic muscle contractions, and long bone or vertebral fractures.

**D. Radiation burns** are caused by exposure to ultraviolet light, x-rays, or radioactivity.

## XXII. INHALATION INJURIES

### **A. Smoke inhalation injury**

1. Description: Respiratory injury that occurs when the victim is trapped in an enclosed, hot, smoke-filled space

 **Airway is a priority concern in an inhalation injury.**

2. Assessment

- a. Facial **burns**
- b. Erythema
- c. Swelling of oropharynx and nasopharynx
- d. Singed nasal hairs
- e. Flaring nostrils
- f. Stridor, wheezing, and dyspnea
- g. Hoarse voice
- h. Sooty (carbonaceous) sputum and cough
- i. Tachycardia
- j. Agitation and anxiety

### **B. Carbon monoxide poisoning**

1. Description

- a. Carbon monoxide is a colorless, odorless, and tasteless gas that has an affinity for hemoglobin 200 times greater than that of oxygen.
- b. Oxygen molecules are displaced and carbon monoxide reversibly binds to hemoglobin to form carboxyhemoglobin.
- c. Tissue hypoxia occurs.

2. Assessment (Table 50-3)

### **C. Smoke poisoning**

1. Description

- a. Smoke poisoning is caused by the inhalation of the byproducts of combustion.
- b. A localized inflammatory reaction occurs, causing a decrease in bronchial ciliary action and a decrease in surfactant.

2. Assessment

- a. Mucosal edema occurs in the airways.
- b. Wheezing is evident on auscultation.
- c. After several hours, sloughing of the tracheobronchial epithelium may occur, and hemorrhagic bronchitis may develop.
- d. Acute respiratory distress syndrome can result.

### **D. Direct thermal heat injury**

1. Description

- a. Thermal heat injury can occur to the lower airways by the inhalation of steam or explosive gases or the aspiration of scalding liquids.

**TABLE 50-3** Carbon Monoxide Poisoning

| Blood Level (%)            | Clinical Manifestations  |
|----------------------------|--|
| 1-10                       | Normal level   |
| 11-20 (mild poisoning)     | Headache<br>Flushing<br>Decreased visual acuity<br>Decreased cerebral functioning<br>Slight breathlessness   |
| 21-40 (moderate poisoning) | Headache<br>Nausea and vomiting<br>Drowsiness<br>Tinnitus and vertigo<br>Confusion and stupor<br>Pale to reddish-purple skin<br>Decreased blood pressure<br>Increased and irregular heart rate |
| 41-60 (severe poisoning)   | Coma<br>Seizures   |
| 61-80 (fatal poisoning)    | Death  |

Modified from Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 530). St. Louis: Saunders.

- b. Injury can occur to the upper airways, which appear erythematous and edematous, with mucosal blisters and ulcerations.
  - c. Mucosal edema can lead to upper airway obstruction, especially during the first 24 to 48 hours.
  - d. All clients with head or neck **burns** should be monitored closely for the development of airway obstruction and are considered immediately for endotracheal intubation if obstruction occurs.
2. Assessment
    - a. Erythema and edema of the upper airways
    - b. Mucosal blisters and ulcerations

### XXIII. PATHOPHYSIOLOGY OF BURNS

- A.** Following the **burn**, vasoactive substances are released from the injured tissue, and these substances cause an increase in capillary permeability, allowing the plasma to seep into the surrounding tissues.
- B.** The direct injury to the vessels increases capillary permeability (capillary permeability decreases 18 to 26 hours after the **burn**, but does not normalize until 2 to 3 weeks following injury).
- C.** Extensive **burns** result in generalized body edema and a decrease in circulating intravascular blood volume.
- D.** The fluid losses result in a decrease in organ perfusion.
- E.** The heart rate increases, cardiac output decreases, and blood pressure drops.
- F.** Initially, hyponatremia and hyperkalemia occur.
- G.** The hematocrit level increases as a result of plasma loss; this initial increase falls to below normal at

the third to fourth day after the **burn** as a result of red blood cell damage and loss at the time of injury.

- H.** Initially, the body shunts blood from the kidneys, causing oliguria; then the body begins to reabsorb fluid, and diuresis of the excess fluid occurs over the next days to weeks.
- I.** Blood flow to the gastrointestinal tract is diminished, leading to intestinal ileus and gastrointestinal dysfunction.
- J.** Immune system function is depressed, resulting in immunosuppression and thus increasing the risk of infection and sepsis.
- K.** Pulmonary hypertension can develop, resulting in a decrease in the arterial oxygen tension level and a decrease in lung compliance.
- L.** Evaporative fluid losses through the **burn** wound are greater than normal, and the losses continue until complete wound closure occurs.
- M.** If the intravascular space is not replenished with intravenously administered fluids, hypovolemic shock and ultimately death occur.

### XXIV. MANAGEMENT OF THE BURN INJURY

- A.** Resuscitation/emergent phase (Table 50-4)
  1. Prehospital care
    - a. Prehospital care begins at the scene of the accident and ends when emergency care is obtained.
    - b. Remove the victim from the source of the **burn**.
    - c. Remove the source of heat.
    - d. Assess the ABCs—airway, breathing, and circulation.
    - e. Assess for associated trauma.
    - f. Conserve body heat.
    - g. Cover **burns** with sterile or clean cloths.
    - h. Remove constricting jewelry and clothing.
    - i. Assess the need for intravenous (IV) fluids.
    - j. Transport to the emergency department.
  2. Emergency department care is a continuation of care administered at the scene of the injury.
  3. Major **burns**
    - a. Evaluate the degree and extent of the **burn** and treat life-threatening conditions.
    - b. Ensure a patent airway and administer 100% oxygen as prescribed if the **burn** occurred in an enclosed area.
    - c. Monitor for respiratory distress and assess the need for intubation.
    - d. Assess oropharynx for blisters and erythema.
    - e. Monitor arterial blood gases and carboxyhemoglobin levels.
    - f. For an inhalation injury, administer 100% oxygen via a tight-fitting non-rebreather face mask as prescribed until the carboxyhemoglobin level falls below 15%.

**TABLE 50-4** Phases of Management of the Burn Injury

| Phase  | Goal   |
|--|--|
| <p><b>RESUSCITATION/EMERGENT PHASE</b><br/>           Begins at the time of injury<br/>           Ends with the restoration of normal capillary permeability<br/>           Duration usually 48 to 72 hr<br/>           Includes prehospital care and emergency department care</p>  | The primary goal is to maintain a patent airway, administer intravenous fluids to prevent hypovolemic shock, and preserve vital organ functioning. |
| <p><b>RESUSCITATIVE PHASE</b><br/>           Begins with the initiation of fluids<br/>           Ends when capillary integrity returns to near-normal levels and large fluid shifts have decreased<br/>           Amount of fluid administered based on client's weight and extent of injury<br/>           (Most fluid replacement formulas are calculated from the time of injury and not from the time of arrival at the hospital.)</p> | The goal is to prevent shock by maintaining adequate circulating blood volume and maintaining vital organ perfusion.                               |
| <p><b>ACUTE PHASE</b><br/>           Begins when the client is hemodynamically stable, capillary permeability is restored, and diuresis has begun<br/>           Usually begins 48 to 72 hr after time of injury<br/>           Focus on infection control, wound care, wound closure, nutritional support, pain management, physical therapy</p>  | The goal during this phase is placed on restorative therapy, and the phase continues until wound closure is achieved.                              |
| <p><b>REHABILITATIVE PHASE</b><br/>           Overlaps acute phase of care<br/>           Extends beyond hospitalization</p>   | The goals of this phase are designed so that the client can gain independence and achieve maximal function.  |

**TABLE 50-5** Common Fluid Resuscitation Formulas for First 24 Hours After a Burn Injury

| Formula  | Solution   | Rate of Administration                               |
|--|--|--|
| <p><b>MODIFIED BROOKE</b><br/>           0.5 mL to 15 mL/kg/% TBSA burn</p>                      | Protenate or 5% albumin in isotonic saline<br>Lactated Ringer's without dextrose | Half given in first 8 hr<br>Half given in next 16 hr |
| <p><b>PARKLAND (BAXTER)</b><br/>           4 mL/kg/% TBSA burn</p>                               | Crystalloid only (lactated Ringer's)   | Half given in first 8 hr, half given in next 16 hr   |
| <p><b>MODIFIED PARKLAND</b><br/>           4 mL/kg/% TBSA burn + 15 mL/m<sup>2</sup> of TBSA</p> | Crystalloid only (lactated Ringer's)   | Half given in first 8 hr, half given in next 16 hr   |

TBSA, Total body surface area.

Modified from Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 533). St. Louis: Saunders.

- g. Initiate peripheral IV access to nonburned skin proximal to any extremity **burn**, or prepare for the insertion of a central venous line as prescribed.
- h. Assess for hypovolemia and prepare to administer fluids intravenously to maintain fluid balance.
- i. Monitor vital signs closely.
- j. Insert a Foley catheter as prescribed, and maintain urine output at 30 to 50 mL/hr.
- k. Maintain an NPO status.
- l. Insert a nasogastric tube as prescribed to remove gastric secretions and prevent aspiration.
- m. Administer tetanus prophylaxis as prescribed.
- n. Administer pain medication, as prescribed, by the IV route.
- o. Prepare the client for an escharotomy or fasciotomy as prescribed.

#### 4. Minor **burns**

- a. Administer pain medication as prescribed.
- b. Instruct the client in the use of oral analgesics as prescribed.
- c. Administer tetanus prophylaxis as prescribed.
- d. Administer wound care as prescribed, which may include cleansing, debriding loose tissue, and removing any damaging agents, followed by the application of topical antimicrobial cream and a sterile dressing.
- e. Instruct the client in follow-up care, including active range-of-motion exercises and wound care treatments.

#### **B.** Resuscitative phase (see Table 50-4)

1. Fluid resuscitation (Table 50-5)
  - a. The amount of fluid administered depends on how much IV fluid per hour is required to maintain a urinary output of 30 to 50 mL/hr.

- b. Successful fluid resuscitation is evaluated by stable vital signs, an adequate urine output, palpable peripheral pulses, and a clear sensorium.
- c. IV fluid replacement may be titrated (adjusted) based on urinary output plus serum electrolyte levels to meet the perfusion needs of the client with **burns**.
- d. If the hemoglobin and hematocrit levels decrease or if the urinary output exceeds 50 mL/hr, the rate of IV fluid administration may be decreased.

 **Urinary output is the most reliable and most sensitive noninvasive assessment parameter for cardiac output and tissue perfusion.**

## 2. Interventions

- a. Monitor for tracheal or laryngeal edema and administer respiratory treatments as prescribed.
- b. Monitor pulse oximetry and prepare for arterial blood gases and carboxyhemoglobin levels if inhalation injury is suspected.
- c. Elevate the head of the bed to 30 degrees or more for **burns** of the face and head.
- d. Initiate electrocardiographic monitoring.
- e. Monitor temperature and assess for infection.
- f. Initiate protective isolation techniques; maintain strict handwashing; use sterile sheets and linens when caring for the client; and use gloves, cap, masks, shoe covers, scrub clothes, and plastic aprons.
- g. Shave or cut body hair around wound margins.
- h. Monitor daily weights, expecting a weight gain of 15 to 20 pounds in the first 72 hours.
- i. Monitor gastric output and pH levels and for gastric discomfort and bleeding, indicating a stress ulcer.
- j. Administer antacids, H<sub>2</sub> receptor antagonists, and antiulcer medications as prescribed to prevent a stress ulcer.
- k. Auscultate bowel sounds for ileus and monitor for abdominal distention and gastrointestinal dysfunction.
- l. Monitor stools for occult blood.
- m. Obtain urine specimen for myoglobin and hemoglobin levels.
- n. Monitor IV fluids and hourly intake and output to determine the adequacy of fluid replacement therapy; notify the physician if urine output is less than 30 or greater than 50 mL/hr.
- o. Elevate circumferential **burns** of the extremities on pillows above the level of the heart to reduce dependent edema if no obvious fractures are present; diuretics increase the risk of hypovolemia and are generally avoided as a means of decreasing edema.

- p. Monitor pulses and capillary refill of the affected extremities and assess perfusion of the distal extremity with a circumferential **burn**.
  - q. Prepare to obtain chest x-rays and other radiographs to rule out fractures or associated trauma.
  - r. Keep the room temperature warm.
  - s. Place the client on an air-fluidized bed or other special mattress and use a bed cradle to keep sheets off the client's skin.
- ## 3. Pain management
- a. Administer opioid analgesics as prescribed by the IV route.
  - b. Avoid administering medication by the oral route because of the possibility of gastrointestinal dysfunction.
  - c. Medicate the client as prescribed and before painful procedures.

 **Avoid the intramuscular or subcutaneous medication routes for medication administration because absorption through the soft tissue is unreliable when hypovolemia and large fluid shifts occur.**

## 4. Nutrition

- a. Proper nutrition is essential to promote wound healing and prevent infection.
- b. The basal metabolic rate is 40 to 100 times higher than normal with a **burn** injury.
- c. Maintain an NPO status until the bowel sounds are heard, and then advance to clear liquids as prescribed.
- d. Nutrition may be provided via enteral tube feeding or parenteral nutrition through a central line.
- e. Provide a diet high in protein, carbohydrates, fats, and vitamins.
- f. Monitor calorie intake.

## 5. Escharotomy

- a. A lengthwise incision is made through the **burn** eschar to relieve constriction and pressure and to improve circulation.
- b. Escharotomy is performed for circulatory compromise caused by circumferential **burns**.
- c. Escharotomy is performed at the bedside without anesthesia because nerve endings have been destroyed by the **burn** injury.
- d. Escharotomy can be performed on the thorax to improve ventilation.
- e. Following the escharotomy, assess pulses, color, movement, and sensation of affected extremity and control any bleeding with pressure.
- f. Pack the incision gently with fine mesh gauze as prescribed after escharotomy.
- g. Apply topical antimicrobial agents to the area as prescribed.

**TABLE 50-6** Open Method Versus Closed Method of Wound Care

| Method  | Advantages  | Disadvantages  |
|---|---|--|
| <b>OPEN</b><br>Antimicrobial cream is applied as prescribed, and wound is left open to the air without a dressing.  | Visualization of the wound<br>Easier mobility and joint range of motion<br>Simplicity in wound care | Increased chance of hypothermia from exposure  |
| <b>CLOSED</b><br>Gauze dressings are carefully wrapped from the distal to the proximal area of the extremity to ensure that circulation is not compromised. No two burn surfaces should be allowed to touch; touching can promote webbing of digits, contractures, and poor cosmetic outcome. Dressings are changed usually every 8 to 12 hr. | Decreases evaporative fluid and heat loss<br>Aids in debridement                                    | Mobility limitations<br>Prevents effective range-of-motion exercises<br>Wound assessment limited |

**Box 50-4 Debridement****Mechanical**

Performed during hydrotherapy; involves use of washcloths or sponges to cleanse and debride eschar and the use of scissors and forceps to lift and trim away loose eschar

May include wet-to-dry or wet-to-wet dressing changes

Painful procedure; may cause bleeding

**Enzymatic**

Application of topical enzyme agents directly to the wound; the agent digests collagen necrotic tissue

**Surgical**

Excision of eschar or necrotic tissue via a surgical procedure in the operating room

**Tangential Technique**

Very thin layers of the necrotic burn surface are excised until bleeding occurs (bleeding indicates that a healthy dermis or subcutaneous fat has been reached).

**Fascial Technique**

The burn wound is excised to the level of superficial fascia; this technique is usually reserved for very deep and extensive burns.

## 6. Fasciotomy

- An incision is made extending through the subcutaneous tissue and fascia.
- The procedure is performed if adequate tissue perfusion does not return following an escharotomy.
- Fasciotomy is performed in the operating room with the client under general anesthesia.
- Following the procedure, assess pulses, color, movement, and sensation of affected extremity and control any bleeding with pressure.
- Apply topical antimicrobial agents and dressings to the area, as prescribed.

**C.** Acute phase (see Table 50-4)

- Continue with protective isolation techniques.
- Provide wound care as prescribed and prepare for wound closure.
- Provide pain management.
- Provide adequate nutrition as prescribed.
- Prepare the client for rehabilitation.

**D.** Wound care (Table 50-6)

- Description: Cleansing, debridement, and dressing of **burn** wounds
- Hydrotherapy

- Wounds are cleansed by immersion, showering, or spraying.
- Hydrotherapy occurs for 30 minutes or less to prevent increased sodium loss through the **burn** wound, heat loss, pain, and stress.
- Client should be premedicated before procedure.
- Hydrotherapy generally is not used for clients who are hemodynamically unstable or those with new skin grafts.
- Care is taken to minimize bleeding and maintain body temperature during the procedure.
- If hydrotherapy is not used, wounds are washed and rinsed with the client in bed before the application of antimicrobial agents.

## 3. Debridement (Box 50-4)

- Debridement is removal of eschar or necrotic tissue to prevent bacterial proliferation under the eschar and to promote wound healing.
- Debridement may be mechanical, enzymatic, or surgical.
- Deep partial-thickness burns** or **deep full-thickness burns**: Wound is cleansed and debrided, and topical antimicrobial agents are applied once or twice daily.

**Box 50-5 Wound Coverings****Biological****Amniotic Membranes**

Amniotic membranes from human placenta are used; adheres to the wound

Effective as a dressing until epithelial cell regrowth occurs  
Requires frequent changes because it does not develop a blood supply and disintegrates in about 48 hours

**Allograft or Homograft (Human Tissue)**

Donated human cadaver skin provided through a skin bank  
Monitor for wound exudate and signs of infection  
Rejection—can occur within 24 hours  
Risk of transmitting bloodborne infection exists when used

**Xenograft or Heterograft (Animal Tissue)**

Pigskin harvested after slaughter is preserved for storage and use.

Monitor for infection and wound adherence  
Placed over granulation tissue; replaced every 2 to 5 days until wound heals naturally or until closure with autograft is complete.

**Cultured Skin**

Grown in laboratory from a small specimen of epidermal cells from an unburned portion of client's body  
Cell sheets are grafted on the client to generate permanent skin surface  
Cell sheets are not durable; care must be taken when applying to ensure adherence, and prevent sloughing

**Artificial Skin**

Consists of two layers—Silastic epidermis and porous dermis made from bovine hide collagen and shark cartilage

After application, fibroblasts move into the collagen part of the artificial skin and create a structure similar to normal dermis

Artificial dermis then dissolves; it is then replaced with normal blood vessels and connective tissue called *neodermis*

Neodermis supports the standard autograph placed over it when Silastic layer is removed

**Biosynthetic**

Combination of biosynthetic and synthetic materials  
Placed in contact with the wound surface; forms an adherent bond until epithelialization occurs

Porous substance allows exudate to pass through  
Monitor for wound exudate and signs of infection

**Synthetic**

Applied directly to the surface of clean or a surgically prepared wound; remains in place until it falls off or is removed

Covering is transparent or translucent; therefore wound can be inspected without removing dressing

Pain at the wound site is reduced because covering prevents contact of the wound with air

**Autograft**

Skin taken from a remote unburned area of client's own body; transplanted to cover burn wound

Graft placed on a clean granulated bed or over surgically excised area of the burn

Provides for permanent skin coverage

**E. Wound closure****1. Description**

- a. Wound closure prevents infection and loss of fluid.
- b. Closure promotes healing.
- c. Closure prevents contractures.
- d. Wound closure is performed usually on day 5 to 21 following the injury, depending on the extent of the **burn**.

**2. Wound coverings (Box 50-5)****3. Autografting (see Box 50-5)**

- a. Autografting provides permanent wound coverage.
- b. Autografting is the surgical removal of a thin layer of the client's own unburned skin, which then is applied to the excised **burn** wound.
- c. Autografting is performed in the operating room under anesthesia.
- d. Monitor for bleeding following the graft because bleeding beneath an autograft can prevent adherence.
- e. If prescribed, small amounts of blood or serum can be removed by gently rolling the

fluid from the center of the graft to the periphery with a sterile gauze pad, where it can be absorbed.

- f. For large accumulations of blood, the physician may aspirate the blood using a small-gauge needle and syringe.
  - g. Autografts are immobilized following surgery for 3 to 7 days to allow time to adhere and attach to the wound bed.
  - h. Position the client for immobilization and elevation of the graft site to prevent movement and shearing of the graft.
4. Care of the graft site
    - a. Elevate and immobilize the graft site.
    - b. Keep the site free from pressure.
    - c. Avoid weight-bearing.
    - d. When the graft takes, if prescribed, roll a cotton-tipped applicator over the graft to remove exudate, because exudate can lead to infection and prevent graft adherence.
    - e. Monitor for foul-smelling drainage, increased temperature, increased white blood cell count, hematoma formation, and fluid accumulation.

- f. Instruct the client to avoid using fabric softeners and harsh detergents in the laundry.
  - g. Instruct the client to lubricate the healing skin with prescribed agents.
  - h. Instruct the client to protect the affected area from sunlight.
  - i. Instruct the client to use splints and support garments as prescribed.
5. Care of the donor site
- a. Method of care varies, depending on the physician's preference
  - b. A moist gauze dressing may be applied at the time of the surgery to maintain pressure and stop any oozing.
  - c. The physician may prescribe site treatment with gauze impregnated with petrolatum or with a biosynthetic dressing.
  - d. Keep the donor site clean, dry, and free from pressure.
  - e. Prevent the client from scratching the donor site.
  - f. Apply lubricating lotions to soften the area and reduce the itching after the donor site is healed.
  - g. Donor site can be reused once healing has occurred (heals spontaneously within 7 to 14 days with proper care).

**F. Physical therapy**

1. An individualized program of splinting, positioning, exercises, ambulation, and activities of daily living is implemented early in the acute phase of recovery to maximize functional and cosmetic outcomes.
2. Perform range-of-motion exercises as prescribed to reduce edema and maintain strength and joint function.
3. Ambulate the client as prescribed to maintain the strength of the lower extremities.
4. Apply splints as prescribed to maintain proper joint position and prevent contractures.
  - a. Static splints immobilize the joint and are applied for periods of immobilization, during sleeping, and for clients who cannot maintain proper positioning.
  - b. Dynamic splints exercise the affected joint.
  - c. Avoid pressure to skin areas when applying splints, which could lead to further tissue and nerve damage.
5. Scarring is controlled by elastic wraps and bandages that apply continuous pressure to the healing skin during the time in which the skin is vulnerable to shearing.
6. Anti-**burn** scar support garments are usually prescribed to be worn 23 hours a day until the **burn** scar tissue has matured, which takes 18 to 24 months.

**G. Rehabilitative phase (see Table 50-4)**

1. Description: Rehabilitation is the final phase of **burn** care.

2. Goals
  - a. Promote wound healing.
  - b. Minimize deformities.
  - c. Increase strength and function.
  - d. Provide emotional support.

**MORE QUESTIONS ON THE CD!**

**Practice Questions**

- 500.** The nurse is conducting a session about the principles of first aid and is discussing the interventions for a snakebite to an extremity. The nurse should inform those attending the session that the first priority intervention in the event of this occurrence is which of the following?
1. Immobilize the affected extremity.
  2. Remove jewelry and constricting clothing from the victim.
  3. Place the extremity in a position so that it is below the level of the heart.
  4. Move the victim to a safe area away from the snake and encourage the victim to rest.
- 501.** A client calls the emergency department and tells the nurse that he had been cleaning a wooded area in the backyard and came directly into contact with poison ivy shrubs. The client tells the nurse that he cannot see anything on the skin and asks the nurse what to do. Which of the following is the appropriate nursing response?
1. "Come to the emergency department."
  2. "Apply calamine lotion immediately to the exposed skin areas."
  3. "Take a shower immediately, lathering and rinsing several times."
  4. "It is not necessary to do anything if you cannot see anything on your skin."
- 502.** The client is being admitted to the hospital for treatment of acute cellulitis of the lower left leg. The client asks the admitting nurse to explain what cellulitis means. The nurse bases the response on the understanding that the characteristics of cellulitis include:
1. An inflammation of the epidermis only
  2. A skin infection into the dermis and subcutaneous tissue
  3. An acute superficial infection of the dermis and lymphatics
  4. An epidermal and lymphatic infection caused by *Staphylococcus*
- 503.** The clinic nurse assesses the skin of a client with a diagnosis of psoriasis. The nurse understands that

which characteristic is associated with this skin disorder?

1. Clear, thin nail beds
  2. Red-purplish scaly lesions
  3. Oily skin and no episodes of pruritus
  4. Silvery-white scaly patches on the scalp, elbows, knees, and sacral regions
- 504.** The clinic nurse notes that the physician has documented a diagnosis of herpes zoster (shingles) in the client's chart. Based on an understanding of the cause of this disorder, the nurse determines that this definitive diagnosis was made following which diagnostic test?
1. Patch test
  2. Skin biopsy
  3. Culture of the lesion
  4. Wood's light examination
- 505.** A client returns to the clinic for follow-up treatment following a skin biopsy of a suspicious lesion performed 1 week ago. The biopsy report indicates that the lesion is a melanoma. The nurse understands that which of the following describes a characteristic of this type of a lesion?
1. Metastasis is rare.
  2. Melanoma is encapsulated.
  3. Melanoma is highly metastatic.
  4. Melanoma is characterized by local invasion.
- 506.** When assessing a lesion diagnosed as malignant melanoma, the nurse most likely expects to note which of the following?
1. An irregularly shaped lesion
  2. A small papule with a dry, rough scale
  3. A firm, nodular lesion topped with crust
  4. A pearly papule with a central crater and a waxy border
- 507.** The client arrives at the emergency department and has experienced frostbite to the right hand. Which of the following would the nurse note on assessment of the client's hand?
1. A pink, edematous hand
  2. A fiery red skin with edema in the nail beds
  3. Black fingertips surrounded by an erythematous rash
  4. A white color to the skin, which is insensitive to touch
- 508.** The evening nurse reviews the nursing documentation in the client's chart and notes that the day nurse has documented that the client has a stage II pressure ulcer in the sacral area. Which of the following would the nurse expect to note on assessment of the client's sacral area?
1. Intact skin
  2. Full-thickness skin loss
  3. Exposed bone, tendon, or muscle
  4. Partial-thickness skin loss of the dermis
- 509.** The adult client was burned as a result of an explosion. The burn initially affected the client's entire face (anterior half of the head) and the upper half of the anterior torso, and there were circumferential burns to the lower half of both arms. The client's clothes caught on fire, and the client ran, causing subsequent burn injuries to the posterior surface of the head and the upper half of the posterior torso. Using the rule of nines, what would be the extent of the burn injury?
1. 18%
  2. 24%
  3. 36%
  4. 48%
- 510.** The nurse is preparing to care for a burn client scheduled for an escharotomy procedure being performed for a third-degree circumferential arm burn. The nurse understands that the anticipated therapeutic outcome of the escharotomy is:
1. Return of distal pulses
  2. Brisk bleeding from the site
  3. Decreasing edema formation
  4. Formation of granulation tissue
- 511.** A client is undergoing fluid replacement after being burned on 20% of her body 12 hours ago. The nursing assessment reveals a blood pressure of 90/50 mm Hg, a pulse rate of 110 beats/min, and a urine output of 20 mL over the past hour. The nurse reports the findings to the physician and anticipates which of the following prescriptions?
1. Transfusing 1 unit of packed red blood cells
  2. Administering a diuretic to increase urine output
  3. Increasing the amount of intravenous (IV) lactated Ringer's solution administered per hour
  4. Changing the IV lactated Ringer's solution to one that contains dextrose in water
- 512.** When caring for a client with extensive burns, the nurse anticipates that pain medication will be administered via which route?
1. Oral
  2. Intravenous
  3. Intramuscular
  4. Subcutaneous
- 513.** The nurse is caring for a client who sustained superficial partial-thickness burns on the anterior lower legs and anterior thorax. Which of the following does the nurse expect to note during the resuscitation/emergent phase of the burn injury?

1. Decreased heart rate
2. Increased urinary output
3. Increased blood pressure
4. Elevated hematocrit levels

**514.** The nurse is caring for a client who suffered an inhalation injury from a wood stove. The carbon monoxide blood report reveals a level of 12%. Based on this level, the nurse would anticipate which of the following signs in the client?

1. Coma
2. Flushing
3. Dizziness
4. Tachycardia

**515.** The client arrives at the emergency department following a burn injury that occurred in the basement at home and an inhalation injury is suspected. Which of the following would the nurse anticipate to be prescribed for the client?

1. 100% oxygen via an aerosol mask
2. Oxygen via nasal cannula at 15 L/min
3. Oxygen via nasal cannula at 10 L/min
4. 100% oxygen via a tight-fitting, non-rebreather face mask

**516.** The nurse is administering fluids intravenously as prescribed to a client who sustained superficial partial-thickness burn injuries of the back and legs. In evaluating the adequacy of fluid resuscitation, the nurse understands that which of the following would provide the most reliable indicator for determining the adequacy?

1. Vital signs
2. Urine output
3. Mental status
4. Peripheral pulses

**517.** The nurse manager is observing a new nursing graduate caring for a burn client in protective isolation. The nurse manager intervenes if the new nursing graduate planned to implement which incorrect component of protective isolation technique?

1. Using sterile sheets and linens
2. Performing strict hand-washing technique
3. Wearing gloves and a gown only when giving direct care to the client
4. Wearing protective garb, including a mask, gloves, cap, shoe covers, gowns, and plastic apron

**518.** The nurse is caring for a client following an autograft and grafting to a burn wound on the right knee. Which of the following would the nurse anticipate to be prescribed for the client?

1. Out of bed
2. Bathroom privileges
3. Immobilization of the affected leg
4. Placing the affected leg in a dependent position

### Alternate Item Format: Multiple Response

**519.** The nurse manager is planning the clinical assignments for the day. Which staff members can be assigned to care for a client with herpes zoster? **Select all that apply.**

- 1. The nurse who never had roseola
- 2. The nurse who never had mumps
- 3. The nurse who never had chickenpox
- 4. The nurse who never had German measles
- 5. The nurse who never received the varicella-zoster vaccine

## ANSWERS

### 500. 4

**Rationale:** In the event of a snakebite, the first priority is to move the victim to a safe area away from the snake and encourage the victim to rest to decrease venom circulation. Next, jewelry and constricting clothing are removed before swelling occurs. Immobilizing the extremity and maintaining the extremity below heart level would be done next; these actions limit the spread of the venom. The victim is kept warm and calm. Alcohol or stimulants such as alcohol or caffeinated beverages are not given to the victim because these products may speed the absorption of the venom. The victim should be transported to an emergency facility as soon as is possible.

**Test-Taking Strategy:** Note the strategic words *first priority*. Eliminate options 1 and 3 first because they are comparable or alike and relate to care to the affected extremity. For the remaining options think about them and visualize each. Moving the victim to a safe area is the priority to prevent further

injury from the snake. Review the priority interventions in the event of a snake bite if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Critical Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 144). St. Louis: Saunders.

### 501. 3

**Rationale:** When an individual comes in contact with a poison ivy plant, the sap from the plant forms an invisible film on the human skin. The client should be instructed to cleanse the area with alcohol and then shower immediately and to lather the skin several times and rinse each time in running water. Calamine lotion may be one product recommended for use if dermatitis develops. The client does not need to be seen in the emergency department at this time.

**Test-Taking Strategy:** Use the process of elimination. Recalling that dermatitis can develop from contact with an allergen and that contact with poison ivy results in an invisible film will assist in directing you to option 3. Review the immediate treatment for contact with poison ivy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Integumentary

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1647). St. Louis: Mosby.

### 502. 2

**Rationale:** Cellulitis is a skin infection into deeper dermal and subcutaneous tissues that results in a deep red erythema without sharp borders and spreads widely throughout tissue spaces. The skin is erythematous, edematous, tender, and sometimes nodular. Erysipelas is an acute, superficial, rapidly spreading inflammation of the dermis and lymphatics.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 3 and 4 because they are comparable or alike and address the lymphatics. Eliminate option 1 because of the close-ended word *only*. If you had difficulty with this question, review the characteristics of cellulitis and erysipelas.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Integumentary

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1225). St. Louis: Saunders.

### 503. 4

**Rationale:** Psoriatic patches are covered with silvery white scales. Affected areas include the scalp, elbows, knees, shins, sacral area, and trunk. Thickening, pitting, and discoloration of the nails occur. Pruritus may occur. The lesions in psoriasis are not red-purplish scaly lesions.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the pathophysiology associated with psoriasis. Recall that psoriasis is associated with the presence of silvery white scaly patches. This will direct you to option 4 and assist in answering questions similar to this one. If you had difficulty with this question, review the manifestations associated with psoriasis.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Integumentary

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 506). St. Louis: Saunders.

### 504. 3

**Rationale:** With the classic presentation of herpes zoster, the clinical examination is diagnostic. A viral culture of the lesion provides the definitive diagnosis. Herpes zoster (shingles) is caused by a reactivation of the varicella-zoster virus, the virus that causes chickenpox. A patch test is a skin test that involves

the administration of an allergen to the surface of the skin to identify specific allergies. A biopsy would provide a cytological examination of tissue. In a Wood's light examination, the skin is viewed under ultraviolet light to identify superficial infections of the skin.

**Test-Taking Strategy:** Use the process of elimination. Recalling that herpes zoster is caused by a virus will assist in directing you to the correct option. Remember that a biopsy will determine tissue type, whereas a culture will identify an organism. Review the diagnostic measures for herpes zoster (shingles) if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Integumentary

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1227). St. Louis: Saunders.

Copstead-Kirkhorn, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 1118). St. Louis: Mosby.

### 505. 3

**Rationale:** Melanomas are pigmented malignant lesions originating in the melanin-producing cells of the epidermis. This skin cancer is highly metastatic, and a person's survival depends on early diagnosis and treatment. Options 1, 2, and 4 are not characteristics of a melanoma.

**Test-Taking Strategy:** Use the process of elimination. Note that options 1, 2, and 4 are comparable or alike and indicate a localized lesion rather than one that will spread to other areas of the body. Also, recalling that melanomas are highly metastatic will assist in directing you to the correct option. If you had difficulty with this question, review the characteristics of melanomas.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Integumentary

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 509). St. Louis: Saunders.

### 506. 1

**Rationale:** A melanoma is an irregularly shaped pigmented papule or plaque with a red-, white-, or blue-toned color. Basal cell carcinoma appears as a pearly papule with a central crater and rolled waxy border. Squamous cell carcinoma is a firm, nodular lesion topped with a crust or a central area of ulceration. Actinic keratosis, a premalignant lesion, appears as a small macule or papule with a dry, rough, adherent yellow or brown scale.

**Test-Taking Strategy:** Use the process of elimination. Remembering that irregularly shaped lesions are a cause for concern will assist in directing you to option 1. If you had difficulty with this question, review the characteristics of a malignant melanoma.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Integumentary

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1221–1222). St. Louis: Saunders.

**507. 4**

**Rationale:** Assessment findings in frostbite include a white or blue color; the skin will be hard, cold, and insensitive to touch. As thawing occurs, flushing of the skin, the development of blisters or blebs, or tissue edema appears. Options 1, 2, and 3 are incorrect.

**Test-Taking Strategy:** Focus on the subject, assessment findings in frostbite. Noting the strategic words *insensitive to touch* in option 4 should direct you to this option. If you had difficulty with this question, review the characteristics associated with frostbite.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Integumentary

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 2213). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 154). St. Louis: Saunders.

**508. 4**

**Rationale:** In a stage II pressure ulcer, the skin is not intact. Partial-thickness skin loss of the dermis has occurred. It presents as a shallow open ulcer with a red-pink wound bed, without slough. It may also present as an intact, open or ruptured, serum-filled blister. The skin is intact in stage I. Full-thickness skin loss occurs in stage III. Exposed bone, tendon, or muscle is present in stage IV.

**Test-Taking Strategy:** Use the process of elimination and visualize the appearance of pressure ulcers. Focus on the strategic words *stage II* to direct you to option 4. If you had difficulty with this question, review the characteristics associated with each stage of pressure ulcers.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Integumentary

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 489). St. Louis: Saunders.

**509. 3**

**Rationale:** According to the rule of nines, with the initial burn, the anterior half of the head equals 4.5%, the upper half of the anterior torso equals 9%, and the lower half of both arms equals 9%. The subsequent burn included the posterior half of head, equaling 4.5%, and the upper half of posterior torso, equaling 9%. This totals 36%.

**Test-Taking Strategy:** Knowledge regarding the rule of nines is required to answer this question. The entire head equals 9%, each arm equals 9% (both arms equal 18%), anterior or posterior torso each equals 18% (36% for entire torso), each leg equals 18% (both legs equal 36%), and the perineum equals 1%. If you had difficulty with this question, remember that 9 (head), 18 (arms), 36 (torso), 36 (legs), and 1 (perineum) equals 100.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Critical Care

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1248). St. Louis: Saunders.

Proehl, J. (2009). *Emergency nursing procedures* (4th ed., pp. 710–711). St. Louis: Saunders.

**510. 1**

**Rationale:** Escharotomies are performed to relieve the compartment syndrome that can occur when edema forms under nondistensible eschar in a circumferential third-degree burn. Escharotomies are performed through avascular eschar to subcutaneous fat. Although bleeding may occur from the site, it is considered a complication rather than an anticipated therapeutic outcome. Usually, direct pressure with a bulky dressing and elevation control the bleeding, but occasionally an artery is damaged and may require ligation. Formation of granulation tissue is not the intent of an escharotomy. Escharotomy does not affect the formation of edema.

**Test-Taking Strategy:** Use the ABCs—airway, breathing, and circulation—to answer the question. The only option that addresses circulation is option 1. If you had difficulty with this question, review the purpose of an escharotomy.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Critical Care

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1254). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 534–535). St. Louis: Saunders.

Proehl, J. (2009). *Emergency nursing procedures* (4th ed., pp. 712–720). St. Louis: Saunders.

**511. 3**

**Rationale:** Fluid management during the first 24 hours following a burn injury generally includes the infusion of (usually) lactated Ringer's solution. Fluid resuscitation is determined by urine output and hourly urine output should be at least 30 mL/hr. The client's urine output is indicative of insufficient fluid resuscitation, which places the client at risk for inadequate perfusion of the brain, heart, kidneys, and other body organs. Therefore the physician would prescribe an increase in the amount of IV lactated Ringer's solution administered per hour. Administering a diuretic would not correct the problem because it would not replace needed fluid. Diuretics promote the removal of the circulating volume, thereby further compromising the inadequate tissue perfusion. Dextrose in water is an isotonic solution and an isotonic solution maintains fluid balance. This type of solution may be administered after the first 24 hours following the burn injury, depending on the client's physiological needs. Blood replacement is not used for fluid therapy for burn injuries.

**Test-Taking Strategy:** Focus on the data in the question and think about the pathophysiology that occurs in a burn injury. Noting that the burn injury occurred 12 hours ago and that the client's urine output is 20 mL and is indicative of insufficient fluid resuscitation will direct you to the correct option. Review fluid resuscitation in a client with a burn injury if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Critical Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 533–534). St. Louis: Saunders.

### 512. 2

**Rationale:** An extensive burn injury causes impairment of muscle and subcutaneous tissue. Additionally, the gastrointestinal tract has decreased perfusion related to the burn injury. Medications administered by mouth, intramuscularly, or subcutaneously are not absorbed consistently as a result of the burn injury. The client may not experience pain relief from these routes of administration and may also receive a sudden bolus of medication at some point after administration, when fluid shifts occur. Therefore options 1, 3, and 4 are incorrect.

**Test-Taking Strategy:** Focus on the data in the question. Noting the word *extensive* in the question will assist in directing you to option 2. Review pain management techniques in a client with a burn injury if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Critical Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 537). St. Louis: Saunders.

### 513. 4

**Rationale:** The resuscitation/emergent phase begins at the time of injury and ends with the restoration of capillary permeability, usually at 48 to 72 hours following the injury. During the resuscitation/emergent phase, the hematocrit level increases to above normal because of hemoconcentration from the large fluid shifts. Hematocrit levels of 50% to 55% are expected during the first 24 hours after injury, with return to normal by 36 hours after injury. Initially, blood is shunted away from the kidneys, and renal perfusion and glomerular filtration are decreased, resulting in low urine output. Pulse rates are typically higher than normal, and the blood pressure is decreased as a result of the large fluid shifts.

**Test-Taking Strategy:** Use the process of elimination and think about how the body would react in such a traumatizing event; this eliminates options 1 and 2. Knowledge that the blood pressure would decrease as a result of the decrease in circulating blood volume will direct you to option 4 from the remaining options. Review the pathophysiology related to burn injuries if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Critical Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 532). St. Louis: Saunders.

### 514. 2

**Rationale:** Carbon monoxide levels between 11% and 20% result in flushing, headache, decreased visual acuity, decreased cerebral functioning, and slight breathlessness;

levels of 21% to 40% result in nausea, vomiting, dizziness, tinnitus, vertigo, confusion, drowsiness, pale to reddish-purple skin, tachycardia; levels of 41% to 60% result in seizure and coma; and levels higher than 60% result in death.

**Test-Taking Strategy:** Use the process of elimination and focus on the carbon monoxide level presented in the question. Remember that flushing occurs with levels between 11% and 20%; this will assist you in answering questions similar to this one. If you had difficulty with this question, review the effects of an inhalation injury, carbon monoxide levels, and the associated clinical manifestations.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Critical Care

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1245). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 530). St. Louis: Saunders.

### 515. 4

**Rationale:** If an inhalation injury is suspected, administration of 100% oxygen via a tight-fitting non-rebreather face mask is prescribed until carboxyhemoglobin levels fall (usually below 15%). In inhalation injuries, the oropharynx is inspected for evidence of erythema, blisters, or ulcerations. The need for endotracheal intubation also is assessed. Options 1, 2, and 3 are incorrect and would not provide the necessary oxygen supply needed for adequate tissue perfusion.

**Test-Taking Strategy:** Use the process of elimination. Recalling that 100% oxygen is required following an inhalation injury will assist you in eliminating options 2 and 3. From the remaining options, recall that a tight-fitting non-rebreather mask is preferred so that the client will not rebreathe exhaled air. If you had difficulty with this question review care of the client following an inhalation injury and the methods of delivering oxygen to the client.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Critical Care

**Reference:** Copstead-Kirkhorn, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 1272). St. Louis: Mosby.

### 516. 2

**Rationale:** Successful or adequate fluid resuscitation in the client is signaled by stable vital signs, adequate urine output, palpable peripheral pulses, and clear sensorium. However, the most reliable indicator for determining adequacy of fluid resuscitation is the urine output. For an adult, the hourly urine volume should be 30 to 50 mL.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *most reliable*. Note the subject of the question, fluid resuscitation. Urine output is most similar to the subject of administering fluids. Review care of the burn client during fluid resuscitation if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Critical Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 534). St. Louis: Saunders.

### 517. 3

**Rationale:** Thorough handwashing should be done before and after each contact with the burn-injured client. Sterile sheets and linens are used because of the client's high risk for infection. Protective garb, including gloves, cap, masks, shoe covers, gowns, and plastic apron need to be worn when in the client's room and when directly caring for the client.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic word *incorrect* in the question. Options 1 and 2 can be eliminated easily. Note the close-ended word *only* in option 3. Also, option 3 identifies the least thorough technique to prevent infection. If you had difficulty with this question, review protective isolation techniques when caring for a burn client.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Delegating/Prioritizing

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1255). St. Louis: Saunders.

### 518. 3

**Rationale:** Autografts placed over joints or on the lower extremities after surgery often are elevated and immobilized for 3 to 7 days. This period of immobilization allows the autograft time to adhere to the wound bed. Options 1, 2, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 2 first because they are comparable or alike and allow out-of-bed activities. From the remaining

options, note that the autograft was placed over a joint. This should direct you to option 3. If you had difficulty with this question, review care of an autograft placed over a joint.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Adult Health—Integumentary

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1265). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 519. 1, 2, 4

**Rationale:** Herpes zoster (shingles) is caused by a reactivation of the varicella-zoster virus, the causative virus of chickenpox. Individuals who have not been exposed to the varicella-zoster virus or who did not receive the varicella-zoster vaccine are susceptible to chickenpox. Health care workers who are unsure of their immune status should have varicella titers done before exposure to a person with herpes zoster.

**Test-Taking Strategy:** Use the process of elimination. Recalling that herpes zoster is caused by a reactivation of the varicella-zoster virus, the causative virus of chickenpox, will direct you to the correct options 1, 2, and 4. Review the relationship between herpes zoster virus and chickenpox if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership and Management—Delegating/Prioritizing

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1227). St. Louis: Saunders.

# Integumentary Medications

## I. POISON IVY TREATMENT (Fig. 51-1; Box 51-1)

- A. Treatment of lesions includes calamine lotion and other products that soothe lesions, Burow's solution compresses, and/or Aveeno baths to relieve discomfort.
- B. Topical corticosteroids are effective to prevent or relieve inflammation, especially when used before blisters form.
- C. Oral corticosteroids may be prescribed for severe reactions and a sedative such as diphenhydramine (Benadryl) may be prescribed.

## II. MEDICATIONS TO TREAT ATOPIC DERMATITIS (Box 51-2)

- A. Description
  1. A chronic inflammatory skin disease that is also known as *eczema* and is characterized by dry and scaly skin.
  2. May be treated with moisturizer and topical glucocorticoids; systemic immunosuppressants may also be prescribed if topical treatment is ineffective.
  3. Systemic immunosuppressants may include methotrexate, cyclosporine (Sandimmune), or azathioprine (Imuran), and oral glucocorticoids.
- B. Topical immunosuppressants
  1. Tacrolimus (Protopic) and pimecrolimus 1% cream (Elidel).
  2. Side effects include redness, burning, and itching; causes sensitization of the skin to sunlight.
  3. Tacrolimus (Protopic) increases the risk of varicella-zoster infection in children.
  4. Tacrolimus (Protopic) may cause **skin cancer** and lymphoma.

## III. TOPICAL GLUCOCORTICOIDS

- A. Description
  1. Anti-inflammatory, antipruritic, and vasoconstrictive actions
  2. Preparations vary in potency and depend on the concentration and type of preparation, and method of application (occlusive dressings enhance absorption, increasing the effects).
  3. Systemic effects are more likely to occur with prolonged therapy and when extensive skin surfaces are treated.

**!** Topical glucocorticoids can be absorbed into the systemic circulation; absorption is greater in permeable skin areas (scalp, axilla, face and neck, eyelids, perineum) and less in areas where permeability is poor (palms, soles, back).

- B. Contraindications
  1. Clients demonstrating previous sensitivity to corticosteroids
  2. Clients with current systemic fungal, viral, or bacterial infections
  3. Clients with current complications related to glucocorticoid therapy
- C. Local adverse effects
  1. Burning, dryness, irritation, itching
  2. Skin atrophy
  3. Thinning of the skin, striae, purpura, telangiectasia
  4. Acneiform eruptions
  5. Hypopigmentation
  6. Overgrowth of bacteria, fungi, and viruses
- D. Systemic adverse effects
  1. Growth retardation in children
  2. Adrenal suppression
  3. Cushing's syndrome
  4. Striae, skin atrophy
  5. Ocular effects (glaucoma and cataracts)
- E. Interventions
  1. Monitoring plasma cortisol levels may be prescribed if prolonged therapy is necessary.
  2. Wash the area just before application to increase medication penetration.
  3. Apply sparingly in a thin film, rubbing gently.
  4. Avoid use of a dry occlusive dressing unless specifically prescribed by the physician.
  5. Instruct client to report signs of adverse effects to the physician.

**!** In the adult, intact skin is generally impermeable to most topical medications. However, medications should not be applied to denuded areas unless prescribed because undesired absorption can occur.

**▲ FIGURE 51-1** Poison ivy. Note “streaked” blisters surrounding one large blister. (From Perry, S., Hockenberry, M., Lowdermilk, D., Wilson, S. [2010]. *Maternal child nursing care* [4th ed.]. St. Louis: Mosby.)

### Box 51-1 Poison Ivy Treatment Products

Bentoquatam—for preventive use (Ivy Block)  
 Calamine lotion (Caladryl lotion)  
 Hydrocortisone (Ivy Soothe, Ivy Stat)  
 Isopropanol; cetyl alcohol (Ivy Cleanse)  
 Zinc acetate; isopropanol (Ivy Dry)  
 Zinc acetate; isopropanol; benzyl alcohol (Ivy Super Dry)

### Box 51-2 Medications to Treat Atopic Dermatitis

#### Systemic Immunosuppressants

Azathioprine (Imuran)  
 Cyclosporine (Sandimmune)  
 Methotrexate  
 Oral glucocorticoids

#### Topical Immunosuppressants

Pimecrolimus 1% cream (Elidel)  
 Tacrolimus (Protopic)

### Box 51-3 Medications to Treat Actinic Keratosis

Aminolevulinic acid (Levulan Kerastick)  
 Diclofenac sodium (Solaraze)  
 Fluorouracil (Carac, Efudex, Fluoroplex)  
 Imiquimod 5% cream (Aldara)

## IV. MEDICATIONS TO TREAT ACTINIC KERATOSIS

(Box 51-3)

### A. Description

1. Actinic keratoses are caused by prolonged exposure to the sun and appear as rough, scaly, red or brown lesions usually found on the face, scalp, arms, and back of the hands.
2. Lesions can progress to squamous cell carcinoma.

3. Treatment includes medications and therapies such as excision, cryotherapy, curettage, and laser therapy.
- B. Medications include fluorouracil (Carac, Efudex, Fluoroplex), diclofenac sodium (Solaraze), imiquimod 5% cream (Aldara), and aminolevulinic acid (Levulan Kerastick).
  1. Fluorouracil (Carac, Efudex, Fluoroplex)
    - a. A topical medication that affects DNA and RNA synthesis and causes a sequence of response that results in healing; results are usually seen in 2 to 6 weeks but may take 1 to 2 months longer for complete healing
    - b. Side effects include itching, burning, inflammation, rash, and increased sensitivity to sunlight.
  2. Diclofenac sodium (Solaraze)
    - a. A nonsteroidal anti-inflammatory topical drug; may take 3 months to be effective
    - b. Side effects include dry skin, itching, redness, and rash.
  3. Imiquimod 5% cream (Aldara)
    - a. In addition to treating actinic keratoses, this topical medication has been used to treat venereal warts; it may take up to 4 months to be effective.
    - b. Side effects include redness, skin swelling, itching, burning, sores, blisters, scabbing, and crusting of the skin.
  4. Aminolevulinic acid (Levulan Kerastick)
    - a. A topical medication used in conjunction with blue light photoactivation; the medication is applied and 14 to 18 hours later the medication is activated by exposing the lesions to the blue light.
    - b. Side effects include burning, stinging, redness, and swelling of the skin; treated areas need to be protected from sunlight and bright indoor lights.

## V. SUNCREENS

- A. Ultraviolet (UV) light can damage the skin and can cause premalignant actinic keratoses and some types of **skin cancer**.
- B. Sunscreens prevent the penetration of UV light and protect the skin.
- C. Organic (chemical) sunscreens absorb UV light; inorganic (physical) reflect and scatter UV light.
- D. A sunscreen that protects against both UVB and UVA rays and one that has a sun protection factor (SPF) of at least 15 should be used.
- E. Sunscreens are most effective when applied at least 30 minutes before exposure to the sun (sunscreens containing para-aminobenzoic acid [PABA] or padimate O require application 2 hours before sun exposure).
- F. Sunscreen should be reapplied every 2 to 3 hours and after swimming or sweating; otherwise, the duration of protection is reduced.

### Box 51-4 Medications and Treatments for Psoriasis

#### Topical Medications

Anthralin (Dritho-Scalp, Psoriatec)  
 Calcipotriene (Dovonex)  
 Coal tar  
 Glucocorticoids  
 Keratolytics  
 Tazarotene (Tazorac)

#### Systemic Medications

Acitretin (Soriatane)  
 Cyclosporine (Neoral)  
 Methotrexate

#### Systemic Biological Medications

Alefacept (Amevive)  
 Ustekinumab (Stelara)

#### Phototherapy

Coal tar and ultraviolet B irradiation  
 Photochemotherapy (PUVA [psoralen and ultraviolet A] therapy)

- G. Products containing PABA need to be avoided by individuals allergic to benzocaine, sulfonamides, or thiazides.
- H. Sunscreens can cause contact dermatitis and photosensitivity reactions.

 The client should be informed that UV light is greatest between the hours of 10:00 AM and 4:00 PM, and that sunglasses, protective clothing, and a hat should be worn to reduce the risk of skin damage from the sun.

## VI. MEDICATIONS TO TREAT PSORIASIS (Box 51-4)

### A. Description

1. Psoriasis is a chronic inflammatory disorder that has varying degrees of severity.
2. Treatment is based on the severity of symptoms and aims to suppress the proliferation of keratinocytes or suppress the activity of inflammatory cells.

### B. Topical medications

1. Glucocorticoids
  - a. Used for mild psoriasis
  - b. Should not be applied to the face, groin, axilla, or genitalia because the medication is readily absorbable making the skin vulnerable to glucocorticoid-induced atrophy
2. Anthralin (Dritho-Scalp, Psoriatec)
  - a. Can cause local irritation and skin redness
  - b. Is applied to lesions at bedtime and allowed to remain on the skin overnight
  - c. Client should be informed that the medication can stain clothing, skin, and hair.
3. Tazarotene (Tazorac)
  - a. Is a vitamin A derivative

- b. Local reactions include itching, burning, stinging, dry skin, and redness; other less common effects include rash, desquamation, contact dermatitis, inflammation, fissuring, and bleeding.
  - c. Sensitization to sunlight can occur and the client should be instructed to use sunscreen and wear protective clothing.
  - d. Medication is usually applied once daily in the evening to dry skin.
4. Calcipotriene (Dovonex)
    - a. Is an analogue of vitamin D
    - b. May take up to 1 to 3 weeks to produce a desired effect
    - c. Can cause local irritation; high-dose applications may cause hypercalcemia
  5. Coal tar
    - a. Suppresses DNA synthesis, mitotic activity, and cell proliferation
    - b. Has an unpleasant odor and may cause irritation, burning, and stinging; can also stain the skin and hair
  6. Keratolytics
    - a. Soften scales and loosen the horny layer of the skin, resulting in minimal peeling to extensive desquamation
    - b. Salicylic acid: Can be absorbed systemically and can cause salicylism, which is characterized by dizziness and tinnitus, hyperpnea, and psychological disturbances; salicylic acid is not applied to large surface areas or open wounds because of the risk of systemic effects.
    - c. Sulfur: Promotes peeling and drying and is used to treat acne, dandruff, seborrheic dermatitis, and psoriasis

### C. Systemic medications

1. Methotrexate
  - a. Reduces proliferation of epidermal cells
  - b. Can be toxic; causes gastrointestinal effects such as diarrhea and ulcerative stomatitis and bone marrow depression leading to blood dyscrasias
  - c. Can be hepatotoxic; hepatic function should be monitored during therapy
2. Acitretin (Soriatane)
  - a. Inhibits keratinization, proliferation, and differentiation of cells; has anti-inflammatory and immunodulator actions; used for severe psoriasis and reserved for use in those who have not responded to safer medications.
  - b. Is embryotoxic and teratogenic: Medication is contraindicated during pregnancy; pregnancy must be ruled out and two reliable forms of contraception need to be implemented before the medication is started (contraception must be implemented at least 1 month before treatment starts and be continued for at least 3 years after treatment is discontinued.)

- c. If pregnancy occurs during treatment with the medication, the medication is discontinued immediately and possible termination of the pregnancy is discussed.
  - d. Dermatological effects include hair loss, skin peeling, dry skin, rash, pruritus, nail disorders; other effects include rhinitis from mucous membrane irritation, inflammation of the lips, dry mouth, dry eyes, nosebleed, gingivitis, stomatitis, bone and joint pain, and spinal disorders.
  - e. Can be hepatotoxic; can elevate triglyceride levels and reduce levels of high-density lipoprotein cholesterol
  - f. Medication should be taken with meals to facilitate absorption; alcohol must be avoided.
  - g. This derivative of vitamin A can cause vitamin A toxicity if taken at the same time as vitamin A supplements.
  - h. Should not be taken concurrently with tetracycline because it can cause increased intracranial pressure
3. Cyclosporine (Neoral)
- a. An immunosuppressant that inhibits proliferation of B and T cells
  - b. Can be toxic and cause kidney damage
  - c. Used for severe psoriasis and reserved for use in those who have not responded to safer medications
- D. Systemic biological medications**
1. Alefacept (Amevive)
- a. The medication reduces the number and activity of memory CD4+ T lymphocytes; therefore the medication is contraindicated in clients with human immunodeficiency virus infection.
  - b. CD4 T-cell counts should be monitored before each dose and discontinued if the count falls below 250 cells/mL.
  - c. Risk of cancer is increased and the medication should not be administered to a client with a history of malignancy; medication should be discontinued if cancer develops.
  - d. Can cause chills, cough, pruritus, myalgia, and inflammation and pain at the intramuscular injection site
2. Ustekinumab (Stelara)
- a. A human monoclonal antibody
  - b. Can decrease the activity of the immune system and increase the risk for certain types of cancer
  - c. Side effects of the medication include upper respiratory infections, headache, and tiredness.
  - d. Contraindicated in clients who have a history of cancer; also contraindicated in clients with infection, or reversible posterior leukoencephalopathy syndrome (rare condition that affects the brain and can cause death)
- e. The client should not receive any live virus vaccines because the viruses used in some types of vaccines can cause infection in those with a weakened immune system; additionally the physician needs to be informed if anyone in the household needs a vaccine.
  - f. The client should not receive the BCG vaccine during the 1 year before taking or 1 year after taking the medication.
  - g. The client should inform the physician if he or she is receiving phototherapy, has any other medical condition, is pregnant or plans to become pregnant, or is breast-feeding or plans to breast-feed.
- E. Phototherapy**
1. Coal tar and ultraviolet B irradiation: Treatment that involves the application of coal tar for 8 to 10 hours; coal tar is washed off and the area is exposed to short-wave UV radiation (ultraviolet B, or UVB)
  2. Photochemotherapy (PUVA [psoralen and ultraviolet A] therapy)
    - a. Combines the use of long-wave radiation (ultraviolet A, or UVA) with oral methoxsalen (photosensitive medication)
    - b. Can cause pruritus, nausea, erythema; may accelerate the aging process of the skin; may increase the risk of **skin cancer**

## VII. ACNE PRODUCTS (Box 51-5; Fig. 51-2)

### A. Description

1. Acne lesions that are mild may be treated with nonpharmacological measures such as gentle

### Box 51-5 Acne Products

#### Topical Antibiotics

Benzoyl peroxide  
 Clindamycin (Cleocin) and erythromycin (Erythroderm)  
 Dapsone (Aczone)  
 Fixed dose combinations: clindamycin/benzoyl peroxide (BenzaClin) and erythromycin/benzoyl peroxide (Benzamycin).

#### Topical Retinoids

Adapalene (Differin)  
 Azelaic acid (Azelex)  
 Tazarotene (Tazorac)  
 Tretinoin (Retin-A, Avita)

#### Oral Medications

Doxycycline (Vibramycin)  
 Erythromycin (Ery-Tab)  
 Isotretinoin (Accutane)  
 Minocycline (Dynacin, Minocin, Solodyn)  
 Tetracycline (Sumycin)

#### Hormonal Medications

Oral contraceptives  
 Spironolactone (Aldactone)

cleansing two or three times daily (oil-based moisturizing products need to be avoided), dermabrasion, or comedo extraction.

2. Mild acne is usually treated pharmacologically with topical agents (antimicrobials and retinoids).
3. Moderate acne is usually treated with oral antibiotics and comedolytics.
4. Severe acne is usually treated with isotretinoin (Accutane).
5. Hormonal medications such as oral contraceptives and spironolactone (Aldactone) may be prescribed to treat acne in female clients.
6. Combination therapy may be prescribed to treat the acne.
7. Actions of the medications may include suppressing the growth of *Propionibacterium acnes*, reducing inflammation, promoting keratolysis, unplugging existing comedones and preventing their development, normalizing hyperproliferation of epithelial cells within the hair follicles; some medications cause thinning of the skin, which facilitates penetration of other medications.
8. For topical applications: Site should be washed and allowed to completely dry before application; hands should be washed after application.
9. All topical products are kept away from the eyes, inside the nose, lips, mucous membranes, hair, and inflamed or denuded skin.

#### B. Topical antibiotic products

1. Benzoyl peroxide
  - a. Can produce drying and peeling
  - b. Severe local irritation (burning, blistering, scaling, swelling) may require reducing the frequency of applications.
  - c. Some products may contain sulfites; monitor for allergic reactions.

▲ **FIGURE 51-2** Acne vulgaris. **A**, Comedones with a few inflammatory pustules. **B**, Papulopustular acne. (From Wong, D., Hockenberry, M., Wilson, S., Lowdermilk, D., & Wilson, D. [2006]. *Maternal child nursing care* [3rd ed.]. St. Louis: Mosby.)

2. Clindamycin (Cleocin) and erythromycin (Erythroderm)
  - a. Both products may be prescribed to prevent emergence of resistance.
  - b. Combination therapy with benzoyl peroxide can be prescribed to prevent emergence of resistance; fixed-dose combinations include clindamycin/benzoyl peroxide (BenzaClin) and erythromycin/benzoyl peroxide (Benzamycin).
3. Dapsone (Aczone): Side effects include oiliness, peeling, dryness, and erythema of the skin.

#### C. Topical retinoids

1. Tretinoin (Retin-A, Avita)
  - a. A derivative of vitamin A (vitamin A supplements should be discontinued during therapy)
  - b. In addition to treating acne, it may be prescribed to reduce fine wrinkles, skin roughness, mottled hyperpigmentation such as those that occur with age spots (tretinoin [Renova]).
  - c. Can cause localized side effects such as blistering, peeling, crusting, burning, and swelling of the skin.
  - d. The use of abrasive products and keratolytic products should be discontinued before using tretinoin because they can cause localized side effects.
  - e. Medication sensitizes the skin to ultraviolet light (UVL); the client needs to be instructed to apply a sunscreen with a sun protection factor (SPF) of 15 or greater and to wear protective clothing when outdoors because the medication increases susceptibility to sunburn.
2. Adapalene (Differin): Similar to tretinoin and sensitizes the skin to UVL; side effects include burning and itching after application, redness, dryness, and scaling of the skin.
3. Tazarotene (Tazorac)
  - a. Is a derivative of vitamin A (vitamin A supplements should be discontinued during therapy)
  - b. In addition to acne, it is used to treat wrinkles and psoriasis.
  - c. Can cause itching, burning, and dry skin and sensitizes the skin to UVL.
4. Azelaic acid (Azelex) can cause burning, itching, stinging, and redness of the skin; it can also cause hypopigmentation of the skin in clients with a dark complexion.

#### D. Oral antibiotics

1. Includes doxycycline (Vibramycin); minocycline (Dynacin, Minocin, Solodyn); tetracycline (Sumycin); and erythromycin (Ery-Tab)
2. Improvement develops slowly with the use of oral antibiotics and may take 3 to 6 months for some improvement to be noted; following control of symptoms the client is usually switched to a topical antibiotic.

**E. Isotretinoin (Accutane)**

1. Derivative of vitamin A (vitamin A supplements should be discontinued during therapy); additionally the use of tetracyclines can increase the risk of adverse effects and should be discontinued before use of isotretinoin
2. Used to treat severe cystic acne; reserved for persons who have not responded to other therapies, including systemic antibiotics
3. Side effects include nosebleeds; inflammation of the lips or eyes; dryness or itching of the skin, nose, or mouth; pain, tenderness, or stiffness in the joints, bones, or muscles; back pain.
4. Less common side effects include rash, hair loss, peeling of the skin, headache, reduction in night vision.
5. Causes sensitization of the skin to UVL
6. The medication elevates triglyceride levels, which should be measured before and during therapy; alcohol consumption should be eliminated during therapy because alcohol could potentiate elevation of serum triglyceride levels.
7. The medication may cause depression in some clients; if depression occurs, the medication should be discontinued.

**!** Isotretinoin (Accutane) is highly teratogenic and can cause fetal abnormalities. It must not be used if the client is pregnant. The client needs to follow strict rules of the iPLEDGE Program.

**F. Hormonal medications**

1. Hormonal medications such as oral contraceptives and spironolactone (Aldactone) may be prescribed to treat acne in female clients.
2. These medications decrease androgen activity, resulting in decreased production of sebum (substance that combines with keratin to create a plug within a pore).
3. Spironolactone is teratogenic; therefore contraception during its use is necessary.
4. Adverse effects of spironolactone include breast tenderness, menstrual irregularities, and hyperkalemia.

**G. iPLEDGE Program**

1. A risk management program that ensures that no woman starting isotretinoin is pregnant or no woman taking this medication becomes pregnant
2. Access to the medication is controlled through a central automated system.
3. Strict rules must be followed by the client, physician prescribing the medication, pharmacist dispensing the medication, and the wholesaler of the medication to ensure safety and to ensure that no woman is pregnant on initiation of therapy or becomes pregnant while taking the medication.

**Box 51-6 Burn Products**

Mafenide acetate (Sulfamylon)  
Nitrofurazone (Furacin)  
Silver sulfadiazine (Silvadene)

**VIII. BURN PRODUCTS (Box 51-6)****A. Nitrofurazone (Furacin)**

1. Applied topically to the **burn** as a solution, ointment, or cream
2. Has a broad spectrum of antibacterial activity
3. Used for **burns** when bacterial resistance to other agents is a problem
4. Topical: Apply  $\frac{1}{16}$ -inch film directly to **burn**.
5. Side effects: Contact dermatitis, rash
6. Less common side effects: Pruritus, local edema

**B. Mafenide acetate (Sulfamylon)**

1. Water-soluble cream that is bacteriostatic for gram-negative and gram-positive organisms
2. Used to treat **burns** to reduce the bacteria present in avascular tissues
3. Diffuses through the devascularized areas of the skin and may precipitate metabolic acidosis (usually compensated for by hyperventilation)
4. Apply  $\frac{1}{16}$ -inch film directly to the **burn**.
5. Side effects can include local pain and rash.
6. Systemic effects include bone marrow depression, hemolytic anemia, and metabolic acidosis.
7. Keep **burn** covered with mafenide acetate at all times.
8. Notify physician if hyperventilation occurs; if acidosis develops, mafenide acetate is washed off the skin and is usually discontinued for 1 to 2 days.

**C. Silver sulfadiazine (Silvadene, Thermazene, SSD Cream)**

1. Has broad spectrum of activity against gram-negative bacteria, gram-positive bacteria, and yeast
2. Released slowly from the cream, which is selectively toxic to bacteria
3. Used primarily to prevent sepsis in clients with **burns**
4. Not a carbonic anhydrase inhibitor; does not cause acidosis
5. Apply  $\frac{1}{16}$ -inch film (keep **burn** covered at all times with silver sulfadiazine).
6. Side effects include rash and itching.
7. Systemic effects include leukopenia and interstitial nephritis.
8. Monitor complete blood cell count, particularly the white blood cells, frequently; if leukopenia develops, the physician is notified (medication is usually discontinued).

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 520.** Salicylic acid is prescribed for a client with a diagnosis of psoriasis. The nurse monitors the client, knowing that which of the following would indicate the presence of systemic toxicity from this medication?
1. Tinnitus
  2. Diarrhea
  3. Constipation
  4. Decreased respirations
- 521.** The camp nurse asks the children preparing to swim in the lake if they have applied sunscreen. The nurse reminds the children that chemical sunscreens are most effective when applied:
1. Immediately before swimming
  2. 15 minutes before exposure to the sun
  3. Immediately before exposure to the sun
  4. At least 30 minutes before exposure to the sun
- 522.** Mafenide acetate (Sulfamylon) is prescribed for the client with a burn injury. When applying the medication, the client complains of local discomfort and burning. Which of the following is the most appropriate nursing action?
1. Notify the physician.
  2. Discontinue the medication.
  3. Inform the client that this is normal.
  4. Apply a thinner film than prescribed to the burn site.
- 523.** The burn client is receiving treatments of topical mafenide acetate (Sulfamylon) to the site of injury. The nurse monitors the client, knowing that which of the following indicates that a systemic effect has occurred?
1. Hyperventilation
  2. Elevated blood pressure
  3. Local pain at the burn site
  4. Local rash at the burn site
- 524.** Isotretinoin (Accutane) is prescribed for a client with severe acne. Before the administration of this medication, the nurse anticipates that which laboratory test will be prescribed?
1. Platelet count
  2. Triglyceride level
  3. Complete blood count
  4. White blood cell count
- 525.** A client with severe acne is seen in the clinic and the physician prescribes isotretinoin (Accutane). The nurse reviews the client's medication record and would contact the physician if the client is taking which medication?
1. Vitamin A
  2. Digoxin (Lanoxin)
  3. Furosemide (Lasix)
  4. Phenytoin (Dilantin)
- 526.** The nurse is applying a topical corticosteroid to a client with eczema. The nurse would monitor for the potential for increased systemic absorption of the medication if the medication were being applied to which of the following body areas?
1. Back
  2. Axilla
  3. Soles of the feet
  4. Palms of the hands
- 527.** The clinic nurse is performing an admission assessment on a client. The nurse notes that the client is taking azelaic acid (Azelex). Because of the medication prescription, the nurse would suspect that the client is being treated for:
1. Acne
  2. Eczema
  3. Hair loss
  4. Herpes simplex
- 528.** The physician has prescribed silver sulfadiazine (Silvadene) for the client with a partial-thickness burn, which has cultured positive for gram-negative bacteria, and the nurse provides information to the client about the medication. Which statement made by the client indicates a lack of understanding about the treatments?
1. "The medication is an antibacterial."
  2. "The medication will help heal the burn."
  3. "The medication will permanently stain my skin."
  4. "The medication should be applied directly to the wound."

### Alternate Item Format: Multiple Response

- 529.** The health education nurse provides instructions to a group of clients regarding measures that will assist in preventing skin cancer. Which instruction(s) should the nurse provide? **Select all that apply.**
- 1. Use sunscreen when participating in outdoor activities.
  - 2. Wear a hat, opaque clothing, and sunglasses when in the sun.
  - 3. Avoid sun exposure in the late afternoon and early evening hours.
  - 4. Examine your body monthly for any lesions that may be suspicious.
  - 5. Sunscreen should be applied every 8 hours.

**ANSWERS****520. 1**

**Rationale:** Salicylic acid is absorbed readily through the skin, and systemic toxicity (salicylism) can result. Symptoms include tinnitus, dizziness, hyperpnea, and psychological disturbances. Constipation and diarrhea are not associated with salicylism.

**Test-Taking Strategy:** Use the process of elimination. Noting the name of the medication will assist in directing you to the correct option if you can recall the toxic effects that occur with acetylsalicylic acid (aspirin). Review the toxic effects of salicylic acid if you are unfamiliar with them.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 1228). St. Louis: Saunders.

**521. 4**

**Rationale:** Sunscreens are most effective when applied at least 30 minutes before exposure to the sun so that they can penetrate the skin. All sunscreens should be reapplied after swimming or sweating.

**Test-Taking Strategy:** Use the process of elimination. Knowledge that sunscreens need to penetrate the skin will assist in eliminating options 2 and 3. Noting the strategic words *most effective* will assist in directing you to option 4. Review protective skin measures if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 765). St. Louis: Saunders.

**522. 3**

**Rationale:** Mafenide acetate is bacteriostatic for gram-negative and gram-positive organisms and is used to treat burns to reduce bacteria present in avascular tissues. The client should be informed that the medication will cause local discomfort and burning and that this is a normal reaction. Therefore options 1, 2, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 2 and 4 because it is not within the scope of nursing practice to alter or discontinue a medication therapy. Recalling that this is a normal expected occurrence will direct you to option 3. If you had difficulty with this question, review the effects of this medication.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**Reference:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 765). St. Louis: Saunders.

**523. 1**

**Rationale:** Mafenide acetate is a carbonic anhydrase inhibitor and can suppress renal excretion of acid, thereby causing acidosis. Clients receiving this treatment should be monitored

for signs of an acid-base imbalance (hyperventilation). If this occurs, the medication will probably be discontinued for 1 to 2 days. Options 3 and 4 describe local rather than systemic effects. An elevated blood pressure may be expected from the pain that occurs with a burn injury.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *systemic effect*. Options 3 and 4 can be eliminated because these are local rather than systemic effects. From the remaining options, recall that the client in pain would likely have an elevated blood pressure. This should direct you to option 1. Review the systemic effects of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 765). St. Louis: Saunders.

**524. 2**

**Rationale:** Isotretinoin can elevate triglyceride levels. Blood triglyceride levels should be measured before treatment and periodically thereafter until the effect on the triglycerides has been evaluated. Options 1, 3, and 4 do not need to be monitored specifically during this treatment.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 3 and 4 first because a complete blood count also measures the white blood cell count. From the remaining options, recall that the medication can affect triglyceride levels in the client. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 1232). St. Louis: Saunders.

**525. 1**

**Rationale:** Isotretinoin is a metabolite of vitamin A and can produce generalized intensification of isotretinoin toxicity. Because of the potential for increased toxicity, vitamin A supplements should be discontinued before isotretinoin therapy. Options 2, 3, and 4 are not contraindicated with the use of isotretinoin.

**Test-Taking Strategy:** Use the process of elimination. Recalling that isotretinoin is a metabolite of vitamin A will direct you to the correct option. If you are unfamiliar with this medication, review the contraindications associated with its use.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 1232). St. Louis: Saunders.

**526. 2**

**Rationale:** Topical corticosteroids can be absorbed into the systemic circulation. Absorption is higher from regions where the skin is especially permeable (scalp, axilla, face, eyelids,

neck, perineum, genitalia), and lower from regions where permeability is poor (back, palms, soles).

**Test-Taking Strategy:** Use the process of elimination. Focus on the subject of the question, permeability and the potential for increased systemic absorption. Eliminate options 3 and 4 because these body areas are comparable or alike in terms of skin substance. From the remaining options, think about permeability of the skin area. This should direct you to option 2. Review the principles related to the administration of topical corticosteroids if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1204). St. Louis: Saunders.

### 527. 1

**Rationale:** Azelaic acid is a topical medication used to treat mild to moderate acne. The acid appears to work by suppressing the growth of *Propionibacterium acnes* and by decreasing the proliferation of keratinocytes. Options 2, 3, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Focusing on the name of the medication, azelaic acid, will direct you to the correct option. Review this medication if you are unfamiliar with it.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 1231). St. Louis: Saunders.

### 528. 3

**Rationale:** Silver sulfadiazine (Silvadene) is an antibacterial that has a broad spectrum of activity against gram-negative

bacteria, gram-positive bacteria, and yeast. It is applied directly to the wound to assist in healing. It does not stain the skin.

**Test-Taking Strategy:** Note the strategic words *lack of understanding*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Recall the characteristics of this medication. Noting the words *permanently stain* in option 3 will direct you to this option. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 1027). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 529. 1, 2, 4

**Rationale:** The client should be instructed to avoid sun exposure between the hours of 10 AM and 4 PM. Sunscreen, a hat, opaque clothing, and sunglasses should be worn for outdoor activities. The client should be instructed to examine the body monthly for the appearance of any possible cancerous or any precancerous lesions. Sunscreen should be reapplied every 2 to 3 hours and after swimming or sweating; otherwise, the duration of protection is reduced.

**Test-Taking Strategy:** Focus on the subject, measures to prevent skin cancer. Read each option carefully. Noting the time frames in options 3 and 5 will assist in eliminating these options. Review client teaching points for the prevention of skin cancer if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Integumentary

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 511). St. Louis: Saunders.

# UNIT IX

## The Adult Client With an Oncological Disorder

### PYRAMID TERMS

**adenocarcinoma** A tumor that arises from glandular epithelial tissue.

**benign** Usually refers to growths that are encapsulated, remain localized, and are slow growing.

**cancer** A neoplastic disorder that can involve all body organs. Cells lose their normal growth-controlling mechanism, and the growth of cells is uncontrolled.

**carcinogen** A physical, chemical, or biological stressor that causes neoplastic changes in normal cells.

**carcinoma** A new growth or malignant tumor that originates from epithelial cells, the skin, gastrointestinal tract, lungs, uterus, breast, or other organ.

**carcinoma in situ** A premalignant lesion with all the histological characteristics of cancer except invasion of the basement membrane.

**hospice** A concept of care for terminally ill clients that includes the idea of intensive caring rather than intensive care. The client and the family are the focus of nursing care, and the goal is to relieve pain and facilitate an optimal quality of life.

**lymphoma** Neoplasm that originates from lymphoid tissue.

**leukemia or myeloma** Neoplasm that originates from a blood-forming organ.

**malignant** Term for growths that are not encapsulated but grow and metastasize. These growths are cancerous lesions having the characteristics of disorderly, uncontrolled, and chaotically proliferating cells.

**metastasis** The transfer of disease from one organ or part to another not directly connected with it. Secondary malignant lesions, originating from the primary tumor, are located in anatomically distant places.

**nadir** The period of time during which an antineoplastic medication has its most profound effects on the bone marrow.

**neoplasm** An abnormal growth, which may be benign or malignant.

**sarcoma** Neoplasm that originates from muscle, bone, fat, the lymph system, or connective tissue.

**staging** A method of classifying malignancies based on the presence and extent of the tumor within the body.

**tumor marker** Specific bodily substances that seem to indicate tumor progression or regression.

**undifferentiated cells** Cells that have lost the capacity for specialized functions.

### PYRAMID TO SUCCESS

Pyramid Points focus on treatment modalities related to an oncological disorder, such as pain management, internal and external radiation, and chemotherapy. Focus for oncological disorders includes disorders such as skin cancer; leukemia; breast cancer; testicular cancer; stomach, bowel, and pancreatic cancer; bladder cancer; prostate cancer; and lung cancer. Specific focus relates to the nursing care related to these treatment modalities and disorders, client adaptation, and the impact of the treatment on the disorder. Specifically, focus on the complications related to chemotherapy and the nursing measures required in monitoring for these complications and preventing life-threatening conditions, such as infection and bleeding.

### CLIENT NEEDS

#### Safe and Effective Care Environment

Discussing oncology-related consultations and referrals  
Ensuring advocacy related to the client's decisions  
Ensuring ethical practice  
Ensuring that advance directives are in the client's medical record

- Establishing priorities
- Handling hazardous and infectious materials related to radiation and chemotherapy safely
- Implementing protective, standard, and other precautions
- Maintaining medical and surgical asepsis
- Preventing disease related to infection
- Providing confidentiality regarding diagnosis
- Providing informed consent for treatments and procedures
- Upholding the client's rights

### **Health Promotion and Maintenance**

- Discussing expected body image changes related to chemotherapy and treatments
- Providing the client and family instructions regarding home care
- Providing instructions regarding monthly breast or testicular self-examinations
- Respecting the client's lifestyle choices
- Teaching about health promotion programs regarding risks for cancer
- Teaching about health screening measures for cancer

### **Psychosocial Integrity**

- Assessing the client's ability to cope, adapt, and/or solve problems during illness or stressful events

- Assisting the client and family to cope with the alteration in body image
- Discussing end-of-life and grief and loss issues related to death and the dying process
- Mobilizing appropriate support and resource systems
- Promoting a positive environment to maintain optimal quality of life
- Respecting religious and cultural preferences
- Assessing the concerns of the client who survived cancer

### **Physiological Integrity**

- Administering blood and blood products
- Caring for central venous access devices
- Caring for the client receiving chemotherapy
- Caring for the client receiving radiation therapy
- Managing pain
- Monitoring diagnostic tests and laboratory values, such as white blood cell and platelet counts
- Monitoring for expected and unexpected responses to radiation and chemotherapy
- Protecting the client from the life-threatening adverse effects of treatments
- Providing basic care and comfort
- Providing nutrition

# Oncological Disorders

## I. CANCER

### A. Description

1. **Cancer** is a neoplastic disorder that can involve all body organs with manifestations that vary according to the body system affected and type of tumor cells.
2. Cells lose their normal growth-controlling mechanism, and the growth of cells is uncontrolled.
3. **Cancer** produces serious health problems such as impaired immune and hematopoietic (blood-producing) function, altered gastrointestinal tract structure and function, motor and sensory deficits, and decreased respiratory function.

### B. Metastasis (Box 52-1)

1. **Cancer** cells move from their original location to other sites.
2. Routes of **metastasis**
  - a. Local seeding: Distribution of shed **cancer** cells occurs in the local area of the primary tumor.
  - b. Bloodborne **metastasis**: Tumor cells enter the blood, which is the most common cause of cancer spread.
  - c. Lymphatic spread: Primary sites rich in lymphatics are more susceptible to early metastatic spread.

### C. Cancer classification

1. Solid tumors: Associated with the organs from which they develop, such as breast **cancer** or lung **cancer**
2. Hematological **cancers**: Originate from blood cell-forming tissues, such as **leukemias**, **lymphomas**, and multiple **myeloma**

### D. Grading and staging (Box 52-2)

1. Grading and **staging** are methods used to describe the tumor.
2. These methods describe the extent of the tumor, the extent to which malignancy has increased in size, the involvement of regional nodes, and metastatic development.
3. Grading a tumor classifies the cellular aspects of the cancer.
4. **Staging** classifies the clinical aspects of the **cancer** and degree of **metastasis** at diagnosis.

### E. Factors that influence **cancer** development

#### 1. Environmental factors

- a. Chemical **carcinogen**: Factors include industrial chemicals, drugs, and tobacco.
- b. Physical **carcinogen**: Factors include ionizing radiation (diagnostic and therapeutic x-rays) and ultraviolet radiation (sun, tanning beds, and germicidal lights), chronic irritation, and tissue trauma.
- c. Viral **carcinogen**: Viruses capable of causing **cancer** are known as oncoviruses, such as Epstein-Barr virus, hepatitis B virus, and human papillomavirus.
- d. *Helicobacter pylori* infection is associated with an increased risk of gastric **cancer**.

#### 2. Obesity and dietary factors including preservatives, contaminants, additives, and nitrates

#### 3. Genetic predisposition: Factors include an inherited predisposition to specific cancers, inherited conditions associated with **cancer**, familial clustering, and chromosomal aberrations.

#### 4. Age: Advancing age is a significant risk factor for the development of **cancer**.

#### 5. Immune function: The incidence of **cancer** is higher in immunosuppressed individuals, such as those with acquired immunodeficiency syndrome and organ transplant recipients who are taking immunosuppressive medications.

### F. Prevention: Avoidance of known or potential carcinogens and avoidance or modification of the factors associated with the development of cancer cells

### G. Early detection (Box 52-3)

1. Mammography
2. Papanicolaou's (Pap) test
3. Stools for occult blood
4. Sigmoidoscopy, colonoscopy
5. Breast self-examination and clinical breast examination
6. Testicular self-examination
7. Skin inspection

## II. BREAST SELF-EXAMINATION

### A. Performing breast self-examination (BSE)

**Box 52-1 Common Sites of Metastasis****Bladder Cancer**

Lung  
Bone  
Liver  
Pelvic, retroperitoneal structures

**Brain Tumors**

Central nervous system

**Breast Cancer**

Bone  
Lung  
Brain  
Liver

**Colorectal Cancer**

Liver

**Lung Cancer**

Brain  
Liver

**Prostate Cancer**

Bone  
Spine  
Lung  
Liver  
Kidneys

**Testicular Cancer**

Lung  
Bone  
Liver  
Adrenal glands  
Retroperitoneal lymph nodes

**Box 52-2 Grading and Staging****Grading**

Grade I: Cells differ slightly from normal cells and are well differentiated (mild dysplasia).

Grade II: Cells are more abnormal and are moderately differentiated (moderate dysplasia).

Grade III: Cells are very abnormal and are poorly differentiated (severe dysplasia).

Grade IV: Cells are immature (anaplasia) and undifferentiated; cell of origin is difficult to determine.

**Staging**

Stage 0: Carcinoma in situ

Stage I: Tumor limited to the tissue of origin; localized tumor growth

Stage II: Limited local spread

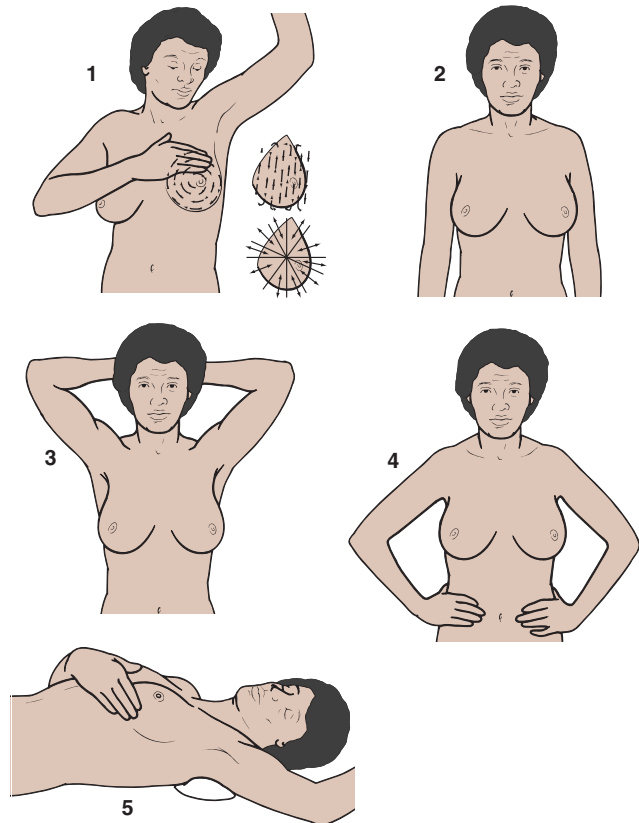

Stage III: Extensive local and regional spread

Stage IV: Distant metastasis

**Box 52-3 Warning Signs of Cancer**

Any sore that does not heal  
Change in bowel or bladder habits  
Indigestion  
Nagging cough or hoarseness  
Obvious change in wart or mole  
Thickening or lump in breast or elsewhere  
Unusual bleeding or discharge

1. Perform monthly 7 to 10 days after menses.
2. Postmenopausal clients or clients who have had a hysterectomy should select a specific day of the month and perform BSE monthly on that day.

**B. Client instructions (Fig. 52-1)**

**▲ FIGURE 52-1** Breast self-examination and patient instruction. **1.** While in the shower or bath, when the skin is slippery with soap and water, examine your breasts. Use the pads of your second, third, and fourth fingers to press every part of the breast firmly. Use your right hand to examine your left breast, and use your left hand to examine your right breast. Using the pads of the fingers on your left hand, examine the entire right breast using small circular motions in a spiral or up-and-down motion so that the entire breast area is examined. Repeat the procedure using your right hand to examine your left breast. Repeat the pattern of palpation under the arm. Check for any lump, hard knot, or thickening of the tissue. **2.** Look at your breasts in a mirror. Stand with your arms at your side. **3.** Raise your arms overhead and check for any changes in the shape of your breasts, dimpling of the skin, or any changes in the nipple. **4.** Next, place your hands on your hips and press down firmly, tightening the pectoral muscles. Observe for asymmetry or changes, keeping in mind that your breasts probably do not match exactly. **5.** While lying down, feel your breasts as described in 1. When examining your right breast, place a folded towel under your right shoulder and put your right hand behind your head. Repeat the procedure while examining your left breast. Mark your calendar that you have completed your breast-self-examination; note any changes or unique characteristics you want to check with your health care provider. (From Lewis, S., Heitkemper, M., Dirksen, S., O'Brien, P., and Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

**III. TESTICULAR SELF-EXAMINATION**

- A.** Performing testicular self-examination: Perform monthly; a day of the month is selected and the examination is performed on the same day each month.
- B.** Client instructions (Fig. 52-2)

▲ **FIGURE 52-2** Testicular self-examination. The best time to perform this examination is right after a shower when your scrotal skin is moist and relaxed, making the testicles easy to feel. First, gently lift each testicle. Each one should feel like an egg, firm but not hard, and smooth with no lumps. Then, using both hands, place your middle fingers on the underside of each testicle and your thumbs on top. Gently roll the testicle between the thumb and fingers to feel for any lumps, swelling, or mass. If you notice any changes from one month to the next, notify your physician or nurse practitioner. (From Harkreader, H., & Hogan, M. A. [2007]. *Fundamentals of nursing: Caring and clinical judgment* [3rd ed.]. St. Louis: Saunders.)

#### IV. DIAGNOSTIC TESTS

**A.** Diagnostic tests to be performed depend on the suspected primary or metastatic site of the **cancer**; invasive procedures require a signed informed consent (Box 52-4).

**B.** Biopsy

1. Description

- a. Biopsy is the definitive means of diagnosing **cancer** and provides histological proof of malignancy.
- b. Biopsy involves the surgical incision of a small piece of tissue for microscopic examination.

2. Types

- a. Needle: Aspiration of cells
- b. Incisional: Removal of a wedge of suspected tissue from a larger mass
- c. Excisional: Complete removal of the entire lesion
- d. **Staging**: Multiple needle or incisional biopsies in tissues where metastasis is suspected or likely (see Boxes 52-1 and 52-2)

3. Tissue examination

- a. Following excision, a frozen section or a permanent paraffin section is prepared to examine the specimen.
- b. The advantage of the frozen section is the speed with which the section can be prepared

#### Box 52-4 Diagnostic Tests

Biopsy

- Bone marrow examination (particularly if a hematolymphoid malignancy is suspected)
- Chest radiograph
- Complete blood count (CBC)
- Computed tomography (CT)
- Cytological studies (Papanicolaou's smear)
- Liver function studies
- Magnetic resonance imaging (MRI)
- Evaluation of serum tumor markers (e.g., carcinoembryonic antigen and alpha-fetoprotein)
- Proctoscopic examination (including guaiac for occult blood)
- Radiographic studies (mammography)
- Radioisotope scanning (liver, brain, bone, lung)
- Tumor markers

and the diagnosis made, because only minutes are required for this test.

c. Permanent paraffin section takes about 24 hours; however, it provides clearer details than the frozen section.

4. Interventions

- a. The procedure usually is performed in an outpatient surgical setting.
- b. Prepare the client for the diagnostic procedure, and provide postprocedure instructions.
- c. Obtain an informed consent.

#### V. PAIN CONTROL

**A.** Causes of pain

1. Bone destruction
2. Obstruction of an organ
3. Compression of peripheral nerves
4. Infiltration, distention of tissue
5. Inflammation, necrosis
6. Psychological factors, such as fear or anxiety

**B.** Interventions

1. Collaborate with other members of the health care team to develop a pain management program.
2. Administer oral preparations if possible and if they provide adequate relief of pain; the transdermal route may also be prescribed.
3. Mild or moderate pain may be treated with salicylates, acetaminophen (Tylenol), and nonsteroidal anti-inflammatory drugs (NSAIDs); drug-drug interactions occur with NSAIDs and anticoagulants, oral hypoglycemics, and antihypertensives.
4. Severe pain is treated with opioids, such as codeine sulfate, morphine sulfate, methadone, and hydromorphone hydrochloride (Dilaudid). Neuropathic pain is treated with a variety of anticonvulsants and antidepressants, as well as opioids.

5. Subcutaneous injections and continuous intravenous (IV) infusions of opioids provide rapid pain control; equianalgesic comparison charts should be used when switching routes of administration of opioids.
6. Monitor vital signs and for side effects of medications.
7. Monitor for effectiveness of medications.
8. Provide nonpharmacological techniques of pain control, such as relaxation, guided imagery, biofeedback, massage, and heat-cold application.

 **Assess the client's pain; pain is what the client describes or says that it is. Do not undermedicate the cancer client who is in pain.**

## VI. SURGERY

- A.** Description: Surgery is indicated to diagnose, stage, and treat **cancer**.
- B.** Prophylactic surgery
  1. Prophylactic surgery is performed in clients with an existing premalignant condition or a known family history that strongly predisposes the person to the development of **cancer**.
  2. An attempt is made to remove the tissue or organ at risk and thus prevent the development of **cancer**.
- C.** Curative surgery: All gross and microscopic tumor is removed or destroyed.
- D.** Control (cytoreductive or “debulking”) surgery
  1. Control surgery is a debulking procedure that consists of removing a large portion of a locally invasive tumor, such as advanced ovarian **cancer**.
  2. Surgery decreases the number of **cancer** cells; therefore, it may increase the chance that other therapies will be successful.
- E.** Palliative surgery
  1. Palliative surgery is performed to improve quality of life during the survival time.
  2. Palliative surgery is performed to reduce pain, relieve airway obstruction, relieve obstructions in the gastrointestinal or urinary tract, relieve pressure on the brain or spinal cord, prevent hemorrhage, remove infected or ulcerated tumors, or drain abscesses.
- F.** Reconstructive or rehabilitative surgery is performed to improve quality of life by restoring maximal function and appearance, such as breast reconstruction after mastectomy.
- G.** Side effects of surgery
  1. Loss or loss of function of a specific body part
  2. Reduced function as a result of organ loss
  3. Scarring or disfigurement
  4. Grieving about altered body image or imposed change in lifestyle

## VII. CHEMOTHERAPY

- A.** Description
  1. Chemotherapy kills or inhibits the reproduction of neoplastic cells and kills normal cells.
  2. The effects are systemic because chemotherapy is usually administered systemically.
  3. Normal cells most profoundly affected include those of the skin, hair, and lining of the gastrointestinal tract, spermatocytes, and hematopoietic cells.
  4. Cell cycle phase-specific medications affect cells only during a certain phase of the reproductive cycle, and cell cycle phase-nonspecific medications affect cells in any phase of the reproductive cycle.
  5. Usually, several chemotherapy and biotherapy agents are used in combination (combination therapy) to increase the therapeutic response.
  6. Combination chemotherapy is planned by the physician so that medications with overlapping toxicities and **nadir**s (the time during which bone marrow activity and white blood cell counts are at their lowest) at or near the same time are not administered; this will minimize immunosuppression.
  7. Chemotherapy may be combined with other treatments, such as surgery and radiation.
  8. The preferred route of administration is intravenously.
- B.** Common side effects include fatigue, alopecia, nausea and vomiting, mucositis, skin changes, and myelosuppression (neutropenia, anemia, and thrombocytopenia).
- C.** See Chapter 53 for information regarding the care of the client receiving chemotherapy.

## VIII. RADIATION THERAPY

- A.** Description
  1. Radiation therapy destroys **cancer** cells, with minimal exposure of normal cells to the damaging effects of radiation; the damaged cells die or become unable to divide.
  2. Radiation therapy is effective on tissues directly within the path of the radiation beam.
  3. Side effects include local skin changes and irritation, alopecia (hair loss), fatigue (most common side effect of radiation), and altered taste sensation; the effects vary according to the site of treatment.
  4. External beam radiation (also called teletherapy) and brachytherapy are the types of radiation therapy most commonly used to treat **cancer**.
- B.** External beam radiation (teletherapy): the actual radiation source is external to the client.
  1. Instruct the client regarding self-care of the skin (Box 52-5).
  2. The client does not emit radiation and does not pose a hazard to anyone else.
- C.** Brachytherapy
  1. The radiation source comes into direct, continuous contact with tumor tissues for a specific time.
  2. The radiation source is within the client; for a period of time, the client emits radiation and can pose a hazard to others.

### Box 52-5 Client Education Guide: Radiation Therapy for Cancer

Wash the irradiated area gently each day with warm water alone or with mild soap and water.

Use the hand rather than a washcloth to wash the area.

Rinse soap thoroughly from the skin.

Take care not to remove the markings that indicate exactly where the beam of radiation is to be focused.

Dry the irradiated area with patting motions rather than rubbing motions; use a clean, soft towel or cloth.

Use no powders, ointments, lotions, or creams on the skin at the radiation site unless they are prescribed by the radiologist.

Wear soft clothing over the skin at the radiation site.

Avoid wearing belts, buckles, straps or any type of clothing that binds or rubs the skin at the radiation site.

Avoid exposure of the irradiated area to the sun.

Avoid heat exposure.

### Box 52-6 Care of the Client With a Sealed Radiation Source

Place the client in a private room with a private bath.

Place a caution sign on the client's door.

Organize nursing tasks to minimize exposure to the radiation source.

Nursing assignments to a client with a radiation implant should be rotated.

Limit time to 30 minutes per care provider per shift.

Wear a dosimeter film badge to measure radiation exposure.

Wear a lead shield to reduce the transmission of radiation.

A nurse should never care for more than one client with a radiation implant at one time.

Do not allow a pregnant nurse to care for the client.

Do not allow children younger than 16 years or a pregnant woman to visit the client.

Limit visitors to 30 minutes per day; visitors should be at least 6 feet from the source.

Save bed linens and dressings until the source is removed; then dispose of in the usual manner.

Other equipment can be removed from the room at any time.

3. Brachytherapy includes an unsealed source or a sealed source of radiation.
4. Unsealed radiation source
  - a. Administration is via the oral or IV route or by instillation into body cavities.
  - b. The source is not confined completely to one body area, and it enters body fluids and eventually is eliminated via various excreta, which are radioactive and harmful to others. Most of the source is eliminated from the body within 48 hours; then neither the client nor the excreta is radioactive or harmful.
5. Sealed radiation source (Box 52-6) (see Priority Nursing Actions)

### PRIORITY NURSING ACTIONS!

#### Actions to Take If a Sealed Radiation Implant Becomes Dislodged

1. Encourage the client to lie still.
2. Use a long-handled forceps to retrieve the radioactive source.
3. Deposit the radioactive source in a lead container.
4. Contact the radiation oncologist.
5. Document the occurrence and the actions taken.

The client with a sealed radiation implant can emit radiation. Therefore the nurse and any other person who is in contact with the client needs to take special precautions to protect self from radiation exposure. In the event that a radiation source becomes dislodged, the nurse would first encourage the client to lie still until the radioactive source has been placed in a safe closed container. The nurse would never touch the dislodged radiation source with his or her hands and would use a long-handled forceps to place the source in the lead container that should be kept in the client's room. The nurse calls the radiation oncologist and then documents the occurrence and the actions taken. In the event that the radiation source cannot be located, the nurse ensures that no linens or other articles in the client's room are disposed of, prohibits visitors, and notifies the radiation oncologist.

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 420). St. Louis: Saunders.

- a. A sealed, temporary or permanent radiation source (solid implant) is implanted within the tumor target tissues.
- b. The client emits radiation while the implant is in place, but the excreta are not radioactive.
6. Removal of sealed radiation sources
  - a. The client is no longer radioactive.
  - b. Inform the client that cancer is not contagious.
  - c. Inform the female client that she may resume sexual intercourse after 7 to 10 days if the implant was cervical or vaginal.
  - d. Provide a douche, as prescribed, if the implant was placed into the cervix.
  - e. Administer a ready-to-use saline enema if prescribed.
  - f. Advise the client who had a cervical or vaginal implant to notify the physician if nausea, vomiting, diarrhea, frequent urination, vaginal or rectal bleeding, hematuria, foul-smelling vaginal discharge, abdominal pain or distention, or fever occurs.

### IX. BONE MARROW TRANSPLANTATION

#### A. Description

1. Bone marrow transplantation (BMT) and peripheral blood stem cell transplantation (PBSCT) are procedures that replace stem cells

that have been destroyed by high doses of chemotherapy and/or radiation therapy.

2. BMT and PBSCT are most commonly used in the treatment of **leukemia** and **lymphoma**, but are also used to treat other cancers, such as neuroblastoma and multiple **myeloma**.
  3. The goal of treatment is to rid the client of all leukemic or other **malignant** cells through treatment with high doses of chemotherapy and whole-body irradiation.
  4. Because these treatments are damaging to bone marrow cells, without the replacement of blood-forming stem cell function through transplantation, the client would die of infection or hemorrhage.
- B. Types of donor stem cells**
1. Allogeneic: Stem cell donor is usually a sibling, parent with a similar tissue type, or a person who is not related to the client (unrelated donor).
  2. Syngeneic: Stem cell is from an identical twin.
  3. Autologous
    - a. Autologous donation is the most common type.
    - b. The client receives his or her own stem cells.
    - c. Stem cells are harvested during disease remission and are stored frozen to be reinfused later.
- C. Procedure**
1. Harvest
    - a. The stem cells used in PBSCT come from the bloodstream in a 4- to 6-hour process called *apheresis* or *leukapheresis* (the blood is removed through a central venous catheter and an apheresis machine removes the stem cells and returns the remainder of the blood to the donor).
    - b. In BMT, marrow is harvested through multiple aspirations from the iliac crest to retrieve sufficient bone marrow for the transplant.
    - c. Marrow is filtered for residual **cancer** cells.
    - d. Allogeneic marrow is transfused immediately; autologous marrow is frozen for later use (cryopreservation).
    - e. Harvesting is done before the initiation of the conditioning regimen.
  2. Conditioning refers to an immunosuppression therapy regimen used to eradicate all **malignant** cells, provide a state of immunosuppression, and create space in the bone marrow for the engraftment of the new marrow.
  3. Transplantation
    - a. Stem cells are administered through the client's central line in a manner similar to that for a blood transfusion.
    - b. Stem cells may be administered by IV infusion or by IV push directly into the central line.
  4. Engraftment
    - a. The transfused stem cells move to the marrow-forming sites of the recipient's bones.

b. Engraftment occurs when the white blood cell, erythrocyte, and platelet counts begin to rise.

c. When successful, the engraftment process takes 2 to 5 weeks.

- D. Post-transplantation period:** Infection, bleeding, or neutropenia and thrombocytopenia are major concerns until engraftment occurs.

 **During the post-transplantation period, the client remains without any natural immunity until the donor stem cells begin to proliferate and engraftment occurs.**

**E. Complications**

1. Failure to engraft: If the transplanted stem cells fail to engraft, the client will die unless another transplantation is attempted and is successful.
2. Graft-versus-host disease in allogeneic transplants
  - a. Although the recipient cannot recognize the donated stem cells as foreign or non-self because of the total immunosuppression, the immune-competent cells of the donor recognize the recipient's cells as foreign and mount an immune offense against them.
  - b. Graft-versus-host disease is managed with immunosuppressive agents cautiously to avoid suppressing the new immune system to the extent that the client becomes more susceptible to infection, or the transplanted cells stop engrafting.
3. Venous-occlusive disease
  - a. The disease involves occlusion of the hepatic venules by thrombosis or phlebitis.
  - b. Signs include right upper quadrant abdominal pain, jaundice, ascites, weight gain, and hepatomegaly.
  - c. Early detection is critical because there is no known way to open the hepatic vessels.
  - d. The client will be treated with fluids and supportive therapy.

**X. SKIN CANCER** (see Chapter 50)

**XI. LEUKEMIA** (Box 52-7)

**A. Description**

1. **Leukemias** are a group of hematological malignancies involving abnormal overproduction of leukocytes, usually at an immature stage, in the bone marrow.
2. The two major types of **leukemia** are lymphocytic (involving abnormal cells from the lymphoid pathway) and myelocytic or myelogenous (involving abnormal cells from the myeloid pathways).
3. **Leukemia** may be acute, with a sudden onset, or chronic, with a slow onset and persistent symptoms over a period of years.

**Box 52-7 Classification of Leukemia****Acute Lymphocytic Leukemia**

Mostly lymphoblasts present in bone marrow.  
Age of onset is younger than 15 years.

**Acute Myelogenous Leukemia**

Mostly myeloblasts present in bone marrow.  
Age of onset is between 15 and 39 years.

**Chronic Myelogenous Leukemia**

Mostly granulocytes present in bone marrow.  
Age of onset is in the fourth decade.

**Chronic Lymphocytic Leukemia**

Mostly lymphocytes present in bone marrow.  
Age of onset is after 50 years.

4. **Leukemia** affects the bone marrow, causing anemia, leukopenia, the production of immature cells, thrombocytopenia, and a decline in immunity.
5. The cause is unknown and appears to involve gene damage of cells, leading to the transformation of cells from a normal state to a **malignant** state.
6. Risk factors include genetic, viral, immunological, and environmental factors and exposure to radiation, chemicals, and medications, such as previous chemotherapy.

**B. Assessment**

1. Anorexia, fatigue, weakness, weight loss
2. Anemia
3. Overt bleeding (nosebleeds, gum bleeding, rectal bleeding, hematuria, increased menstrual flow) and occult bleeding (e.g., as detected in a fecal occult blood test)
4. Ecchymosis, petechiae
5. Prolonged bleeding after minor abrasions or lacerations
6. Elevated temperature
7. Enlarged lymph nodes, spleen, liver
8. Palpitations, tachycardia, orthostatic hypotension
9. Pallor and dyspnea on exertion
10. Headache
11. Bone pain and joint swelling
12. Normal, elevated, or reduced white blood cell count
13. Decreased hemoglobin and hematocrit levels
14. Decreased platelet count
15. Positive bone marrow biopsy identifying leukemic blast phase cells

**C. Infection**

1. Infection can occur through autocontamination or cross-contamination. The WBC count may be extremely low during the period of greatest bone marrow depression, known as the *nadir*.
2. Common sites of infection are the skin, respiratory tract, and gastrointestinal tract.
3. Initiate protective isolation procedures.

**Box 52-8 Mouth Care for the Client With Mucositis**

Inspect the mouth daily.

Offer complete mouth care before and after every meal and at bedtime.

Brush the teeth and tongue with a soft-bristled toothbrush or sponges.

Provide mouth rinses every 12 hours with the prescribed solution.

Administer topical anesthetic agents to mouth sores as prescribed.

Avoid the use of alcohol- or glycerin-based mouthwashes or swabs because they are irritating to the mucosa.

Offer soft foods that are cool to warm in temperature rather than foods that are hard or spicy.

4. Ensure frequent and thorough hand washing by the client, family, and health care providers.
5. Staff and visitors with known infections or exposure to communicable diseases should avoid contact with the client until risk of infectious spread has passed.
6. Use strict aseptic technique for all procedures.
7. Keep supplies for the client separate from supplies for other clients; keep frequently used equipment in the room for the client's use only.
8. Limit the number of staff entering the client's room; reducing the number of staff who come into contact with the client reduces the risk of cross-infection.
9. Maintain the client in a private room with the door closed.
10. Place the client in a room with high-efficiency particulate air filtration or a laminar airflow system if possible.
11. Reduce exposure to environmental organisms by thoroughly washing or eliminating fresh or raw fruits and vegetables (low-bacteria diet) from the diet; eliminate fresh flowers and live plants from the client's room and avoid leaving standing water in the client's room.
12. Be sure that the client's room is cleaned daily.
13. Assist the client with daily bathing, using an antimicrobial soap.
14. Assist the client to perform oral hygiene frequently.
15. Initiate a bowel program to prevent constipation and prevent rectal trauma.
16. Avoid invasive procedures such as injections, rectal temperatures, and urinary catheterization.
17. Change wound dressings daily, and inspect the wounds for redness, swelling, or drainage.
18. Assess the urine for cloudiness and other characteristics of infection.
19. Assess skin and oral mucous membranes for signs of infection (Box 52-8).

20. Auscultate lung sounds, and encourage the client to cough and deep-breathe.
  21. Monitor temperature, pulse, respirations, blood pressure, and for pain.
  22. Monitor white blood cell and neutrophil counts.
  23. Notify the physician if signs of infection are present, and prepare to obtain specimens for culture of the blood, open lesions, urine, and sputum; chest radiograph may also be prescribed.
  24. Administer prescribed antibiotic, antifungal, and antiviral medications.
  25. Instruct the client to avoid crowds and those with infections.
  26. Instruct the client about a low-bacteria diet.
  27. Instruct the client to avoid activities that expose the client to infection, such as changing a pet's litter box or working with house plants or in the garden.
  28. Instruct the client that neither they nor their household contacts should receive immunization with a live virus such as measles, mumps, rubella, polio, varicella, shingles, and some influenza, including H1N1 vaccine).
12. Avoid rectal suppositories, enemas, and thermometers.
  13. If the female client is menstruating, count the number of pads or tampons used.
  14. Administer blood products as prescribed.
  15. Instruct the client to use a soft toothbrush and avoid dental floss.
  16. Instruct the client to use only an electric razor for shaving.
  17. Instruct the client to avoid blowing the nose.
  18. Discourage the client from engaging in activities involving the use of sharp objects; contact sports also need to be avoided.
  19. Instruct the client to avoid using nonsteroidal anti-inflammatory drugs and products that contain aspirin.

 Infection is a major cause of death in the immunosuppressed client.

-  **D. Bleeding**
  1. During the period of greatest bone marrow suppression (the **nadir**), the platelet count may be extremely low.
  2. The client is at risk for bleeding when the platelet count falls below 50,000/mm<sup>3</sup>, and spontaneous bleeding frequently occurs when the platelet count is fewer than 20,000/mm<sup>3</sup>.
  3. Clients with platelet counts lower than 20,000/mm<sup>3</sup> may need a platelet transfusion.
  4. For clients with anemia and fatigue, packed red blood cells may be prescribed.
  5. Monitor laboratory values.
  6. Examine the client for signs and symptoms of bleeding; examine all body fluids and excrement for the presence of blood.
  7. Handle the client gently; use caution when taking blood pressures to prevent skin injury.
  8. Monitor for signs of internal hemorrhage (e.g., pain, rapid and weak pulse, increased abdominal girth, and abdomen guarding).
  9. Provide soft foods that are cool to warm to avoid oral mucosa damage.
  10. Avoid injections, if possible, to prevent trauma to the skin and bleeding; apply firm and gentle pressure to a needle stick site for at least 5 minutes, or longer if needed.
  11. Pad side rails and sharp corners of the bed and furniture.
- E. Fatigue and nutrition**
  1. Assist the client in selecting a well-balanced diet.
  2. Provide small, frequent meals (high calorie, high protein, high carbohydrate) that require little chewing to reduce energy expenditure at mealtimes.
  3. Assist the client in self-care and mobility activities.
  4. Allow adequate rest periods during care.
  5. Do not perform activities unless they are essential; assist the client in scheduling important or pleasurable activities during periods of highest energy.
  6. Administer blood products for anemia as prescribed.
- F. Additional interventions**
  1. Chemotherapy
    - a. Induction therapy is aimed at achieving a rapid, complete remission of all manifestations of the disease.
    - b. Consolidation therapy is administered early in remission with the aim of cure.
    - c. Maintenance therapy may be prescribed for months or years following successful induction and consolidation therapy; the aim is to maintain remission.
  2. Administer antibiotic, antibacterial, antiviral, and antifungal medications as prescribed.
  3. Administer colony-stimulating factors as prescribed.
  4. Administer blood replacements as prescribed.
  5. Maintain infection and bleeding precautions.
  6. Prepare the client for transplantation if indicated.
  7. Instruct the client in appropriate home care measures.
  8. Provide psychosocial support and support services for home care.

## XII. LYMPHOMA: HODGKIN'S DISEASE

### A. Description

1. **Lymphomas**, classified as Hodgkin's and non-Hodgkin's depending on the cell type, are characterized by abnormal proliferation of lymphocytes.

2. Hodgkin's disease is a malignancy of the lymph nodes that originates in a single lymph node or a chain of nodes.
3. **Metastasis** occurs to other adjacent lymph structures and eventually invades nonlymphoid tissue.
4. The disease usually involves lymph nodes, tonsils, spleen, and bone marrow and is characterized by the presence of Reed-Sternberg cells in the nodes.
5. Possible causes include viral infections; clients treated with combination chemotherapy for Hodgkin's disease have a greater risk of developing acute **leukemia** and non-Hodgkin's **lymphoma**, among other secondary malignancies.
6. Prognosis depends on the stage of the disease.

#### B. Assessment

1. Fever
2. Malaise, fatigue, and weakness
3. Night sweats
4. Loss of appetite and significant weight loss
5. Anemia and thrombocytopenia
6. Enlarged lymph nodes, spleen, and liver
7. Positive biopsy of lymph nodes, with cervical nodes most often affected first
8. Presence of Reed-Sternberg cells in nodes
9. Positive computed tomography (CT) scan of the liver and spleen

#### C. Interventions

1. For earlier stages (stages I and II), without mediastinal node involvement, the treatment of choice is extensive external radiation of the involved lymph node regions.
2. With more extensive disease, radiation and multiagent chemotherapy are used.
3. Monitor for side effects related to chemotherapy or radiation therapy.
4. Monitor for signs of infection and bleeding.
5. Maintain infection and bleeding precautions.
6. Discuss the possibility of sterility with the male client receiving radiation, and inform the client of fertility options such as sperm banking.

### XIII. MULTIPLE MYELOMA

#### A. Description

1. A **malignant** proliferation of plasma cells within the bone
2. An excessive number of abnormal plasma cells invade the bone marrow and ultimately destroy bone; invasion of the lymph nodes, spleen, and liver occurs.
3. The abnormal plasma cells produce an abnormal antibody (**myeloma** protein or the Bence Jones protein) found in the blood and urine.
4. Multiple **myeloma** causes decreased production of immunoglobulin and antibodies and increased levels of uric acid and calcium, which can lead to renal failure.
5. The disease typically develops slowly and the cause is unknown.

#### B. Assessment

1. Bone (skeletal) pain, especially in the ribs, spine, and pelvis
2. Weakness and fatigue
3. Recurrent infections
4. Anemia
5. Urinalysis shows Bence Jones proteinuria and elevated total serum protein level.
6. Osteoporosis (bone loss and the development of pathological fractures)
7. Thrombocytopenia and leukopenia
8. Elevated calcium and uric acid levels
9. Renal failure
10. Spinal cord compression and paraplegia
11. Bone marrow aspiration shows an abnormal number of immature plasma cells.

 The client with multiple myeloma is at risk for pathological fractures. Therefore provide skeletal support during moving, turning, and ambulating and provide a hazard-free environment.

#### C. Interventions

1. Administer chemotherapy as prescribed.
2. Provide supportive care to control symptoms and prevent complications, especially bone fractures, hypercalcemia, renal failure, and infections.
3. Maintain neutropenic and bleeding precautions as necessary.
4. Monitor for signs of bleeding, infection, and skeletal fractures.
5. Encourage at least 2 L of fluids per day to offset potential problems associated with hypercalcemia, hyperuricemia, and proteinuria, and encourage additional fluid as indicated and tolerated.
6. Monitor for signs of renal failure.
7. Encourage ambulation to prevent renal problems and to slow down bone resorption.
8. Administer IV fluids and diuretics as prescribed to increase renal excretion of calcium.
9. Administer blood transfusions as prescribed for anemia.
10. Administer analgesics as prescribed and provide nonpharmacological therapies to control pain.
11. Administer antibiotics as prescribed for infection.
12. Prepare the client for local radiation therapy if prescribed.
13. Instruct the client in home care measures and the signs and symptoms of infection.
14. Administer bisphosphonate medications as prescribed to slow bone damage and reduce pain and risk of fractures.

### XIV. TESTICULAR CANCER

#### A. Description

1. Testicular cancer arises from germinal epithelium from the sperm-producing germ cells or

**Box 52-9 Types of Testicular Cancer****Germinal Tumors**

Seminomas  
Nonseminomas

**Nongerminial Tumors**

Interstitial cell tumors  
Androblastoma

from nongerminial epithelium from other structures in the testicles (Box 52-9).

2. Testicular cancer most often occurs between the ages of 15 and 40 years.
  3. The cause of testicular **cancer** is unknown, but a history of undescended testicle (cryptorchidism) and genetic predisposition have been associated with testicular tumor development.
  4. **Metastasis** occurs to the lung, liver, bone, and adrenal glands via the blood, and to the retroperitoneal lymph nodes via lymphatic channels.
- B.** Early detection: Perform monthly testicular self-examination (see Fig. 52-2)
- C.** Assessment
1. Painless testicular swelling occurs.
  2. "Dragging" or "pulling" sensation is experienced in the scrotum.
  3. Palpable lymphadenopathy, abdominal masses, and gynecomastia may indicate **metastasis**.
  4. Late signs include back or bone pain and respiratory symptoms.
- D.** Interventions
1. Administer chemotherapy as prescribed.
  2. Prepare the client for radiation therapy as prescribed.
  3. Prepare the client for unilateral orchiectomy, if prescribed, for diagnosis and primary surgical management or radical orchiectomy (surgical removal of the affected testis, spermatic cord, and regional lymph nodes).
  4. Prepare the client for retroperitoneal lymph node dissection, if prescribed, to stage the disease and reduce tumor volume so that chemotherapy and radiation therapy are more effective.
  5. Discuss reproduction, sexuality, and fertility information and options with the client.
  6. Identify reproductive options such as sperm storage, donor insemination, and adoption.
- E.** Postoperative interventions
1. Monitor for signs of bleeding and wound infection; antibiotics may be administered to prevent wound infection.
  2. Monitor intake and output.
  3. Provide and explain pain management methods; to reduce swelling in the first 48 hours, apply an ice pack with an intervening protective layer of cloth.
  4. Notify the physician if chills, fever, increasing pain or tenderness at the incision site, or drainage from the incision occurs.

**Box 52-10 Premalignant Cancers: Cervical Intraepithelial Neoplasia**

Stage I: Mild dysplasia

Stage II: Moderate dysplasia

Stage III: Severe dysplasia to carcinoma in situ

5. After the orchiectomy, instruct the client to avoid heavy lifting and strenuous activity for the length of time prescribed by the physician.
6. Instruct the client to perform a monthly testicular self-examination on the remaining testicle (see Fig. 52-2).
7. Inform the client that sutures will be removed approximately 7 to 10 days after surgery.

**XV. CERVICAL CANCER****A.** Description

1. Preinvasive **cancer** is limited to the cervix (Box 52-10).
2. Invasive **cancer** is in the cervix and other pelvic structures.
3. **Metastasis** usually is confined to the pelvis, but distant **metastasis** occurs through lymphatic spread.
4. Premalignant changes are described on a continuum from dysplasia, which is the earliest premalignancy change, to **carcinoma in situ**, the most advanced premalignant change.

**B.** Risk factors

1. Human papillomavirus (HPV) infection (vaccination against HPV is effective to avoid HPV infection, and thus cervical **cancer**)
2. Cigarette smoking, both active and passive
3. Reproductive behavior including early first intercourse (before age 17), multiple sex partners, or male partners with multiple sex partners.
4. Screening via regular gynecological examinations and Papanicolaou smear (Pap test), with treatment of precancerous abnormalities, decreases the incidence and mortality of cervical **cancer**.

**C.** Assessment

1. Painless vaginal postmenstrual and postcoital bleeding
2. Foul-smelling or serosanguineous vaginal discharge
3. Pelvic, lower back, leg, or groin pain
4. Anorexia and weight loss
5. Leakage of urine and feces from the vagina
6. Dysuria
7. Hematuria
8. Cytological changes on Pap test

**D.** Interventions (Box 52-11)**E.** Laser therapy

1. Laser therapy is used when all boundaries of the lesion are visible during colposcopic examination.
2. Energy from the beam is absorbed by fluid in the tissues, causing them to vaporize.

**Box 52-11 Treatment for Cervical Cancer****Nonsurgical**

Chemotherapy  
 Cryosurgery  
 External radiation  
 Internal radiation implants (intracavitary)  
 Laser therapy

**Surgical**

Conization  
 Hysterectomy  
 Pelvic exenteration

3. Minimal bleeding is associated with the procedure.
4. Slight vaginal discharge is expected following the procedure, and healing occurs in 6 to 12 weeks.

**F. Cryosurgery**

1. Cryosurgery involves freezing of the tissues using a probe, with subsequent necrosis and sloughing.
2. No anesthesia is required, although cramping may occur during the procedure.
3. A heavy watery discharge will occur for several weeks following the procedure.
4. Instruct the client to avoid intercourse and the use of tampons while the discharge is present.

 **G. Conization**

1. A cone-shaped area of the cervix is removed.
2. Conization allows the woman to retain reproductive capacity.
3. Long-term follow-up care is needed because new lesions can develop.
4. The risks of the procedure include hemorrhage, uterine perforation, incompetent cervix, cervical stenosis, and preterm labor in future pregnancies.

**H. Hysterectomy**

1. Description
  - a. Hysterectomy is performed for microinvasive cancer if childbearing is not desired.
  - b. A vaginal approach is most commonly used.
  - c. A radical hysterectomy and bilateral lymph node dissection may be performed for **cancer** that has spread beyond the cervix but not to the pelvic wall.
2. Postoperative interventions
  - a. Monitor vital signs
  - b. Assist with coughing and deep-breathing exercises.
  - c. Assist with range-of-motion exercises and provide early ambulation.
  - d. Apply antiembolism stockings or sequential compression devices as prescribed.
  - e. Monitor intake and output, Foley catheter drainage, and hydration status.
  - f. Monitor bowel sounds.
  - g. Assess incision site for signs of infection.

**Box 52-12 Types of Pelvic Exenteration****Anterior**

Removal of the uterus, ovaries, fallopian tubes, vagina, bladder, urethra, and pelvic lymph nodes

**Posterior**

Removal of the uterus, ovaries, fallopian tubes, descending colon, rectum, and anal canal

**Total**

Combination of anterior and posterior

- h. Administer pain medication as prescribed.
- i. Instruct the client to limit stair climbing for 1 month as prescribed and to avoid tub baths and sitting for long periods. 
- j. Avoid strenuous activity or lifting anything weighing more than 20 pounds. 
- k. Instruct the client to consume foods that promote tissue healing.
- l. Instruct the client to avoid sexual intercourse for 3 to 6 weeks as prescribed.
- m. Instruct the client in the signs associated with complications.

 **Monitor vaginal bleeding following hysterectomy. More than one saturated pad per hour may indicate excessive bleeding.**

**I. Pelvic exenteration (Box 52-12)**

1. Description
  - a. Pelvic exenteration, the removal of all pelvic contents, including bowel, vagina, and bladder, is a radical surgical procedure performed for recurrent **cancer** if no evidence of tumor outside the pelvis and no lymph node involvement exist.
  - b. When the bladder is removed, an ileal conduit is created and located on the right side of the abdomen to divert urine.
  - c. A colostomy may need to be created on the left side of the abdomen for the passage of feces.
2. Postoperative interventions
  - a. Similar to postoperative interventions following hysterectomy.
  - b. Monitor for signs of altered respiratory status. 
  - c. Monitor incision site for infection.
  - d. Monitor intake and output and for signs of dehydration.
  - e. Monitor for hemorrhage, shock, and deep vein thrombosis. 
  - f. Apply antiembolism stockings or sequential compression devices as prescribed. 
  - g. Administer prophylactic heparin as prescribed.
  - h. Administer perineal irrigations and sitz baths as prescribed.

- i. Instruct the client to avoid strenuous activity for 6 months.
- j. Instruct the client that the perineal opening, if present, may drain for several months.
- k. Instruct the client in the care of the ileal conduit and colostomy, if created.
- l. Provide sexual counseling because vaginal intercourse is not possible after anterior and total pelvic exenteration.

## XVI. OVARIAN CANCER

### A. Description

1. Ovarian **cancer** grows rapidly, spreads fast, and is often bilateral.
2. **Metastasis** occurs by direct spread to the organs in the pelvis, by distal spread through lymphatic drainage, or by peritoneal seeding.
3. In its early stages, ovarian **cancer** is often asymptomatic; because most women are diagnosed in advanced stages, ovarian **cancer** has more deaths than any other **cancer** of the female reproductive system, particularly white women between 55 and 65 years of age of North American or European descent.
4. An exploratory laparotomy is performed to diagnose and stage the tumor.

### B. Assessment

1. Abdominal discomfort or swelling
2. Gastrointestinal disturbances
3. Dysfunctional vaginal bleeding
4. Abdominal mass
5. Elevated **tumor marker** (CA-125)

### C. Interventions

1. External radiation may be used if the tumor has invaded other organs; intraperitoneal radioisotopes may be instilled for stage I disease.
2. Chemotherapy is used postoperatively for most stages of ovarian **cancer**.
3. Intraperitoneal chemotherapy involves the instillation of chemotherapy into the abdominal cavity.
4. Total abdominal hysterectomy and bilateral salpingo-oophorectomy with tumor debulking may be necessary.

## XVII. ENDOMETRIAL (OVARIAN) CANCER

### A. Description

1. Endometrial **cancer** is a slow-growing tumor arising from the endometrial mucosa of the uterus, associated with the menopausal years.
2. **Metastasis** occurs through the lymphatic system to the ovaries and pelvis, via the blood to the lungs, liver, and bone, or intra-abdominally to the peritoneal cavity.

### B. Risk factors

1. Use of estrogen replacement therapy (ERT)
2. Nulliparity
3. Polycystic ovary disease

4. Increased age
5. Late menopause
6. Family history of uterine **cancer** or hereditary nonpolyposis colorectal **cancer**
7. Obesity
8. Hypertension
9. Diabetes mellitus

### C. Assessment

1. Abnormal bleeding, especially in postmenopausal women
2. Vaginal discharge
3. Low back, pelvic, or abdominal pain (pain occurs late in the disease process)
4. Enlarged uterus (in advanced stages)

### D. Nonsurgical interventions

1. External or internal radiation is used alone or in combination with surgery, depending on the stage of **cancer**.
2. Chemotherapy is used to treat advanced or recurrent disease.
3. Progestational therapy with medication may be prescribed for estrogen-dependent tumors.
4. Tamoxifen (Nolvadex), an antiestrogen medication, also may be prescribed.

### E. Surgical interventions: Total abdominal hysterectomy and bilateral salpingo-oophorectomy

## XVIII. BREAST CANCER

### A. Description

1. Breast **cancer** is classified as invasive when it penetrates the tissue surrounding the mammary duct and grows in an irregular pattern.
2. **Metastasis** occurs via lymph nodes.
3. Common sites of **metastasis** are the bone and lungs; **metastasis** may also occur to the brain and liver.
4. Diagnosis is made by breast biopsy through a needle aspiration or by surgical removal of the tumor with microscopic examination for **malignant** cells.

### B. Risk factors

1. Age
2. Family history of breast cancer
3. Early menarche and late menopause
4. Previous **cancer** of the breast, uterus, or ovaries
5. Nulliparity, late first birth
6. Obesity
7. High-dose radiation exposure to chest

### C. Assessment

1. Mass felt during BSE
2. Mass usually felt in the upper outer quadrant, beneath the nipple, or in axilla
3. A fixed, irregular nonencapsulated mass; typically painless except in the late stages
4. Nipple retraction or elevation
5. Asymmetry, with the affected breast being higher
6. Bloody or clear nipple discharge
7. Skin dimpling, retraction, or ulceration

8. Skin edema or peau d'orange skin
9. Axillary lymphadenopathy
10. Lymphedema of the affected arm
11. Symptoms of bone or lung **metastasis** in late stage
12. Presence of the lesion on mammography

**D.** Early detection: Monthly BSE

**E.** Nonsurgical interventions

1. Chemotherapy
2. Radiation therapy
3. Hormonal manipulation via the use of medication in postmenopausal women or other medications for estrogen receptor–positive tumors

**F.** Surgical interventions: Surgical breast procedures, with possible breast reconstruction (Box 52-13)

**G.** Postoperative interventions

1. Monitor vital signs.
2. Position the client in a semi-Fowler's position; turn from the back to the unaffected side, with the affected arm elevated above the level of the heart to promote drainage and prevent lymphedema.
3. Encourage coughing and deep breathing.
4. If a drain (usually a Jackson-Pratt) is in place, maintain suction and record the amount of drainage and drainage characteristics; teach the client about home management of the drain (Fig. 52-3).
5. Assess operative site for infection, swelling, or the presence of fluid collection under the skin flaps or in the arm.
6. Monitor incision site for restriction of dressing, impaired sensation, or color changes of the skin.
7. If breast reconstruction was performed, the client will return from surgery with a surgical brassiere and a prosthesis in place.
8. Provide the use of a pressure sleeve as prescribed if edema is severe.
9. Maintain fluid and electrolyte balance; administer diuretics and provide a low-salt diet as prescribed for severe lymphedema.

10. Consult with the physician and physical therapist regarding the appropriate exercise program and assist client with prescribed exercise.
11. Instruct the client about home care measures (Box 52-14).

**!** No IVs, no injections, no blood pressure measurements, and no venipunctures should be done in the arm on the side of the mastectomy. The arm on the side of the mastectomy is protected, and any intervention that could traumatize the affected arm is avoided.

### Box 52-13 Surgical Breast Procedures

#### Lumpectomy

Tumor is excised and removed.  
Lymph node dissection may also be performed.

#### Simple Mastectomy

Breast tissue and the nipple are removed.  
Lymph nodes are usually left intact.

#### Modified Radical Mastectomy

Breast tissue, nipple, and lymph nodes are removed.  
Muscles are left intact.

**▲ FIGURE 52-3** Jackson-Pratt device. **A**, Drainage tubes and reservoir. **B**, Emptying drainage reservoir. (From Potter, P., & Perry, A. [2009]. *Fundamentals of nursing* [7th ed.]. St. Louis: Mosby.)

## XIX. GASTRIC CANCER

### A. Description

1. Gastric **cancer** is a **malignant** growth of the mucosal cells in the inner lining of the stomach, with invasion to the muscle and beyond in advanced disease.
2. No single causative agent has been identified but it is believed that *Helicobacter pylori* infection and a diet of smoked, highly salted, processed, or spiced foods have carcinogenic effects; other risk factors include smoking, alcohol and nitrate ingestion, and a history of gastric ulcers.
3. Complications include hemorrhage, obstruction, **metastasis**, and dumping syndrome.
4. The goal of treatment is to remove the tumor and provide a nutritional program.

### B. Assessment

1. Early symptoms of gastric **cancer**
  - a. Indigestion
  - b. Abdominal discomfort
  - c. Full feeling
  - d. Epigastric, back, or retrosternal pain
2. Late symptoms of gastric **cancer**
  - a. Weakness and fatigue
  - b. Anorexia and weight loss
  - c. Nausea and vomiting
  - d. A sensation of pressure in the stomach
  - e. Dysphagia and obstructive symptoms
  - f. Iron deficiency anemia

### Box 52-14 Client Instructions Following Mastectomy

Avoid overuse of the arm during the first few months. To prevent lymphedema, keep the affected arm elevated; consultation with lymphedema specialist may be prescribed.

Provide incision care with an emollient to soften and prevent wound contracture.

Encourage use of Reach for Recovery volunteers.

Encourage the client to perform breast self-examination on the remaining breast.

Protect the affected hand and arm.

Avoid strong sunlight on the affected arm.

Do not let the affected arm hang dependent.

Do not carry a pocketbook or anything heavy over the affected arm.

Avoid trauma, cuts, bruises, or burns to the affected side.

Avoid wearing constricting clothing or jewelry on the affected side.

Wear gloves when gardening.

Use thick oven mitts when cooking.

Use a thimble when sewing.

Apply hand cream several times daily.

Use cream cuticle remover.

Call the physician if signs of inflammation occur in the affected arm.

Wear a Medic-Alert bracelet stating which arm is lymphedematous.

g. Ascites

h. Palpable epigastric mass

### C. Interventions

1. Monitor vital signs.
2. Monitor hemoglobin and hematocrit and administer blood transfusions as prescribed.
3. Monitor weight.
4. Assess nutritional status; encourage small, bland, easily digestible meals with vitamin and mineral supplements.
5. Administer pain medication as prescribed.
6. Prepare the client for chemotherapy or radiation therapy as prescribed.
7. Prepare the client for surgical resection of the tumor as prescribed (Box 52-15).

### D. Postoperative interventions

1. Monitor vital signs.
2. Place in Fowler's position for comfort.
3. Administer analgesics, antiemetics, as prescribed.
4. Monitor intake and output; administer fluids and electrolyte replacement by IV as prescribed; administer parenteral nutrition as indicated.
5. Maintain NPO status as prescribed for 1 to 3 days until peristalsis returns; assess for bowel sounds.
6. Monitor nasogastric suction.
7. Do not irrigate or remove the nasogastric tube (follow agency procedures); assist the physician with irrigation or removal.
8. Advance the diet from NPO to sips of clear water to six small bland meals a day, as prescribed.
9. Monitor for complications such as hemorrhage, dumping syndrome, diarrhea, hypoglycemia, and vitamin B<sub>12</sub> deficiency.

## XX. PANCREATIC CANCER

### A. Description

1. Most pancreatic tumors are highly **malignant**, rapidly growing **adenocarcinomas** originating from the epithelium of the ductal system.

### Box 52-15 Surgical Interventions for Gastric Cancer

#### Subtotal Gastrectomy

##### Billroth I

Also called gastroduodenostomy

Partial gastrectomy, with remaining segment anastomosed to the duodenum

##### Billroth II

Also called gastrojejunostomy

Partial gastrectomy, with remaining segment anastomosed to the jejunum

#### Total Gastrectomy

Also called esophagojejunostomy

Removal of the stomach, with attachment of the esophagus to the jejunum or duodenum

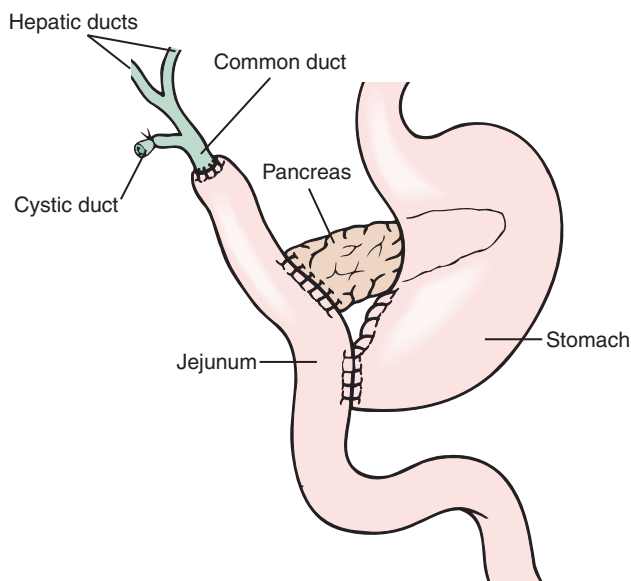

2. Pancreatic **cancer** is associated with increased age, a history of diabetes mellitus, alcohol use, history of previous pancreatitis, smoking, ingestion of a high-fat diet, and exposure to environmental chemicals.
3. Symptoms usually do not occur until the tumor is large; therefore, the prognosis is poor.
4. Endoscopic retrograde cholangiopancreatography for visualization of the pancreatic duct and biliary system and collection of tissue and secretions may be done.

#### B. Assessment

1. Nausea and vomiting
2. Jaundice
3. Unexplained weight loss
4. Clay-colored stools
5. Glucose intolerance
6. Abdominal pain

#### C. Interventions

1. Radiation
2. Chemotherapy
3. Whipple procedure, which involves a pancreaticoduodenectomy with removal of the distal third of the stomach, pancreaticojejunostomy, gastrojejunostomy, and choledochojejunostomy (Fig. 52-4)
4. Postoperative care measures and complications are similar to those for the care of a client with pancreatitis and the client following gastric surgery; monitor blood glucose levels for transient hyperglycemia or hypoglycemia resulting from surgical manipulation of the pancreas.

▲ **FIGURE 52-4** Whipple procedure, or radical pancreaticoduodenectomy. (From Lewis, S., Heitkemper, M., Dirksen, S., O'Brien, P., and Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

## XXI. INTESTINAL TUMORS

### A. Description

1. Intestinal tumors are **malignant** lesions that develop in the cells lining the bowel wall or develop as adenomatous polyps in the colon or rectum.
2. Tumors spread is by direct invasion and through the lymphatic and circulatory systems.
3. Complications include bowel perforation with peritonitis, abscess and fistula formation, hemorrhage, and complete intestinal obstruction.

### B. Risk factors for colorectal cancer

1. Age older than 50 years
2. Familial polyposis, family history of colorectal **cancer**
3. Previous colorectal polyps, history of colorectal **cancer**
4. History of chronic inflammatory bowel disease
5. History of ovarian or breast **cancer**

### C. Assessment

1. Blood in stool (most common manifestation)
2. Anorexia, vomiting, and weight loss
3. Anemia
4. Abnormal stools
  - a. Ascending colon tumor: Diarrhea
  - b. Descending colon tumor: Constipation or some diarrhea, or flat, ribbon-like stool caused by a partial obstruction
  - c. Rectal tumor: Alternating constipation and diarrhea
5. Guarding or abdominal distention, abdominal mass (late sign)
6. Cachexia (late sign)
7. Masses noted on barium enema, colonoscopy, CT scan, sigmoidoscopy

### D. General interventions

1. Monitor for signs of complications, which include bowel perforation with peritonitis, abscess or fistula formation (fever associated with pain), hemorrhage (signs of shock), and complete intestinal obstruction. 
2. Monitor for signs of bowel perforation, which include low blood pressure, rapid and weak pulse, distended abdomen, and elevated temperature. 
3. Monitor for signs of intestinal obstruction, which include vomiting (may be fecal contents), pain, constipation, and abdominal distention; provide comfort measures. 
4. Note that an early sign of intestinal obstruction is increased peristaltic activity, which produces an increase in bowel sounds; as the obstruction progresses, hypoactive bowel sounds may be heard. 
5. Prepare for radiation preoperatively to facilitate surgical resection, and postoperatively to decrease the risk of recurrence or to reduce pain, hemorrhage, bowel obstruction, or **metastasis**.

**E. Nonsurgical interventions**

1. Preoperative radiation for local control and postoperative radiation for palliation may be prescribed.
2. Postoperative chemotherapy to control symptoms and the spread of disease

**F. Surgical interventions: Bowel, local lymph node resection and creation of a colostomy or ileostomy****G. Colostomy, ileostomy****1. Preoperative interventions**

- a. Consult with the enterostomal therapist to assist in identifying optimal placement of the ostomy.
- b. Instruct the client to eat a low-fiber diet for 1 to 2 days before surgery and administer bowel preparation (laxatives and enemas), as prescribed.
- c. Administer intestinal antiseptics and antibiotics, as prescribed, to decrease the bacterial content of the colon and to reduce the risk of infection from the surgical procedure.

**2. Postoperative: Colostomy**

- a. If a pouch system is not in place, apply a petroleum jelly gauze over the stoma to keep it moist, covered with a dry sterile dressing; place a pouch system on the stoma as soon as possible.
- b. Monitor the pouch system for proper fit and signs of leakage; empty the pouch when one-third full.
- c. Monitor the stoma for size, unusual bleeding, color changes, or necrotic tissue.
- d. Note that the normal stoma color is red or pink, indicating high vascularity.
- e. Note that a pale pink stoma indicates low hemoglobin and hematocrit levels.
- f. Assess the functioning of the colostomy.
- g. Expect that stool will be liquid postoperatively but will become more solid, depending on the area of the colostomy.
- h. Expect liquid stool from an ascending colon colostomy, loose to semiformal stool from a transverse colon colostomy, or close to normal stool from a descending colon colostomy.
- i. Fecal matter should not be allowed to remain on the skin.
- j. Administer analgesics and antibiotics as prescribed.
- k. Irrigate perineal wound if present and if prescribed, and monitor for signs of infection; provide comfort measures for perineal itching and pain.
- l. Instruct the client to avoid foods that cause excessive gas formation and odor.
- m. Instruct the client in stoma care and irrigations as prescribed.
- n. Instruct the client on how to resume normal activities, including work, travel, and sexual

intercourse, as prescribed; provide psychosocial support.

**3. Postoperative: Ileostomy**

- a. Healthy stoma is red; a color change to dark blue or black should be reported to the physician.
- b. Postoperative drainage will be dark green and progress to yellow as the client begins to eat.
- c. Stool is liquid.
- d. Risk for dehydration and electrolyte imbalance exists.
- e. Do not administer medications such as suppositories through an ileostomy.

 **Monitor stoma color.** A dark blue, purple, or black stoma indicates compromised circulation, requiring physician notification.

**XXII. LUNG CANCER****A. Description**

1. Lung **cancer, malignant** tumor of the bronchi and peripheral lung tissue, is one of the leading causes of **cancer**-related deaths in men and women in the United States.
2. The lungs are a common target for **metastasis** from other organs.
3. Bronchogenic **cancer** (tumors originate in the epithelium of the bronchus) spreads through direct extension and lymphatic dissemination.
4. Classified according to histological cell type, there are two main types of lung **cancer**, small cell lung **cancer** (SCLC) and non-small cell lung **cancer** (NSCLC); epidermal (squamous cell), **adenocarcinoma**, and large cell anaplastic **carcinoma** are classified as NSCLC because of their similar responses to treatment.
5. Diagnosis is made by a chest x-ray study, CT scan, or magnetic resonance imaging (MRI), which shows a lesion or mass, and by bronchoscopy and sputum studies, which demonstrate a positive cytological study for **cancer** cells.

**B. Causes**

1. Cigarette smoking, also exposure to “passive” tobacco smoke
2. Exposure to environmental and occupational pollutants

**C. Assessment**

1. Cough
2. Wheezing, dyspnea
3. Hoarseness
4. Hemoptysis, blood-tinged or purulent sputum
5. Chest pain
6. Anorexia and weight loss
7. Weakness
8. Diminished or absent breath sounds, respiratory changes

**D. Interventions**

1. Monitor vital signs.
2. Monitor breathing patterns and breath sounds and for signs of respiratory impairment; monitor for hemoptysis.
3. Assess for tracheal deviation.
4. Administer analgesics as prescribed for pain management.
5. Place in a Fowler's position to help ease breathing.
6. Administer oxygen as prescribed and humidification to moisten and loosen secretions.
7. Monitor pulse oximetry.
8. Provide respiratory treatments as prescribed.
9. Administer bronchodilators and corticosteroids as prescribed to decrease bronchospasm, inflammation, and edema.
10. Provide a high-calorie, high-protein, high-vitamin diet.
11. Provide activity as tolerated, rest periods, and active and passive range-of-motion exercises.

**E. Nonsurgical interventions**

1. Radiation therapy may be prescribed for localized intrathoracic lung **cancer** and for palliation of hemoptysis, obstructions, dysphagia, superior vena cava syndrome, and pain.
2. Chemotherapy may be prescribed for treatment of nonresectable tumors or as adjuvant therapy.

**F. Surgical interventions**

1. Laser therapy: To relieve endobronchial obstruction
2. Thoracentesis and pleurodesis: To remove pleural fluid and relieve hypoxia
3. Thoracotomy (opening into the thoracic cavity) with pneumonectomy: Surgical removal of one entire lung
4. Thoracotomy with lobectomy: Surgical removal of one lobe of the lung for tumors confined to a single lobe
5. Thoracotomy with segmental resection: Surgical removal of a lobe segment

**G. Preoperative interventions**

1. Explain the potential postoperative need for chest tubes.
2. Note that closed chest drainage usually is not used for a pneumonectomy and the serous fluid that accumulates in the empty thoracic cavity eventually consolidates, preventing shifts of the mediastinum, heart, and remaining lung.

**H. Postoperative interventions**

1. Monitor vital signs.
2. Assess cardiac and respiratory status; monitor lung sounds.
3. Maintain the chest tube drainage system, which drains air and blood that accumulates in the pleural space; monitor for excess bleeding. (See Chapter 21 for care of the client with a chest tube.)

4. Administer oxygen as prescribed.
5. Check the physician's prescriptions regarding client positioning; avoid complete lateral turning.
6. Monitor pulse oximetry.
7. Provide activity as tolerated.
8. Encourage active range-of-motion exercises of the operative shoulder as prescribed.
9. See Chapter 21 for care of the client with a chest tube.

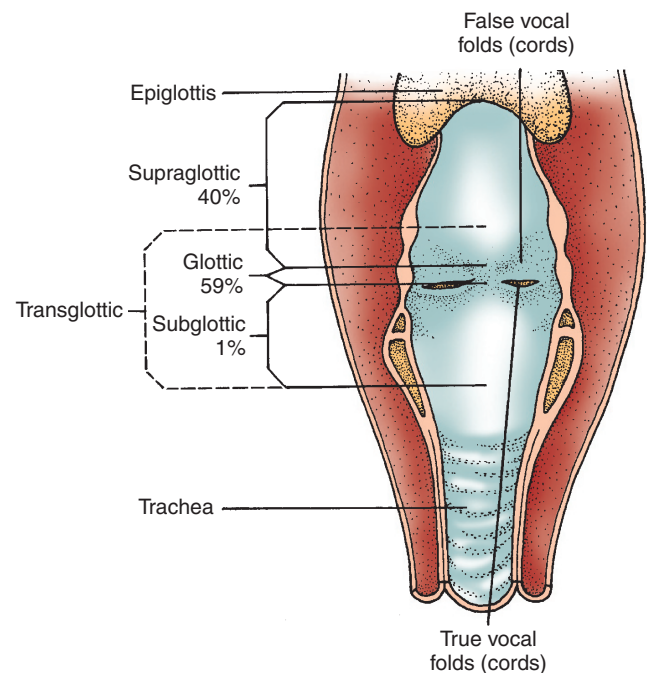

▲ **Airway is the priority for a client with lung or laryngeal cancer.**

**XXIII. LARYNGEAL CANCER****A. Description**

1. Laryngeal **cancer** is a **malignant** tumor of the larynx (Fig. 52-5).
2. Laryngeal **cancer** presents as **malignant** ulcerations with underlying infiltration and is spread by local extension to adjacent structures in the throat and neck, and by the lymphatic system.
3. Diagnosis is made by laryngoscopy and biopsy showing a positive cytological study for **cancer** cells.
4. Laryngoscopy allows for evaluation of the throat and biopsy of tissues; chest radiography, CT, and MRI are used for **staging**.

**B. Risk factors**

1. Cigarette smoking
2. Heavy alcohol use and the combined use of tobacco and alcohol

▲ **FIGURE 52-5** Sites and incidence of primary laryngeal tumors. (From Ignatavicius, D., & Workman, M. [2006]. *Medical-surgical nursing: Critical thinking for collaborative care* [5th ed.]. St. Louis: Saunders.)

3. Exposure to environmental pollutants (e.g., asbestos, wood dust)
4. Exposure to radiation

#### C. Assessment

1. Persistent hoarseness or sore throat
2. Painless neck mass
3. Feeling of a lump in the throat
4. Burning sensation in the throat
5. Dysphagia
6. Change in voice quality
7. Dyspnea
8. Weakness and weight loss
9. Hemoptysis
10. Foul breath odor

#### D. Interventions

1. Place in Fowler's position to promote optimal air exchange.
2. Monitor respiratory status.
3. Monitor for signs of aspiration of food and fluid.
4. Administer oxygen as prescribed.
5. Provide respiratory treatments as prescribed.
6. Provide activity as tolerated.
7. Provide a high-calorie and high-protein diet.
8. Provide nutritional support via parenteral nutrition, nasogastric tube feedings, or gastrostomy or jejunostomy tube, as prescribed.
9. Administer analgesics as prescribed for pain.

#### E. Nonsurgical interventions

1. Radiation therapy if the **cancer** is limited to a small area in one vocal cord
2. Chemotherapy, which may be given in combination with radiation and surgery

#### F. Surgical interventions

1. The goal is to remove the **cancer** while preserving as much normal function as possible.
2. Surgical intervention depends on the tumor size, location, and amount of tissue to be resected.
3. Types of resection include cordal stripping, cordectomy, partial laryngectomy, and total laryngectomy.
4. A tracheostomy is performed with a total laryngectomy; this airway opening is permanent and is referred to as a laryngectomy stoma.

#### G. Preoperative interventions

1. Discuss self-care of the airway, alternate methods of communication, suctioning, pain control methods, the critical care environment, and nutritional support.
2. Encourage the client to express feelings about changes in body image and loss of voice.
3. Describe the rehabilitation program and information about the tracheostomy and suctioning.

#### H. Postoperative interventions

1. Monitor vital signs.
2. Monitor respiratory status; monitor airway patency and provide frequent suctioning to remove bloody secretions.

3. Place the client in a high Fowler's position.
4. Maintain mechanical ventilator support or a tracheostomy collar with humidification, as prescribed.
5. Monitor pulse oximetry.
6. Maintain surgical drains in the neck area if present.
7. Observe for hemorrhage and edema in the neck.
8. Monitor IV fluids or parenteral nutrition until nutrition is administered via a nasogastric, gastrostomy, or jejunostomy tube.
9. Provide oral hygiene.
10. Assess gag and cough reflexes and the ability to swallow.
11. Increase activity as tolerated.
12. Assess the color, amount, and consistency of sputum.
13. Provide stoma and laryngectomy care (Box 52-16).
14. Provide consultation with speech and language pathologist as prescribed.
15. Reinforce method of communication established preoperatively.
16. Prepare the client for rehabilitation and speech therapy (Box 52-17).

## XXIV. PROSTATE CANCER

### A. Description

1. Prostate **cancer**, a slow-growing malignancy of the prostate gland, is a common **cancer** in American men; most prostate tumors are **adenocarcinomas** arising from androgen-dependent epithelial cells.
2. The risk increases in men with each decade after the age of 50 years.

### Box 52-16 Stoma Care Following Laryngectomy

Protect the neck from injury.

Instruct the client in how to clean the incision and provide stoma care.

Instruct the client to wear a stoma guard to shield the stoma.

Demonstrate ways to prevent debris from entering the stoma.

Advise the client to wear loose-fitting, high-collared clothing to cover the stoma.

Avoid swimming, showering, and using aerosol sprays.

Teach the client clean suctioning technique.

Advise the client to increase humidity in the home.

Increase fluid intake to 3000 mL/day as prescribed.

Avoid exposure to persons with infections.

Alternate rest periods with activity.

Instruct the client in range-of-motion exercises for the arms, shoulders, and neck as prescribed.

Advise the client to wear a Medic-Alert bracelet.

### Box 52-17 Speech Rehabilitation Following Laryngectomy

#### Esophageal Speech

The client produces esophageal speech by “burping” the air swallowed.

The voice produced is monotone, cannot be raised or lowered, and carries no pitch.

The client must have adequate hearing because his or her mouth shapes words as they are heard.

#### Mechanical Devices

The devices are known as an electrolarynx.

The device is placed against the side of the neck; the air inside the neck and pharynx is vibrated, and the client articulates.

Other devices consist of a plastic tube placed inside the client’s mouth that vibrates on articulation.

#### Tracheoesophageal Fistula

A fistula is created surgically between the trachea and the esophagus, with eventual placement of a prosthesis to produce speech.

The prosthesis provides the client with a means to divert air from the trachea into the esophagus, and out of the mouth.

Lip and tongue movement produce the speech.

3. Prostate **cancer** can spread via direct invasion of surrounding tissues or by **metastasis** through the bloodstream and lymphatics, to the bony pelvis and spine.
4. Bone **metastasis** is a concern, as is spread to the lungs, liver, and kidneys.
5. The cause of prostate **cancer** is unclear, but advancing age, heavy metal exposure, smoking, and history of sexually transmitted disease are contributing factors.

#### B. Assessment

1. Asymptomatic in early stages
2. Hard, pea-sized nodule or irregularities palpated on rectal examination
3. Gross, painless hematuria
4. Late symptoms such as weight loss, urinary obstruction, and bone pain radiating from the lumbosacral area down the leg
5. The prostate-specific antigen level is elevated in various noncancerous conditions; therefore, it should not be used as a screening test without a digital rectal examination. It is routinely used to monitor response to therapy.
6. Diagnosis is made through biopsy of the prostate gland.

#### C. Nonsurgical interventions

1. Prepare the client for hormone manipulation therapy as prescribed.
2. Luteinizing hormone may be prescribed to slow the rate of growth of the tumor.

3. Pain medication, radiation therapy, corticosteroids, and bisphosphonates may be prescribed for palliation of advanced prostate **cancer**.
4. Prepare the client for external beam radiation or brachytherapy, which may be prescribed alone or with surgery, preoperatively or postoperatively, to reduce the lesion and limit **metastasis**.
5. Prepare the client for the administration of chemotherapy in cases of hormone-resistant tumors.

#### D. Surgical interventions

1. Prepare the client for orchiectomy (palliative), if prescribed, which will limit the production of testosterone.
2. Prepare the client for prostatectomy, if prescribed.
3. The radical prostatectomy can be performed via a retropubic, perineal, or suprapubic approach.
4. Cryosurgical ablation is a minimally invasive procedure that may be an alternative to radical prostatectomy; liquid nitrogen freezes the gland, and the dead cells are absorbed by the body.

#### E. Transurethral resection of the prostate (TURP)

may be performed for palliation in prostate **cancer** clients.

1. The procedure involves insertion of a scope into the urethra to excise prostatic tissue.
2. Monitor for hemorrhage; bleeding is common following TURP.
3. Postoperative continuous bladder irrigation (CBI) may be prescribed, which prevents catheter obstruction from clots.
4. Assess for signs of transurethral resection syndrome, which include signs of cerebral edema and increased intracranial pressure, such as increased blood pressure, bradycardia, confusion, disorientation, muscle twitching, visual disturbances, and nausea and vomiting.
5. Antispasmodics may be prescribed for bladder spasm.
6. Instruct the client to monitor and report dribbling or incontinence postoperatively and teach perineal exercises.
7. Sterility is possible following the surgical procedure.

#### F. Suprapubic prostatectomy

1. Suprapubic prostatectomy is removal of the prostate gland by an abdominal incision with a bladder incision.
2. The client will have an abdominal dressing that may drain copious amounts of urine, and the abdominal dressing will need to be changed frequently.
3. Severe hemorrhage is possible, and monitoring for blood loss is an important nursing intervention.
4. Antispasmodics may be prescribed for bladder spasms.
5. CBI is prescribed and carried out to maintain pink-colored urine.
6. Sterility occurs with this procedure.

**Box 52-18 Continuous Bladder Irrigation****Description**

A three-way (lumen) irrigation is used to decrease bleeding and to keep the bladder free from clots—one lumen is for inflating the balloon (30 mL); one lumen is for instillation (inflow); one lumen is for outflow.

**Interventions**

Maintain traction on the catheter, if applied, to prevent bleeding by pulling the catheter taut and taping it to the abdomen or thigh.

Instruct the client to keep the leg straight if traction is applied to the catheter and it is taped to the thigh.

Catheter traction is not released without a physician's prescription; it usually is released after any bright red drainage has diminished.

Use only sterile bladder irrigation solution or prescribed solution to prevent water intoxication.

Run the solution at a rate, as prescribed, to keep the urine pink. Run the solution rapidly if bright red drainage or clots are present; monitor output closely. Run the solution at about 40 gtt/min when the bright red drainage clears.

If the urinary catheter becomes obstructed, turn off the CBI and irrigate the catheter with 30 to 50 mL of normal

saline, if prescribed; notify the physician if obstruction does not resolve.

Discontinue CBI and the Foley catheter as prescribed, usually 24 to 48 hours after surgery.

Monitor for continence and urinary retention when the catheter is removed. Inform the client that some burning, frequency, and dribbling may occur following catheter removal.

Inform the client that he should be voiding 150 to 200 mL of clear yellow urine every 3 to 4 hours by 3 days after surgery.

Inform the client that he may pass small clots and tissue debris for several days.

Teach the client to avoid heavy lifting, stressful exercise, driving, Valsalva maneuver, and sexual intercourse for 2 to 6 weeks to prevent strain, and to call the physician if bleeding occurs or if there is a decrease in urinary stream.

Instruct the client to drink 2400 to 3000 mL of fluid each day, preferably before 8 PM to avoid nocturia.

Instruct the client to avoid alcohol, caffeinated beverages, and spicy foods, and overstimulation of the bladder.

Instruct the client that if the urine becomes bloody, to rest and increase fluid intake and, if the bleeding does not subside, to notify the physician.

-  **G. Retropubic prostatectomy**
1. Retropubic prostatectomy is removal of the prostate gland by a low abdominal incision without opening the bladder.
  2. Less bleeding occurs with this procedure compared with the suprapubic procedure, and the client experiences fewer bladder spasms.
  3. Abdominal drainage is minimal.
  4. CBI may be used.
  5. Sterility occurs with this procedure.
-  **H. Perineal prostatectomy**
1. The prostate gland is removed through an incision made between the scrotum and anus.
  2. Minimal bleeding occurs with this procedure.
  3. The client needs to be monitored closely for infection, because the risk of infection is increased with this type of prostatectomy.
  4. Urinary incontinence is common.
  5. The procedure causes sterility.
  6. Teach the client how to perform perineal exercises.
- I. Postoperative interventions**
1. Monitor vital signs.
  2. Monitor urinary output and urine for hemorrhage or clots.
  3. Increase fluids to 2400 to 3000 mL/day, unless contraindicated.
  4. Monitor for arterial bleeding as evidenced by bright red urine with numerous clots; if it occurs, increase CBI and notify the physician immediately.
  5. Monitor for venous bleeding as evidenced by burgundy-colored urine output; if it occurs, inform the physician, who may apply traction on the catheter.
- J. Postoperative interventions: Suprapubic prostatectomy**
1. Monitor suprapubic and Foley catheter drainage.
  2. Monitor CBI if prescribed.
  3. Monitor hemoglobin and hematocrit levels.
  4. Expect red to light pink urine for 24 hours, turning to amber in 3 days.
  5. Ambulate the client as early as possible and as soon as urine begins to clear in color.
  6. Inform the client that a continuous feeling of an urge to void is normal.
  7. Instruct the client to avoid attempts to void around the catheter because this will cause bladder spasms.
  8. Administer antibiotics, analgesics, stool softeners, and antispasmodics as prescribed.
  9. Monitor the three-way Foley catheter, which usually has a 30- to 45-mL retention balloon.
  10. Maintain CBI with sterile bladder irrigation solution as prescribed to keep the catheter free of obstruction and maintain the urine pink in color (Box 52-18).
-   
-  **Following TURP, monitor for transurethral resection syndrome or severe hyponatremia (water intoxication) caused by the excessive absorption of bladder irrigation during surgery. (Signs include altered mental status, bradycardia, increased blood pressure, and confusion.)**

3. Note that the Foley catheter will be removed 2 to 4 days postoperatively if the client has a suprapubic catheter.

4. If prescribed, clamp the suprapubic catheter after the Foley catheter is removed, and instruct the client to attempt to void; after the client has voided, assess the residual urine in the bladder by unclamping the suprapubic catheter and measuring the output.

5. Prepare for removal of the suprapubic catheter when the client consistently empties the bladder and residual urine is 75 mL or less.

6. Monitor the suprapubic incision dressing, which may become saturated with urine, until the incision heals; dressing may need to be changed frequently.

**K. Postoperative interventions: Retropubic prostatectomy**

1. Note that because the bladder is not entered, there is no urinary drainage on the abdominal dressing.

2. Assess for urinary or purulent drainage on the dressing; if this occurs, notify the physician.

3. Monitor for fever and increased pain, which may indicate an infection.

**L. Postoperative interventions: Perineal prostatectomy**

1. Note that the client will have an incision, which may or may not have a drain.

2. Avoid the use of rectal thermometers, rectal tubes, and enemas because they may cause trauma and bleeding.

## XXV. BLADDER CANCER

### A. Description

1. Bladder **cancer** is papillomatous growths in the bladder urothelium that undergo **malignant** changes and that may infiltrate the bladder wall.

2. Predisposing factors include cigarette smoking, exposure to industrial chemicals, and exposure to radiation.

3. Common sites of **metastasis** include the liver, bones, and lungs.

4. As the tumor progresses, it can extend into the rectum, vagina, other pelvic soft tissues, and retroperitoneal structures.

### B. Assessment

1. Gross or microscopic, painless hematuria

2. Frequency, urgency, dysuria

3. Clot-induced obstruction

4. Bladder wash specimens and biopsy confirms diagnosis

### C. Radiation

1. Radiation therapy is indicated for advanced disease that cannot be eradicated by surgery; palliative radiation may be used to relieve pain and bowel obstruction and control potential hemorrhage and leg edema caused by venous or lymphatic obstruction.

2. Intracavitary radiation may be prescribed, which protects adjacent tissue.

3. External beam radiation combined with chemotherapy or surgery may be prescribed to improve survival.

### 4. Complications of radiation

a. Abacterial cystitis

b. Proctitis

c. Fistula formation

d. Ileitis or colitis

e. Bladder ulceration and hemorrhage

### D. Chemotherapy

#### 1. Intravesical instillation

a. An alkylating chemotherapeutic agent is instilled into the bladder.

b. This method provides a concentrated topical treatment with little systemic absorption.

c. The medication is injected into a urethral catheter and retained for 2 hours.

d. Following instillation, the client's position is rotated every 15 to 30 minutes, starting in the supine position, to avoid lying on a full bladder.

e. After 2 hours, the client voids in a sitting position and is instructed to increase fluids to flush the bladder.

f. Treat the urine as a biohazard and send to the radioisotope laboratory for monitoring.

g. For 6 hours following intravesical chemotherapy, disinfect the toilet with household bleach after the client has voided.

2. Systemic chemotherapy: Used to treat inoperable tumors or distant **metastasis**.

#### 3. Complications of chemotherapy

a. Bladder irritation

b. Hemorrhagic cystitis

### E. Surgical interventions

#### 1. Transurethral resection of bladder tumor

a. Local resection and fulguration (destruction of tissue by electrical current through electrodes placed in direct contact with the tissue)

b. Performed for early tumors for cure or for inoperable tumors for palliation

#### 2. Partial cystectomy

a. Partial cystectomy is the removal of up to half the bladder.

b. The procedure is done for early-stage tumors and for clients who cannot tolerate a radical cystectomy.

c. During the initial postoperative period, bladder capacity is reduced greatly to about 60 mL; however, as the bladder tissue expands, the capacity increases to 200 to 400 mL.

d. Maintenance of a continuous output of urine following surgery is critical to prevent bladder distention and stress on the suture line.

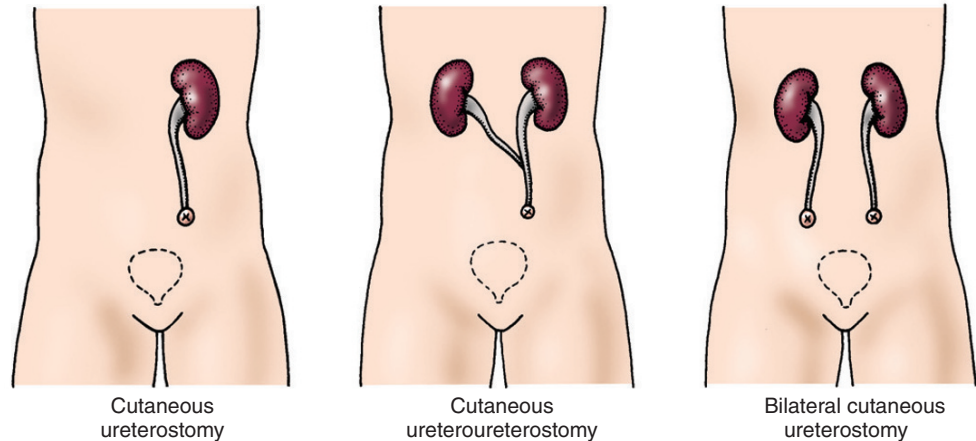

e. A urethral catheter and a suprapubic catheter may be in place, and the suprapubic catheter

may be left in place for 2 weeks until healing occurs.

3. Cystectomy and urinary diversion (Fig. 52-6)
  - a. Various surgical procedures performed to create alternate pathways for urine collection and excretion
  - b. Urinary diversion may be performed with or without cystectomy (bladder removal).

- c. The surgery may be performed in two stages if the tumor is extensive, with the creation of the urinary diversion first and the cystectomy several weeks later.
- d. If a radical cystectomy is performed, lower extremity lymphedema may occur as a result of lymph node dissection, and male impotence may occur.

**Ureterostomies** divert urine directly to the skin surface through a ureteral-skin opening (stoma). After ureterostomy, the client must wear a pouch.

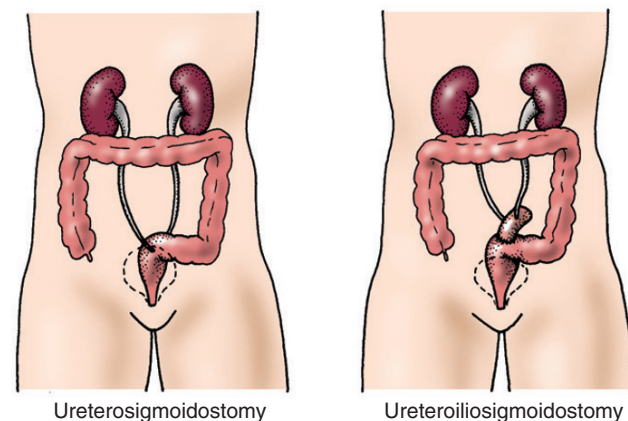

**Conduits** collect urine in a portion of the intestine, which is then opened onto the skin surface as a stoma. After the creation of a conduit, the client must wear a pouch.

**Ileal reservoirs** divert urine into a surgically created pouch, or pocket, that functions as a bladder. The stoma is continent, and the client removes urine by regular self-catheterization.

**Sigmoidostomies** divert urine to the large intestine, so no stoma is required. The client excretes urine with bowel movements, and bowel incontinence may result.

▲ **FIGURE 52-6** Urinary diversion procedures used in the treatment of bladder cancer. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

4. Ileal conduit
  - a. The ileal conduit also is called ureteroileostomy, or Bricker's procedure.
  - b. Ureters are implanted into a segment of the ileum, with the formation of an abdominal stoma.
  - c. The urine flows into the conduit and is propelled continuously out through the stoma by peristalsis.
  - d. The client is required to wear an appliance over the stoma to collect the urine (Box 52-19).
  - e. Complications include obstruction, pyelonephritis, leakage at the anastomosis site, stenosis, hydronephrosis, calculi, skin irritation and ulceration, and stomal defects.
5. Kock pouch
  - a. The Kock pouch is a continent internal ileal reservoir created from a segment of the ileum and ascending colon.
  - b. The ureters are implanted into the side of the reservoir, and a special nipple valve is constructed to attach the reservoir to the skin.
  - c. Postoperatively, the client will have a Foley catheter in place to drain urine continuously until the pouch has healed.
  - d. The catheter is irrigated gently with normal saline to prevent obstruction from mucus or clots.
  - e. Following removal of the catheter, the client is instructed in how to self-catheterize and to drain the reservoir at 4- to 6-hour intervals (Box 52-20).

### Box 52-19 Urinary Stoma Care

Instruct the client to change the appliance in the morning, when urinary production is slowest.

Collect equipment, remove collection bag, and use water or commercial solvent to loosen adhesive.

Hold a rolled gauze pad against the stoma to collect and absorb urine during the procedure.

Cleanse the skin around stoma and under the drainage bag with mild nonresidue soap and water.

Inspect the skin for excoriation, and instruct the client to prevent urine from coming into contact with the skin.

After the skin is dry, apply skin adhesive around the appliance.

Instruct the client to cut the stoma opening of the skin barrier just large enough to fit over the stoma (no more than 3 mm larger than the stoma).

Instruct the client that the stoma will begin to shrink, requiring a smaller stoma opening on the skin barrier.

Apply skin barrier before attaching the pouch or face plate.

Place the appliance over the stoma and secure in place.

Encourage self-care; teach the client to use a mirror.

Instruct the client that the pouch may be drained by a bedside bag or leg bag, especially at night.

Instruct the client to empty the urinary collection bag when it is one-third full to prevent pulling of the appliance and leakage.

Instruct the client to check the appliance seal if perspiring occurs.

Instruct the client to leave the urinary pouch in place as long as it is not leaking and to change it every 5 to 7 days.

During appliance changes, leave the skin open to air as long as possible.

Use a nonkaraya gum product, because urine erodes karaya gum.

To control odor, instruct the client to drink adequate fluids, wash the appliance thoroughly with soap and lukewarm water, and soak the collection pouch in dilute white vinegar for 20 to 30 minutes; a special deodorant tablet can also be placed into the pouch while it is being worn.

Instruct the client who takes baths to keep the level of the water below the stoma and to avoid oily soaps.

If the client plans to shower, instruct the client to direct the flow of water away from the stoma.

### Box 52-20 Self-Irrigation and Catheterization of Stoma

#### Irrigation

Instruct the client to wash hands and use clean technique.

Instruct the client to use a catheter and syringe, instill 60 mL of normal saline or water into the reservoir, and aspirate gently or allow to drain.

Instruct the client to irrigate until the drainage remains free of mucus but to be careful not to overirrigate.

#### Catheterization

Instruct the client to wash hands and use clean technique.

Initially, instruct the client to insert a catheter every 2 to 3 hours to drain the reservoir; during each week thereafter, increase the interval by 1 hour until catheterization is done every 4 to 6 hours.

Lubricate the catheter well with water-soluble lubricant, and instruct the client never to force the catheter into the reservoir.

If resistance is met, instruct the client to pause, rotate the catheter, and apply gentle pressure to insert.

Instruct the client to notify the physician if the client is unable to insert the catheter.

When urine has stopped, instruct the client to take several deep breaths and move the catheter in and out 2 to 3 inches to ensure that the pouch is empty.

Instruct the client to withdraw the catheter slowly and pinch the catheter when withdrawn so that it does not leak urine.

Instruct the client to carry catheterization supplies with him or her.

6. Indiana pouch
    - a. A continent reservoir is created from the ascending colon and terminal ileum, making a pouch larger than the Kock pouch (additional continent reservoirs include the Mainz and Florida pouch systems)
    - b. Postoperatively, care is similar as with the Koch pouch.
  7. Creation of a neobladder
    - a. Creation of a neobladder is similar to the creation of an internal reservoir, with the difference being that instead of emptying through an abdominal stoma, the bladder empties through a pelvic outlet into the urethra.
    - b. The client empties the neobladder by relaxing the external sphincter and creating abdominal pressure or by intermittent self-catheterization.
  8. Percutaneous nephrostomy or pyelostomy
    - a. These procedures are used to prevent or treat obstruction.
    - b. The procedures involve a percutaneous or surgical insertion of a nephrostomy tube into the kidney for drainage.
    - c. Nursing interventions involve stabilizing the tube to prevent dislodgment and monitoring output.
  9. Ureterostomy
    - a. Ureterostomy may be performed as a palliative procedure if the ureters are obstructed by the tumor.
    - b. The ureters are attached to the surface of the abdomen, where the urine flows directly into a drainage appliance without a conduit.
    - c. Potential problems include infection, skin irritation, and obstruction to urinary flow as a result of strictures at the opening.
  10. Vesicostomy
    - a. The bladder is sutured to the abdomen, and a stoma is created in the bladder wall.
    - b. The bladder empties through the stoma.
- F. Preoperative interventions**
1. Instruct the client in preoperative, operative, and postoperative management including diet, medications, nasogastric tube placement, IV lines, NPO status, pain control, coughing and deep breathing, leg exercises, and postoperative activity.
  2. Demonstrate appliance application and use for those clients who will have a stoma.
  3. Arrange an enterostomal nurse consult and for a visit with a person who has had urinary diversion.
  4. Administer antimicrobials for bowel preparation as prescribed.
  5. Encourage discussion of feelings including the effects on sexual activities.

**G. Postoperative interventions**

 Monitor urinary output closely following bladder surgery. Irrigate the ureteral catheter (if present and if prescribed) gently to prevent obstruction. Follow the physician's prescriptions and agency policy regarding irrigation.

1. Monitor vital signs.
2. Assess incision site.
3. Assess stoma (should be red and moist) every hour for the first 24 hours.
4. Monitor for edema in the stoma, which may be present in the immediate postoperative period.
5. Notify the physician if the stoma appears dark and dusky (indicates necrosis).
6. Monitor for prolapse or retraction of the stoma.
7. Assess bowel function; monitor for expected return of peristalsis in 3 to 4 days.
8. Maintain NPO status as prescribed until bowel sounds return.
9. Monitor continuous urine flow (30 to 60 mL/hr).
10. Notify the physician if the urine output is less than 30 mL/hr or if no urine output occurs for more than 15 minutes.
11. Ureteral stents or catheters, if present, may be in place for 2 to 3 weeks or until healing occurs; maintain stability with catheters to prevent dislodgment.
12. Monitor for hematuria.
13. Monitor for signs of peritonitis.
14. Monitor for bladder distention following a partial cystectomy.
15. Monitor for shock, hemorrhage, thrombophlebitis, and lower extremity lymphedema after a radical cystectomy.
16. Monitor the urinary drainage pouch for leaks, and check skin integrity (see Box 52-20).
17. Monitor the pH of the urine (do not place the dipstick in the stoma) because strongly alkaline urine can cause skin irritation and facilitate crystal formation.
18. Instruct the client regarding the potential for urinary tract infection or the development of calculi.
19. Instruct the client to assess the skin for irritation, monitor the urinary drainage pouch, and report any leakage.
20. Encourage the client to express feelings about changes in body image, embarrassment, and sexual dysfunction.

**XXVI. ONCOLOGICAL EMERGENCIES**

- A. Sepsis and disseminated intravascular coagulation (DIC)**
1. Description: The client with **cancer** is at increased risk for infection, particularly gram-negative organisms, in the bloodstream (sepsis

or septicemia) and DIC, a life-threatening problem frequently associated with sepsis.

## 2. Interventions

- a. Prevent the complication through early identification of clients at high risk for sepsis and DIC.
- b. Maintain strict aseptic technique with the immunocompromised client and monitor closely for infection.
- c. Administer antibiotics intravenously as prescribed.
- d. Administer anticoagulants as prescribed during the early phase of DIC.
- e. Administer cryoprecipitated clotting factors, as prescribed, when DIC progresses and hemorrhage is the primary problem.

 Notify the physician immediately if signs of an oncological emergency occur.

## B. Syndrome of inappropriate antidiuretic hormone (SIADH)

### 1. Description

- a. Tumors can produce, secrete, or stimulate substances that mimic antidiuretic hormone.
- b. Mild symptoms include weakness, muscle cramps, loss of appetite, and fatigue; serum sodium levels range from 115 to 120 mEq/L.
- c. More serious signs and symptoms relate to water intoxication and include weight gain, personality changes, confusion, and extreme muscle weakness.
- d. As the serum sodium level approaches 110 mEq/L, seizures, coma, and eventually death will occur, unless the condition is treated rapidly.

### 2. Interventions

- a. Initiate fluid restriction and increased sodium intake as prescribed.
- b. As prescribed, administer an antagonist to antidiuretic hormone.
- c. Monitor serum sodium levels.
- d. Treat the underlying cause with chemotherapy or radiation to reduce the tumor.

## C. Spinal cord compression

### 1. Description

- a. Spinal cord compression occurs when a tumor directly enters the spinal cord or when the vertebral column collapses from tumor entry, impinging on the spinal cord.
- b. Spinal cord compression causes back pain, usually before neurological deficits occur.
- c. Neurological deficits relate to the spinal level of compression and include numbness, tingling, loss of urethral, vaginal, and rectal sensation, and muscle weakness.

### 2. Interventions

- a. Early recognition: Assess for back pain and neurological deficits.
- b. Administer high-dose corticosteroids to reduce swelling around the spinal cord and relieve symptoms.
- c. Prepare the client for immediate radiation and/or chemotherapy to reduce the size of the tumor and relieve compression.
- d. Surgery may need to be performed to remove the tumor and relieve the pressure on the spinal cord.
- e. Instruct the client in the use of neck or back braces if they are prescribed.

## D. Hypercalcemia

### 1. Description

- a. Hypercalcemia is a late manifestation of extensive malignancy that occurs most often with bone **metastasis**, when the bone releases calcium into the bloodstream.
- b. Decreased physical mobility contributes to or worsens hypercalcemia.
- c. Early signs include fatigue, anorexia, nausea, vomiting, constipation, and polyuria.
- d. More serious signs and symptoms include severe muscle weakness, diminished deep tendon reflexes, paralytic ileus, dehydration, and changes in the electrocardiogram.

### 2. Interventions

- a. Monitor serum calcium level and electrocardiographic changes.
- b. Administer oral or parenteral fluids as prescribed.
- c. Administer medications that lower the calcium level as prescribed.
- d. Prepare the client for dialysis if the condition becomes life-threatening or is accompanied by renal impairment.

## E. Superior vena cava syndrome

### 1. Description

- a. Superior vena cava (SVC) syndrome occurs when the SVC is compressed or obstructed by tumor growth (commonly associated with lung **cancer** and **lymphoma**).
- b. Signs and symptoms result from blockage of blood flow in the venous system of the head, neck, and upper trunk.
- c. Early signs and symptoms generally occur in the morning and include edema of the face, especially around the eyes, and tightness of the shirt or blouse collar (Stokes' sign).
- d. As the condition worsens, edema in the arms and hands, dyspnea, erythema of the upper body, and epistaxis occur.
- e. Life-threatening signs and symptoms include airway obstruction, hemorrhage, cyanosis, mental status changes, decreased cardiac output, and hypotension.

2. Interventions
  - a. Assess for early signs and symptoms of superior vena cava syndrome.
  - b. Prepare the client for high-dose radiation therapy to the mediastinal area, and possible surgery to insert a metal stent in the vena cava.

#### F. Tumor lysis syndrome

1. Description
  - a. Tumor lysis syndrome occurs when large quantities of tumor cells are destroyed rapidly and intracellular components such as potassium and uric acid are released into the bloodstream faster than the body can eliminate them.
  - b. Tumor lysis syndrome can indicate that **can-  
cer** treatment is destroying tumor cells; however, if left untreated, it can cause severe tissue damage and death.
  - c. Hyperkalemia, hyperphosphatemia with resultant hypocalcemia, and hyperuricemia occur; hyperuricemia can lead to acute renal failure.
2. Interventions
  - a. Encourage oral hydration; IV hydration may be prescribed for the client experiencing nausea; monitor renal function.
  - b. Administer diuretics to increase the urine flow through the kidneys as prescribed.
  - c. Administer medications that increase the excretion of purines, such as allopurinol (Zyloprim), as prescribed.
  - d. Prepare to administer IV infusion of glucose and insulin to treat hyperkalemia.
  - e. Prepare the client for dialysis if hyperkalemia and hyperuricemia persist despite treatment.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 530.** The nurse is reviewing the laboratory results of a client diagnosed with multiple myeloma. Which would the nurse expect to note specifically in this disorder?
1. Increased calcium level
  2. Increased white blood cells
  3. Decreased blood urea nitrogen level
  4. Decreased number of plasma cells in the bone marrow
- 531.** The nurse is developing a plan of care for the client with multiple myeloma and includes which priority intervention in the plan?
1. Encouraging fluids
  2. Providing frequent oral care
  3. Coughing and deep breathing
  4. Monitoring the red blood cell count
- 532.** The nurse is caring for a client with an internal radiation implant. When caring for the client, the nurse should observe which principle?
1. Limit the time with the client to 1 hour per shift.
  2. Do not allow pregnant women into the client's room.
  3. Remove the dosimeter film badge when entering the client's room.
  4. Individuals younger than 16 years old may be allowed to go in the room as long as they are 6 feet away from the client.
- 533.** The client is hospitalized for insertion of an internal cervical radiation implant. While giving care, the nurse finds the radiation implant in the bed. The initial action by the nurse is to:
1. Call the physician.
  2. Reinsert the implant into the vagina immediately.
  3. Pick up the implant with gloved hands and flush it down the toilet.
  4. Pick up the implant with long-handled forceps and place it in a lead container.
- 534.** The nurse is caring for a client experiencing neutropenia as a result of chemotherapy and develops a plan of care for the client. The nurse plans to:
1. Restrict all visitors.
  2. Restrict fluid intake.
  3. Teach the client and family about the need for hand hygiene.
  4. Insert an indwelling urinary catheter to prevent skin breakdown.
- 535.** The home health care nurse is caring for a client with cancer and the client is complaining of acute pain. The most appropriate nursing assessment of the client's pain would include which of the following?
1. The client's pain rating
  2. Nonverbal cues from the client
  3. The nurse's impression of the client's pain
  4. Pain relief after appropriate nursing intervention
- 536.** The nurse is caring for a client who is postoperative following a pelvic exenteration and the physician changes the client's diet from NPO status to clear liquids. The nurse makes which priority assessment before administering the diet?
1. Bowel sounds
  2. Ability to ambulate
  3. Incision appearance
  4. Urine specific gravity
- 537.** The client is admitted to the hospital with a suspected diagnosis of Hodgkin's disease. Which assessment finding would the nurse expect to note specifically in the client?

1. Fatigue
  2. Weakness
  3. Weight gain
  4. Enlarged lymph nodes
- 538.** During the admission assessment of a client with advanced ovarian cancer, the nurse recognizes which symptom as typical of the disease?
1. Diarrhea
  2. Hypermenorrhea
  3. Abnormal bleeding
  4. Abdominal distention
- 539.** When assessing the laboratory results of the client with bladder cancer and bone metastasis, the nurse notes a calcium level of 12 mg/dL. The nurse recognizes that this is consistent with which oncological emergency?
1. Hyperkalemia
  2. Hypercalcemia
  3. Spinal cord compression
  4. Superior vena cava syndrome
- 540.** The female client who has been receiving radiation therapy for bladder cancer tells the nurse that it feels as if she is voiding through the vagina. The nurse interprets that the client may be experiencing:
1. Rupture of the bladder
  2. The development of a vesicovaginal fistula
  3. Extreme stress caused by the diagnosis of cancer
  4. Altered perineal sensation as a side effect of radiation therapy
- 541.** The nurse is instructing the client to perform a testicular self-examination. The nurse tells the client:
1. To examine the testicles while lying down
  2. That the best time for the examination is after a shower
  3. To gently feel the testicle with one finger to feel for a growth
  4. That testicular self-examinations should be done at least every 6 months
- 542.** A client is diagnosed with multiple myeloma and the client asks the nurse about the diagnosis. The nurse bases the response on which description of this disorder?
1. Altered red blood cell production
  2. Altered production of lymph nodes
  3. Malignant exacerbation in the number of leukocytes
  4. Malignant proliferation of plasma cells within the bone
- 543.** A gastrectomy is performed on a client with gastric cancer. In the immediate postoperative period, the nurse notes bloody drainage from the nasogastric tube. Which of the following is the appropriate nursing intervention?
1. Notify the physician.
  2. Measure abdominal girth.
  3. Irrigate the nasogastric tube.
  4. Continue to monitor the drainage.
- 544.** The nurse is teaching a client about the risk factors associated with colorectal cancer. The nurse determines that further teaching related to colorectal cancer is necessary if the client identifies which of the following as an associated risk factor?
1. Age younger than 50 years
  2. History of colorectal polyps
  3. Family history of colorectal cancer
  4. Chronic inflammatory bowel disease
- 545.** The nurse is assessing the perineal wound in a client who has returned from the operating room following an abdominal perineal resection and notes serosanguineous drainage from the wound. Which nursing intervention is appropriate?
1. Notify the physician.
  2. Clamp the Penrose drain.
  3. Change the dressing as prescribed.
  4. Remove and replace the perineal packing.
- 546.** The nurse is assessing the colostomy of a client who has had an abdominal perineal resection for a bowel tumor. Which of the following assessment findings indicates that the colostomy is beginning to function?
1. Absent bowel sounds
  2. The passage of flatus
  3. The client's ability to tolerate food
  4. Bloody drainage from the colostomy
- 547.** The nurse is reviewing the history of a client with bladder cancer. The nurse expects to note documentation of which most common symptom of this type of cancer?
1. Dysuria
  2. Hematuria
  3. Urgency on urination
  4. Frequency of urination
- 548.** The nurse is assessing the stoma of a client following a ureterostomy. Which of the following should the nurse expect to note?
1. A dry stoma
  2. A pale stoma
  3. A dark-colored stoma
  4. A red and moist stoma

- 549.** The nurse is caring for a client following a mastectomy. Which nursing intervention would assist in preventing lymphedema of the affected arm?
1. Placing cool compresses on the affected arm
  2. Elevating the affected arm on a pillow above heart level
  3. Avoiding arm exercises in the immediate post-operative period
  4. Maintaining an intravenous site below the antecubital area on the affected side
- 550.** A nurse is monitoring a client for signs and symptoms related to superior vena cava syndrome. Which of the following is an early sign of this oncological emergency?
1. Cyanosis
  2. Arm edema
  3. Periorbital edema
  4. Mental status changes
- 551.** A nurse manager is teaching the nursing staff about signs and symptoms related to hypercalcemia in a client with metastatic prostate cancer and tells the staff that which of the following is a serious late sign of this oncological emergency?
1. Headache
  2. Dysphagia
  3. Constipation
  4. Electrocardiographic changes
- 552.** As part of chemotherapy education, the nurse teaches a female client about the risk for bleeding and self-care during the period of the greatest bone marrow suppression (the nadir). The nurse understands that further teaching is needed when the client states:
1. "I should avoid blowing my nose."
  2. "I may need a platelet transfusion if my platelet count is too low."
  3. "I'm going to take aspirin for my headache as soon as I get home."
  4. "I will count the number of pads and tampons I use when menstruating."
- 553.** The community health nurse is instructing a group of female clients about breast self-examination. The nurse instructs the clients to perform the examination:
1. At the onset of menstruation
  2. Every month during ovulation
  3. Weekly at the same time of day
  4. 1 week after menstruation begins
- 554.** The client is diagnosed as having a bowel tumor and several diagnostic tests are prescribed. The nurse understands that which test will confirm the diagnosis of malignancy?
1. Biopsy of the tumor
  2. Abdominal ultrasound
  3. Magnetic resonance imaging
  4. Computed tomography scan

### Alternate Item Format: Multiple Response

- 555.** A client with carcinoma of the lung develops syndrome of inappropriate antidiuretic hormone (SIADH) as a complication of the cancer. The nurse anticipates that which of the following may be prescribed? **Select all that apply.**
- 1. Radiation
  - 2. Chemotherapy
  - 3. Increased fluid intake
  - 4. Serum sodium levels
  - 5. Decreased oral sodium intake
  - 6. Medication that is antagonistic to antidiuretic hormone

## ANSWERS

### 530. 1

**Rationale:** Findings indicative of multiple myeloma are an increased number of plasma cells in the bone marrow, anemia, hypercalcemia caused by the release of calcium from the deteriorating bone tissue, and an elevated blood urea nitrogen level. An increased white blood cell count may or may not be present and is not related specifically to multiple myeloma.

**Test-Taking Strategy:** Use the process of elimination. Noting the name of the disorder and recalling the pathophysiology of the disease and that proliferation of plasma cells in the bone occurs will direct you to option 1. Review this information if you are unfamiliar with this oncological disorder.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Oncology

**References:** Copstead-Kirkhorn, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 1193). St. Louis: Mosby.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 915). St. Louis: Saunders.

### 531. 1

**Rationale:** Hypercalcemia caused by bone destruction is a priority concern in the client with multiple myeloma. The nurse should administer fluids in adequate amounts to maintain a urine output of 1.5 to 2 L/day; this requires about 3 L of fluid intake per day. The fluid is needed not only to dilute

the calcium overload but also to prevent protein from precipitating in the renal tubules. Options 2, 3, and 4 may be components of the plan of care but are not the priority in this client.

**Test-Taking Strategy:** Use the process of elimination. Recalling the pathophysiology of this disorder and that hypercalcemia can occur will direct you to option 1. Review the specific manifestations of this disorder if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Oncology

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 162, 296). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 436). St. Louis: Saunders.

### 532. 2

**Rationale:** The time that the nurse spends in a room of a client with an internal radiation implant is 30 minutes per 8-hour shift. The dosimeter film badge must be worn when in the client's room. Children younger than 16 years of age and pregnant women are not allowed in the client's room.

**Test-Taking Strategy:** Use the process of elimination. Option 3 can be eliminated first. Recalling the time frame related to exposure to the client will assist in eliminating option 1. From the remaining options, select option 2 because of the possible risks associated with exposure to the mother and fetus. Review these safety principles if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Oncology

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 420). St. Louis: Saunders.

### 533. 4

**Rationale:** A lead container and long-handled forceps should be kept in the client's room at all times during internal radiation therapy. If the implant becomes dislodged, the nurse should pick up the implant with long-handled forceps and place it in the lead container. Options 1, 2, and 3 are inaccurate interventions.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *initial* in the question. Option 2 is not an appropriate action. Eliminate option 3 next because the implant would not be discarded. Although the physician would be notified, the initial action is option 4. Review the initial measures related to a dislodged radiation implant if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 420). St. Louis: Saunders.

### 534. 3

**Rationale:** In the neutropenic client, meticulous hand hygiene education is implemented for the client, family, visitors, and staff. Not all visitors are restricted, but the client is protected from persons with known infections. Fluids should be encouraged. Invasive measures such as an indwelling urinary catheter should be avoided to prevent infections.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 1 because of the word *all*. Next, eliminate option 2 because it is not reasonable to restrict fluids in a client receiving chemotherapy who is at risk for fluid and electrolyte imbalances. Eliminate option 4 because of the risk of infection that exists with this measure. Review interventions for the client with neutropenia if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 426). St. Louis: Saunders.

### 535. 1

**Rationale:** The client's self-report is a critical component of pain assessment. The nurse should ask the client about the description of the pain and listen carefully to the client's words used to describe the pain. The nurse's impression of the client's pain is not appropriate in determining the client's level of pain. Nonverbal cues from the client are important but are not the most appropriate pain assessment measure. Assessing pain relief is an important measure, but this option is not related to the subject of the question.

**Test-Taking Strategy:** Use the process of elimination. Noting the subject of the question will assist in eliminating option 4. Eliminate option 3 because the nurse is not the client of the question. From the remaining options, the subjective data from the client will provide the most accurate description of the pain. Review pain assessment techniques if the question was difficult.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Caring

**Content Area:** Adult Health—Oncology

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 43, 416). St. Louis: Saunders.

### 536. 1

**Rationale:** The client is kept NPO until peristalsis returns, usually in 4 to 6 days. When signs of bowel function return, clear fluids are given to the client. If no distention occurs, the diet is advanced as tolerated. The most important assessment is to assess bowel sounds before feeding the client. Options 2, 3, and 4 are unrelated to the subject of the question.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *priority* and the strategic words *NPO to clear liquids* in the question. Option 1 is the only option that relates to gastrointestinal function, which is the subject of the question. Review care of the client following pelvic exenteration if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Perioperative Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1704–1705). St. Louis: Saunders.

### 537. 4

**Rationale:** Hodgkin's disease is a chronic progressive neoplastic disorder of lymphoid tissue characterized by the painless enlargement of lymph nodes with progression to extralymphatic sites, such as the spleen and liver. Weight loss is most likely to be noted. Fatigue and weakness may occur but are not related significantly to the disease.

**Test-Taking Strategy:** Use the process of elimination. Options 1 and 2 are comparable or alike and are rather vague symptoms that can occur in many disorders. Option 3 can be eliminated because, in such a disorder, weight loss is most likely to occur. Also, recalling that Hodgkin's disease affects the lymph nodes will direct you to option 4. Review the manifestations associated with Hodgkin's disease if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Oncology

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 2125). St. Louis: Saunders.

### 538. 4

**Rationale:** Clinical manifestations of ovarian cancer include abdominal distention, urinary frequency and urgency, pleural effusion, malnutrition, pain from pressure caused by the growing tumor and the effects of urinary or bowel obstruction, constipation, ascites with dyspnea, and ultimately general severe pain. Abnormal bleeding, often resulting in hypermenorrhea, is associated with uterine cancer.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 2 and 3 first because they are comparable or alike. From the remaining options, consider the anatomical location of the cancer. This will assist in directing you to option 4. Review the manifestations associated with ovarian cancer if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Oncology

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1706). St. Louis: Saunders.

### 539. 2

**Rationale:** Hypercalcemia is a serum calcium level higher than 10 mg/dL, most often occurs in clients who have bone metastasis, and is a late manifestation of extensive malignancy. The presence of cancer in the bone causes the bone to release calcium into the bloodstream.

**Test-Taking Strategy:** Use the process of elimination. Recalling the normal calcium level will direct you easily to option 2. Also note the relationship of *calcium level* in the question and

*hypercalcemia* in the correct option. Review oncological emergencies if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Oncology

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 162, 296). St. Louis: Saunders.

Copstead-Kirkhorn, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 607). St. Louis: Mosby.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 436). St. Louis: Saunders.

### 540. 2

**Rationale:** A vesicovaginal fistula is a genital fistula that occurs between the bladder and vagina. The fistula is an abnormal opening between these two body parts and, if this occurs, the client may experience drainage of urine through the vagina. The client's complaint is not associated with options 1, 3, or 4.

**Test-Taking Strategy:** Use the process of elimination. Noting the strategic words *voiding through the vagina* should direct you to option 2. Review the symptoms associated with vesicovaginal fistula if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Adult Health—Oncology

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1694). St. Louis: Saunders.

### 541. 2

**Rationale:** The testicular-self examination is recommended monthly after a warm bath or shower when the scrotal skin is relaxed. The client should stand to examine the testicles. Using both hands, with fingers under the scrotum and thumbs on top, the client should gently roll the testicles, feeling for any lumps.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 4 first because of the words *6 months*. Next, eliminate option 3 because of the word *one*. From the remaining options, eliminate option 1 by trying to visualize the process of the self-examination. If you had difficulty with this question, review the procedure for this self-examination.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Health Assessment/Physical Exam

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1726). St. Louis: Saunders.

### 542. 4

**Rationale:** Multiple myeloma is a B-cell neoplastic condition characterized by abnormal malignant proliferation of plasma cells and the accumulation of mature plasma cells in the bone

marrow. Options 1 and 2 are not characteristics of multiple myeloma. Option 3 describes the leukemic process.

**Test-Taking Strategy:** Use the process of elimination. Focusing on the name of the disorder, *multiple myeloma*, will direct you to option 4. Review the characteristics of multiple myeloma if you are unfamiliar with this oncological disorder.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Oncology

**Reference:** Copstead-Kirkhorn, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 1193). St. Louis: Mosby.

#### 543. 4

**Rationale:** Following gastrectomy, drainage from the nasogastric tube is normally bloody for 24 hours postoperatively, changes to brown-tinged, and is then to yellow or clear. Because bloody drainage is expected in the immediate postoperative period, the nurse should continue to monitor the drainage. The nurse does not need to notify the physician at this time. Measuring abdominal girth is performed to detect the development of distention. Following gastrectomy, a nasogastric tube should not be irrigated unless there are specific physician prescriptions to do so.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *immediate postoperative period*. This should direct you to option 4. Remember that drainage from the nasogastric tube is normally bloody for 24 hours postoperatively, changes to brown-tinged and then to yellow or clear. If you had difficulty with this question, review the postoperative expected findings following gastrectomy.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Oncology

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1282, 1285). St. Louis: Saunders.

#### 544. 1

**Rationale:** Colorectal cancer risk factors include age older than 50 years, a family history of the disease, colorectal polyps, and chronic inflammatory bowel disease.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *further teaching is necessary*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Noting the words *younger than* in option 1 will direct you to this option. Review the risk factors associated with colorectal cancer if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Oncology

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 266–267). St. Louis: Saunders.

#### 545. 3

**Rationale:** Immediately after surgery, profuse serosanguineous drainage from the perineal wound is expected. The nurse does

not need to notify the physician at this time. A Penrose drain should not be clamped because this action will cause the accumulation of drainage within the tissue. Penrose drains and packing are removed gradually over a period of 5 to 7 days as prescribed. The nurse should not remove the perineal packing.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 2 and 4, knowing that these are inappropriate interventions. Recalling that serosanguineous drainage is expected following this type of surgery will assist in directing you to option 3. Review postoperative nursing care following abdominal perineal resection if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Oncology

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 706). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 292). St. Louis: Saunders.

#### 546. 2

**Rationale:** Following abdominal perineal resection, the nurse would expect the colostomy to begin to function within 72 hours after surgery, although it may take up to 5 days. The nurse should assess for a return of peristalsis, listen for bowel sounds, and check for the passage of flatus. Absent bowel sounds would not indicate the return of peristalsis. The client would remain NPO until bowel sounds return and the colostomy is functioning. Bloody drainage is not expected from a colostomy.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *beginning to function*. These should assist in eliminating option 1. Knowledge of general postoperative measures will assist in eliminating option 3. Focus on the subject of the question to assist in eliminating option 4 as a correct option. Review postoperative care of a client following abdominal perineal resection if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Oncology

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 706). St. Louis: Saunders.

#### 547. 2

**Rationale:** The most common symptom in clients with cancer of the bladder is hematuria. The client also may experience irritative voiding symptoms such as frequency, urgency, and dysuria, and these symptoms often are associated with carcinoma in situ.

**Test-Taking Strategy:** Focus on the subject, bladder cancer, and note the strategic words *most common* in the question. Options 1, 3, and 4 are symptoms that are associated most often with bladder infection. Review the clinical manifestations associated with bladder cancer if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Oncology

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 737). St. Louis: Saunders.

#### 548. 4

**Rationale:** Following ureterostomy, the stoma should be red and moist. A pale stoma may indicate an inadequate amount of vascular supply. A dry stoma may indicate a body fluid deficit. Any sign of darkness or duskiness in the stoma may indicate a loss of vascular supply and must be reported immediately or necrosis can occur.

**Test-Taking Strategy:** Use the process of elimination. You should be able to eliminate options 2 and 3 easily. From the remaining options, note the strategic word *moist* in option 4. This should indicate that this is an expected and positive assessment. If you had difficulty with this question, review expected and unexpected findings following ureterostomy.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Oncology

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 708). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1299). St. Louis: Saunders.

#### 549. 2

**Rationale:** Following mastectomy, the arm should be elevated above the level of the heart. Simple arm exercises should be encouraged. No blood pressure readings, injections, intravenous lines, or blood draws should be performed on the affected arm. Cool compresses are not a suggested measure to prevent lymphedema from occurring.

**Test-Taking Strategy:** Note the strategic words *assist in preventing*. Use the process of elimination and note the relationship between *lymphedema* in the question and *elevating* in the correct option. Also using general principles related to gravity will direct you to the correct option. Review postoperative care measures following mastectomy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Oncology

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 957). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1674). St. Louis: Saunders.

#### 550. 3

**Rationale:** Superior vena cava syndrome occurs when the superior vena cava is compressed or obstructed by tumor growth. Early signs and symptoms generally occur in the morning and include edema of the face, especially around the eyes, and client complaints of tightness of a shirt or blouse collar. As the

compression worsens, the client experiences edema of the hands and arms. Mental status changes and cyanosis are late signs.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *early* in the question. Think about the pathophysiology associated with this disorder and focus on the strategic word to assist in eliminating options 1, 2, and 4. If you are unfamiliar with vena cava syndrome, review this oncological emergency.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Oncology

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 436–437). St. Louis: Saunders.

#### 551. 4

**Rationale:** Hypercalcemia is a late manifestation of bone metastasis in late-stage cancer. Headache and dysphagia are not associated with hypercalcemia. Constipation may occur early in the process. Electrocardiogram changes include shortened ST segment and a widened T wave.

**Test-Taking Strategy:** Use the process of elimination. Focus on the name of the oncological emergency, *hypercalcemia*, to direct you to option 4. Eliminate options 1 and 2 because they are not signs of hypercalcemia. Eliminate option 3 because it is an early sign of hypercalcemia. Also, noting the strategic words *serious* and *late sign* in the question will direct you to option 4. Review the early and late signs of hypercalcemia if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Oncology

**References:** Copstead-Kirkhorn, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 607). St. Louis: Mosby.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 194, 722). St. Louis: Saunders.

#### 552. 3

**Rationale:** During the period of greatest bone marrow suppression (the nadir), the platelet count may be low, less than 20,000 cells/mm<sup>3</sup>. Option 3 describes an incorrect statement by the client. Aspirin and nonsteroidal anti-inflammatory drugs and products that contain aspirin should be avoided because of their antiplatelet activity. Options 1, 2 and 4 are correct statements by the client to prevent and monitor bleeding.

**Test-Taking Strategy:** Note the strategic words *risk for bleeding* and *nadir*. Also note the strategic words *further teaching is needed*. Recalling the causes of thrombocytopenia will direct you to option 3. Review this information if you are unfamiliar with thrombocytopenia precautions.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Oncology

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 291). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 423, 910). St. Louis: Saunders.

#### 553. 4

**Rationale:** The breast self-examination should be performed monthly 7 days after the onset of the menstrual period. Performing the examination weekly is not recommended. At the onset of menstruation and during ovulation, hormonal changes occur that may alter breast tissue.

**Test-Taking Strategy:** Use the process of elimination. Option 3 can be eliminated easily because of the word *weekly*. Eliminate options 1 and 2 next because of the similarity that exists regarding the hormonal changes that occur during these times. Review the procedure for performing breast self-examination if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Health Assessment/Physical Exam

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1666). St. Louis: Saunders.

#### 554. 1

**Rationale:** A biopsy is done to determine whether a tumor is malignant or benign. Magnetic resonance imaging, computed tomography scan, and ultrasound will visualize the presence of a mass but will not confirm a diagnosis of malignancy.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *confirm*. This strategic word should direct you easily to option 1. Review the purpose of the tests identified in the options if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Oncology

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 2090). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 915, 1293–1294). St. Louis: Saunders.

### ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

#### 555. 1, 2, 4, 6

**Rationale:** Cancer is a common cause of syndrome of inappropriate antidiuretic hormone (SIADH). In SIADH, excessive amounts of water are reabsorbed by the kidney and put into the systemic circulation. The increased water causes hyponatremia (decreased serum sodium levels) and some degree of fluid retention. The syndrome is managed by treating the condition and cause and usually includes fluid restriction, increased sodium intake, and medication with a mechanism of action that is antagonistic to antidiuretic hormone. Sodium levels are monitored closely because hypernatremia can develop suddenly as a result of treatment. The immediate institution of appropriate cancer therapy, usually radiation or chemotherapy, can cause tumor regression so that antidiuretic hormone synthesis and release processes return to normal.

**Test-Taking Strategy:** Focusing on the client's diagnosis and recalling that in SIADH excessive amounts of water are reabsorbed by the kidney and put into the systemic circulation will assist in answering this question. Review the treatment for SIADH if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Adult Health—Oncology

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 435–436). St. Louis: Saunders.

# Antineoplastic Medications

## I. ANTINEOPLASTIC MEDICATIONS

### A. Description

1. Antineoplastic medications kill or inhibit the reproduction of neoplastic cells.
2. Antineoplastic medications are used to cure, increase survival time, and decrease life-threatening complications.
3. The effect of antineoplastic medications may not be limited to neoplastic cells; normal cells also are affected by the medication.
4. Cell cycle phase-specific medications affect cells only during a certain phase of the reproductive cycle (Fig. 53-1).
5. Cell cycle phase-nonspecific medications affect cells in any phase of the reproductive cycle (see Fig. 53-1).
6. Usually, several medications are used in combination to increase the therapeutic response.
7. Antineoplastic medications may be combined with other treatments, such as surgery and radiation.
8. Although the intravenous (IV) route is most common for administration, antineoplastic medication may be given by the oral, intra-arterial, isolated limb perfusion, or intracavitary route; dosing is usually based on the client's body surface area (BSA) and type of **cancer**.
9. Chemotherapy dosing is usually based on total BSA, which requires a current, accurate height and weight for BSA calculation (before each medication administration) to ensure that the client receives optimal doses of chemotherapy medications.

 Side effects from chemotherapy result from the effects of the antineoplastic medication on normal cells.

### B. Side effects

1. Mucositis
2. Alopecia
3. Anorexia, nausea, and vomiting
4. Diarrhea
5. Anemia
6. Low white blood cell count (neutropenia)
7. Thrombocytopenia
8. Infertility, sexual alterations

### C. General interventions

#### 1. Physiological integrity

- a. Monitor complete blood cell count, white blood cell count, platelet count, uric acid level, and electrolytes.
- b. Initiate bleeding precautions if thrombocytopenia occurs.
- c. When the platelet count is less than 50,000 cells/mm<sup>3</sup>, minor trauma can lead to episodes of prolonged bleeding; when less than 20,000 cells/mm<sup>3</sup>, spontaneous and uncontrollable bleeding can occur.
- d. Monitor for petechiae, ecchymosis, bleeding of the gums, and nosebleeds because the decreased platelet count can precipitate bleeding tendencies.
- e. Avoid intramuscular injections and venipunctures as much as possible to prevent bleeding.
- f. Initiate neutropenic precautions if the white blood cell count decreases.
- g. Monitor for fever, sore throat, unusual bleeding, or signs and symptoms of infection.
- h. Inform the client that loss of appetite also may be the result of taste changes or a bitter taste in the mouth from the medications.
- i. Monitor for nausea and vomiting and provide a high-calorie diet with protein supplements.
- j. Administer antiemetics several hours before chemotherapy and for 12 to 48 hours after as prescribed, because antineoplastic medications stimulate the vomiting center in the brain.
- k. Encourage hydration; IV fluids are administered before and during therapy.
- l. Promote a fluid intake of at least 2000 mL/day to maintain adequate renal function.

 Antineoplastic medication causes the rapid destruction of cells, resulting in the release of uric acid. Allopurinol (Zyloprim) may be prescribed to lower the serum uric acid level.

#### 2. Safe and effective care environment

- a. Prepare IV chemotherapy in an air-vented space (biohazard cabinet area).

**▲ FIGURE 53-1** The cell cycle. G1, The cell is preparing for division; S (synthesis phase, DNA replication), the cell doubles its DNA content through DNA synthesis; G2, the cell produces proteins to be used in cell division and in normal physiological function after cell division is complete; and M (mitotic phase), the single cell splits apart into two cells.

- b. Wear gloves, gown, eye protectors, and mask when handling IV medications.
  - c. Nurses who are pregnant should avoid chemotherapy preparation or the administration of chemotherapy.
  - d. Discard IV equipment in designated (biohazard) containers.
  - e. Administer antineoplastic medication precisely as prescribed to maximize antineoplastic effects while allowing normal cells to recover.
  - f. Monitor for phlebitis with IV administration because these medications may irritate the veins.
  - g. Monitor for extravasation (leakage of medication into surrounding skin and subcutaneous tissue, which causes tissue necrosis) and notify the physician if this occurs; heat or ice is applied depending on the medication, and an antidote may be injected into the site.
3. Psychosocial integrity
    - a. Instruct the client about the possibility of hair loss and that varying degrees of hair loss may occur after the first or second treatment.
    - b. Discuss the purchase of a wig before treatment starts.
    - c. Inform the client that new hair growth will occur several months after the final treatment.
    - d. Instruct the client about the need for contraception because these medications have teratogenic effects.
    - e. Discuss the potential effect of infertility, which may be irreversible.
    - f. Encourage pretreatment counseling.
  4. Health promotion and maintenance
    - a. Instruct the client, if diarrhea is a problem, to avoid hot foods and high-fiber foods, which increase peristalsis.
    - b. Instruct the client to inspect the oral mucosa frequently for erythema and ulcers, rinse the mouth after meals, and carry out good oral hygiene.
    - c. Instruct the client to use mouth rinses as prescribed for mouth sores if necessary.
    - d. Instruct the client in the use of antifungal agents for mouth sores, if prescribed, for the development of a fungal infection.
    - e. Instruct the client to avoid crowds and persons with infections and to report signs of infection such as a low-grade fever, chills, or sore throat.
    - f. Instruct individuals with colds or infections to wear a mask when visiting or to avoid visiting the client.
    - g. Instruct the client to use a soft toothbrush and electric razor to minimize the risk of bleeding.
    - h. Instruct the client to avoid aspirin-containing products to minimize the risk of bleeding.
    - i. Instruct the client to consult the physician before receiving vaccinations (live vaccines should not be administered).
- D. Anaphylactic reactions**
1. Precautions
    - a. Obtain an allergy history.
    - b. Administer a test dose when prescribed by the physician.
    - c. Stay with the client during the administration of medication.
    - d. Monitor vital signs.
    - e. Have emergency equipment and medications readily available.
    - f. Provide an IV line for the administration of emergency medications if needed.
  2. Signs of an anaphylactic reaction
    - a. Dyspnea
    - b. Chest tightness or pain
    - c. Pruritus or urticaria
    - d. Tachycardia
    - e. Dizziness
    - f. Anxiety or agitation
    - g. Flushed appearance
    - h. Hypotension
    - i. Decreased sensorium
    - j. Cyanosis
  3. Interventions for an anaphylactic reaction (see Priority Nursing Actions)

**PRIORITY NURSING ACTIONS!****Actions to Take If an Anaphylactic Reaction Occurs From Medication**

1. Assess respiratory status.
2. Stop the medication.
3. Contact the physician and the Rapid Response Team if necessary.
4. Administer oxygen.
5. Maintain the IV access with normal saline.
6. Raise the client's feet and legs, if not contraindicated.
7. Administer prescribed emergency medications.
8. Monitor vital signs.
9. Document the event, actions taken, and the client's response.

If anaphylaxis occurs, the nurse immediately assesses the client's respiratory status. The medication is also immediately stopped. If the client's airway needs to be established or stabilized the Rapid Response Team is called. Additionally the physician is contacted. The IV line is not removed because IV access is needed to administer emergency medications such as diphenhydramine (Benadryl) or epinephrine. The client is positioned appropriately. The legs and feet are elevated. The head of the bed is elevated to improve ventilation; elevate the head of the bed 10 degrees if hypotension is present and 45 degrees or higher if the blood pressure is normal. The nurse stays with the client and monitors the client's status, including the vital signs. The nurse documents the event, actions taken, and the client's response.

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care*. (6th ed., p. 392). St. Louis: Saunders.

**II. ALKYLATING MEDICATIONS (Box 53-1)****A. Description**

1. Breaks DNA helix, thereby interfering with DNA replication
2. Cell cycle phase–nonspecific medications

**B. Side effects**

1. Anorexia, nausea, and vomiting may occur.
2. Stomatitis may occur.
3. Rash may occur.
4. Client may feel IV site pain during IV administration.
5. Busulfan (Myleran, Busulfex) may cause hyperuricemia.
6. Chlorambucil (Leukeran) and mechlorethamine (Mustargen) may cause gonadal suppression and hyperuricemia.
7. Cisplatin (Platinol-AQ), a platinum compound, may cause ototoxicity, tinnitus, hypokalemia, hypocalcemia, hypomagnesemia, and nephrotoxicity.
8. Cyclophosphamide (Cytoxan, Neosar) may cause alopecia, gonadal suppression, hemorrhagic cystitis, and hematuria.

**Box 53-1 Alkylating Medications****Nitrogen Mustards**

Bendamustine (Treanda)  
 Chlorambucil (Leukeran)  
 Cyclophosphamide (Cytoxan, Neosar)  
 Ifosfamide (Ifex)  
 Mechlorethamine (Mustargen)  
 Melphalan (Alkeran)

**Nitrosoureas**

Carmustine (BiCNU, Gliadel)  
 Lomustine (CeeNu)  
 Streptozocin (Zanosar)

**Alkylating-Like Medications**

Altretamine (Hexalen)  
 Busulfan (Myleran, Busulfex)  
 Carboplatin (Paraplatin)  
 Cisplatin (Platinol-AQ)  
 Dacarbazine (DTIC-Dome)  
 Oxaliplatin (Eloxatin)  
 Temozolomide (Temodar)  
 Thiotepa (Thioplex)

**C. Interventions:** Refer to general interventions section under Antineoplastic Medications. 

1. Withhold medication if the platelet count is less than 75,000/mm<sup>3</sup> or the neutrophil count is less than 2000/mm<sup>3</sup>, and notify the physician (depending on alkylating agent and agency policy).
2. Assess results of pulmonary function tests.
3. Assess results of chest radiography and renal and liver function studies.
4. Hydrate the client with IV and/or oral fluids before administering the antineoplastic medication as prescribed.
5. As prescribed, reduce IV site pain by altering IV rates or warming the injection site to distend the vein and increase blood flow.
6. When administering cisplatin assess the client for dizziness, tinnitus, hearing loss, incoordination, and numbness or tingling of extremities.
7. Mesna (Mesnex) may be administered with ifosfamide to reduce the potential of ifosfamide-induced cystitis.
8. Instruct the client that cyclophosphamide, when prescribed orally, is administered without food.
9. Instruct the client to follow a diet low in purines to alkalinize the urine and lower uric acid blood levels.
10. Instruct the client how to avoid infection.
11. Instruct the client to report signs of infection or bleeding.
12. Instruct the client about good oral hygiene and the use of a soft toothbrush.

 Cyclophosphamide (Cytosan, Neosar) and ifosfamide (Ifex) are medications that can cause hemorrhagic cystitis. Encourage the client to drink increased fluids (2 to 3 L per day) during therapy, unless contraindicated.

### III. ANTITUMOR ANTIBIOTIC MEDICATIONS

(Box 53-2)

#### A. Description

1. Interfere with DNA and RNA synthesis
2. Cell cycle phase–nonspecific medications

#### B. Side effects

1. Nausea and vomiting
2. Fever
3. Bone marrow depression
4. Rash
5. Alopecia
6. Stomatitis
7. Gonadal suppression
8. Hyperuricemia
9. Vesication (blistering of tissue at IV site)
10. Daunorubicin (DaunoXome) may cause congestive heart failure and dysrhythmias.
11. Doxorubicin (Adriamycin, Doxil) and idarubicin (Idamycin) may cause cardiotoxicity, cardiomyopathy, and electrocardiographic changes (Dexrazoxane [Zinecard] may be administered with doxorubicin to reduce cardiomyopathy).
12. Pulmonary toxicity can occur with bleomycin (Blenoxane).

#### C. Interventions: Refer to general interventions section under Antineoplastic Medications.

1. Withhold medication if the platelets are lower than  $75,000/\text{mm}^3$  or the neutrophil count is lower than  $2000/\text{mm}^3$ , and notify physician (this may vary depending on antitumor antibiotic agent and agency policy).
2. Assess results of pulmonary function tests.
3. Monitor for electrocardiographic changes.
4. Assess lung sounds for crackles.
5. Assess for signs of congestive heart failure, including dyspnea, crackles, peripheral edema, and weight gain.
6. Assess results of chest radiography and renal and liver function studies.

#### Box 53-2 Antitumor Antibiotic Medications

Bleomycin sulfate (Blenoxane)  
 Dactinomycin (Cosmegen)  
 Daunorubicin (DaunoXome)  
 Doxorubicin (Adriamycin, Doxil)  
 Epirubicin (Ellence)  
 Idarubicin (Idamycin)  
 Mitomycin (Mutamycin)  
 Mitoxantrone (Novantrone)

7. Hydrate the client with IV and/or oral fluids before the antineoplastic medication.
8. As prescribed, reduce IV site pain by altering IV rates or warming injection site to distend vein and increase blood flow.
9. Monitor IV site for irritation, phlebitis, and vesication, change site as needed.
10. Assess for myocardial toxicity, dyspnea, dysrhythmias, hypotension, and weight gain when administering doxorubicin (Adriamycin, Doxil) or idarubicin
11. Monitor pulmonary status when administering bleomycin (Blenoxane).

### IV. ANTIMETABOLITE MEDICATIONS (Box 53-3)

#### A. Description

1. Antimetabolite medications halt the synthesis of cell protein; their presence impairs cell division
2. Antimetabolite medications are cell cycle phase–specific and affect the S phase.

#### B. Side effects

1. Anorexia, nausea, and vomiting
2. Diarrhea
3. Alopecia
4. Stomatitis
5. Depression of bone marrow
6. Cytarabine (Cytosar-U, DepoCyt, Tarabine PFS) may cause alopecia, stomatitis, hyperuricemia, and hepatotoxicity.
7. Fluorouracil (Acrucil) may cause alopecia, stomatitis, diarrhea, phototoxicity reactions, and cerebellar dysfunction.
8. Mercaptopurine (Purinethol) may cause hyperuricemia and hepatotoxicity.
9. Methotrexate (Rheumatrex, Trexall) may cause alopecia, stomatitis, hyperuricemia, photosensitivity, hepatotoxicity, and hematological, gastrointestinal, and skin toxicity.

#### C. Interventions: Refer to general interventions section under Antineoplastic Medications

#### Box 53-3 Antimetabolite Medications

Capecitabine (Xeloda)  
 Cladribine (Leustatin)  
 Clofarabine (Clolar)  
 Cytarabine (Cytosar-U, DepoCyt, Tarabine PFS)  
 Floxuridine (FUDR)  
 Fludarabine (Fludara)  
 Fluorouracil (Acrucil)  
 Gemcitabine (Gemzar)  
 Hydroxyurea (Hydrea, Mylocel)  
 Mercaptopurine (Purinethol)  
 Methotrexate (Rheumatrex, Trexall)  
 Pemetrexed (Alimta)  
 Pentostatin (Nipent)  
 Thioguanine (Tabloid)

1. Hold medication if the neutrophil count is less than 2000 cells/mm<sup>3</sup> or the platelet count is less than 75,000 cells/mm<sup>3</sup>, and notify the physician (depending on the antimetabolite medication and agency policy).
2. Monitor renal function studies.
3. Monitor for cerebellar dysfunction.
4. Assess for photosensitivity.
5. Monitor IV site for extravasation.
6. Encourage fluid intake of 2 to 3 L/day.
7. Encourage good oral hygiene.
8. Instruct the client how to avoid infections and bleeding.
9. When administering fluorouracil, assess for signs of cerebellar dysfunction, such as dizziness, weakness, and ataxia, and assess for stomatitis and diarrhea, which may necessitate medication discontinuation.
10. When administering fluorouracil or methotrexate, instruct the client to use sunscreen and wear protective clothing to prevent photosensitivity reactions.

 When administering methotrexate in large doses, prepare to administer leucovorin (folinic acid or citrovorum factor) as prescribed to prevent toxicity. This is known as *leucovorin rescue*.

#### V. MITOTIC INHIBITOR MEDICATIONS (VINCA ALKALOIDS) (Box 53-4)

- A. Description
  1. Mitotic inhibitors prevent mitosis, causing cell death; mitotic inhibitors prevent cell division.
  2. Mitotic inhibitors are cell cycle phase-specific and act on the M phase.
- B. Side effects
  1. Leukopenia
  2. Neurotoxicity with vincristine (Oncovin, Vincasar) manifested as numbness and tingling in the fingers and toes, constipation, paralytic ileus.
  3. Ptosis
  4. Hoarseness
  5. Motor instability
  6. Anorexia, nausea, and vomiting
  7. Peripheral neuropathy
  8. Alopecia

#### Box 53-4 Mitotic Inhibitors

##### Vinca Alkaloids

Vinblastine sulfate (Velban)  
Vincristine sulfate (Oncovin, Vincasar)  
Vinorelbine (Navelbine)

##### Taxanes

Docetaxel (Taxotere)  
Paclitaxel (Abraxane, Taxol, Onxol)

9. Stomatitis
  10. Hyperuricemia
  11. Phlebitis at IV site
- C. Interventions: Refer to general interventions section under Antineoplastic Medications.
    1. Monitor for hoarseness.
    2. Assess eyes for ptosis.
    3. Assess motor stability and initiate safety precautions as necessary.
    4. Monitor for neurotoxicity with vincristine sulfate manifested as numbness and tingling in the fingers and toes.
    5. Monitor for constipation and paralytic ileus.

#### VI. TOPOISOMERASE INHIBITORS (Box 53-5)

- A. Description
  1. Block the enzyme needed for DNA synthesis and cell division
  2. Cell cycle phase-specific; act on the G2 and S phases
- B. Side effects
  1. Leukopenia, thrombocytopenia, anemia
  2. Anorexia, nausea, and vomiting
  3. Diarrhea
  4. Alopecia
  5. Orthostatic hypotension
  6. Hypersensitivity reaction
- C. Interventions: Refer to general interventions section under Antineoplastic Medications.

#### VII. HORMONAL MEDICATIONS AND ENZYMES (Box 53-6)

- A. Description
  1. Suppress the immune system and block normal hormones in hormone-sensitive tumors
  2. Change the hormonal balance and slow the growth rates of certain tumors
- B. Side effects
  1. Anorexia, nausea, and vomiting
  2. Leukopenia
  3. Impaired pancreatic function with asparaginase (Elspar)
  4. Sex characteristic alterations
    - a. Masculinizing effect in women: Chest and facial hair, menses stops (androgens, antiestrogen receptor drugs)
    - b. Feminine manifestations in men: Gynecomastia (estrogens, progestins, antiestrogen receptors)
  5. Breast swelling
  6. Hot flashes
  7. Weight gain

#### Box 53-5 Topoisomerase Inhibitors

Etoposide (VePesid, Toposar, Etopophos)  
Irinotecan (Camptosar)  
Teniposide (Vumon)  
Topotecan (Hycamtin)

**Box 53-6 Hormonal Medications and Enzymes****Estrogens**

Diethylstilbestrol  
 Estramustine (Emcyt)  
 Ethinyl estradiol (Estinyl)

**Antiestrogens**

Anastrozole (Arimidex)  
 Exemestane (Aromasin)  
 Fulvestrant (Faslodex)  
 Letrozole (Femara)  
 Raloxifene (Evista)  
 Tamoxifen citrate (Nolvadex)  
 Toremifene (Fareston)

**Antiandrogens**

Bicalutamide (Casodex)  
 Flutamide (Eulexin)  
 Goserelin acetate (Zoladex)  
 Nilutamide (Nilandron)  
 Triptorelin (Trelstar)

**Progestins**

Medroxyprogesterone (Depo-Provera)  
 Megestrol acetate (Megace)

**Other Hormonal Antagonists and Enzymes**

Asparaginase (Elspar)  
 Leuprolide acetate (Lupron)  
 Mitotane (Lysodren)

8. Hemorrhagic cystitis, hypouricemia, and hypercholesterolemia, with mitotane (Lysodren)
9. Hypertension
10. Thromboembolic disorders
11. Edema
12. Electrolyte imbalances
13. Tamoxifen citrate (Nolvadex) may cause edema, hypercalcemia, and elevated cholesterol and triglyceride levels.
14. Tamoxifen citrate decreases the effects of estrogen.
15. Diethylstilbestrol may cause impotence and gynecomastia in men.
16. Diethylstilbestrol may alter effects of insulin, orally administered anticoagulants, and orally administered hypoglycemic agents.

**C. Interventions**

1. Monitor vital signs.
2. Assess medications that the client is taking currently.
3. Monitor serum calcium levels with androgens.
4. Monitor for signs of alterations in sexual characteristics.
5. Monitor pancreatic function with asparaginase
6. Encourage an oral intake of 2 to 3 L of fluids per day.
7. Monitor uric acid and cholesterol levels.
8. Monitor for signs of hemorrhagic cystitis.

**Box 53-7 Immunomodulator Agents**

Aldesleukin (Proleukin, interleukin-2)  
 Interferon alfa-2a  
 Interferon alfa-2b  
 Interferon alfa-n3 (Alferon N)  
 Recombinant interferon alfa-2a (Intron A)  
 Recombinant interferon alfa-2b (Roferon-A)

**Common Monoclonal Antibodies**

Alemtuzumab (Campath)  
 Gemtuzumab ozogamicin (Mylotarg)  
 Ibritumomab (Zevalin)  
 Rituximab (Rituxan)  
 Trastuzumab (Herceptin)

**Box 53-8 Colony-Stimulating Factors****Granulocyte-Macrophage Colony-Stimulating Factor**

Sargramostim (Leukine)

**Granulocyte Colony-Stimulating Factor**

Filgrastim (Neupogen)  
 Pegfilgrastim (Neulasta)

**Erythropoietin**

Epoetin alfa (Epogen)  
 Darbepoetin alfa (Aranesp)

**Thrombopoietic Growth Factor**

Oprelvekin (Interleukin-11)

**VIII. IMMUNOMODULATOR AGENTS: BIOLOGICAL RESPONSE MODIFIERS (Box 53-7)****A. Description**

1. Immunomodulators stimulate the immune system to recognize **cancer** cells and take action to eliminate or destroy them.
2. Interleukins help different immune system cells recognize and destroy abnormal body cells.
3. Interferons slow tumor cell division, stimulate proliferation, and cause **cancer** cells to differentiate into nonproliferative forms.

**B.** Colony-stimulating factors induce more rapid bone marrow recovery after suppression by chemotherapy (Box 53-8).

**IX. TARGETED THERAPY****A. Description**

1. Medications used as targeted therapies are monoclonal antibodies that target a cellular element of the **cancer** cell or antisense medications that work at the gene level.
2. Examples of monoclonal antibodies are rituximab (Rituxan), tositumomab (Bexxar), trastuzumab (Herceptin), alemtuzumab (Campath), and cetuximab (Erbix).

**Box 53-9 Other Antineoplastic Medications**

Asparaginase (Elspar)  
 Arsenic trioxide (Trisenox)  
 Bexarotene (Targretin)  
 Bortezomib (Velcade)  
 Imatinib (Gleevec)  
 Temozolomide (Temodar)

- B.** Side effects: Allergic reactions (monoclonal antibodies)

**X. OTHER ANTINEOPLASTIC MEDICATIONS**

(Box 53-9)

- A.** Altretamine (Hexalen): Cytotoxic agent used to treat ovarian **cancer**
- B.** Denileukin diftitox (Ontak): Recombinant DNA-derived medication used to treat cutaneous T-cell **lymphoma**
- C.** Gemcitabine (Gemzar): Used to treat non-small cell lung **cancer** and adenocarcinoma of the pancreas, as well as metastatic breast **cancer** and lung cancer (in combination with paclitaxel [Abraxane, Taxol, Onxol])
- D.** Irinotecan (Camptosar): Used to treat colorectal or rectal **cancer**
- E.** Paclitaxel (Abraxane, Taxol, Onxol): Used to treat ovarian or metastatic breast **cancer**
- F.** Pegaspargase (Oncaspar): Used in combination chemotherapies for acute lymphoblastic **leukemia** in clients unable to take asparaginase (Elspar)
- G.** Topotecan (Hycamtin): Indicated for the treatment of relapsed or refractory metastatic ovarian **cancer** after other therapies have failed
- H.** Trastuzumab (Herceptin): Used in combination chemotherapy to treat breast **cancer**
- I.** Bexarotene (Targretin): Use to treat advanced stage cutaneous T-cell **lymphoma**
- 558.** The client with acute myelocytic leukemia is being treated with busulfan (Myleran, Busulfex). Which laboratory value would the nurse specifically monitor during treatment with this medication?
1. Clotting time
  2. Blood glucose level
  3. Uric acid level
  4. Potassium level
- 559.** The client with small cell lung cancer is being treated with etoposide (VePesid). The nurse monitors the client during administration, knowing that which side effect is specifically associated with this medication?
1. Alopecia
  2. Chest pain
  3. Pulmonary fibrosis
  4. Orthostatic hypotension
- 560.** The clinic nurse prepares a teaching plan for the client receiving an antineoplastic medication. When implementing the plan, the nurse tells the client:
1. To take aspirin (acetylsalicylic acid) as needed for headache
  2. To drink beverages containing alcohol in moderate amounts each evening
  3. To consult with health care providers before receiving immunizations
  4. That it is not necessary to consult health care providers before receiving a flu vaccine at the local health fair
- 561.** The client with ovarian cancer is being treated with vincristine (Oncovin, Vincasar). The nurse monitors the client, knowing that which of the following indicates a side effect specific to this medication?
1. Diarrhea
  2. Hair loss
  3. Chest pain
  4. Numbness and tingling in the fingers and toes
- 562.** The nurse is reviewing the history and physical examination of a client who will be receiving asparaginase (Elspar), an antineoplastic agent. The nurse contacts the physician before administering the medication if which of the following is documented in the client's history?
1. Pancreatitis
  2. Diabetes mellitus
  3. Myocardial infarction
  4. Chronic obstructive pulmonary disease

**MORE QUESTIONS ON THE CD!****Practice Questions**

- 556.** Chemotherapy dosage is frequently based on total body surface area (BSA), so it is important for the nurse to do which of the following before administering chemotherapy?
1. Measure abdominal girth.
  2. Calculate body mass index.
  3. Ask the client about his or her height and weight.
  4. Weigh and measure the client on the day of medication administration.
- 557.** The client with squamous cell carcinoma of the larynx is receiving bleomycin (Blenoxane) intravenously. The nurse caring for the client anticipates that which diagnostic study will be prescribed?

- 563.** Tamoxifen (Nolvadex) is prescribed for the client with metastatic breast carcinoma. The nurse administering the medication understands that the primary action of this medication is to:
1. Increase DNA and RNA synthesis.
  2. Promote the biosynthesis of nucleic acids.
  3. Increase estrogen concentration and estrogen response.
  4. Compete with estradiol for binding to estrogen in tissues containing high concentrations of receptors.
- 564.** The client with metastatic breast cancer is receiving tamoxifen (Nolvadex). The nurse specifically monitors which laboratory value while the client is taking this medication?
1. Glucose level
  2. Calcium level
  3. Potassium level
  4. Prothrombin time
- 565.** Megestrol acetate (Megace), an antineoplastic medication, is prescribed for the client with metastatic endometrial carcinoma. The nurse reviews the client's history and contacts the physician if which diagnosis is documented in the client's history?
1. Gout
  2. Asthma
  3. Thrombophlebitis
  4. Myocardial infarction
- 566.** The nurse is monitoring the laboratory results of a client receiving an antineoplastic medication by the intravenous route. The nurse plans to initiate bleeding precautions if which laboratory result is noted?
1. A clotting time of 10 minutes
  2. An ammonia level of 20 mcg/dL
  3. A platelet count of 50,000/mm<sup>3</sup>
  4. A white blood cell count of 5,000/mm<sup>3</sup>
- 567.** The nurse is analyzing the laboratory results of a client with leukemia who has received a regimen of chemotherapy. Which laboratory value would the nurse specifically note as a result of the massive cell destruction that occurred from the chemotherapy?
1. Anemia
  2. Decreased platelets
  3. Increased uric acid level
  4. Decreased leukocyte count
- 568.** The nurse is providing medication instructions to a client with breast cancer who is receiving cyclophosphamide (Cytoxan, Neosar). The nurse tells the client to:
1. Take the medication with food.
  2. Increase fluid intake to 2000 to 3000 mL daily.
  3. Decrease sodium intake while taking the medication.
  4. Increase potassium intake while taking the medication.
- 569.** The client with non-Hodgkin's lymphoma is receiving daunorubicin (DaunoXome). Which of the following would indicate to the nurse that the client is experiencing an adverse effect related to the medication?
1. Fever
  2. Diarrhea
  3. Complaints of nausea and vomiting
  4. Crackles on auscultation of the lungs

### Alternate Item Format: Multiple Response

- 570.** The nurse is monitoring the intravenous (IV) infusion of an antineoplastic medication. During the infusion, the client complains of pain at the insertion site. On inspection of the site, the nurse notes redness and swelling and that the infusion of the medication has slowed in rate. The nurse should take which actions? **Select all that apply.**
- 1. Stop the infusion.
  - 2. Notify the physician.
  - 3. Prepare to apply ice or heat to the site.
  - 4. Restart the IV at a distal part of the same vein.
  - 5. Prepare to administer a prescribed antidote into the site.
  - 6. Increase the flow rate of the solution to flush the skin and subcutaneous tissue.

## ANSWERS

### 556. 4

**Rationale:** To ensure that the client receives optimal doses of chemotherapy, dosing is usually based on the total body surface area (BSA), which requires a current accurate height and weight for BSA calculation (before each medication administration). Asking the client about his or her height and weight may lead to inaccuracies in determining a true BSA and

dosage. Calculating body mass index and measuring abdominal girth will not provide the data needed.

**Test-Taking Strategy:** Use the process of elimination, recalling the basis for dosing chemotherapy. Recalling that a current accurate height and weight need to be obtained for BSA calculation and chemotherapy dosing will direct you to option 4. Eliminate option 3 because it is an unreliable way of obtaining the information, and options 1 and 2 do not

relate to chemotherapy dosing. If you are unfamiliar with BSA and chemotherapy dosing, review these concepts.

**Level of Cognitive Ability:** Analyzing

**Content Area:** Pharmacology

**References:** Edmunds, M. (2010). *Introduction to clinical pharmacology* (6th ed., p. 86). St. Louis: Mosby.

Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., pp. 59, 74). St. Louis: Saunders.

#### 557. 4

**Rationale:** Bleomycin (Blenoxane) is an antineoplastic medication that can cause interstitial pneumonitis, which can progress to pulmonary fibrosis. Pulmonary function studies along with hematological, hepatic, and renal function tests need to be monitored. The nurse needs to monitor lung sounds for dyspnea and crackles, which indicate pulmonary toxicity. The medication needs to be discontinued immediately if pulmonary toxicity occurs. Options 1, 2, and 3 are unrelated to the specific use of this medication.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 2 first because they are cardiac-related and are therefore comparable or alike. From the remaining options, use the ABCs—airway, breathing, and circulation—to direct you to option 4. If you had difficulty with this question, review the toxic effects of this medication.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**Reference:** Gahart, B., & Nazareno, A. (2010). *2010 Intravenous medications* (26th ed., pp. 203–204). St. Louis: Mosby.

#### 558. 3

**Rationale:** Busulfan (Myleran, Busulfex) can cause an increase in the uric acid level. Hyperuricemia can produce uric acid nephropathy, renal stones, and acute renal failure. Options 1, 2, and 4 are not specifically related to this medication.

**Test-Taking Strategy:** Focus on the medication addressed in the question. It is necessary to know the adverse effects associated with this medication. Recalling that busulfan increases the uric acid level will direct you to the correct option. If you had difficulty with this question, review the effects of busulfan.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 538). St. Louis: Saunders.

Skidmore-Roth, L. (2010). *Mosby's nursing drug reference* (23rd ed., p. 216). St. Louis: Mosby.

#### 559. 4

**Rationale:** A side effect specific to etoposide is orthostatic hypotension. Etoposide should be administered slowly over 30 to 60 minutes to avoid hypotension. The client's blood pressure is monitored during the infusion. Hair loss occurs with nearly all the antineoplastic medications.

Chest pain and pulmonary fibrosis are unrelated to this medication.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 1 first because this side effect is associated with many of the antineoplastic agents. Eliminate options 2 and 3 next because they are unrelated to etoposide. Note that the question asks for the side effect *specific* to this medication. Correlate hypotension with etoposide. Review the side effects of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Gahart, B., & Nazareno, A. (2010). *2010 Intravenous medications* (26th ed., p. 566). St. Louis: Mosby.

#### 560. 3

**Rationale:** Because antineoplastic medications lower the resistance of the body, clients must be informed not to receive immunizations without a physician's or health care provider's approval. Clients also need to avoid contact with individuals who have recently received a live virus vaccine. Clients need to avoid aspirin and aspirin-containing products to minimize the risk of bleeding, and they need to avoid alcohol to minimize the risk of toxicity and side effects.

**Test-Taking Strategy:** Think about the adverse effects of antineoplastic medications. Recalling that antineoplastic medications lower the resistance of the body will direct you to option 3. Review the client teaching points regarding these medications if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 541). St. Louis: Saunders.

#### 561. 4

**Rationale:** A side effect specific to vincristine is peripheral neuropathy, which occurs in almost every client. Peripheral neuropathy can be manifested as numbness and tingling in the fingers and toes. Depression of the Achilles tendon reflex may be the first clinical sign indicating peripheral neuropathy. Constipation rather than diarrhea is most likely to occur with this medication, although diarrhea may occur occasionally. Hair loss occurs with nearly all the antineoplastic medications. Chest pain is unrelated to this medication.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 2 first because these side effects are associated with many of the antineoplastic agents. Note that the question asks for the side effect *specific* to this medication. Correlate peripheral neuropathy with vincristine. Review the side effects of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 1184). St. Louis: Saunders.

**562. 1**

**Rationale:** Asparaginase (Elspar) is contraindicated if hypersensitivity exists, in pancreatitis, or if the client has a history of pancreatitis. The medication impairs pancreatic function and pancreatic function tests should be performed before therapy begins and when a week or more has elapsed between dose administrations. The client needs to be monitored for signs of pancreatitis, which include nausea, vomiting, and abdominal pain. The conditions noted in options 2, 3, and 4 are not contraindicated with this medication.

**Test-Taking Strategy:** Focus on the medication addressed in the question. It is necessary to know the contraindications associated with this medication. Recalling that this medication affects pancreatic function will direct you to option 1. Review this medication if you had difficulty answering this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 86). St. Louis: Saunders.

**563. 4**

**Rationale:** Tamoxifen (Nolvadex) is an antineoplastic medication that competes with estradiol for binding to estrogen in tissues containing high concentrations of receptors. Tamoxifen is used to treat metastatic breast carcinoma in women and men. Tamoxifen is also effective in delaying the recurrence of cancer following mastectomy. Tamoxifen reduces DNA synthesis and estrogen response.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 2 first because they are comparable or alike. Nucleic acids include DNA and RNA. From this point, select option 4, because it is unlikely that treatment of metastatic breast carcinoma would focus on increasing estrogen concentration and estrogen response. If you had difficulty with this question, review the action of this medication.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 1072). St. Louis: Saunders.

**564. 2**

**Rationale:** Tamoxifen (Nolvadex) may increase calcium, cholesterol, and triglyceride levels. Before the initiation of therapy, a complete blood count, platelet count, and serum calcium levels should be assessed. These blood levels, along with cholesterol and triglyceride levels, should be monitored periodically during therapy. The nurse should assess for hypercalcemia while the client is taking this medication. Signs of hypercalcemia include increased urine volume, excessive thirst, nausea, vomiting, constipation, hypotonicity of muscles, and deep bone and flank pain.

**Test-Taking Strategy:** Focus on the medication addressed in the question. It is necessary to know the adverse effects associated with this medication. Recalling that this medication causes hypercalcemia will direct you to option 2. Review this medication if you had difficulty answering this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 1073). St. Louis: Saunders.

**565. 3**

**Rationale:** Megestrol acetate (Megace) suppresses the release of luteinizing hormone from the anterior pituitary by inhibiting pituitary function and regressing tumor size. Megestrol is used with caution if the client has a history of thrombophlebitis. Options 1, 2, and 4 are not contraindications for this medication.

**Test-Taking Strategy:** Focus on the medication addressed in the question. It is necessary to know the adverse effects associated with this medication. Recalling that megestrol acetate is a hormonal antagonist enzyme and that an adverse effect is thrombotic disorders will direct you to option 3. Review this medication if you had difficulty answering this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 708). St. Louis: Saunders.

**566. 3**

**Rationale:** Bleeding precautions need to be initiated when the platelet count decreases. The normal platelet count is 150,000 to 450,000/mm<sup>3</sup>. When the platelets are lower than 50,000/mm<sup>3</sup>, any small trauma can lead to episodes of prolonged bleeding. The normal white blood cell count is 4500 to 11,000/mm<sup>3</sup>. When the white blood cell count drops, neutropenic precautions need to be implemented. The normal clotting time is 8 to 15 minutes. The normal ammonia value is 10 to 80 mcg/dL.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding normal laboratory values. Options 1, 2, and 4 identify normal laboratory values. Remember to correlate a low platelet count with the need for bleeding precautions and a low white blood cell count with the need for neutropenic precautions. Review the indications to implement bleeding precautions in a client receiving chemotherapy if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Safety/Infection Control

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 426, 428). St. Louis: Saunders.

Kee, J., Hayes, E., & McCuistion, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 534). St. Louis: Saunders.

**567. 3**

**Rationale:** Hyperuricemia is especially common following treatment for leukemias and lymphomas because chemotherapy results in massive cell kill. Although options 1, 2, and 4 also may be noted, an increased uric acid level is related specifically to cell destruction.

**Test-Taking Strategy:** Note the strategic words *massive cell destruction* in the question. Recalling the cell response to destruction when administering chemotherapy will assist in directing you to option 3. Review the effects of chemotherapy if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 645). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 1177). St. Louis: Saunders.

### 568. 2

**Rationale:** Hemorrhagic cystitis is an adverse effect that can occur with the use of cyclophosphamide (Cytoxan, Neosar). The client needs to be instructed to drink copious amounts of fluid during the administration of this medication. Clients also should monitor urine output for hematuria. The medication should be taken on an empty stomach, unless gastrointestinal upset occurs. Hyperkalemia can result from the use of the medication; therefore, the client would not be told to increase potassium intake. The client would not be instructed to alter sodium intake.

**Test-Taking Strategy:** Use the process of elimination. Recalling the adverse effects of cyclophosphamide and that it can cause hemorrhagic cystitis will direct you to option 2. If you had difficulty with this question, review the adverse effects associated with this medication.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 287). St. Louis: Saunders.

### 569. 4

**Rationale:** Cardiotoxicity noted by abnormal electrocardiographic findings or cardiomyopathy manifested as congestive heart failure is an adverse effect of daunorubicin. Bone marrow depression is also a toxic effect. Nausea and vomiting

is a frequent side effect associated with the medication that begins a few hours after administration and lasts 24 to 48 hours. Fever is a frequent side effect and diarrhea can occur occasionally. Options 1, 2, and 3, however, are not adverse effects.

**Test-Taking Strategy:** Use the process of elimination, keeping in mind that the question is asking about an adverse effect. Use of the ABCs—airway, breathing, and circulation—will direct you easily to option 4. If you had difficulty with this question, review the adverse effects associated with daunorubicin.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 1192). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 570. 1, 2, 3, 5

**Rationale:** Redness and swelling and a slowed infusion indicate signs of extravasation. If extravasation occurs during the intravenous administration of an antineoplastic medication, the infusion is stopped and the physician is notified. Ice or heat may be prescribed for application to the site and an antidote may be prescribed to be administered into the site. Increasing the flow rate can increase damage to the tissues. Restarting an IV in the same vein can increase damage to the site and vein.

**Test-Taking Strategy:** Focus on the assessment signs in the question. Visualize the situation to identify the nursing actions. Think about the actions that will cause further damage. This will assist in eliminating options 4 and 6. Review nursing actions if extravasation occurs if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 226, 423–424). St. Louis: Saunders.

# UNIT X

## The Adult Client With an Endocrine Disorder

### PYRAMID TERMS

**addisonian crisis** A life-threatening disorder caused by adrenal hormone insufficiency. Crisis is precipitated by infection, trauma, stress, or surgery. Death can occur from shock, vascular collapse, or hyperkalemia.

**Addison's disease** Hyposecretion of adrenal cortex hormones (glucocorticoids and mineralocorticoids) from the adrenal gland, resulting in deficiency of the corticosteroid hormones. The condition is fatal if left untreated.

**adrenalectomy** The surgical removal of an adrenal gland. Lifelong replacement of glucocorticoids and mineralocorticoids is necessary with a bilateral adrenalectomy. Temporary replacement may be necessary for up to 2 years for a unilateral adrenalectomy.

**Chvostek's sign** A spasm of the facial muscles elicited by tapping the facial nerve just anterior to the ear. The sign is noted in hypocalcemia.

**Cushing's disease** A metabolic disorder characterized by abnormally increased secretion (endogenous) of cortisol, caused by increased amounts of adrenocorticotropic hormone (ACTH) secreted by the pituitary gland.

**Cushing's syndrome** A metabolic disorder resulting from the chronic and excessive production of cortisol by the adrenal cortex or by the administration of glucocorticoids in large doses for several weeks or longer (exogenous or iatrogenic).

**dawn phenomenon** A nocturnal release of growth hormone, which may cause blood glucose level elevations before breakfast in the client with diabetes mellitus. Treatment includes administering an evening dose of intermediate-acting insulin at 10 PM.

**diabetes insipidus** The hyposecretion of antidiuretic hormone from the posterior pituitary gland, resulting in failure of tubular reabsorption of water in the kidneys and diuresis.

**diabetic ketoacidosis** A life-threatening complication of diabetes mellitus that develops when a severe insulin deficiency occurs. Hyperglycemia progresses to ketoacidosis over a period of several hours to several days. Acidosis occurs in clients with type 1 diabetes mellitus, persons with undiagnosed diabetes, and persons who stop prescribed treatment for diabetes.

**diabetes mellitus** A chronic disorder of glucose intolerance and impaired carbohydrate, protein, and lipid metabolism caused by a deficiency of insulin or resistance to the action of insulin. A deficiency of effective insulin results in hyperglycemia.

**hyperglycemia** Elevated blood glucose level greater than 250 mg/dL.

**hyperglycemic hyperosmolar nonketotic syndrome** Extreme hyperglycemia without acidosis. A complication of type 2 diabetes mellitus, which may result in dehydration or vascular collapse but does not include the acidosis component of diabetic ketoacidosis. Onset is usually slow, taking from hours to days.

**hyperthyroidism** A condition that occurs as a result of excessive thyroid hormone secretion.

**hypoglycemia** Low blood glucose level (lower than 70 mg/dL) that results from too much insulin, not enough food, or excess activity.

**hypophysectomy** The removal of the pituitary gland.

**hypothyroidism** A hypothyroid state resulting from a hyposecretion of thyroid hormone. The condition occurs in adulthood.

**myxedema** The most severe form of hypothyroidism characterized by swelling of the hands, face, feet, and periorbital tissues. At this stage, the disease may lead to coma and death.

**myxedema coma** A rare but serious disorder that results from persistently low thyroid production. Coma can be precipitated by acute illness, rapid withdrawal of thyroid medication, anesthesia and surgery, hypothermia, and the use of sedatives and opioid analgesics.

**Somogyi phenomenon** A rebound phenomenon that occurs in clients with type 1 diabetes mellitus. Normal or elevated blood glucose levels are present at bedtime; hypoglycemia occurs at about 2 to 3 AM. Counterregulatory hormones, produced to prevent further hypoglycemia, result in hyperglycemia (evident in the prebreakfast blood glucose level). Treatment includes decreasing the evening (predinner or bedtime) dose of intermediate-acting insulin or increasing the bedtime snack.

**thyroidectomy** Surgical removal of the thyroid gland to treat persistent hyperthyroidism or thyroid tumors.

**thyroid storm** An acute, potentially fatal exacerbation of hyperthyroidism that may result from manipulation of the thyroid gland during surgery, severe infection, or stress.

**Trousseau's sign** A sign of hypocalcemia. Carpal spasm can be elicited by compressing the brachial artery with a blood pressure cuff for 3 minutes.

## PYRAMID TO SUCCESS

The endocrine system is made up of organs or glands that secrete hormones and release them directly into the circulation. The endocrine system can be understood easily if you remember that basically one of two situations can occur—hypersecretion or hyposecretion of hormones from the organ or gland. When an excess of the hormone occurs, treatment is aimed at blocking the hormone release through medication or surgery. When a deficit of the hormone exists, treatment is aimed at replacement therapy. Pyramid Points focus on diabetes mellitus, including its prevention, the prevention and treatment of complications, insulin therapy, hypoglycemic and hyperglycemic reactions, and diabetic ketoacidosis; Addison's disease and Addisonian crisis; Cushing's disease or Cushing's syndrome; thyroid disorders and thyroid storm; and care of the client after thyroidectomy or adrenalectomy.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Acting as a client advocate
- Collaborating with multidisciplinary team regarding treatment
- Consulting with appropriate care providers
- Delegating care activities to others
- Establishing priorities of care

- Handling hazardous and infectious materials
- Informed consent for treatments and procedures
- Maintaining confidentiality related to the disorder
- Preventing accidents and client injury
- Using medical and surgical asepsis to prevent infection

### Health Promotion and Maintenance

- Discussing expected body image changes
- Identifying lifestyle choices related to treatment
- Performing physical assessment of the endocrine system
- Preventing disease
- Providing health screening
- Teaching about self-care measures

### Psychosocial Integrity

- Discussing grief and loss issues related to complications of the disorder
- Discussing situational role changes related to the disorder
- Discussing unexpected body image changes
- Identifying coping mechanisms
- Monitoring for sensory and perceptual alterations as a result of the disorder
- Using support systems

### Physiological Integrity

- Administering medications safely
- Monitoring for alterations in body systems as a result of the disorder
- Monitoring for expected outcomes and effects of pharmacological therapy
- Monitoring for fluid and electrolyte imbalances that can occur
- Monitoring laboratory values
- Monitoring for complications of diagnostic tests, treatments, procedures
- Monitoring for complications from surgical procedures and health alterations
- Monitoring for problems with elimination as a result of the disorder
- Monitoring for unexpected response to therapies
- Performing dosage calculation related to medication administration
- Preparing the client for diagnostic tests
- Providing nonpharmacological comfort interventions
- Providing nutrition and oral hydration measures
- Providing emergency care to the client

# Endocrine System

## I. ANATOMY AND PHYSIOLOGY OF ENDOCRINE GLANDS (Box 54-1)

- A. Functions**
1. Maintenance and regulation of vital functions
  2. Response to stress and injury
  3. Growth and development
  4. Energy metabolism
  5. Reproduction
  6. Fluid, electrolyte, and acid-base balance
- B. Risk factors (Box 54-2)**
- C. Hypothalamus (Box 54-3)**
1. Portion of the diencephalon of the brain, forming the floor and part of the lateral wall of the third ventricle
  2. Activates, controls, and integrates the peripheral autonomic nervous system, endocrine processes, and many somatic functions, such as body temperature, sleep, and appetite
- D. Pituitary gland (Box 54-4; Fig. 54-1)**
1. The master gland; located at the base of the brain
  2. Influenced by the hypothalamus; directly affects the function of the other endocrine glands
  3. Promotes growth of body tissue, influences water absorption by the kidney, and controls sexual development and function
- E. Adrenal gland**
1. One adrenal gland is on top of each kidney.
  2. Regulates sodium and electrolyte balance; affects carbohydrate, fat, and protein metabolism; influences the development of sexual characteristics; and sustains the fight-or-flight response
  3. Adrenal cortex
    - a. The cortex is the outer shell of the adrenal gland.
    - b. The cortex synthesizes glucocorticoids and mineralocorticoids and secretes small amounts of sex hormones (androgens, estrogens; Box 54-5).
  4. Adrenal medulla
    - a. The medulla is the inner core of the adrenal gland.
    - b. The medulla works as part of the sympathetic nervous system and produces epinephrine and norepinephrine.
- F. Thyroid gland**
1. Located in the anterior part of the neck
  2. Controls the rate of body metabolism and growth and produces thyroxine ( $T_4$ ), triiodothyronine ( $T_3$ ), and thyrocalcitonin
- G. Parathyroid glands**
1. Located on the thyroid gland
  2. Control calcium and phosphorus metabolism; produce parathyroid hormone
- H. Pancreas**
1. Located posteriorly to the stomach
  2. Influences carbohydrate metabolism, indirectly influences fat and protein metabolism, and produces insulin and glucagon
- I. Ovaries and testes**
1. The ovaries are located in the pelvic cavity and produce estrogen and progesterone.
  2. The testes are located in the scrotum, control the development of the secondary sex characteristics, and produce testosterone.
- J. Negative-feedback loop**
1. Regulates hormone secretion by the hypothalamus and pituitary gland
  2. Increased amounts of target gland hormones in the bloodstream decrease secretion of the same hormone and other hormones that stimulate its release.
- ## II. DIAGNOSTIC TESTS
- A. Stimulation and suppression tests**
1. Stimulation testing
    - a. In the client with suspected underactivity of an endocrine gland, a stimulus may be provided to determine whether the gland is capable of normal hormone production.
    - b. Measured amounts of selected hormones or substances are administered to stimulate the target gland to produce its hormone.
    - c. Hormone levels produced by the target gland are measured.
    - d. Failure of the hormone level to increase with stimulation indicates hypofunction.

**Box 54-1 Endocrine Glands**

|              |             |
|--------------|-------------|
| Adrenal      | Parathyroid |
| Hypothalamus | Pituitary   |
| Ovaries      | Testes      |
| Pancreas     | Thyroid     |

**Box 54-2 Risk Factors for Endocrine Disorders**

|                    |                                |
|--------------------|--------------------------------|
| Age                | Environmental factors          |
| Heridity           | Consequence of other disorders |
| Congenital factors |                                |
| Trauma             |                                |

**Box 54-3 Hypothalamus Hormones**

Corticotropin-releasing hormone (CRH)  
 Gonadotropin-releasing hormone (GnRH)  
 Growth hormone-inhibiting hormone (GHIH)  
 Growth hormone-releasing hormone (GHRH)  
 Melanocyte-inhibiting hormone (MIH)  
 Prolactin-inhibiting hormone (PIH)  
 Thyrotropin-releasing hormone (TRH)

2. Suppression tests
  - a. Suppression tests are used when hormone levels are high or in the upper range of normal.
  - b. Agents that normally induce a suppressed response are administered to determine whether normal negative feedback is intact.
  - c. Failure of hormone production to be suppressed during standardized testing indicates hyperfunction.

**B. Radioactive iodine uptake**

1. This thyroid function test measures the absorption of the iodine isotope to determine how the thyroid gland is functioning.
2. A small dose of radioactive iodine is given by mouth or intravenously; the amount of radioactivity is measured in 2 to 4 hours and again at 24 hours.
3. Normal values are 3% to 10% at 2 to 4 hours, and 5% to 30% in 24 hours.
4. Elevated values indicate **hyperthyroidism**, decreased iodine intake, or increased iodine excretion.
5. Decreased values indicate a low  $T_4$  level, the use of antithyroid medications, thyroiditis, **myxedema**, or **hypothyroidism**.
6. The test is contraindicated in pregnancy.

**C.  $T_3$  and  $T_4$  resin uptake test**

1. Blood tests are used to diagnose thyroid disorders.
2.  $T_3$  and  $T_4$  regulate thyroid-stimulating hormone.
3. Normal values (normal findings vary between laboratory settings)

**Box 54-4 Pituitary Gland Hormones****Anterior Lobe Production**

Adrenocorticotrophic hormone (ACTH)  
 Follicle-stimulating hormone (FSH)  
 Growth hormone (GH)  
 Luteinizing hormone (LH)  
 Melanocyte-stimulating hormone (MSH)  
 Prolactin (PRL)  
 Somatotrophic growth-stimulating hormone  
 Thyroid-stimulating hormone (TSH)

**Posterior Lobe**

These hormones are produced by the hypothalamus, stored in the posterior lobe, and secreted into the blood when needed:

Oxytocin  
 Vasopressin, antidiuretic hormone (ADH)

- a.  $T_3$ : 80 to 230 ng/dL
- b.  $T_4$ : 5 to 12 mcg/dL
- c. Thyroxine, free ( $FT_4$ ): 0.8 to 2.4 ng/dL
4. The  $T_3$  level is elevated in **hyperthyroidism**, decreases with the aging process, and may be decreased in **hypothyroidism**.
5. The  $T_4$  level is elevated in **hyperthyroidism** and decreased in **hypothyroidism**.

**D. Thyroid-stimulating hormone**

1. Blood test is used to differentiate the diagnosis of primary **hypothyroidism**.
2. Normal value is 0.2 to 5.4 microunits/mL (normal findings vary among laboratories).
3. Elevated values indicate primary **hypothyroidism**.
4. Decreased values indicate **hyperthyroidism** or secondary **hypothyroidism**.

**E. Thyroid scan**

1. A thyroid scan is performed to identify nodules or growths in the thyroid gland.
2. A radioisotope of iodine or technetium is administered before scanning the thyroid gland.
3. Reassure the client that the level of radioactive medication is not dangerous to self or others.
4. Determine whether the client has received radiographic contrast agents within the past 3 months, because these may invalidate the scan.
5. Check with the physician regarding discontinuing medications containing iodine for 14 days before the test and the need to discontinue thyroid medication before the test.
6. Instruct the client to maintain an NPO status after midnight on the day before the test; if iodine is used, the client will fast for an additional 45 minutes after ingestion of the oral isotope and the scan will be performed in 24 hours.
7. If technetium is used, it is administered by the intravenous (IV) route 30 minutes before the scan.

▲ **FIGURE 54-1** Pituitary hormones. (From Lilley, L., Harrington, S., & Snyder, J. [2008]. *Pharmacology and the nursing process* [5th ed.]. St. Louis: Mosby.)

### Box 54-5 Adrenal Cortex

#### Glucocorticoids: Cortisol, Cortisone, Corticosterone

Responsible for glucose metabolism, protein metabolism, fluid and electrolyte balance, suppression of the inflammatory response to injury, protective immune response to invasion by infectious agents, and resistance to stress

#### Mineralocorticoids: Aldosterone

Regulation of electrolyte balance by promoting sodium retention and potassium excretion

8. The test is contraindicated in pregnancy.
- F.** Needle aspiration of thyroid tissue
1. Aspiration of thyroid tissue is done for cytological examination.
  2. No client preparation is necessary.
  3. Light pressure is applied to the aspiration site after the procedure.

**G.** Glucose tolerance test

1. The glucose tolerance test aids in the diagnosis of **diabetes mellitus**.
2. A 2-hour postload glucose level (2 hours after injection or ingestion of glucose) higher than 200 mg/dL confirms the diagnosis of **diabetes mellitus**.
3. Client preparation (Box 54-6)
4. Many factors can alter the results and therefore it is not always a reliable test.

**H.** Glycosylated hemoglobin

1. Description
  - a. Glycosylated hemoglobin is blood glucose bound to hemoglobin.
  - b. Glycosylated hemoglobin A<sub>1c</sub> (HbA<sub>1c</sub>) indicates how well blood glucose levels have been controlled for the prior 3 to 4 months.

⚠ **Hyperglycemia in a client with diabetes mellitus is usually the cause of an increase in the HbA<sub>1c</sub> value.**

### Box 54-6 Client Preparation: Glucose Tolerance Test

Eat a diet with at least 150 g of carbohydrates for 3 days before the test.

Avoid alcohol, coffee, and smoking for 36 hours before testing.

Fast for 10 to 12 hours before the test.

Avoid strenuous exercise for 8 hours before and after the test.

Withhold morning insulin or oral hypoglycemic medication (client with diabetes mellitus).

A sample is drawn for determination of the fasting blood glucose level and then the client will be given a high-glucose drink.

Blood samples will be drawn at 30-minute intervals for a minimum of 2 hours.

2. Values
  - a. Values are expressed as a percentage of the total hemoglobin.
  - b. The goal for clients with **diabetes mellitus** is 7% or lower.
  - c. For clients without **diabetes mellitus**, the normal range is 4% to 6%.

3. Nursing consideration: Fasting is not required.

#### I. Glycosylated serum albumin (fructosamine)

1. Reflects average serum glucose levels over a period of 2 to 3 weeks
2. More sensitive to recent changes than the HbA<sub>1c</sub> value
3. Normal ranges vary according to the method of testing used; nondiabetic client, 1.5 to 2.7 mmol/L; diabetic client, 2.0 to 5.0 mmol/L

### III. PITUITARY GLAND DISORDERS (Box 54-7)

#### A. Hypopituitarism

1. Description: Hyposecretion of one or more of the pituitary hormones caused by tumors, trauma, encephalitis, autoimmunity, or stroke
2. Hormones most often affected are growth hormone (GH) and gonadotropic hormones (luteinizing hormone, follicle-stimulating hormone), but thyroid-stimulating hormone (TSH), adrenocorticotrophic hormone (ACTH), or antidiuretic hormone (ADH) may be involved.
3. Assessment
  - a. Mild to moderate obesity (GH, TSH)
  - b. Reduced cardiac output (GH, ADH)
  - c. Infertility, sexual dysfunction (gonadotropins, ACTH)
  - d. Fatigue, low blood pressure (TSH, ADH, ACTH, GH)
  - e. Tumors of the pituitary also may cause headaches and visual defects (pituitary is located near the optic nerve).

#### 4. Interventions

- a. Provide emotional support to the client and family.

### Box 54-7 Pituitary Gland Disorders

#### Anterior Pituitary

Hyperpituitarism

Hypopituitarism

#### Posterior Pituitary

These disorders can be caused by damage to the posterior pituitary or hypothalamus.

Diabetes insipidus

Syndrome of inappropriate antidiuretic hormone (SIADH)

- b. Encourage the client and family to express feelings related to disturbed body image or sexual dysfunction.
- c. Client may need hormone replacement for the specific deficient hormones.
- d. Client education is needed regarding the signs and symptoms of hypofunction and hyperfunction related to insufficient or excess hormone replacement

#### B. Hyperpituitarism

##### 1. Description

- a. Hypersecretion of growth hormone by the anterior pituitary gland in an adult; caused primarily by pituitary tumors
- b. Leads to conditions such as acromegaly and **Cushing's disease**

##### 2. Assessment

- a. Large hands and feet
- b. Thickening and protrusion of the jaw
- c. Arthritic changes and joint pain
- d. Visual disturbances
- e. Diaphoresis
- f. Oily, rough skin
- g. Organomegaly
- h. Hypertension
- i. Dysphagia
- j. Deepening of the voice

##### 3. Interventions

- a. Provide emotional support to the client and family, and encourage the client and family to express feelings related to disturbed body image.
- b. Provide frequent skin care.
- c. Provide pharmacological and nonpharmacological interventions for joint pain.
- d. Prepare the client for radiation of the pituitary gland if prescribed.
- e. Prepare the client for **hypophysectomy** if planned.

#### C. Hypophysectomy (pituitary adenectomy, transsphenoidal pituitary surgery)

##### 1. Description

- a. Removal of the pituitary tumor via craniotomy or transsphenoidal (endoscopic

transnasal) approach (latter approach is preferred because it is associated with fewer complications)

- b. Complications for craniotomy include increased intracranial pressure, bleeding, meningitis, and hypopituitarism.
  - c. Complications for the transsphenoidal surgery include cerebrospinal fluid leak, infection, and hypopituitarism.
2. Postoperative interventions
    - a. Initiate postoperative care similar to craniotomy care.
    - b. Monitor vital signs, neurological status, and level of consciousness.
    - c. Elevate the head of the bed.
    - d. Monitor for increased intracranial pressure.
    - e. Monitor for bleeding.
    - f. Instruct the client to avoid sneezing, coughing, and blowing the nose.
    - g. Monitor for signs of temporary **diabetes insipidus** or syndrome of inappropriate antidiuretic hormone resulting from ADH disturbances.
    - h. Monitor intake and output, and avoid water intoxication.
    - i. Administer glucocorticoids and other hormone replacements as prescribed.
    - j. Administer antibiotics, analgesics, and antipyretics as prescribed.
    - k. Instruct the client in the administration of prescribed medications.

 **Following transsphenoidal hypophysectomy, monitor for any postnasal drip or nasal drainage, which might indicate leakage of cerebrospinal fluid (check the nasal drainage for glucose).**

#### D. Diabetes insipidus

1. Description
  - a. Hyposecretion of ADH caused by stroke or trauma, or may be idiopathic
  - b. Kidney tubules fail to reabsorb water.
2. Assessment
  - a. Polyuria of 4 to 24 L/day
  - b. Polydipsia
  - c. Dehydration (decreased skin turgor and dry mucous membranes)
  - d. Inability to concentrate urine
  - e. Low urinary specific gravity, 1.006 or lower
  - f. Fatigue
  - g. Muscle pain and weakness
  - h. Headache
  - i. Postural hypotension that may progress to vascular collapse without rehydration
  - j. Tachycardia
3. Interventions
  - a. Monitor vital signs and neurological and cardiovascular status.

- b. Provide a safe environment, particularly for the client with postural hypotension.
- c. Monitor electrolyte values and for signs of dehydration.
- d. Maintain client intake of adequate fluids.
- e. Monitor intake and output, weight, serum osmolality, and specific gravity of urine.
- f. Instruct the client to avoid foods or liquids that produce diuresis.
- g. Vasopressin tannate (Pitressin) or desmopressin acetate (DDAVP, Stimate) may be prescribed; these are used when the ADH deficiency is severe or chronic.
- h. Instruct the client in the administration of medications as prescribed; DDAVP may be administered by injection, intranasally, or orally.
- i. Instruct the client to wear a Medic-Alert bracelet.

#### E. Syndrome of inappropriate antidiuretic hormone (SIADH)

1. Description
  - a. Excess ADH is released, but not in response to the body's need for it.
  - b. Causes include trauma, stroke, malignancies (often in the lungs or pancreas), medications, and stress.
  - c. The syndrome results in water intoxication and hyponatremia.
2. Assessment
  - a. Signs of fluid volume overload
  - b. Changes in level of consciousness and mental status changes
  - c. Weight gain
  - d. Hypertension
  - e. Tachycardia
  - f. Anorexia, nausea, and vomiting
  - g. Hyponatremia
3. Interventions
  - a. Monitor vital signs and cardiac and neurological status.
  - b. Provide a safe environment, particularly for the client with changes in level of consciousness or mental status.
  - c. Monitor intake and output and obtain weight daily.
  - d. Monitor fluid and electrolyte balance.
  - e. Monitor serum and urine osmolality.
  - f. Restrict fluid intake as prescribed.
  - g. Administer diuretics and IV fluids (usually normal saline or hypertonic saline) as prescribed; monitor IV fluids carefully because of the risk for fluid volume overload (IV solutions containing water are contraindicated because of the risk of water intoxication).
  - h. Medications that inhibit ADH-induced water reabsorption and produce water diuresis may be prescribed.

**IV. ADRENAL GLAND DISORDERS** (Box 54-8)**A. Addison's disease**

1. Description
  - a. Hyposecretion of adrenal cortex hormones (glucocorticoids and mineralocorticoids)
  - b. Can be primary or secondary
  - c. The condition is fatal if left untreated.
2. Assessment (Table 54-1)
3. Interventions
  - a. Monitor vital signs, particularly blood pressure, weight, and intake and output.
  - b. Monitor white blood cell (WBC) count, blood glucose, and potassium, sodium, and calcium levels.
  - c. Administer glucocorticoid or mineralocorticoid medications as prescribed.
  - d. Observe for **addisonian crisis** caused by stress, infection, trauma, or surgery.
4. Client education
  - a. Avoid individuals with an infection.
  - b. Diet: High protein and high carbohydrate, normal sodium intake
  - c. Avoid strenuous exercise and stressful situations.
  - d. Need for lifelong glucocorticoid therapy
  - e. Avoid over-the-counter medications.
  - f. Wear a Medic-Alert bracelet.
  - g. Signs and symptoms of complications such as underreplacement and overreplacement of hormones

**B. Addisonian crisis**

1. Description (Box 54-9)

## 2. Assessment

- a. Severe headache
- b. Severe abdominal, leg, and lower back pain
- c. Generalized weakness
- d. Irritability and confusion
- e. Severe hypotension
- f. Shock

## 3. Interventions

- a. Prepare to administer glucocorticoids intravenously as prescribed; hydrocortisone sodium succinate (Solu-Cortef) usually is prescribed initially.
- b. Following resolution of the crisis, administer glucocorticoid and mineralocorticoid orally as prescribed.
- c. Monitor vital signs, particularly blood pressure.
- d. Monitor neurological status, noting irritability and confusion.
- e. Monitor intake and output.
- f. Monitor laboratory values, particularly the sodium, potassium, and blood glucose levels.
- g. Administer IV fluids as prescribed to restore electrolyte balance.
- h. Protect the client from infection.
- i. Maintain bedrest and provide a quiet environment.

**!** Addison's disease is characterized by the hyposecretion of adrenal cortex hormones (glucocorticoids and mineralocorticoids), whereas Cushing's disease is characterized by a hypersecretion of glucocorticoids.

**Box 54-8 Adrenal Gland Disorders****Adrenal Cortex**

Addison's disease  
 Primary hyperaldosteronism (Conn's syndrome)  
 Cushing's disease  
 Cushing's syndrome

**Adrenal Medulla**

Pheochromocytoma

**Box 54-9 Addisonian Crisis**

A life-threatening disorder caused by acute adrenal insufficiency

Precipitated by stress, infection, trauma, surgery, or abrupt withdrawal of exogenous corticosteroid use

Can cause hyponatremia, hyperkalemia, hypoglycemia, and shock

**TABLE 54-1** Assessment: Addison's Disease and Cushing's Disease (Cushing's Syndrome)

| Addison's Disease  | Cushing's Disease and Syndrome   |
|--|--|
| Lethargy, fatigue, and muscle weakness                   | Generalized muscle wasting and weakness                                      |
| Gastrointestinal disturbances                            | Moon face, buffalo hump  |
| Weight loss  | Truncal obesity with thin extremities, supraclavicular fat pads; weight gain |
| Menstrual changes in women; impotence in men             | Hirsutism (masculine characteristics in female)                              |
| Hypoglycemia, hyponatremia                               | Hyperglycemia, hypernatremia   |
| Hyperkalemia, hypercalcemia                              | Hypokalemia, hypocalcemia  |
| Postural hypotension                                     | Hypertension   |
| Hyperpigmentation of skin (bronzed) with primary disease | Fragile skin that easily bruises   |
|  | Reddish-purple striae on the abdomen and upper thighs                        |

### C. Cushing's disease and Cushing's syndrome (hypercortisolism)

1. Description
  - a. Characterized by a hypersecretion of glucocorticoids from the adrenal cortex
  - b. **Cushing's disease** is a metabolic disorder characterized by abnormally increased secretion (endogenous) of cortisol, caused by increased amounts of ACTH secreted by the pituitary gland.
  - c. **Cushing's syndrome** is a metabolic disorder resulting from the chronic and excessive production of cortisol by the adrenal cortex or by the administration of glucocorticoids in large doses for several weeks or longer (exogenous or iatrogenic).
2. Assessment (Fig. 54-2; see Table 54-1)
3. Interventions
  - a. Monitor vital signs, particularly blood pressure.
  - b. Monitor intake and output and weight.
  - c. Monitor laboratory values, particularly the white blood cell count, and serum glucose, sodium, potassium, and calcium levels.
  - d. Provide meticulous skin care.
  - e. Allow the client to discuss feelings related to body appearance.
  - f. Administer chemotherapeutic agents as prescribed for inoperable adrenal tumors.
  - g. Prepare the client for radiation as prescribed if the condition results from a pituitary adenoma.
  - h. Prepare the client for removal of pituitary tumor (**hypophysectomy**, transsphenoidal adenectomy) if the condition results from increased pituitary secretion of ACTH.

**▲ FIGURE 54-2** Typical appearance of a client with Cushing's syndrome. Note truncal obesity, moon face, buffalo hump, thinner arms and legs, and abdominal striae. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

- i. Prepare the client for **adrenalectomy** if the condition results from an adrenal adenoma; glucocorticoid replacement may be required following **adrenalectomy**.

### D. Primary hyperaldosteronism (Conn's syndrome)

1. Description
  - a. Hypersecretion of mineralocorticoids (aldosterone) from the adrenal cortex of the adrenal gland
  - b. Most commonly caused by an adenoma
2. Assessment
  - a. Symptoms related to hypokalemia, hypernatremia, and hypertension
  - b. Headache, fatigue, muscle weakness, nocturia
  - c. Polydipsia and polyuria
  - d. Paresthesias
  - e. Visual changes
  - f. Low urine specific gravity and increased urinary aldosterone level
  - g. Elevated serum aldosterone levels
  - h. Metabolic alkalosis
3. Interventions
  - a. Monitor vital signs, particularly blood pressure.
  - b. Monitor for signs of hypokalemia and hypernatremia.
  - c. Monitor intake and output and urine for specific gravity.
  - d. Spironolactone (Aldactone) may be prescribed to promote fluid balance and control hypertension; this is a potassium-sparing diuretic and aldosterone antagonist, and clients need to be monitored for hyperkalemia, particularly those with impaired renal function or excessive potassium intake.
  - e. Administer potassium supplements as prescribed.
  - f. Prepare the client for **adrenalectomy**.
  - g. Maintain sodium restriction, if prescribed, preoperatively.
  - h. Administer glucocorticoids preoperatively, as prescribed, to prevent adrenal hypofunction.
  - i. Monitor the client for adrenal insufficiency postoperatively.
  - j. Instruct the client regarding the need for glucocorticoid therapy following **adrenalectomy**.
  - k. Instruct the client about the need to wear a Medic-Alert bracelet.

### E. Pheochromocytoma

1. Description
  - a. Catecholamine-producing tumor usually found in the adrenal medulla, but extra-adrenal locations include the chest, bladder, abdomen, and brain; typically is a benign tumor but can be malignant
  - b. Excessive amounts of epinephrine and norepinephrine are secreted.

- c. Diagnostic tests include a 24-hour urine collection for vanillylmandelic acid (VMA), a product of catecholamine metabolism, metanephrine, and catecholamines, all of which are elevated in the presence of pheochromocytoma; the normal range of urinary catecholamines is up to 14 mcg/100 mL of urine, with higher levels occurring in pheochromocytoma.
- d. Surgical removal of the adrenal gland is the primary treatment.
- e. Symptomatic treatment is initiated if surgical removal is not possible.
- f. The complications associated with pheochromocytoma include hypertensive crisis, including hypertensive retinopathy and nephropathy, cardiac enlargement, and dysrhythmias, congestive heart failure, myocardial infarction, increased platelet aggregation, and stroke.
- g. Death can occur from shock, stroke, renal failure, dysrhythmias, or dissecting aortic aneurysm.

## 2. Assessment

- a. Paroxysmal or sustained hypertension
- b. Severe headaches
- c. Palpitations
- d. Flushing and profuse diaphoresis
- e. Pain in the chest or abdomen with nausea and vomiting
- f. Heat intolerance
- g. Weight loss
- h. Tremors
- i. **Hyperglycemia**

## 3. Interventions

- a. Monitor vital signs, particularly the blood pressure and heart rate.
- b. Monitor for hypertensive crisis; monitor for complications that can occur with hypertensive crisis, such as stroke, cardiac dysrhythmias, myocardial infarction.
- c. Instruct the client not to smoke, drink caffeine-containing beverages, or change position suddenly.
- d. Prepare to administer a  $\beta$ -adrenergic blocking agent as prescribed to control hypertension.
- e. Monitor serum glucose level.
- f. Promote rest and a nonstressful environment.
- g. Provide a diet high in calories, vitamins, and minerals.
- h. Prepare the client for **adrenalectomy**.

 For the client with pheochromocytoma, avoid stimuli that can precipitate a hypertensive crisis, such as increased abdominal pressure and vigorous abdominal palpation.

## F. Adrenalectomy

### 1. Description (Box 54-10)

### Box 54-10 Adrenalectomy

Surgical removal of an adrenal gland

Lifelong glucocorticoid and mineralocorticoid replacement are necessary with bilateral adrenalectomy

Temporary glucocorticoid replacement, usually up to 2 years, is necessary after a unilateral adrenalectomy.

Catecholamine levels drop as a result of surgery, which can result in cardiovascular collapse, hypotension, and shock, and the client needs to be monitored closely.

Hemorrhage also can occur because of the high vascularity of the adrenal glands.

### 2. Preoperative interventions

- a. Monitor electrolyte levels and correct electrolyte imbalances.
- b. Assess for dysrhythmias.
- c. Monitor for **hyperglycemia**.
- d. Protect the client from infections.
- e. Administer glucocorticoids as prescribed.

### 3. Postoperative interventions

- a. Monitor vital signs.
- b. Monitor intake and output; if the urinary output is lower than 30 mL/hr, notify the physician, because this may indicate renal failure and impending shock.
- c. Monitor weight daily.
- d. Monitor electrolyte and serum glucose levels.
- e. Monitor for signs of hemorrhage and shock, particularly during the first 24 to 48 hours.
- f. Monitor for manifestations of adrenal insufficiency.
- g. Assess the dressing for drainage.
- h. Monitor for paralytic ileus, as manifested by abdominal distention and pain, nausea, vomiting, and diminished or absent bowel sounds (paralytic ileus can develop from internal bleeding, anesthesia effects, and bowel manipulation).
- i. Administer IV fluids as prescribed to maintain blood volume.
- j. Administer glucocorticoids and mineralocorticoids as prescribed.
- k. Administer pain medication as prescribed.
- l. Provide pulmonary interventions to prevent atelectasis (cough and deep breathing, incentive spirometry, splinting of incision).
- m. Instruct the client in the importance of hormone replacement therapy following surgery.
- n. Instruct the client regarding signs and symptoms of complications such as underreplacement and overreplacement of hormones.
- o. Instruct the client regarding the need to wear a Medic-Alert bracelet.

**Box 54-11 Thyroid Gland Disorders**

Hyperthyroidism  
Hypothyroidism

**V. THYROID GLAND DISORDERS** (Box 54-11)**A. Hypothyroidism**

1. Description
  - a. Hypothyroid state resulting from hyposecretion of thyroid hormones  $T_3$  and  $T_4$ .
  - b. Characterized by a decreased rate of body metabolism
2. Assessment
  - a. Lethargy and fatigue
  - b. Weakness, muscle aches, paresthesias
  - c. Intolerance to cold
  - d. Weight gain
  - e. Dry skin and hair and loss of body hair
  - f. Bradycardia
  - g. Constipation
  - h. Generalized puffiness and edema around the eyes and face (**myxedema**)
  - i. Forgetfulness and loss of memory
  - j. Menstrual disturbances
  - k. Cardiac enlargement, tendency to develop congestive heart failure
  - l. Goiter may or may not be present.
3. Interventions
  - a. Monitor vital signs, including heart rate and rhythm.
  - b. Administer thyroid replacement; levothyroxine sodium (Synthroid) is most commonly prescribed.
  - c. Instruct the client about thyroid replacement therapy and about the clinical manifestations of both **hypothyroidism** and **hyperthyroidism** related to underreplacement or overreplacement of the hormone.
  - d. Instruct the client in low-calorie, low-cholesterol, low-saturated fat diet.
  - e. Assess the client for constipation; provide roughage and fluids to prevent constipation.
  - f. Provide a warm environment for the client.
  - g. Avoid sedatives and opioid analgesics because of increased sensitivity to these medications.
  - h. Monitor for overdose of thyroid medications, characterized by tachycardia, chest pain, restlessness, nervousness, and insomnia.
  - i. Instruct the client to report episodes of chest pain or other signs of overdose immediately.

**B. Myxedema coma**

1. Description (Box 54-12)
2. Assessment
  - a. Hypotension
  - b. Bradycardia

**Box 54-12 Myxedema Coma**

This rare but serious disorder results from persistently low thyroid production.

Coma can be precipitated by acute illness, rapid withdrawal of thyroid medication, anesthesia and surgery, hypothermia, or the use of sedatives and opioid analgesics.

- c. Hypothermia
- d. Hyponatremia
- e. **Hypoglycemia**
- f. Generalized edema
- g. Respiratory failure
- h. Coma
3. Interventions
  - a. Maintain a patent airway.
  - b. Institute aspiration precautions.
  - c. Administer IV fluids (normal or hypertonic saline) as prescribed.
  - d. Administer levothyroxine sodium intravenously as prescribed.
  - e. Administer glucose intravenously as prescribed.
  - f. Administer corticosteroids as prescribed.
  - g. Assess client's temperature hourly.
  - h. Monitor blood pressure frequently.
  - i. Keep the client warm.
  - j. Monitor for changes in mental status.
  - k. Monitor electrolyte and glucose levels.

**C. Hyperthyroidism**

1. Description
  - a. Hyperthyroid state resulting from hypersecretion of thyroid hormones ( $T_3$  and  $T_4$ )
  - b. Characterized by an increased rate of body metabolism
  - c. A common cause is Graves' disease, also known as toxic diffuse goiter.
  - d. Clinical manifestations are referred to as *thyrotoxicosis*.
2. Assessment for **hyperthyroidism** caused by Graves' disease
  - a. Enlarged thyroid gland (goiter)
  - b. Palpitations, cardiac dysrhythmias, such as tachycardia or atrial fibrillation
  - c. Protruding eyeballs (exophthalmos) may be present (Fig. 54-3)
  - d. Hypertension
  - e. Heat intolerance
  - f. Diaphoresis
  - g. Weight loss
  - h. Diarrhea
  - i. Smooth, soft skin and hair
  - j. Nervousness and fine tremors of the hands
  - k. Personality changes such as irritability, agitation, and mood swings

▲ **FIGURE 54-3** Exophthalmos. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

### 3. Interventions

- a. Provide adequate rest.
- b. Administer sedatives as prescribed.
- c. Provide a cool and quiet environment.
- d. Obtain weight daily.
- e. Provide a high-calorie diet.
- f. Avoid the administration of stimulants.
- g. Administer antithyroid medications (propylthiouracil, PTU) that block thyroid synthesis as prescribed.
- h. Administer iodine preparations that inhibit the release of thyroid hormone as prescribed.
- i. Administer propranolol (Inderal) for tachycardia as prescribed.
- j. Prepare the client for radioactive iodine therapy, as prescribed, to destroy thyroid cells.
- k. Prepare the client for **thyroidectomy** if prescribed.

### D. Thyroid storm

#### 1. Description (Box 54-13)

#### 2. Assessment

- a. Elevated temperature (fever)
- b. Tachycardia
- c. Systolic hypertension
- d. Nausea, vomiting, and diarrhea
- e. Agitation, tremors, anxiety
- f. Irritability, agitation, restlessness, confusion, and seizures as the condition progresses
- g. Delirium and coma

#### 3. Interventions

- a. Maintain a patent airway and adequate ventilation.
- b. Administer antithyroid medications, sodium iodide solution, propranolol, and glucocorticoids as prescribed.
- c. Monitor vital signs.
- d. Monitor continually for cardiac dysrhythmias.

### Box 54-13 Thyroid Storm

This acute and life-threatening condition occurs in a client with uncontrollable hyperthyroidism.

It can be caused by manipulation of the thyroid gland during surgery and the release of thyroid hormone into the bloodstream; it also can occur from severe infection and stress.

Antithyroid medications,  $\beta$ -blockers, glucocorticoids, and iodides may be administered to the client before thyroid surgery to prevent its occurrence.

- e. Administer nonsalicylate antipyretics as prescribed (salicylates increase free thyroid hormone levels).
- f. Use a cooling blanket to decrease temperature as prescribed.

### E. Thyroidectomy

#### 1. Description

- a. Removal of the thyroid gland
- b. Performed when persistent **hyperthyroidism** exists

#### 2. Preoperative interventions

- a. Obtain vital signs and weight.
- b. Assess electrolyte levels.
- c. Assess for **hyperglycemia**.
- d. Instruct the client in how to perform coughing and deep-breathing exercises and how to support the neck in the postoperative period when coughing and moving.
- e. Administer antithyroid medications, sodium iodide solution, propranolol, and glucocorticoids as prescribed to prevent the occurrence of **thyroid storm**.

#### 3. Postoperative interventions

- a. Monitor for respiratory distress.
- b. Have a tracheotomy set, oxygen, and suction at the bedside.
- c. Limit client talking, and assess level of hoarseness.
- d. Monitor for laryngeal nerve damage, as evidenced by respiratory obstruction, dysphonia, high-pitched voice, stridor, dysphagia, and restlessness.
- e. Monitor for signs of hypocalcemia and tetany, which can be caused by trauma to the parathyroid gland (Box 54-14).
- f. Prepare to administer calcium gluconate as prescribed for tetany.
- g. Monitor for **thyroid storm**.

▲ Following thyroidectomy, maintain the client in a semi-Fowler's position. Monitor the surgical site for edema and for signs of bleeding and check the dressing anteriorly and at the back of the neck.

**Box 54-14 Signs of Tetany**

Cardiac dysrhythmias  
 Carpopedal spasm  
 Dysphagia  
 Muscle and abdominal cramps  
 Numbness and tingling of the face and extremities  
 Positive Chvostek's sign  
 Positive Trousseau's sign  
 Visual disturbances (photophobia)  
 Wheezing and dyspnea (bronchospasm, laryngospasm)  
 Seizures

**Box 54-15 Parathyroid Gland Disorders**

Hyperparathyroidism  
 Hypoparathyroidism

**VI. PARATHYROID GLAND DISORDERS** (Box 54-15)**A. Hypoparathyroidism**

1. Description
  - a. Condition caused by hyposecretion of parathyroid hormone by the parathyroid gland
  - b. Can occur following **thyroidectomy** because of removal of parathyroid tissue
2. Assessment
  - a. Hypocalcemia and hyperphosphatemia
  - b. Numbness and tingling in the face
  - c. Muscle cramps and cramps in the abdomen or in the extremities
  - d. Positive **Trousseau's sign** or **Chvostek's sign**
  - e. Signs of overt tetany, such as bronchospasm, laryngospasm, carpopedal spasm, dysphagia, photophobia, cardiac dysrhythmias, seizures
  - f. Hypotension
  - g. Anxiety, irritability, depression
3. Interventions
  - a. Monitor vital signs.
  - b. Monitor for signs of hypocalcemia and tetany.
  - c. Initiate seizure precautions.
  - d. Place a tracheotomy set, oxygen, and suctioning at the bedside.
  - e. Prepare to administer calcium gluconate intravenously for hypocalcemia.
  - f. Provide a high-calcium, low-phosphorus diet.
  - g. Instruct the client in the administration of calcium supplements as prescribed.
  - h. Instruct the client in the administration of vitamin D supplements as prescribed; vitamin D enhances the absorption of calcium from the gastrointestinal tract.
  - i. Instruct the client in the administration of phosphate binders as prescribed to promote

the excretion of phosphate through the gastrointestinal tract.

- j. Instruct the client to wear a Medic-Alert bracelet.

**B. Hyperparathyroidism**

1. Description: Condition caused by hypersecretion of parathyroid hormone by the parathyroid gland
2. Assessment
  - a. Hypercalcemia and hypophosphatemia
  - b. Fatigue and muscle weakness
  - c. Skeletal pain and tenderness
  - d. Bone deformities that result in pathological fractures
  - e. Anorexia, nausea, vomiting, epigastric pain
  - f. Weight loss
  - g. Constipation
  - h. Hypertension
  - i. Cardiac dysrhythmias
  - j. Renal stones
3. Interventions
  - a. Monitor vital signs, particularly the blood pressure.
  - b. Monitor for cardiac dysrhythmias.
  - c. Monitor intake and output and for signs of renal stones.
  - d. Monitor for skeletal pain; move the client slowly and carefully.
  - e. Encourage fluid intake.
  - f. Administer furosemide (Lasix) as prescribed to lower calcium levels.
  - g. Administer normal saline intravenously as prescribed to maintain hydration.
  - h. Administer phosphates as prescribed, which interfere with calcium resorption.
  - i. Administer calcitonin (Calcimar) as prescribed to decrease skeletal calcium release and increase renal excretion of calcium.
  - j. Monitor calcium and phosphorus levels.
  - k. Prepare the client for parathyroidectomy as prescribed.

 **For the client with hyperparathyroidism, notify the physician immediately if a precipitous drop in the calcium level occurs; assess for tingling and numbness in the face and extremities and for other signs of hypocalcemia.**

**C. Parathyroidectomy**

1. Description: Removal of one or more of the parathyroid glands
2. Preoperative interventions
  - a. Monitor electrolytes, calcium, phosphate, and magnesium levels.
  - b. Ensure that calcium levels are decreased to near-normal values.
  - c. Inform the client that talking may be painful for the first day or two after surgery.

**Box 54-16 Major Types of Diabetes Mellitus**

Type 1: Primary beta cell destruction leading to absolute insulin deficiency

Type 2: Ranges from insulin resistance with an insulin deficiency to secretory deficit with insulin resistance

3. Postoperative interventions
  - a. Monitor for respiratory distress.
  - b. Place a tracheotomy set, oxygen, and suctioning at the bedside.
  - c. Monitor vital signs.
  - d. Position the client in a semi-Fowler's position.
  - e. Assess neck dressing for bleeding.
  - f. Monitor for hypocalcemic crisis, as evidenced by tingling and twitching in the extremities and face.
  - g. Assess for positive **Trousseau's sign** or **Chvostek's sign**, which signals the potential for tetany.
  - h. Monitor for changes in voice pattern and hoarseness.
  - i. Monitor for laryngeal nerve damage.
  - j. Instruct the client in the administration of calcium and vitamin D supplements as prescribed.

**VII. DISORDERS OF THE PANCREAS****A. Diabetes mellitus** (Box 54-16)

1. Description
    - a. Chronic disorder of impaired carbohydrate, protein, and lipid metabolism caused by a deficiency of insulin
    - b. An absolute or relative deficiency of insulin results in **hyperglycemia**.
    - c. Type 1 **diabetes mellitus** is a nearly absolute deficiency of insulin; if insulin is not given, fats are metabolized for energy, resulting in ketonemia (acidosis).
    - d. Type 2 **diabetes mellitus** is a relative lack of insulin or resistance to the action of insulin; usually, insulin is sufficient to stabilize fat and protein metabolism but not carbohydrate metabolism.
    - e. Metabolic syndrome is also known as syndrome X and the individual has coexisting risk factors for developing type 2 **diabetes mellitus**; these risk factors include abdominal obesity, **hyperglycemia**, hypertension, high triglyceride level, and a lowered HDL (high-density lipoprotein) cholesterol level.
    - f. **Diabetes mellitus** can lead to chronic health problems and early death as a result of complications that occur in the large and small blood vessels in tissues and organs.
    - g. Macrovascular complications include coronary artery disease, cardiomyopathy, hypertension, cerebrovascular disease, and peripheral vascular disease. (Refer to Chapter 60 for information on cardiovascular disorders.)
    - h. Microvascular complications include retinopathy, nephropathy, and neuropathy.
    - i. Infection is also a concern because of reduced healing ability.
    - j. Male erectile dysfunction can also occur as a result of the disease.
- ! Obesity is a major risk factor for diabetes mellitus.**
2. Assessment
    - a. Polyuria, polydipsia, polyphagia (more common in type 1 **diabetes mellitus**)
    - b. **Hyperglycemia**
    - c. Weight loss (common in type 1 **diabetes mellitus**, rare in type 2 **diabetes mellitus**)
    - d. Blurred vision
    - e. Slow wound healing
    - f. Vaginal infections
    - g. Weakness and paresthesias
    - h. Signs of inadequate circulation to the feet
    - i. Signs of accelerated atherosclerosis (renal, cerebral, cardiac, peripheral)
  3. Diet
    - a. The total number of calories is individualized based on the client's current or desired weight and the presence of other existing health problems.
    - b. Day-to-day consistency in timing and amount of food intake helps control the blood glucose level.
    - c. As prescribed by the physician, the client may be advised to follow the food exchange recommendations of the American Diabetic Association diet or U.S. dietary guidelines (MyPyramid) issued by the U.S. Departments of Agriculture and Health and Human Services.
    - d. Carbohydrate counting may be a simpler approach for some clients; it focuses on the total grams of carbohydrates eaten per meal. The client may be more compliant with carbohydrate counting, resulting in better glycemic control; it is usually necessary for clients undergoing intense insulin therapy.
    - e. Incorporate the diet into individual client needs, lifestyle, and cultural and socioeconomic patterns.
  4. Exercise
    - a. Exercise lowers the blood glucose level, encourages weight loss, reduces cardiovascular risks, improves circulation and muscle tone, decreases total cholesterol and triglyceride levels, and decreases insulin resistance and glucose intolerance.
    - b. Instruct the client in dietary adjustments when exercising; dietary adjustments are individualized.

- c. If the client requires extra food during exercise to prevent **hypoglycemia**, it need not be deducted from the regular meal plan.
- d. If the blood glucose level is higher than 250 mg/dL and urinary ketones (type 1 **diabetes mellitus**) are present, the client is instructed not to exercise until the blood glucose level is closer to normal and urinary ketones are absent.

⚠ Instruct the client with diabetes mellitus to monitor the blood glucose level before, during, and after exercising.

### 5. Oral hypoglycemic medications

- a. Oral medications are prescribed for clients with **diabetes mellitus** type 2 when diet and weight control therapy have failed to maintain satisfactory blood glucose levels.
- b. Assess the client's knowledge of **diabetes mellitus** and the use of oral hypoglycemic agents.
- c. Assess vital signs and blood glucose levels.
- d. Assess the medications that the client is currently taking.
- e. Aspirin, alcohol, sulfonamides, oral contraceptives, and monoamine oxidase inhibitors increase the hypoglycemic effect, causing a decrease in blood glucose levels.
- f. Glucocorticoids, thiazide diuretics, and estrogen increase blood glucose levels.
- g. Teach the client to recognize the signs and symptoms of **hypoglycemia** and **hyperglycemia**.
- h. Teach the client to avoid over-the-counter medications unless prescribed by the physician.
- i. Inform the client with type 2 **diabetes mellitus** that insulin may be needed during stress, surgery, or infection.
- j. Teach the client about the importance of compliance with the prescribed medication.
- k. Advise the client to wear a Medic-Alert bracelet.

⚠ To prevent a serious reaction, inform the client taking a sulfonylurea to avoid consuming alcohol.

### 6. Insulin

- a. Insulin is used to treat types 1 and 2 **diabetes mellitus** when diet, weight control therapy, and oral hypoglycemic agents have failed to maintain satisfactory blood glucose levels.
- b. Aspirin, alcohol, oral anticoagulants, oral hypoglycemic medications,  $\beta$ -blockers, tricyclic antidepressants, tetracycline, and monoamine oxidase inhibitors increase the hypoglycemic effect of insulin, causing a further decrease in the blood glucose level.
- c. Glucocorticoids, thiazide diuretics, thyroid agents, oral contraceptives, and estrogen increase the blood glucose level.

- d. Illness, infection, and stress increase the blood glucose level and the need for insulin; insulin should not be withheld during illness, infection, or stress because **hyperglycemia** and **ketoacidosis** can result.
- e. Instruct the client to recognize the signs and symptoms of **hypoglycemia** and **hyperglycemia**.
- f. The peak action time of insulin is important to explain to the client because of the possibility of hypoglycemic reactions occurring during this time.

⚠ Regular insulin is the only insulin that can be administered intravenously. It is used in the emergency treatment of diabetic ketoacidosis.

### B. Complications of insulin therapy

1. Local allergic reactions
  - a. Redness, swelling, tenderness, and induration or a wheal at the site of injection may occur 1 to 2 hours after administration.
  - b. Reactions usually occur during the early stages of insulin therapy.
  - c. Instruct the client to cleanse the skin with alcohol before injection.
2. Insulin lipodystrophy
  - a. Lipoatrophy is loss of subcutaneous fat and appears as slight dimpling or more serious pitting of subcutaneous fat; the use of human insulin helps prevent this complication (Fig. 54-4).
  - b. Lipohypertrophy is the development of fibrous fatty masses at the injection site and is caused by repeated use of an injection site (Fig. 54-5).
  - c. Instruct the client to avoid injecting insulin into affected sites.

▲ **FIGURE 54-4** Lipoatrophy at insulin injection site. (From Mosby. [2009]. *Mosby's dictionary of medicine, nursing, and health professions* [8th ed.]. St. Louis: Mosby.)

- d. Instruct the client about the importance of rotating insulin injection at one anatomical site.
  - 3. Insulin resistance
    - a. The client receiving insulin develops immune antibodies that bind the insulin, thereby decreasing the insulin available for use in the body.
    - b. Treatment consists of administering a purer insulin preparation.
    - c. Insulin resistance is also the term used for lack of tissue sensitivity to the insulin from the body, which results in **hyperglycemia**.
  - 4. **Dawn phenomenon**
    - a. **Dawn phenomenon** results from reduced tissue sensitivity to insulin that usually develops between 5 and 8 AM (prebreakfast hyperglycemia occurs); it may be caused by nocturnal release of growth hormone.
    - b. Treatment includes administering an evening dose (or increasing the amount of a current dose) of intermediate-acting insulin at about 10 PM.
  - 5. **Somogyi phenomenon**
    - a. Normal or elevated blood glucose levels are present at bedtime; **hypoglycemia** occurs at about 2 to 3 AM, which causes an increase in the production of counterregulatory hormones.
    - b. By about 7 AM, in response to the counterregulatory hormones, the blood glucose rebounds significantly to the hyperglycemic range.
    - c. Treatment includes decreasing the evening (predinner or bedtime) dose of intermediate-acting insulin or increasing the bedtime snack.
- C. Insulin administration**
1. Subcutaneous injections and mixing insulin: See Chapter 55.
  2. Insulin pumps
    - a. Continuous subcutaneous insulin infusion is administered by an externally worn device that contains a syringe attached to a long, thin, narrow-lumen tube with a needle or Teflon catheter attached to the end.
    - b. The client inserts the needle or Teflon catheter into the subcutaneous tissue (usually on the abdomen) and secures it with tape or a transparent dressing; the pump is worn on a belt or in a pocket; the needle or Teflon catheter is changed at least every 2 to 3 days.
    - c. A continuous basal rate of insulin infuses; in addition, based on the blood glucose level, the anticipated food intake, and the activity level, the client delivers a bolus of insulin before each meal.
    - d. Both rapid-acting and regular insulin (buffered to prevent the precipitation of insulin crystals within the catheter) are appropriate for use in these pumps.
  3. Insulin pump and skin sensor
    - a. A skin sensor device that monitors the client's blood glucose continuously; the information is transmitted to the pump, determines the need for insulin, and then the insulin is injected.
    - b. The pump holds up to a 3-day supply of insulin and can be easily disconnected for activities such as bathing.
  4. Jet injectors
    - a. A jet injector is a needleless device that delivers insulin through the skin under pressure in an extremely fine stream.
    - b. Insulin administered by this device usually absorbs faster.
    - c. The injector can cause bruising at the site of insulin delivery.
  5. Pancreas transplants
    - a. The goal of pancreatic transplantation is to halt or reverse the complications of **diabetes mellitus**.
    - b. Transplantations are performed on a limited number of clients (generally, these are clients who are undergoing kidney transplantation simultaneously).
    - c. Immunosuppressive therapy is prescribed to prevent and treat rejection.

- D. Self-monitoring of blood glucose level**
1. Self-monitoring provides the client with the current blood glucose level and information to maintain good glycemic control.
  2. Monitoring requires a finger prick to obtain a drop of blood for testing.
  3. Alternative site testing (obtaining blood from the forearm, upper arm, abdomen, thigh, or calf) is now available using specific measurement devices.
  4. Tests must be used with caution in clients with diabetic neuropathy.
  5. Client instructions (Box 54-17)
- E. Urine testing**
1. Urine testing for glucose is not a reliable indicator of the blood glucose level and is not used for monitoring purposes.
  2. Instruct the client in the procedure for testing for urine ketones.

▲ **FIGURE 54-5** Lipohypertrophy at insulin injection site. (From Mosby. [2009]. *Mosby's dictionary of medicine, nursing, and health professions* [8th ed.]. St. Louis: Mosby.)

3. The presence of ketones may indicate impending **ketoacidosis**.
4. Urine ketone testing should be performed during illness and whenever the client with type 1 **diabetes mellitus** has persistently elevated blood glucose levels (higher than 240 mg/dL for two consecutive testing periods).

### VIII. ACUTE COMPLICATIONS OF DIABETES MELLITUS

#### A. Hypoglycemia (see Priority Nursing Actions)

#### PRIORITY NURSING ACTIONS!

##### Actions to Take If the Client Experiences a Hypoglycemic Reaction

1. Check the client's blood glucose level.
2. Give the client a 10 to 15 g carbohydrate item such as ½ cup of fruit juice to drink.
3. Take the client's vital signs.
4. Retest the blood glucose level.
5. Give the client a small snack of carbohydrate and protein.
6. Document the client's complaints, actions taken, and outcome.

If the client experiences symptoms of a hypoglycemic reaction such as hunger, irritability, shakiness, or weakness, the nurse first would check the client's blood glucose level to verify that the client is experiencing hypoglycemia. Once this is verified, the nurse would give the client 10 to 15 g of carbohydrates. The nurse would retest the blood glucose level in 15 minutes. In the meantime, the nurse would check the client's vital signs. The nurse would give the client another 10- to 15-g carbohydrate food item if the client's symptoms do not resolve. Otherwise, the nurse would provide a small snack of carbohydrates and protein if the client's next scheduled meal is more than an hour away from the time of the occurrence. Following treatment and resolution of the hypoglycemic event, the nurse would document the occurrence, actions taken, and outcome.

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1507-1508). St. Louis: Saunders.

#### Box 54-17 Client Instructions: Monitoring of Blood Glucose Level

Use the proper procedure for obtaining the sample for determining the blood glucose level.  
 Perform the procedure precisely to obtain accurate results. Follow the manufacturer's instructions for the glucometer. Wash hands before and after performing the procedure to prevent infection.  
 Calibrate the monitor as instructed by the manufacturer. Check the expiration date on the test strips.  
 If the blood glucose level results do not seem reasonable, reread the instructions, reassess technique, check the expiration date of the test strips, and perform the procedure again to verify results.

1. Description
  - a. **Hypoglycemia** occurs when the blood glucose level falls below 70 mg/dL or when the blood glucose level drops rapidly from an elevated level.
  - b. **Hypoglycemia** is caused by too much insulin or oral hypoglycemic agents, too little food, or excessive activity.
  - c. The client needs to be instructed always to carry some form of fast-acting simple carbohydrate with him or her.
  - d. If the client has a hypoglycemic reaction and does not have any of the recommended emergency foods available, any available food should be eaten; high-fat foods slow the absorption of glucose and the hypoglycemic symptoms may not resolve quickly.
2. Assessment (Box 54-18)
  - a. Mild **hypoglycemia**: The client remains fully awake but displays adrenergic symptoms; the blood glucose level is usually lower than 60 mg/dL.
  - b. Moderate **hypoglycemia**: The client displays symptoms of worsening **hypoglycemia**; the blood glucose level is usually lower than 40 mg/dL.
  - c. Severe **hypoglycemia**: The client displays severe neuroglycopenic symptoms; the blood glucose level is usually lower than 20 mg/dL.

#### Box 54-18 Assessment of Hypoglycemia

##### Mild

Hunger  
 Nervousness  
 Palpitations  
 Sweating  
 Tachycardia  
 Tremor

##### Moderate

Confusion  
 Double vision  
 Drowsiness  
 Emotional changes  
 Headache  
 Impaired coordination  
 Inability to concentrate  
 Irrational or combative behavior  
 Light-headedness  
 Numbness of the lips and tongue  
 Slurred speech

##### Severe

Difficulty arousing  
 Disoriented behavior  
 Loss of consciousness  
 Seizures

3. Interventions: Mild **hypoglycemia**

- Give 10 to 15 g of a fast-acting simple carbohydrate (Box 54-19).
- Retest the blood glucose level in 15 minutes and repeat the treatment if symptoms do not resolve.
- Once symptoms resolve, a snack containing protein and carbohydrates, such as low-fat milk or cheese and crackers, is recommended unless the client plans to eat a regular meal within 60 minutes.

4. Interventions: Moderate **hypoglycemia**

- Administer 15 to 30 g of a fast-acting simple carbohydrate.
- Administer additional food such as low-fat milk or cheese and crackers after 10 to 15 minutes.

5. Interventions: Severe **hypoglycemia**

- If the client is unconscious and cannot swallow, an injection of glucagon is administered subcutaneously or intramuscularly.
- Administer a second dose in 10 minutes if the client remains unconscious.
- A small meal is given to the client when the client awakens as long as the client is not nauseated.
- The physician is notified if a severe hypoglycemic reaction occurs.
- Family members need to be instructed about the administration of glucagon.

**!** Do not attempt to administer oral food or fluids to the client experiencing a severe hypoglycemic reaction who is semiconscious or unconscious and is unable to swallow. This client is at risk for aspiration. For this client, an injection of glucagon is administered subcutaneously or intramuscularly. In the hospital or emergency department, the client may be treated with an IV injection of 25 to 50 mL of 50% dextrose in water.

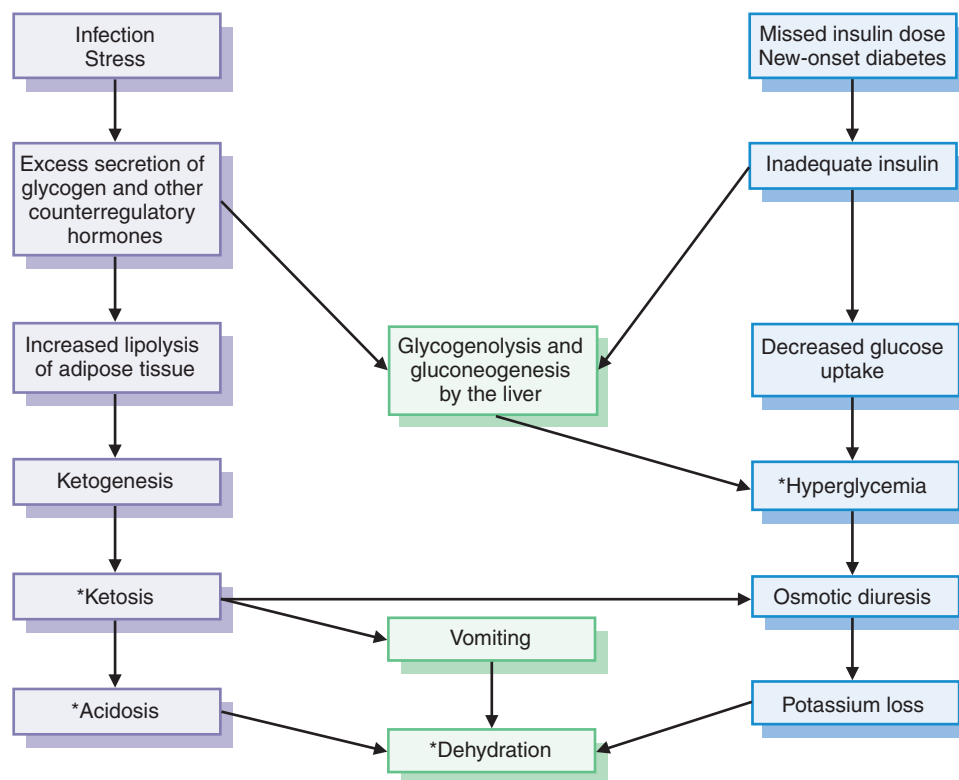

### Box 54-19 Simple Carbohydrates to Treat Hypoglycemia

Commercially prepared glucose tablets  
 6 to 10 Life Savers or hard candy  
 4 tsp of sugar  
 4 sugar cubes  
 1 Tbsp of honey or syrup  
 ½ cup of fruit juice or regular (nondiet) soft drink  
 8 oz low-fat milk  
 6 saltine crackers  
 3 graham crackers

### B. Diabetic ketoacidosis (DKA)

## 1. Description (Fig. 54-6)

- Diabetic ketoacidosis** is a life-threatening complication of type 1 **diabetes mellitus** that develops when a severe insulin deficiency occurs.

\*Hallmarks of DKA

**▲ FIGURE 54-6** Pathophysiology of diabetic ketoacidosis (DKA). (From Black, J., & Hawks, J., [2009]. *Medical-surgical nursing: Clinical management for positive outcomes* [8th ed.]. St. Louis: Saunders.)

**TABLE 54-2** Differences Between Diabetic Ketoacidosis and Hyperglycemic-Hyperosmolar Nonketotic Syndrome

|                            | <b>Diabetic Ketoacidosis (DKA)</b>   | <b>Hyperglycemic-Hyperosmolar Nonketotic Syndrome (HHNS)</b>     |
|----------------------------|--|--|
| Onset                      | Sudden   | Gradual  |
| Precipitating factors      | Infection  | Infection  |
|                            | Other stressors  | Other stressors  |
|                            | Inadequate insulin dose  | Poor fluid intake  |
| Manifestations             | Ketosis: Kussmaul's respiration, "fruity" breath, nausea, abdominal pain   | Altered central nervous system function with neurologic symptoms |
|                            | Dehydration or electrolyte loss: Polyuria, polydipsia, weight loss, dry skin, sunken eyes, soft eyeballs, lethargy, coma | Dehydration or electrolyte loss: Same as for DKA                 |
| <b>Laboratory Findings</b> |  |  |
| Serum glucose              | >300 mg/dL (16.7 mmol/L)   | >800 mg/dL (44.5 mmol/L)   |
| Osmolarity                 | Variable   | >350 mOsm/L  |
| Serum ketones              | Positive at 1:2 dilution   | Negative   |
| Serum pH                   | <7.35  | >7.4   |
| Serum HCO <sub>3</sub>     | <15 mEq/L  | >20 mEq/L  |
| Serum Na                   | Low, normal, or high   | Normal or low  |
| Serum K                    | Normal; elevated with acidosis, low following dehydration  | Normal or low  |
| BUN                        | >20 mg/dL; elevated because of dehydration   | Elevated   |
| Creatinine                 | >1.5 mg/dL; elevated because of dehydration  | Elevated   |
| Urine ketones              | Positive   | Negative   |

BUN, Blood urea nitrogen; HCO<sub>3</sub>, bicarbonate.

From Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (5th ed., p. 1510). St. Louis: Saunders.

- b. The main clinical manifestations include **hyperglycemia**, dehydration, ketosis, and acidosis.
2. Assessment (Table 54-2)
3. Interventions
  - a. Restore circulating blood volume and protect against cerebral, coronary, and renal hypoperfusion.
  - b. Treat dehydration with rapid IV infusions of 0.9% or 0.45% normal saline (NS) as prescribed; dextrose is added to IV fluids (D<sub>5</sub>NS, or 5% dextrose in 0.45% saline) when the blood glucose level reaches 250 to 300 mg/dL.
  - c. Treat **hyperglycemia** with regular insulin administered intravenously as prescribed.
  - d. Correct electrolyte imbalances (potassium level may be elevated as a result of dehydration and acidosis).
  - e. Monitor potassium level closely because when the client receives treatment for the dehydration and acidosis, the serum potassium level will decrease and potassium replacement may be required.
4. Insulin IV administration
  - a. Use regular insulin only.
  - b. An IV bolus dose of regular insulin (usually 5 to 10 units) may be prescribed before a continuous infusion is begun.
  - c. Mix the prescribed IV dose of regular insulin for continuous infusion in 0.9% or 0.45% NS as prescribed.
  - d. Flush the insulin solution through the entire intravenous infusion set and discard the first 50 to 100 mL of solution before connecting and administering it to the client (insulin molecules adhere to the plastic of IV infusion sets)
  - e. Always place the insulin infusion on an IV infusion controller.
  - f. Insulin is infused continuously until subcutaneous administration resumes to prevent a rebound of the blood glucose level.
  - g. Monitor vital signs.
  - h. Monitor urinary output and for signs of fluid overload.
  - i. Monitor potassium and glucose levels and for signs of increased intracranial pressure.
  - j. The potassium level will fall rapidly within the first hour of treatment as the dehydration and the acidosis are treated.
  - k. Potassium is administered intravenously in a diluted solution as prescribed when the potassium reaches a normal level to prevent hypokalemia; ensure adequate renal function before administering potassium.

### Box 54-20 Client Education: Guidelines During Illness

Take insulin or oral antidiabetic medications as prescribed. Test blood glucose level and test the urine for ketones every 3 to 4 hours.

If the usual meal plan cannot be followed, substitute soft foods six to eight times a day.

If vomiting, diarrhea, or fever occurs, consume liquids every 30 to 60 minutes to prevent dehydration and to provide calories.

Notify the physician if vomiting, diarrhea, or fever persists, if blood glucose levels are higher than 250 to 300 mg/dL, when ketonuria is present for more than 24 hours, when unable to take food or fluids for a period of 4 hours, or when illness persists for more than 2 days.

#### 5. Client education (Box 54-20)

 **Monitor the client being treated for DKA closely for signs of increased intracranial pressure. If the blood glucose level falls too far or too fast before the brain has time to equilibrate, water is pulled from the blood to the cerebrospinal fluid and the brain, causing cerebral edema and increased intracranial pressure.**

### C. Hyperglycemic hyperosmolar nonketotic syndrome (HHNS)

#### 1. Description

- Extreme **hyperglycemia** occurs without ketosis or acidosis.
- The syndrome occurs most often in individuals with type 2 **diabetes mellitus**.
- The major difference between HHNS and DKA is that ketosis and acidosis do not occur with HHNS; enough insulin is present with HHNS to prevent breakdown of fats for energy, thus preventing ketosis.

#### 2. Assessment (see Table 54-2)

#### 3. Interventions

- Treatment is similar to that for DKA.
- Treatment includes fluid replacement, correction of electrolyte imbalances, and insulin administration.
- Fluid replacement in the older client must be done very carefully because of the potential for heart failure.
- Insulin plays a less critical role in the treatment of HHNS than it does for the treatment of DKA because ketosis and acidosis do not occur; rehydration alone may decrease glucose levels.

### IX. CHRONIC COMPLICATIONS OF DIABETES MELLITUS

#### A. Diabetic retinopathy

##### 1. Description

- Chronic and progressive impairment of the retinal circulation that eventually causes hemorrhage

- Permanent vision changes and blindness can occur.
- The client has difficulty with carrying out the daily tasks of blood glucose testing and insulin injections.

##### 2. Assessment

- A change in vision is caused by the rupture of small microaneurysms in retinal blood vessels.
- Blurred vision results from macular edema.
- Sudden loss of vision results from retinal detachment.
- Cataracts result from lens opacity.

##### 3. Interventions

- Maintain safety.
- Early prevention via the control of hypertension and blood glucose levels 
- Photocoagulation (laser therapy) may be done to remove hemorrhagic tissue to decrease scarring and prevent progression of the disease process.
- Vitrectomy may be done to remove vitreous hemorrhages and thus decrease tension on the retina, preventing detachment.
- Cataract removal with lens implantation improves vision.

#### B. Diabetic nephropathy

##### 1. Description: Progressive decrease in kidney function

##### 2. Assessment

- Microalbuminuria
- Thirst
- Fatigue
- Anemia
- Weight loss
- Signs of malnutrition
- Frequent urinary tract infections
- Signs of a neurogenic bladder

##### 3. Interventions

- Early prevention measures include the control of hypertension and blood glucose levels. 
- Assess vital signs.
- Monitor intake and output.
- Monitor the blood urea nitrogen and creatinine and urine albumin levels.
- Restrict dietary protein, sodium, and potassium intake as prescribed.
- Avoid nephrotoxic medications.
- Prepare the client for dialysis procedures if planned.
- Prepare the client for kidney transplant if planned.
- Prepare the client for pancreas transplant if planned.

#### C. Diabetic neuropathy

##### 1. Description

- General deterioration of the nervous system throughout the body

- b. Complications include the development of nonhealing ulcers of the feet, gastric paresis, and erectile dysfunction.
2. Classifications
    - a. Focal neuropathy or mononeuropathy: Involves a single nerve or group of nerves, most frequently cranial nerves III (oculomotor) and VI (abducens), resulting in diplopia
    - b. Sensory or peripheral neuropathy: Affects distal portion of nerves, most frequently in the lower extremities
    - c. Autonomic neuropathy: Symptoms vary according to organ system involved
    - d. Cardiovascular: Cardiac denervation syndrome (heart rate does not respond to changes in oxygenation needs) and orthostatic hypotension occur.
    - e. Pupillary: Pupil does not dilate in response to decreased light.
    - f. Gastric: Decreased gastric emptying (gastroparesis)
    - g. Urinary: Neurogenic bladder
    - h. Sudomotor: Decreased sweating
    - i. Adrenal: Hypoglycemic unawareness
    - j. Reproductive: Impotence (male), painful intercourse (female)
  3. Assessment: findings depend on the classification
    - a. Paresthesias
    - b. Decreased or absent reflexes
    - c. Decreased sensation to vibration or light touch
    - d. Pain, aching, and burning in the lower extremities
    - e. Poor peripheral pulses
    - f. Skin breakdown and signs of infection
    - g. Weakness or loss of sensation in cranial nerves III (oculomotor), IV (trochlear), V (trigeminal), VI (abducens)
    - h. Dizziness and postural hypotension
    - i. Nausea and vomiting
    - j. Diarrhea or constipation
    - k. Incontinence
    - l. Dyspareunia
    - m. Impotence
    - n. Hypoglycemic unawareness
  4. Interventions
    - a. Early prevention measures include the control of hypertension and blood glucose levels.
    - b. Careful foot care is required to prevent trauma (Box 54-21).
    - c. Administer medications as prescribed for pain relief.
    - d. Initiate bladder training programs.
    - e. Instruct in the use of estrogen-containing lubricants for women with dyspareunia.
    - f. Prepare the male client with impotence for penile injections for possible treatment options as prescribed.

### Box 54-21 Preventive Foot Care Instructions

Provide meticulous skin care and proper foot care.

Inspect feet daily and monitor feet for redness, swelling, or break in skin integrity.

Notify the physician if redness or a break in the skin occurs. Avoid thermal injuries from hot water, heating pads, and baths.

Wash feet with warm (not hot) water and dry thoroughly (avoid foot soaks).

Avoid treating corns, blisters, or ingrown toenails.

Do not cross legs or wear tight garments that may constrict blood flow.

Apply moisturizing lotion to the feet but not between the toes. Prevent moisture from accumulating between the toes.

Wear loose socks and well-fitting (not tight) shoes, and instruct the client not to go barefoot.

Wear clean cotton socks to keep the feet warm and change the socks daily.

Avoid wearing the same pair of shoes 2 days in a row.

Avoid wearing open-toed shoes or shoes with a strap that goes between the toes.

Check shoes for cracks or tears in the lining and for foreign objects before putting them on.

Break in new shoes gradually.

Cut toenails straight across and smooth nails with an emery board.

Avoid smoking.

- g. Prepare for surgical decompression of compression lesions related to the cranial nerves as prescribed.

### X. CARE OF THE DIABETIC CLIENT UNDERGOING SURGERY

#### A. Preoperative care

1. Check with physician regarding withholding oral hypoglycemic medications or insulin.
2. Some long-acting oral antidiabetic medications are discontinued 24 to 48 hours before surgery.
3. Metformin (Glucophage) may need to be discontinued 48 hours before surgery and may not be restarted until renal function is normal postoperatively.
4. All other oral antidiabetic medications are usually withheld the day of surgery.
5. Insulin dose may be adjusted or withheld if IV insulin administration during surgery is planned.
6. Monitor blood glucose level.
7. Administer IV fluids as prescribed.

#### B. Intraoperative care

1. Monitor blood glucose levels frequently.
2. Administer IV short- or rapid-acting insulin as prescribed to maintain the blood glucose level lower than 200 mg/dL.

#### C. Postoperative care

1. Administer IV glucose and regular insulin infusions as prescribed until the client can tolerate oral feedings.

2. Administer supplemental short-acting insulin as prescribed based on blood glucose results.
3. Monitor blood glucose levels frequently if the client is receiving parenteral nutrition.
4. When the client is tolerating food, ensure that the client receives an adequate amount of carbohydrates daily to prevent **hypoglycemia**.
5. Client is at higher risk for cardiovascular and renal complications postoperatively.
6. Client is also at risk for impaired wound healing.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 571.** A client is brought to the emergency department in an unresponsive state, and a diagnosis of hyperglycemic hyperosmolar nonketotic syndrome is made. The nurse would immediately prepare to initiate which of the following anticipated physician's prescriptions?
1. Endotracheal intubation
  2. 100 units of NPH insulin
  3. Intravenous infusion of normal saline
  4. Intravenous infusion of sodium bicarbonate
- 572.** An external insulin pump is prescribed for a client with diabetes mellitus and the client asks the nurse about the functioning of the pump. The nurse bases the response on the information that the pump:
1. Is timed to release programmed doses of regular or NPH insulin into the bloodstream at specific intervals
  2. Continuously infuses small amounts of NPH insulin into the bloodstream while regularly monitoring blood glucose levels
  3. Is surgically attached to the pancreas and infuses regular insulin into the pancreas, which in turn releases the insulin into the bloodstream
  4. Gives a small continuous dose of regular insulin subcutaneously, and the client can self-administer a bolus with an additional dose from the pump before each meal
- 573.** A client with a diagnosis of diabetic ketoacidosis (DKA) is being treated in an emergency department. Which finding would a nurse expect to note as confirming this diagnosis?
1. Comatose state
  2. Decreased urine output
  3. Increased respirations and an increase in pH
  4. Elevated blood glucose level and low plasma bicarbonate level
- 574.** A nurse teaches a client with diabetes mellitus about differentiating between hypoglycemia and ketoacidosis. The client demonstrates an understanding of the teaching by stating that a form of glucose should be taken if which of the following symptoms develops?
1. Polyuria
  2. Shakiness
  3. Blurred vision
  4. Fruity breath odor
- 575.** A client with diabetes mellitus demonstrates acute anxiety when first admitted for the treatment of hyperglycemia. The appropriate intervention to decrease the client's anxiety is to:
1. Administer a sedative.
  2. Convey empathy, trust, and respect toward the client.
  3. Ignore the signs and symptoms of anxiety so that they will soon disappear.
  4. Make sure that the client knows all the correct medical terms to understand what is happening.
- 576.** A nurse provides instructions to a client newly diagnosed with type 1 diabetes mellitus. The nurse recognizes accurate understanding of measures to prevent diabetic ketoacidosis when the client states:
1. "I will stop taking my insulin if I'm too sick to eat."
  2. "I will decrease my insulin dose during times of illness."
  3. "I will adjust my insulin dose according to the level of glucose in my urine."
  4. "I will notify my physician if my blood glucose level is higher than 250 mg/dL."
- 577.** A client is admitted to a hospital with a diagnosis of diabetic ketoacidosis (DKA). The initial blood glucose level was 950 mg/dL. A continuous intravenous infusion of regular insulin is initiated, along with intravenous rehydration with normal saline. The serum glucose level is now 240 mg/dL. The nurse would next prepare to administer which of the following?
1. Ampule of 50% dextrose
  2. NPH insulin subcutaneously
  3. Intravenous fluids containing 5% dextrose
  4. Phenytoin (Dilantin) for the prevention of seizures
- 578.** A nurse is monitoring a client newly diagnosed with diabetes mellitus for signs of complications. Which of the following, if exhibited in the client, would indicate hyperglycemia and warrant physician notification?
1. Polyuria
  2. Diaphoresis
  3. Hypertension
  4. Increased pulse rate

- 579.** A nurse is preparing a plan of care for a client with diabetes mellitus who has hyperglycemia. The priority nursing diagnosis would be:
1. Deficient knowledge
  2. Deficient fluid volume
  3. Compromised family coping
  4. Imbalanced nutrition, less than body requirements
- 580.** A home health nurse visits a client with a diagnosis of type 1 diabetes mellitus. The client relates a history of vomiting and diarrhea and tells the nurse that no food has been consumed for the last 24 hours. Which additional statement by the client indicates a need for further teaching?
1. "I need to stop my insulin."
  2. "I need to increase my fluid intake."
  3. "I need to monitor my blood glucose every 3 to 4 hours."
  4. "I need to call the physician because of these symptoms."
- 581.** A nurse is caring for a client after hypophysectomy. The nurse notices clear nasal drainage from the client's nostril. The initial nursing action would be to:
1. Lower the head of the bed.
  2. Test the drainage for glucose.
  3. Obtain a culture of the drainage.
  4. Continue to observe the drainage.
- 582.** After several diagnostic tests, a client is diagnosed with diabetes insipidus. A nurse performs an assessment on the client, knowing that which symptom is most indicative of this disorder?
1. Fatigue
  2. Diarrhea
  3. Polydipsia
  4. Weight gain
- 583.** A client is admitted to an emergency department, and a diagnosis of myxedema coma is made. Which action would the nurse prepare to carry out initially?
1. Warm the client.
  2. Maintain a patent airway.
  3. Administer thyroid hormone.
  4. Administer fluid replacement.
- 584.** A nurse is caring for a client admitted to the emergency department with diabetic ketoacidosis (DKA). In the acute phase, the priority nursing action is to prepare to:
1. Correct the acidosis.
  2. Administer 5% dextrose intravenously.
  3. Administer regular insulin intravenously.
  4. Apply a monitor for an electrocardiogram.
- 585.** A client with type 1 diabetes mellitus calls the nurse to report recurrent episodes of hypoglycemia with exercising. Which statement by the client indicates an inadequate understanding of the peak action of NPH insulin and exercise?
1. "The best time for me to exercise is after I eat."
  2. "The best time for me to exercise is after breakfast."
  3. "The best time for me to exercise is mid- to late afternoon."
  4. "The best time for me to exercise is after my morning snack."
- 586.** A nurse is completing an assessment on a client who is being admitted for a diagnostic workup for primary hyperparathyroidism. Which client complaint would be characteristic of this disorder?
1. Diarrhea
  2. Polyuria
  3. Polyphagia
  4. Weight gain
- 587.** A nurse is caring for a postoperative parathyroidectomy client. Which client complaint would indicate that a serious, life-threatening complication may be developing, requiring immediate notification of the physician?
1. Laryngeal stridor
  2. Abdominal cramps
  3. Difficulty in voiding
  4. Mild to moderate incisional pain
- 588.** A client is diagnosed with pheochromocytoma. A nurse prepares a plan of care for the client; while planning, the nurse understands that pheochromocytoma is a condition that:
1. Causes profound hypotension
  2. Is manifested by severe hypoglycemia
  3. Is not curable and is treated symptomatically
  4. Causes the release of excessive amounts of catecholamines
- 589.** A nurse is caring for a client with pheochromocytoma who is scheduled for adrenalectomy. In the preoperative period, the priority nursing action would be to monitor:
1. Vital signs
  2. Intake and output
  3. Blood urea nitrogen results
  4. Urine for glucose and ketones
- 590.** A nurse is performing an assessment on a client with pheochromocytoma. Which of the following assessment data would indicate a potential complication associated with this disorder?
1. A coagulation time of 5 minutes

2. A urinary output of 50 mL per hour
  3. A blood urea nitrogen level of 20 mg/dL
  4. A heart rate that is 90 beats/min and irregular
- 591.** A nursing instructor asks a student to describe the pathophysiology that occurs in Cushing's disease. Which statement by the student indicates an accurate understanding of this disorder?
1. "Cushing's disease results from an oversecretion of insulin."
  2. "Cushing's disease results from an undersecretion of corticotropic hormones."
  3. "Cushing's disease results from an undersecretion of mineralocorticoid hormones."
  4. "Cushing's disease results from an increased pituitary secretion of adrenocorticotropic hormone."
- 592.** A nurse performs a physical assessment on a client with type 2 diabetes mellitus. Findings include a fasting blood glucose of 120 mg/dL, temperature of 101° F, pulse of 88 beats/min, respirations of 22 breaths/min, and blood pressure of 100/72 mm Hg. Which finding would be of most concern to the nurse?
1. Pulse
  2. Respiration
  3. Temperature
  4. Blood pressure
- 593.** A nurse is interviewing a client with type 2 diabetes mellitus. Which statement by the client indicates an understanding of the treatment for this disorder?
1. "I take oral insulin instead of shots."
  2. "By taking these medications, I am able to eat more."
  3. "When I become ill, I need to increase the number of pills I take."
  4. "The medications I'm taking help release the insulin I already make."
- 594.** A nurse is providing discharge instructions to a client who has Cushing's syndrome. Which client statement indicates that instructions related to dietary management are understood?
1. "I can eat foods that have a lot of potassium in them."
  2. "I will need to limit the amount of protein in my diet."
  3. "I am fortunate that I can eat all the salty foods I enjoy."
  4. "I am fortunate that I do not need to follow any special diet."
- 595.** The nurse is caring for a client who is 2 days postoperative following an abdominal hysterectomy. The client has a history of diabetes mellitus and has been receiving regular insulin according to capillary blood glucose testing four times a day. A carbohydrate-controlled diet has been prescribed but the client has been complaining of nausea and is not eating. On entering the client's room, the nurse finds the client to be confused and diaphoretic. Which action is appropriate at this time?
1. Call a code to obtain needed assistance immediately.
  2. Obtain a capillary blood glucose level and perform a focused assessment.
  3. Stay with the client and ask the nursing assistant to call the physician for a prescription for intravenous 50% dextrose.
  4. Ask the nursing assistant to stay with the client while obtaining 15 to 30 g of a carbohydrate snack for the client to eat.

### Alternate Item Format: Multiple Response

- 596.** A nurse is monitoring a client who was diagnosed with type 1 diabetes mellitus and is being treated with NPH and regular insulin. Which client complaint(s) would alert the nurse to the presence of a possible hypoglycemic reaction? **Select all that apply.**

- 1. Tremors
- 2. Anorexia
- 3. Irritability
- 4. Nervousness
- 5. Hot, dry skin
- 6. Muscle cramps

## ANSWERS

### 571. 3

**Rationale:** The primary goal of treatment in hyperglycemic hyperosmolar nonketotic syndrome (HHNS) is to rehydrate the client to restore fluid volume and to correct electrolyte deficiency. Intravenous fluid replacement is similar to that administered in diabetic ketoacidosis (DKA) and begins with IV infusion of normal saline. Regular insulin, not NPH

insulin, would be administered. The use of sodium bicarbonate to correct acidosis is avoided because it can precipitate a further drop in serum potassium levels. Intubation and mechanical ventilation are not required to treat HHNS.

**Test-Taking Strategy:** Use the process of elimination. If you can recall the treatment for DKA, you will be able to answer this question easily. Treatment for HHNS is similar to the treatment for DKA and begins with rehydration. Review the treatment for HHNS if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Endocrine

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1093–1094). St. Louis: Saunders.

#### 572. 4

**Rationale:** An insulin pump provides a small continuous dose of regular insulin subcutaneously throughout the day and night, and the client can self-administer a bolus with an additional dose from the pump before each meal as needed. Regular insulin is used in an insulin pump. An external pump is not attached surgically to the pancreas.

**Test-Taking Strategy:** Use the process of elimination. Recalling that regular insulin is used in an insulin pump will assist in eliminating options 1 and 2. Noting the word *external* in the question will assist in eliminating option 3. Review the use of the insulin pump if you are unfamiliar with it.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Endocrine

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1074–1075). St. Louis: Saunders.

#### 573. 4

**Rationale:** In DKA, the arterial pH is lower than 7.35, plasma bicarbonate is lower than 15 mEq/L, the blood glucose level is higher than 250 mg/dL, and ketones are present in the blood and urine. The client would be experiencing polyuria, and Kussmaul's respirations would be present. A comatose state may occur if DKA is not treated, but coma would not confirm the diagnosis.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *confirming* in the question. Eliminate option 1 because a comatose state can exist in many conditions. Eliminate option 3 because in acidosis the pH would be low. Remember that polyuria exists in DKA. Review the clinical manifestations of DKA if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Endocrine

**References:** Copstead-Kirkhorn, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 949). St. Louis: Mosby.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1510–1511). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., pp. 387–388). St. Louis: Mosby.

#### 574. 2

**Rationale:** Shakiness is a sign of hypoglycemia and would indicate the need for food or glucose. A fruity breath odor, blurred vision, and polyuria are signs of hyperglycemia.

**Test-Taking Strategy:** Focus on the subject of the question, the treatment of hypoglycemia, and think about its

pathophysiology and the manifestations that occur. Recalling the signs of hypoglycemia will direct you to option 2. Review these signs if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Endocrine

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1507–1508, 1510). St. Louis: Saunders.

#### 575. 2

**Rationale:** The appropriate intervention is to address the client's feelings related to the anxiety. Administering a sedative is not the most appropriate intervention. The nurse should not ignore the client's anxious feelings. A client will not relate to medical terms, particularly when anxiety exists.

**Test-Taking Strategy:** Use therapeutic communication techniques to answer the question. Remember that the client's feelings are the priority. Keeping this in mind will direct you easily to option 2. Review therapeutic communication techniques if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Caring

**Content Area:** Adult Health—Endocrine

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1475). St. Louis: Saunders.

#### 576. 4

**Rationale:** During illness, the client should monitor blood glucose levels and should notify the physician if the level is higher than 250 mg/dL. Insulin should never be stopped. In fact, insulin may need to be increased during times of illness. Doses should not be adjusted without the physician's advice and are usually adjusted based on blood glucose levels, not urinary glucose readings.

**Test-Taking Strategy:** Use the process of elimination. Note that options 1, 2, and 3 are comparable or alike and all relate to adjustment of insulin doses. Review diabetic management during illness if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Endocrine

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1512). St. Louis: Saunders.

#### 577. 3

**Rationale:** During management of DKA, when the blood glucose level falls to 250 to 300 mg/dL, the infusion rate is reduced and a 5% dextrose in 0.45% saline is added to maintain a blood glucose level of about 250 mg/dL, or until the client recovers from ketosis. NPH insulin is not used to treat DKA. Fifty percent dextrose is used to treat hypoglycemia. Phenytoin (Dilantin) is not a usual treatment measure for DKA.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 2 first, knowing that regular insulin is used in

the management of DKA. Eliminate option 1 next, knowing that this is the treatment for hypoglycemia. Note the strategic words *the serum glucose level is now 240 mg/dL*. This should indicate that the IV solution containing 5% dextrose is the next step in the management of care. Review care of the client with DKA if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Endocrine

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1093–1094). St. Louis: Saunders.

### 578. 1

**Rationale:** Classic symptoms of hyperglycemia include polydipsia, polyuria, and polyphagia. Options 2, 3, and 4 are not signs of hyperglycemia.

**Test-Taking Strategy:** Use the process of elimination. Remember the three P's associated with hyperglycemia—polyuria, polydipsia, polyphagia. Learn the signs of hyperglycemia if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Endocrine

**Reference:** Copstead-Kirkhorn, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 952). St. Louis: Mosby.

### 579. 2

**Rationale:** An increased blood glucose level will cause the kidneys to excrete the glucose in the urine. This glucose is accompanied by fluids and electrolytes, causing an osmotic diuresis leading to dehydration. This fluid loss must be replaced when it becomes severe. Options 1, 3, and 4 are not related specifically to the subject of the question.

**Test-Taking Strategy:** Use Maslow's Hierarchy of Needs theory to answer this question. Option 2 indicates a physiological need and is the priority. Options 1, 3, and 4 are nursing diagnoses that may need to be addressed after providing for the high-priority physiological needs. Review the priority concerns for the client with hyperglycemia if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—planning

**Content Area:** Adult Health—Endocrine

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1475). St. Louis: Saunders.

### 580. 1

**Rationale:** When a client with diabetes mellitus is unable to eat normally because of illness, the client still should take the prescribed insulin or oral medication. The client should consume additional fluids and should notify the physician. The client should monitor the blood glucose level every 3 to 4 hours. The client should also monitor the urine for ketones.

**Test-Taking Strategy:** Note the strategic words *need for further teaching*. These words indicate a negative event query and the need to select the incorrect statement. Remembering that the client needs to take insulin will direct you easily to option 1.

Review the sick rule guidelines for the client with diabetes mellitus if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Endocrine

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1512). St. Louis: Saunders.

### 581. 2

**Rationale:** After hypophysectomy, the client should be monitored for rhinorrhea, which could indicate a cerebrospinal fluid leak. If this occurs, the drainage should be collected and tested for the presence of cerebrospinal fluid. The head of the bed should not be lowered to prevent increased intracranial pressure. Clear nasal drainage would not indicate the need for a culture. Continuing to observe the drainage without taking action could result in a serious complication.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *initial*. This indicates that an action is required. Option 1 can be eliminated first recalling that this action can increase intracranial pressure. Option 3 can be eliminated also because the drainage is clear. Because an action is required, eliminate option 4. Review the complications following hypophysectomy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Endocrine

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1431). St. Louis: Saunders.

### 582. 3

**Rationale:** Diabetes insipidus is characterized by a hyposecretion of the antidiuretic hormone and the kidney tubules fail to reabsorb water. Polydipsia and polyuria are classic symptoms of diabetes insipidus. The urine is pale, and the specific gravity is low. Anorexia and weight loss occur. Option 1 is a vague symptom. Options 2 and 4 are not specific to this disorder.

**Test-Taking Strategy:** Note the strategic words *most indicative*. Eliminate option 1 first because this symptom is rather vague and occurs in many conditions. Knowledge of the pathophysiology and manifestations of diabetes insipidus will assist you in eliminating options 2 and 4. If you had difficulty with this question, review the clinical manifestations associated with diabetes insipidus.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Endocrine

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 373). St. Louis: Mosby.

### 583. 2

**Rationale:** The initial nursing action would be to maintain a patent airway. Oxygen would be administered, followed by

fluid replacement, keeping the client warm, monitoring vital signs, and administering thyroid hormones by the intravenous route.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *initially*. All the options are appropriate interventions, but use the ABCs—airway, breathing, and circulation—in selecting the correct option. Review the initial interventions for myxedema coma if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Endocrine

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1022). St. Louis: Saunders.

### 584. 3

**Rationale:** Lack (absolute or relative) of insulin is the primary cause of DKA. Treatment consists of insulin administration (regular insulin), intravenous fluid administration (normal saline initially), and potassium replacement, followed by correcting acidosis. Applying an electrocardiogram monitor is not a priority action.

**Test-Taking Strategy:** Use the process of elimination and focus on the client's diagnosis. Note the strategic word *priority*. Remember that in DKA, the initial treatment is regular insulin. Normal saline is administered initially; therefore, option 2 is incorrect. Options 1 and 4 may be components of the treatment plan but are not the priority. Review the initial treatment for DKA if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Endocrine

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1092). St. Louis: Saunders.

### 585. 3

**Rationale:** A hypoglycemic reaction may occur in response to increased exercise. Clients should avoid exercise during the peak time of insulin. NPH insulin peaks at 4 to 12 hours; therefore, afternoon exercise takes place during the peak of the medication. Options 1, 2, and 4 do not address peak action times.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *inadequate understanding*. Focus on the subject, peak action of NPH. Recalling that NPH peaks at 4 to 12 hours will direct you to option 3. Review the peak action time of NPH insulin if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Endocrine

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1079). St. Louis: Saunders.

Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 795). St. Louis: Saunders.

### 586. 2

**Rationale:** Hypercalcemia is the hallmark of hyperparathyroidism. Elevated serum calcium levels produce osmotic diuresis and thus polyuria. This diuresis leads to dehydration (weight loss rather than weight gain). Options 1, 3, and 4 are gastrointestinal symptoms and are not associated with the common gastrointestinal symptoms typical of hyperparathyroidism (nausea, vomiting, anorexia, constipation).

**Test-Taking Strategy:** Use the process of elimination and think about the pathophysiology associated with hyperparathyroidism. Note that options 1, 3, and 4 are gastrointestinal symptoms and are comparable or alike. Review the clinical manifestations of hyperparathyroidism if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Endocrine

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1033–1034). St. Louis: Saunders.

Copstead-Kirkhorn, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 937). St. Louis: Mosby.

### 587. 1

**Rationale:** During the postoperative period, the nurse carefully observes the client for signs of hemorrhage, which causes swelling and compression of adjacent tissue. Laryngeal stridor is a harsh, high-pitched sound heard on inspiration and expiration; stridor is caused by compression of the trachea, leading to respiratory distress. Stridor is an acute emergency situation that requires immediate attention to avoid complete obstruction of the airway. Options 2, 3, and 4 do not identify signs of a life-threatening complication.

**Test-Taking Strategy:** Consider the anatomical location of the surgical procedure and use the ABCs—airway, breathing, and circulation—to select the correct option. Options 2, 3, and 4 are usual postoperative findings that are not life-threatening. Option 1 addresses the airway. Review postoperative care of the parathyroidectomy client if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Endocrine

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1035). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1463). St. Louis: Saunders.

### 588. 4

**Rationale:** Pheochromocytoma is a catecholamine-producing tumor and causes secretion of excessive amounts of epinephrine and norepinephrine. Hypertension is the principal manifestation, and the client has episodes of high blood pressure accompanied by pounding headaches. The excessive release of catecholamine

also results in excessive conversion of glycogen into glucose in the liver. Consequently, hyperglycemia and glucosuria occur during attacks. Pheochromocytoma is curable. The primary treatment is surgical removal of one or both of the adrenal glands, depending on whether the tumor is unilateral or bilateral.

**Test-Taking Strategy:** Use the process of elimination and knowledge of the manifestations of pheochromocytoma to answer this question. Remember that pheochromocytoma is a catecholamine-producing tumor. If you are unfamiliar with this disorder, review this content.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Endocrine

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1051). St. Louis: Saunders.

### 589. 1

**Rationale:** Pheochromocytoma is a catecholamine-producing tumor. Hypertension is the hallmark of pheochromocytoma. Severe hypertension can precipitate a stroke or sudden blindness. Although all the options are accurate nursing interventions for the client with pheochromocytoma, the priority nursing action is to monitor the vital signs, particularly the blood pressure.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *priority nursing action*. Use the ABCs—airway, breathing, and circulation. Monitoring vital signs is the nursing action that would assess airway, breathing, and circulation. Also, options 2, 3, and 4 refer to the assessment of the renal system, whereas option 1 does not. Review preoperative care of the client with pheochromocytoma if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Endocrine

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1053). St. Louis: Saunders.

### 590. 4

**Rationale:** The complications associated with pheochromocytoma include hypertensive retinopathy and nephropathy, myocarditis, increased platelet aggregation, and stroke. Death can occur from shock, stroke, renal failure, dysrhythmias, or dissecting aortic aneurysm. An irregular heart rate indicates the presence of a dysrhythmia. A urinary output of 50 mL/hr is an adequate output. A blood urea nitrogen level of 20 mg/dL is a normal finding. A coagulation time of 5 minutes is normal.

**Test-Taking Strategy:** Use the process of elimination and the ABCs—airway, breathing, and circulation. An irregular heart rate is associated with circulation. In addition, if you knew the normal hourly expectations associated with urinary output and the normal laboratory values for coagulation time and blood urea nitrogen level, you would be easily directed to option 4. Review the complications associated with pheochromocytoma if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Adult Health—Endocrine

**Reference:** Copstead-Kirkhorn, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 936). St. Louis: Mosby.

### 591. 4

**Rationale:** Cushing's disease is a metabolic disorder characterized by abnormally increased secretion (endogenous) of cortisol, caused by increased amounts of adrenocorticotropic hormone (ACTH) secreted by the pituitary gland. Addison's disease is characterized by the hyposecretion of adrenal cortex hormones (glucocorticoids and mineralocorticoids) from the adrenal gland, resulting in deficiency of the corticosteroid hormones. Options 1, 2, and 3 are inaccurate regarding Cushing's disease.

**Test-Taking Strategy:** Use the process of elimination. Options 2 and 3 can be eliminated easily if you remember that in Cushing's (*up*) disease there is an oversecretion and in Addison's disease there is an undersecretion. Next, eliminate option 1 because this disease is unrelated to insulin. Review the pathophysiology associated with Cushing's disease if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Endocrine

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1049). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1440). St. Louis: Saunders.

### 592. 3

**Rationale:** An elevated temperature may indicate infection. Infection is a leading cause of hyperglycemic hyperosmolar nonketotic syndrome or diabetic ketoacidosis. The other findings noted in the question are within normal limits.

**Test-Taking Strategy:** Use the process of elimination and knowledge of the normal values of vital signs to direct you to option 3. The client's temperature is the only abnormal value. Remember that an elevated temperature can indicate an infectious process that can lead to complications in the client with diabetes mellitus. Review normal and abnormal findings in the client with diabetes mellitus if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Endocrine

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1475). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 397). St. Louis: Mosby.

### 593. 4

**Rationale:** Clients with type 2 diabetes mellitus have decreased or impaired insulin secretion. Oral hypoglycemic

agents are given to these clients to facilitate glucose uptake. Insulin injections may be given during times of stress-induced hyperglycemia. Oral insulin is not available because of the breakdown of the insulin by digestion. Options 1, 2, and 3 are incorrect.

**Test-Taking Strategy:** Use the process of elimination, focusing on the subject, type 2 diabetes mellitus. Eliminate option 1 because *oral insulin* is not available. Treatment with medication does not mean that the client can eat more; therefore, eliminate option 2. Recalling that during times of illness insulin may be required will eliminate option 3. Review treatment measures for type 2 diabetes mellitus if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Endocrine

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1069). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1472). St. Louis: Saunders.

#### 594. 1

**Rationale:** A diet low in carbohydrates and sodium but ample in protein and potassium is encouraged for a client with Cushing's syndrome. Such a diet promotes weight loss, reduction of edema and hypertension, control of hypokalemia, and rebuilding of wasted tissue.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 4 because it reflects that no dietary change is necessary. Eliminate option 2 next because protein most likely is limited in liver or renal disorders (not in Cushing's syndrome). From the remaining options, eliminate option 3 because excess sodium is not normally healthy. Review dietary management in Cushing's syndrome if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Endocrine

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1444). St. Louis: Saunders.

Nix, S. (2009). *Williams' basic nutrition and diet therapy* (13th ed., p. 388). St. Louis: Mosby.

#### 595. 2

**Rationale:** Diaphoresis and confusion are signs of moderate hypoglycemia. A likely cause of the client's change in

condition could be related to the administration of insulin without the client eating enough food. However, an assessment is necessary to confirm the presence of hypoglycemia. The nurse would obtain a capillary blood glucose level to confirm the hypoglycemia and perform a focused assessment to determine the extent and cause of the client's condition. Once hypoglycemia is confirmed, the nurse stays with the client and asks the nursing assistant to obtain the appropriate carbohydrate snack. A code is called if the client is not breathing or if the heart is not beating.

**Test-Taking Strategy:** Focus on the data in the question and note the strategic words *at this time*. Eliminate option 1 because there are no data in the question indicating the need to call a code. Eliminate option 3 next because it is inappropriate to ask a nursing assistant to call a physician for a prescription. To select from the remaining options, use the steps of the nursing process, recalling that assessment is the first step. Review care of the client experiencing a hypoglycemic reaction if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Endocrine

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 387). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

#### 596. 1, 3, 4

**Rationale:** Decreased blood glucose levels produce autonomic nervous system symptoms, which are manifested classically as nervousness, irritability, and tremors. Option 5 is more likely to occur with hyperglycemia. Options 2 and 6 are unrelated to the signs of hypoglycemia.

**Test-Taking Strategy:** Focus on the subject, a hypoglycemic reaction. Think about the manifestations that occur in this complication. Recalling the signs of this type of reaction will direct you easily to the correct options. Review the signs of hypoglycemia if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Endocrine

# Endocrine Medications

## I. PITUITARY MEDICATIONS

- A. Description**
1. The anterior pituitary gland secretes growth hormone (GH), thyroid-stimulating hormone (TSH), adrenocorticotrophic hormone (ACTH), prolactin, melanocyte-stimulating hormone (MSH), and gonadotropins (follicle-stimulating hormone [FSH] and luteinizing hormone [LH]).
  2. The posterior pituitary gland secretes antidiuretic hormone (vasopressin) and oxytocin.
- B. Growth hormones and related medications (Box 55-1)**
1. Uses
    - a. Growth hormones are used to treat pediatric or adult growth hormone deficiency.
    - b. Growth hormone receptor antagonists are used to treat acromegaly.
    - c. Growth hormone releasing factor is used to evaluate anterior pituitary function.
  2. Side effects
    - a. May vary depending on the medication
    - b. Development of antibodies to growth hormone
    - c. Headache, muscle pain, weakness, vertigo
    - d. Diarrhea, nausea, abdominal discomfort
    - e. Mild **hyperglycemia**
    - f. Hypertension
    - g. Weight gain
    - h. Allergic reaction (rash, swelling), pain at injection site
    - i. Elevated aspartate aminotransferase (AST) and alanine aminotransferase (ALT)
  3. Interventions
    - a. Assess the child's physical growth and compare growth with standards.
    - b. Recommend annual bone age determinations for children receiving growth hormones.
    - c. Monitor vital signs, blood glucose levels, AST and ALT levels, and thyroid function tests.
    - d. Teach the client and family about the clinical manifestations of **hyperglycemia** and about other side effects of therapy and the importance of follow-up regarding periodic blood tests.

## II. ANTIDIURETIC HORMONES (Box 55-2)

- A. Description**
1. Antidiuretic hormones enhance reabsorption of water in the kidneys, promoting an antidiuretic effect and regulating fluid balance.
  2. Antidiuretic hormones are used in **diabetes insipidus**.
- B. Side effects**
1. Flushing
  2. Headache
  3. Nausea and abdominal cramps
  4. Water intoxication
  5. Hypertension with water intoxication
  6. Nasal congestion with nasal administration
- C. Interventions**
1. Monitor weight.
  2. Monitor intake and output and urine osmolality.
  3. Monitor electrolyte levels.
  4. Monitor for signs of dehydration, indicating the need to increase the dosage.
  5. Monitor for signs of water intoxication (drowsiness, listlessness, shortness of breath, and headache), indicating need to decrease dosage.
  6. Monitor blood pressure.
  7. Instruct the client in how to use the intranasal medication.
  8. Instruct the client to weigh themselves daily to identify weight gain.
  9. Instruct the client to report signs of water intoxication or symptoms of headache or shortness of breath.

## III. THYROID HORMONES (Box 55-3)

- A. Description**
1. Thyroid hormones control the metabolic rate of tissues and accelerate heat production and oxygen consumption.
  2. Thyroid hormones are used to replace the thyroid hormone deficit in conditions such as **hypothyroidism** and **myxedema**.
  3. Thyroid hormones enhance the action of oral anticoagulants, sympathomimetics, and antidepressants and decrease the action of insulin, oral hypoglycemics, and digitalis preparations; the

### Box 55-1 Growth Hormones and Related Medications

#### Growth Hormones

Somatropin (Humatrope)  
Mecasermin (Increlex)

#### Growth Hormone Receptor Antagonists

Octreotide acetate (Sandostatin)  
Pegvisomant (Somavert)

#### Growth Hormone Releasing Factor

Sermorelin (Geref)

### Box 55-2 Antidiuretic Hormones

Desmopressin acetate (DDAVP, Stimate, Minirin)  
Vasopressin (Pitressin)

### Box 55-3 Thyroid Hormones

Levothyroxine sodium (Synthroid, Levothroid, Levoxyl, Thyro-Tabs, Unithroid)  
Liothyronine sodium (Cytomel, Triostat)  
Liotrix (Thyrolar)  
Thyroid (Armour Thyroid, Bio-Throid, Nature-Thyroid, Thyroid USP, Westhroid)

action of thyroid hormones is decreased by phenytoin (Dilantin) and carbamazepine (Tegretol).

4. Thyroid hormones should be given at least 4 hours apart from multivitamins, aluminum hydroxide and magnesium hydroxide, simethicone, calcium carbonate, bile acid sequestrants, iron, and sucralfate (Carafate) because these medications decrease the absorption of thyroid replacements.

#### B. Side effects

1. Nausea and decreased appetite
2. Abdominal cramps and diarrhea
3. Weight loss
4. Nervousness and tremors
5. Insomnia
6. Sweating and heat intolerance
7. Tachycardia, dysrhythmias, palpitations, chest pain
8. Hypertension
9. Headache
10. Toxicity: **Hyperthyroidism**

#### C. Interventions

1. Assess the client for a history of medications currently being taken.
2. Monitor vital signs.
3. Monitor weight.

### Box 55-4 Antithyroid Medications

Methimazole (Tapazole)  
Propylthiouracil (PTU)  
Strong iodine solution (Lugol's solution)  
Potassium iodide  
Iodide I 131 (Iodotope)

4. Monitor triiodothyronine, thyroxine, and thyroid-stimulating hormone levels.
5. Instruct the client to take the medication at the same time each day, in the morning without food.
6. Instruct the client in how to monitor the pulse rate.
7. Instruct the client to avoid foods that can inhibit thyroid secretion, such as strawberries, peaches, pears, cabbage, turnips, spinach, kale, Brussels sprouts, cauliflower, radishes, and peas.
8. Advise the client to avoid over-the-counter medications.
9. Instruct the client to wear a Medic-Alert bracelet.

 Advise the client taking a thyroid hormone to report symptoms of hyperthyroidism, such as tachycardia, chest pain, palpitations, and excessive sweating. These indicate signs of toxicity.

## IV. ANTITHYROID MEDICATIONS (Box 55-4)

### A. Description

1. Antithyroid medications inhibit the synthesis of thyroid hormone.
2. Antithyroid medications are used for **hyperthyroidism**, or Graves' disease.

### B. Side effects

1. Nausea and vomiting
2. Diarrhea
3. Drowsiness, headache, fever
4. Hypersensitivity with rash
5. Agranulocytosis with leukopenia and thrombocytopenia
6. Alopecia and hyperpigmentation
7. Toxicity: **Hypothyroidism**
8. Iodism: Characterized by vomiting, abdominal pain, metallic or brassy taste in the mouth, rash, and sore gums and salivary glands

### C. Interventions

1. Monitor vital signs.
2. Monitor triiodothyronine, thyroxine, and thyroid-stimulating hormone levels.
3. Monitor weight.
4. Instruct the client to take medication with meals to avoid gastrointestinal upset.
5. Instruct the client in how to monitor the pulse rate.
6. Inform the client of side effects and when to notify the physician.

**Box 55-5 Medications to Treat Calcium Disorders****Oral Calcium Supplements**

Calcium acetate (PhosLo)  
 Calcium carbonate (Rolaids, Tums, others)  
 Calcium chloride  
 Calcium citrate (Citracal)  
 Calcium gluconate (Calcionate, calciquid)  
 Calcium gluconate  
 Calcium lactate (Cal-lac)  
 Tribasic calcium phosphate (Posture)

**Vitamin D Supplements**

Cholecalciferol (Vitamin D<sub>3</sub>)  
 Ergocalciferol (Vitamin D<sub>2</sub>)

**Biphosphonates and Calcium Regulators**

Alendronate sodium (Fosamax)

Calcitonin salmon (Calcimar, Cibacalcin, Fortical)  
 Etidronate disodium (Didronel)  
 Ibandronate (Boniva)  
 Pamidronate disodium (Aredia)  
 Risedronate sodium (Actonel)  
 Tiludronate disodium (Skelid)  
 Zoledronate (Reclast)  
 Zoledronate (Zometa)

**Medications to Treat Hypercalcemia**

Cinacalcet hydrochloride (Sensipar)  
 Doxercalciferol (Hectorol)  
 Gallium nitrate (Ganite)  
 Paricalcitol (Zemlar)

7. Instruct the client in the signs of **hypo-thyroidism**.
8. Instruct the client regarding the importance of medication compliance and that abruptly stopping the medication could cause **thyroid storm**.
9. Instruct the client to monitor for signs and symptoms of **thyroid storm** (fever, flushed skin, confusion and behavioral changes, tachycardia, dysrhythmias, and signs of heart failure).
10. Instruct the client to monitor for signs of iodism.
11. Advise the client to consult physician before eating iodized salt and iodine-rich foods.
12. Instruct the client to avoid acetylsalicylic acid (aspirin) and medications containing iodine.

 **Propylthiouracil (PTU) causes agranulocytosis. Therefore, advise the client to contact the physician if a fever or sore throat develops.**

**V. PARATHYROID MEDICATIONS (Box 55-5)****A. Description**

1. Parathyroid hormone regulates serum calcium levels.
2. Low serum levels of calcium stimulate parathyroid hormone release.
3. Hyperparathyroidism results in a high serum calcium level and bone demineralization; medication is used to lower the serum calcium level.
4. Hypoparathyroidism results in a low serum calcium level, which increases neuromuscular excitability; treatment includes calcium and vitamin D supplements.
5. Calcium salts administered with digoxin (Lanoxin) increases the risk of digoxin toxicity.
6. Oral calcium salts reduce the absorption of tetracycline hydrochloride.

**B. Interventions****Box 55-6 Corticosteroid: Mineralocorticoid**

Fludrocortisone acetate

1. Monitor electrolyte and calcium levels.
2. Assess for signs and symptoms of hypocalcemia and hypercalcemia.
3. Assess for symptoms of tetany in the client with hypocalcemia.
4. Assess for renal calculi in the client with hypercalcemia.
5. Instruct the client in the signs and symptoms of hypercalcemia and hypocalcemia.
6. Instruct the client to check over-the-counter medication labels for the possibility of calcium content.
7. Instruct the client receiving oral calcium supplements to maintain an adequate intake of vitamin D because vitamin D enhances absorption of calcium.
8. Instruct the client receiving calcium regulators such as alendronate sodium (Fosamax) to swallow the tablet whole with water at least 30 minutes before breakfast and not to lie down for at least 30 minutes.
9. Instruct the client using nasal spray of calcitonin (Calcimar) to alternate nares.
10. Instruct the client using antihypercalcemic agents to avoid foods rich in calcium such as green, leafy vegetables, dairy products, shellfish, and soy.
11. Instruct the client not to take other medications within 1 hour of taking a calcium salt.
12. Instruct the client to increase fluid and fiber in diet to prevent constipation associated with calcium supplements.

**VI. CORTICOSTEROIDS (MINERALOCORTICOID) (Box 55-6)**

**A. Description**

1. Mineralocorticoids are steroid hormones that enhance the reabsorption of sodium and chloride and promote the excretion of potassium and hydrogen from the renal tubules, thereby helping maintain fluid and electrolyte balance.
2. Mineralocorticoids are used for replacement therapy in primary and secondary adrenal insufficiency in **Addison's disease**.

**B. Side effects**

1. Sodium and water retention (hypernatremia and edema), hypertension
2. Hypokalemia
3. Hypocalcemia
4. Osteoporosis, compression fractures
5. Weight gain
6. Heart failure

**C. Interventions**

1. Monitor vital signs.
2. Monitor intake and output and weight and for edema.
3. Monitor electrolyte and calcium levels.
4. Instruct the client to take medication with food or milk.
5. Instruct the client to consume a high-potassium diet.
7. Instruct the client to report illness, such as severe diarrhea, vomiting, and fever.
8. Instruct the client to notify the physician if low blood pressure, weakness, cramping, palpitations, or changes in mental status occur.
9. Instruct the client to wear a Medic-Alert bracelet.

 **Instruct the client taking a corticosteroid not to stop the medication abruptly because this could result in adrenal insufficiency.**

**VII. CORTICOSTEROIDS (GLUCOCORTICOIDS)**

(Box 55-7)

**A. Description**

1. Glucocorticoids affect glucose, protein, and bone metabolism, alter the normal immune response and suppress inflammation, and produce anti-inflammatory, antiallergic, and antistress effects.
2. Glucocorticoids may be used as a replacement in adrenocortical insufficiency.

**Box 55-7 Corticosteroids: Glucocorticoids**

Betamethasone  
Cortisone acetate  
Dexamethasone  
Hydrocortisone  
Methylprednisolone  
Prednisolone  
Prednisone  
Triamcinolone

**B. Side effects**

1. **Hyperglycemia**
2. Hypokalemia
3. Hypocalcemia, osteoporosis
4. Sodium and fluid retention
5. Weight gain
6. Mood swings
7. Moon face, buffalo hump, truncal obesity
8. Increased susceptibility to infection and masking of the signs and symptoms of infection
9. Cataracts
10. Hirsutism, acne, fragile skin, bruising
11. Growth retardation in children
12. Gastrointestinal (GI) irritation, peptic ulcer, pancreatitis
13. Seizures, psychosis

**C. Contraindications and cautions**

1. Contraindicated in clients with hypersensitivity, psychosis, and fungal infections
2. Should be used with caution in clients with **diabetes mellitus**
3. Used with extreme caution in clients with infections because they mask the signs and symptoms of an infection
4. Increase the potency of medications taken concurrently, such as aspirin, and nonsteroidal anti-inflammatory drugs, thus increasing the risk of gastrointestinal bleeding and ulceration.
5. Use of potassium-wasting diuretics increases potassium loss, resulting in hypokalemia.
6. Dexamethasone decreases the effects of orally administered anticoagulants and antidiabetic agents.
7. Barbiturates, phenytoin (Dilantin), and rifampin (Rifadin) decrease the effect of prednisone.

**D. Interventions**

1. Monitor vital signs.
2. Monitor serum electrolyte and blood glucose levels.
3. Monitor for hypokalemia and **hyperglycemia**.
4. Monitor intake and output and weight and for edema.
5. Monitor for hypertension.
6. Assess medical history for glaucoma, cataracts, peptic ulcer, mental health disorders, or **diabetes mellitus**.
7. Monitor the older client for signs and symptoms of increased osteoporosis.
8. Assess for changes in muscle strength.
9. Prepare a schedule for the client with information on short-term tapered doses.
10. Instruct the client that it is best to take medication in the early morning.
11. Advise the client to eat foods high in potassium.
12. Instruct the client to avoid individuals with respiratory infections.
13. Advise the client to inform all health care providers of the medication regimen.

14. Instruct the client to report signs and symptoms of a medication overdose or **Cushing's syndrome**, including a moon face, puffy eyelids, edema in the feet, increased bruising, dizziness, bleeding, and menstrual irregularities.
15. Note that the client may need additional doses during periods of stress, such as surgery.
16. Instruct the client not to stop the medication abruptly because abrupt withdrawal can result in severe adrenal insufficiency.
17. Advise the client to consult with the physician before receiving vaccinations.
18. Advise the client to wear a Medic-Alert bracelet.

### VIII. ANDROGENS (Box 55-8)

#### A. Description

1. Used to replace deficient hormones or to treat hormone-sensitive disorders
2. Can cause bleeding if the client is taking oral anti-coagulants (increase the effect of anticoagulants)
3. Can cause decreased serum glucose concentration, thereby reducing insulin requirements in the client with **diabetes mellitus**
4. Hepatotoxic medications are avoided with the use of androgens because of the risk of additive damage to the liver.
5. Androgens usually are avoided in men with known prostate or breast carcinoma because androgens often stimulate growth of these tumors.

#### B. Side effects

1. Masculine secondary sexual characteristics (body hair growth, lowered voice, muscle growth)
2. Bladder irritation and urinary tract infections
3. Breast tenderness
4. Gynecomastia
5. Priapism
6. Menstrual irregularities
7. Virilism
8. Sodium and water retention with edema
9. Nausea, vomiting, or diarrhea
10. Acne
11. Changes in libido
12. Hepatotoxicity, jaundice
13. Hypercalcemia

#### Box 55-8 Androgens

Fluoxymesterone  
 Methyltestosterone (Testred)  
 Testosterone preparations  
 Testosterone, pellets (Testopel)  
 Testosterone, transdermal (Androderm)  
 Testosterone cypionate (Depo-Testosterone)  
 Testosterone enanthate (Delatestryl)  
 Testosterone (Striant)

#### C. Interventions

1. Monitor vital signs.
2. Monitor for edema, weight gain, and skin changes.
3. Assess mental status and neurological function.
4. Assess for signs of liver dysfunction, including right upper quadrant abdominal pain, malaise, fever, jaundice, and pruritus.
5. Assess for the development of secondary sexual characteristics.
6. Instruct the client to take medication with meals or a snack.
7. Instruct the client to notify the physician if priapism develops.
8. Instruct the client to notify the physician if fluid retention occurs.
9. Instruct women to use a nonhormonal contraceptive while on therapy.
10. For women, monitor for menstrual irregularities and decreased breast size.

### IX. ESTROGENS AND PROGESTINS

#### A. Description

1. Estrogens are steroids that stimulate female reproductive tissue.
2. Progestins are steroids that specifically stimulate the uterine lining.
3. Estrogen and progestin preparations may be used to stimulate the endogenous hormones to restore hormonal balance or to treat hormone-sensitive tumors (suppress tumor growth) or for contraception (Boxes 55-9 and 55-10).

#### B. Contraindications and cautions

1. Estrogens
  - a. Estrogens are contraindicated in clients with breast cancer, endometrial hyperplasia,

#### Box 55-9 Estrogens

Esterified estrogens (Menest)  
 Estradiol (Estrace, Femtrace)  
 Estrogens, conjugated (Premarin, Cenestin, Enjuvia)  
 Ethinyl estradiol (Estinyl)

#### Box 55-10 Progestins

Estradiol/drospirenone (Angeliq)  
 Estradiol/norgestimate (Prefest)  
 Estradiol/northindrone (Femhrt)  
 Medroxyprogesterone acetate (Depo-Provera, Provera)  
 Medroxyprogesterone and conjugated estrogens (Premphase, Prempro)  
 Megestrol acetate (Megace)  
 Norethindrone acetate (Aygestin)  
 Norgestrel (Ovrette)  
 Progesterone (Prometrium)

endometrial cancer, history of thromboembolism, known or suspected pregnancy, or lactation.

- b. Use estrogens with caution in clients with hypertension, gallbladder disease, or liver or kidney dysfunction.
- c. Estrogens increase the risk of toxicity when used with hepatotoxic medications.
- d. Barbiturates, phenytoin (Dilantin), and rifampin (Rifadin) decrease the effectiveness of estrogen.

2. Progestins are contraindicated in clients with thromboembolic disorders and should be avoided in clients with breast tumors or hepatic disease.

#### C. Side effects

1. Breast tenderness, menstrual changes
2. Nausea, vomiting, and diarrhea
3. Malaise, depression, excessive irritability
4. Weight gain
5. Edema and fluid retention
6. Atherosclerosis
7. Hypertension, stroke, myocardial infarction
8. Thromboembolism (estrogen)
9. Migraine headaches and vomiting (estrogen)

#### D. Interventions

1. Monitor vital signs.
2. Monitor for hypertension.
3. Assess for edema and weight gain.
4. Advise the client not to smoke.
5. Advise the client to undergo routine breast and pelvic examinations.

## X. CONTRACEPTIVES

### A. Description

1. These medications contain a combination of estrogen and a progestin or a progestin alone.
2. Estrogen-progestin combinations suppress ovulation and change the cervical mucus, making it difficult for sperm to enter.
3. Medications that contain only progestins are less effective than the combined medications.
4. Contraceptives usually are taken for 21 consecutive days and stopped for 7 days; the administration cycle is then repeated.
5. Contraceptives provide reversible prevention of pregnancy.
6. Contraceptives are useful in controlling irregular or excessive menstrual cycles.
7. Risk factors associated with the development of complications related to the use of contraceptives include smoking, obesity, and hypertension.
8. Contraceptives are contraindicated in women with hypertension, thromboembolic disease, cerebrovascular or coronary artery disease, estrogen-dependent cancers, and pregnancy.
9. Contraceptives should be avoided with the use of hepatotoxic medications.

10. Contraceptives interfere with the activity of bromocriptine mesylate (Parlodel) and anticoagulants and increase the toxicity of tricyclic antidepressants.

11. Contraceptives may alter blood glucose levels.
12. Antibiotics may decrease the absorption and effectiveness of oral contraceptives.

### B. Side effects

1. Breakthrough bleeding
2. Excessive cervical mucus formation
3. Breast tenderness
4. Hypertension
5. Nausea, vomiting

### C. Interventions

1. Monitor vital signs and weight.
2. Instruct the client in the administration of the medication (it may take up to 1 week for full contraceptive effect to occur when the medication is begun).
3. Instruct the client with **diabetes mellitus** to monitor blood glucose levels carefully.
4. Instruct the client to report signs of thromboembolic complications.
5. Instruct the client to notify the physician if vaginal bleeding or menstrual irregularities occur or if pregnancy is suspected.
6. Advise the client to use an alternate method of birth control when taking antibiotics because these may decrease absorption of the oral contraceptive.
7. Instruct the client to perform breast self-examination monthly and about the importance of annual physical examinations.
8. Contraceptive patches
  - a. Designed to be worn for 3 weeks and removed for a 1-week period
  - b. Applied on clean, dry, intact skin on the buttocks, abdomen, upper outer arm, or upper torso
  - c. Instruct the client to peel away half of backing on patch, apply the sticky surface to the skin, remove the other half of the backing, and then press down on the patch with the palm for 10 seconds.
  - d. Instruct the client to change the patch weekly, using a new location for each patch.
  - e. If the patch falls off and remains off for less than 24 hours (such as when the client is sleeping or is unaware that it has fallen off), it can be reapplied if still sticky, or it can be replaced with a new patch.
  - f. If the patch is off for more than 24 hours, a new 4-week cycle must be started immediately.
9. Vaginal ring
  - a. Inserted into the vagina by the client, left in place for 3 weeks, and removed for 1 week
  - b. The medication is absorbed through mucous membranes of the vagina.
  - c. Removed rings should be wrapped in a foil pouch and discarded, not flushed down the toilet.

**Box 55-11 Fertility Medications**

Chorionic gonadotropin (Profasi)  
 Clomiphene citrate (Clomid)  
 Follitropin alfa (Gonal-f)  
 Follitropin beta (Follistim AQ)  
 Menotropins (Pergonal, Repronex, Menopur)  
 Urotropin alfa (Bravelle, Fertinex, Metrodin)  
 Lutropin alfa (Luveris)

- Implants and depot injections provide long-acting forms of birth control, from 3 months to 5 years in duration.

 If the client decides to discontinue the contraceptive to become pregnant, recommend that the client use an alternative form of birth control for 2 months after discontinuation to ensure more complete excretion of hormonal agents before conception.

**XI. FERTILITY MEDICATIONS** (Box 55-11)**A. Description**

- Fertility medications act to stimulate follicle development and ovulation in functioning ovaries and are combined with human chorionic gonadotropin to maintain the follicles once ovulation has occurred.
- Fertility medications are contraindicated in the presence of primary ovarian dysfunction, thyroid or adrenal dysfunction, ovarian cysts, pregnancy, or idiopathic uterine bleeding.
- Fertility medications should be used with caution in clients with thromboembolic or respiratory disease.

**B. Side effects**

- Risk of multiple births and birth defects
- Ovarian overstimulation (abdominal pain, distention, ascites, pleural effusion)
- Headache, irritability
- Fluid retention and bloating
- Nausea, vomiting
- Uterine bleeding
- Ovarian enlargement
- Gynecomastia
- Rash
- Orthostatic hypotension
- Febrile reactions

**C. Interventions**

- Instruct the client regarding administration of the medication.
- Provide a calendar of treatment days and instructions on when intercourse should occur to increase therapeutic effectiveness of the medication.
- Provide information about the risks and hazards of multiple births.

- Instruct the client to notify the physician if signs of ovarian overstimulation occur.
- Inform the client about the need for regular follow-up for evaluation.

**XII. MEDICATIONS FOR ERECTILE DYSFUNCTION****A. Description**

- Alprostadil (Caverject, Edex) is a prostaglandin that relaxes smooth muscle and promotes blood flow when injected directly into the corpus cavernosum.
- Sildenafil (Viagra), tadalafil (Cialis), and vardenafil (Levitra) cause smooth muscle relaxation and allow blood flow into the corpus cavernosum.
- Erectile dysfunction medications are contraindicated in the presence of any anatomical obstruction or condition that might predispose to priapism and in clients with penile implants.
- Caution should be used in clients with bleeding disorders.
- Sildenafil, tadalafil, and vardenafil are used cautiously in clients with coronary artery disease, active peptic ulcer disease, bleeding disorders, or retinitis pigmentosa.
- Sildenafil, tadalafil, and vardenafil cannot be administered to clients taking nitrates, nitroprusside, or  $\beta$ -blockers.

**B. Side effects**

- Alprostadil: Pain at the injection site, infection, priapism, penile fibrosis, rash
- Sildenafil, tadalafil, and vardenafil: Headache, flushing, dyspepsia, urinary tract infection, diarrhea, hypotension, dizziness, rash, neuralgia, insomnia
- Blurred vision and changes in color vision

**C. Interventions**

- Perform a thorough assessment of health and medication history.
- Instruct the client regarding administration of the medication; alprostadil is injected intracavernously; sildenafil, tadalafil, and vardenafil are taken orally.
- Inform the client of side effects necessitating the need to notify the physician.

**XIII. MEDICATIONS FOR DIABETES MELLITUS****A. Insulin and oral hypoglycemic medications****1. Description**

- Insulin increases glucose transport into cells and promotes conversion of glucose to glycogen, decreasing serum glucose levels.
- Oral hypoglycemic agents stimulate the pancreas to produce more insulin, increase the sensitivity of peripheral receptors to insulin, decrease hepatic glucose output, or delay intestinal absorption of glucose, thus decreasing serum glucose levels.

2. Contraindications and concerns
  - a. Insulin is contraindicated in clients with hypersensitivity.
  - b. Oral hypoglycemic agents are contraindicated in type 1 **diabetes mellitus**.
  - c.  $\beta$ -Adrenergic blocking agents may mask signs and symptoms of **hypoglycemia** associated with hypoglycemic medications.
  - d. Anticoagulants, chloramphenicol (Chloromycetin), salicylates, propranolol (Inderal), monoamine oxidase inhibitors, pentamidine (Pentam 300), and sulfonamides may cause **hypoglycemia**.
  - e. Corticosteroids, sympathomimetics, thiazide diuretics, phenytoin (Dilantin), thyroid preparations, oral contraceptives, and estrogen compounds may cause **hyperglycemia**.
  - f. Side effects of the sulfonylureas include gastrointestinal symptoms and dermatological reactions; **hypoglycemia** can occur when an excessive dose is administered or when meals are omitted or delayed, food intake is decreased, or activity is increased.

 **Sulfonylureas can cause a disulfiram (Antabuse) type of reaction when alcohol is ingested.**

## B. Oral hypoglycemic medications

1. Prescribed for clients with type 2 **diabetes mellitus**
2. Sulfonylureas (Box 55-12)
  - a. Sulfonylureas may be classified as first- or second-generation sulfonylureas.
  - b. Sulfonylureas stimulate the beta cells to produce more insulin.
3. Biguanides (see Box 55-12)
  - a. May be used alone or in combination with a sulfonylurea
  - b. Suppresses hepatic production of glucose and increases insulin sensitivity
  - c. Side effects: Diarrhea (most common), lactic acidosis (most serious)
4. Alpha-glucosidase inhibitors (see Box 55-12)
  - a. Delay absorption of ingested carbohydrates (sucrose and complex carbohydrates), resulting in smaller increase in blood glucose level after meals.
  - b. Do not increase insulin production
  - c. Can be given alone or in combination with sulfonylureas
  - d. Will not cause **hypoglycemia** when given alone
  - e. Given with first bite of meal
5. Thiazolidinediones (see Box 55-12)
  - a. Insulin-sensitizing agents that lower blood glucose by decreasing hepatic glucose production and improving target cell response to insulin
  - b. May cause liver toxicity

## Box 55-12 Sulfonylureas and Nonsulfonylureas

### Sulfonylureas

Acetohexamide (Dymelor)  
 Chlorpropamide (Diabinese)  
 Glimepiride (Amaryl)  
 Glipizide (Glucotrol)  
 Glyburide (DiaBeta, Micronase)  
 Tolazamide (Tolinase)  
 Tolbutamide (Orinase)

### Biguanide

Metformin (Glucophage)

### Alpha-Glucosidase Inhibitors

Acarbose (Precose)  
 Miglitol (Glyset)

### Thiazolidinediones

Pioglitazone (Actos)  
 Rosiglitazone (Avandia)

### Meglitinides

Nateglinide (Starlix)  
 Repaglinide (Prandin)

### Gliptins

Sitagliptin (Januvia)

6. Meglitinides (see Box 55-12)
  - a. Stimulate pancreatic insulin secretion
  - b. Quicker and shorter duration of action; therefore, less chance of **hypoglycemia** because blood glucose-lowering effect wears off quickly
  - c. Very fast onset of action allows client to take the medication with meals and skip a dose when a meal is skipped
7. Interventions
  - a. Assess the client's knowledge of **diabetes mellitus** and the use of oral antidiabetic agents.
  - b. Obtain a medication history regarding the medications that the client is taking currently.
  - c. Assess vital signs and blood glucose levels.
  - d. Instruct the client to recognize the signs and symptoms of **hypoglycemia** and **hyperglycemia**.
  - e. Instruct the client to avoid over-the-counter medications unless prescribed by the health care provider.
  - f. Instruct the client not to ingest alcohol with sulfonylureas.
  - g. Inform the client that insulin may be needed during stress, surgery, or infection.
  - h. Instruct the client in the necessity of compliance with prescribed medication.
  - i. Instruct the client on how to take each specific medication, such as with the first bite of the meal for meglitinides and alpha-glucosidase inhibitors.
  - j. Advise the client to wear a Medic-Alert bracelet.

- C. Insulin**
1. Insulin primarily acts in the liver, muscle, and adipose tissue by attaching to receptors on cellular membranes and facilitating the passage of glucose, potassium, and magnesium.
  2. Insulin is prescribed for clients with type 1 **diabetes mellitus** and type 2 **diabetes mellitus** in clients whose blood glucose level is not controlled with oral hypoglycemic agents.
  3. The onset, peak, and duration of action depend on the insulin type (Table 55-1).
  4. Storing of insulin (Box 55-13)
  5. Insulin injection sites
    - a. The main areas for injections are the abdomen, arms (posterior surface), thighs (anterior surface), and hips (Fig. 55-1).
    - b. Insulin injected into the abdomen may absorb more evenly and rapidly than at other sites.
    - c. Systematic rotation within one anatomical area is recommended to prevent lipodystrophy; client should be instructed not to use the same site more than once in a 2- to 3-week period.
    - d. Injections should be 1½ inches apart within the anatomical area.
    - e. Heat, massage, and exercise of the injected area can increase absorption rates and may result in **hypoglycemia**.

#### Box 55-13 Storing Insulin

Avoid exposing insulin to extremes in temperature. Insulin should not be frozen or kept in direct sunlight or a hot car. Before injection, insulin should be at room temperature. If a vial of insulin will be used up in 1 month, it may be kept at room temperature; otherwise, the vial should be refrigerated.

**TABLE 55-1** Time Activity of Pharmacological Insulin\*

| Preparation  | Brand             | Onset (hr) | Peak (hr) | Duration (hr) |
|--|-------------------|------------|-----------|---------------|
| <b>RAPID-ACTING INSULIN</b>  |                   |            |           |               |
| Insulin aspart   | NovoLog           | 0.25       | 1-3       | 3-5           |
| Insulin glulisine  | Apidra            | 0.3        | 0.5-1.5   | 3-4           |
| Human lispro injection   | Humalog           | 0.25       | 0.5-1.5   | 5             |
| <b>SHORT-ACTING INSULIN</b>  |                   |            |           |               |
| Regular human insulin injection                                      | Humulin R         | 0.5        | 2-4       | 5-7           |
|  | Novolin R         | 0.5        | 2.5-5     | 8             |
|  | ReliOn R          |            |           |               |
| Humulin R (concentrated U-500)                                       | Humulin R (U 500) | 1.5        | 4-12      | 24            |
| <b>INTERMEDIATE-ACTING INSULIN</b>                                   |                   |            |           |               |
| Isophane insulin NPH injection                                       | Humulin N         | 1.5        | 4-12      | 16-24+        |
|  | Novolin N         | 1.5        | 4-12      | 16-24+        |
|  | ReliOn N          |            |           |               |
| Insulin detemir injection  | Levemir           | 1          | 6-8       | 5.7-24        |
| 70% human insulin isophane suspension/30% human insulin injection    | Humulin 70/30     | 0.5        | 2-12      | 24            |
|  | Novolin 70/30     |            |           |               |
|  | ReliOn 70/30      |            |           |               |
| 50% human insulin isophane suspension/50% human insulin injection    | Humulin 50/50     | 0.5        | 3-5       | 24            |
| 70% insulin aspart protamine suspension/30% insulin aspart injection | NovoLog Mix 70/30 | 0.25       | 1-4       | 24            |
| 75% insulin lispro protamine suspension/25% insulin lispro injection | Humalog Mix 75/25 | 0.25       | 1-2       | 24            |
| <b>LONG-ACTING INSULIN</b>   |                   |            |           |               |
| Insulin glargine injection   | Lantus            | 2-4        | None      | 24            |

\*Time activity may be dose related.

From Ignatavicius, D., & Workman, M. (2010). *Medical surgical nursing: Patient centered collaborative care* (6th ed., p. 1485). St. Louis: Saunders.

**▲ FIGURE 55-1** Common insulin injection sites. (From Ignatavicius, D., & Workman, M. [2010]. *Medical surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

f. Injection into scar tissue may delay absorption of insulin.

#### 6. Administering insulin

**!** Insulin glargine *cannot* be mixed with any other types of insulin.

- To prevent dosage errors, be certain that there is a match between the insulin concentration noted on the vial and the calibration of units on the insulin syringe; the usual concentration of insulin is U 100 (100 units/mL).
- Most insulin syringes have a 27- to 29-gauge needle that is about ½-inch long.
- Before use, swirl insulin vial gently or rotate between palms to ensure that the insulin and ingredients are mixed well; otherwise, an inaccurate dose will be drawn; vigorously shaking the bottle will cause bubbles to form.
- Premixed insulins (NPH and regular insulin) are available as 70/30 (most commonly used) and 50/50 (premixed insulin lispro protamine and insulin lispro 75/25 are also available).
- Inject air into the insulin bottle (a vacuum makes it difficult to draw up the insulin).
- When mixing insulins, draw up the regular (shorter acting) insulin first (Fig. 55-2).
- Regular insulin may be mixed with NPH or Lente insulin.
- Lispro insulin may be mixed with Humulin N or Humulin-U (Ultralente)
- Insulin aspart protamine may be mixed with NPH insulin only.
- Insulin zinc suspensions may be mixed only with each other and regular insulin, not with other types of insulin.

- Wash hands.
- Gently rotate NPH insulin bottle.
- Wipe off tops of insulin vials with alcohol sponge.
- Draw back amount of air into the syringe that equals total dose.

- Inject air equal to NPH dose into NPH vial. Remove syringe from vial.
- Inject air equal to regular dose into regular vial.

**▲ FIGURE 55-2** Steps for mixing insulins. (From Lewis, S., Heitkemper, M., Dirksen, S., O'Brien, P., & Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

- Administer a mixed dose of insulin within 5 to 15 minutes of preparation; after this time, the regular insulin binds with the NPH insulin and its action is reduced.
- Aspiration generally is not recommended with self-injection of insulin.
- Administer insulin at a 45- to 90-degree angle in clients with normal subcutaneous mass and at a 45- to 60-degree angle in thin persons or those with a decreased amount of subcutaneous mass.

**!** Regular insulin is the only type of insulin that can be administered intravenously.

#### D. Exenatide (Byetta)

- A synthetic hormone classified as an incretin mimetic that is administered subcutaneously.
- Used for clients with type 2 **diabetes mellitus** (not recommended for clients taking insulin nor should clients be taken off of insulin and given exenatide)
- Restores first-phase insulin response (first 10 minutes after food ingestion), lowers the

production of glucagon after meals, slows gastric emptying (which limits the rise in the blood glucose level after a meal), reduces fasting and postprandial blood glucose levels, and reduces caloric intake, resulting in weight loss

4. Packaged in premeasured doses (pen) that require refrigeration (cannot be frozen)
5. Administered as a subcutaneous injection in the thigh, abdomen, or upper arm within 60 minutes before morning and evening meals; not taken after meals; if a dose is missed, the treatment regimen is resumed as prescribed with the next scheduled dose.
6. Can cause mild to moderate nausea that abates with use.

#### E. Pramlintide (Symlin)

1. Synthetic form of amylin, a naturally occurring hormone secreted by the pancreas
2. Used for clients with types 1 and 2 **diabetes mellitus** who use insulin; given before meals to lower blood glucose level after meals, leading to less fluctuation during the day and better long-term glucose control
3. Associated with an increased risk of insulin-induced severe **hypoglycemia**, particularly in clients with type 1 **diabetes mellitus**
4. Gastrointestinal side effects including nausea can occur.
5. Unopened vials are refrigerated; opened vials can be refrigerated or kept at room temperature for up to 28 days.

#### F. Glucagon

1. Hormone secreted by the alpha cells of the islets of Langerhans in the pancreas
2. Increases blood glucose level by stimulating glycogenolysis in the liver
3. Can be administered subcutaneously, intramuscularly, or intravenously
4. Used to treat insulin-induced **hypoglycemia** when the client is semiconscious or unconscious and is unable to ingest liquids
5. The blood glucose level begins to increase within 5 to 20 minutes after administration.
6. Instruct the family in the procedure for administration.
7. See Chapter 54 for additional information regarding interventions for severe **hypoglycemia**.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

**597.** A nurse is teaching a client how to mix regular insulin and NPH insulin in the same syringe. Which of the following actions, if performed by the client, indicates the need for further teaching?

1. Withdraws the NPH insulin first
2. Withdraws the regular insulin first
3. Injects air into NPH insulin vial first
4. Injects an amount of air equal to the desired dose of insulin into the vial

**598.** A home care nurse visits a client recently diagnosed with diabetes mellitus who is taking Humulin NPH insulin daily. The client asks the nurse how to store the unopened vials of insulin. The nurse tells the client to:

1. Freeze the insulin.
2. Refrigerate the insulin.
3. Store the insulin in a dark, dry place.
4. Keep the insulin at room temperature.

**599.** Glimepiride (Amaryl) is prescribed for a client with diabetes mellitus. A nurse instructs the client to avoid which of the following while taking this medication?

1. Alcohol
2. Organ meats
3. Whole-grain cereals
4. Carbonated beverages

**600.** Sildenafil (Viagra) is prescribed to treat a client with erectile dysfunction. A nurse reviews the client's medical record and would question the prescription if which of the following is noted in the client's history?

1. Neuralgia
2. Insomnia
3. Use of nitroglycerin
4. Use of multivitamins

**601.** The health care provider prescribes exenatide (Byetta) for a client with type 1 diabetes mellitus who takes insulin. The nurse plans to take which appropriate intervention?

1. Administer the medication within 60 minutes before the morning and evening meal.
2. Hold the medication and call the health care provider, questioning the prescription for the client.
3. Monitor the client for gastrointestinal side effects after administering the medication.
4. Withdraw the insulin from the prefilled pen into an insulin syringe to prepare for administration.

**602.** A client is taking Humulin NPH insulin daily every morning. The nurse instructs the client that the most likely time for a hypoglycemic reaction to occur is:

1. 2 to 4 hours after administration
2. 4 to 12 hours after administration
3. 16 to 18 hours after administration
4. 18 to 24 hours after administration

- 603.** A client with diabetes mellitus visits a health care clinic. The client's diabetes mellitus previously had been well controlled with glyburide (DiaBeta) daily, but recently the fasting blood glucose level has been 180 to 200 mg/dL. Which medication, if added to the client's regimen, may have contributed to the hyperglycemia?
1. Prednisone
  2. Phenelzine (Nardil)
  3. Atenolol (Tenormin)
  4. Allopurinol (Zyloprim)
- 604.** A community health nurse visits a client at home. Prednisone 10 mg orally daily, has been prescribed for the client and the nurse teaches the client about the medication. Which statement, if made by the client, indicates that further teaching is necessary?
1. "I can take aspirin or my antihistamine if I need it."
  2. "I need to take the medication every day at the same time."
  3. "I need to avoid coffee, tea, cola, and chocolate in my diet."
  4. "If I gain more than 5 pounds a week, I will call my doctor."
- 605.** Desmopressin acetate (DDAVP) is prescribed for the treatment of diabetes insipidus. The nurse administering the medication monitors the client for which therapeutic response?
1. Decreased urinary output
  2. Decreased blood pressure
  3. Decreased peripheral edema
  4. Decreased blood glucose level
- 606.** A nurse is monitoring a client receiving desmopressin acetate (DDAVP) for adverse effects to the medication. Which of the following indicates the presence of an adverse effect?
1. Insomnia
  2. Drowsiness
  3. Weight loss
  4. Increased urination
- 607.** A nurse provides instructions to a client who is taking levothyroxine (Synthroid). The nurse tells the client to take the medication:
1. With food
  2. At lunchtime
  3. On an empty stomach
  4. At bedtime with a snack
- 608.** A nurse provides medication instructions to a client who is taking levothyroxine (Synthroid). The nurse instructs the client to notify the physician if which of the following occurs?
1. Fatigue
  2. Tremors
  3. Cold intolerance
  4. Excessively dry skin
- 609.** A nurse performs an admission assessment on a client who visits a health care clinic for the first time. The client tells the nurse that propylthiouracil (PTU) is taken daily. The nurse continues to collect data from the client, suspecting that the client has a history of:
1. Myxedema
  2. Graves' disease
  3. Addison's disease
  4. Cushing's syndrome
- 610.** A nurse is instructing a client regarding intranasal desmopressin (DDAVP). The nurse tells the client that which of the following is a side effect of the medication?
1. Headache
  2. Vulval pain
  3. Runny nose
  4. Flushed skin
- 611.** A daily dose of prednisone is prescribed for a client. A nurse provides instructions to the client regarding administration of the medication and instructs the client that the best time to take this medication is:
1. At noon
  2. At bedtime
  3. Early morning
  4. Any time, at the same time, each day
- 612.** Prednisone is prescribed for a client with diabetes mellitus who is taking Humulin NPH insulin daily. Which of the following prescription changes does the nurse anticipate during therapy with the prednisone?
1. An additional dose of prednisone daily
  2. A decreased amount of daily Humulin NPH insulin
  3. An increased amount of daily Humulin NPH insulin
  4. The addition of an oral hypoglycemic medication daily

### Alternate Item Format: Multiple Response

- 613.** The home health care nurse is visiting a client who was recently diagnosed with type 2 diabetes mellitus. The client is prescribed repaglinide (Prandin) and metformin (Glucophage) and asks the nurse to explain these medications. The nurse should provide which instructions to the client? **Select all that apply.**

- ❑ 1. Diarrhea may occur secondary to the metformin.
- ❑ 2. The repaglinide is not taken if a meal is skipped.
- ❑ 3. The repaglinide is taken 30 minutes before eating.
- ❑ 4. Candy or another simple sugar is carried and used to treat mild hypoglycemia episodes.
- ❑ 5. Metformin increases hepatic glucose production to prevent hypoglycemia associated with repaglinide.
- ❑ 6. Muscle pain is an expected side effect of metformin and may be treated with acetaminophen (Tylenol).

## ANSWERS

### 597. 1

**Rationale:** When preparing a mixture of regular insulin with another insulin preparation, the regular insulin is drawn into the syringe first. This sequence will avoid contaminating the vial of regular insulin with insulin of another type. Options 2, 3, and 4 identify the correct actions for preparing NPH and regular insulin.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *need for further teaching*. These words indicate a negative event query and ask you to select an option that is an incorrect action. Remember RN—draw up the Regular insulin before the NPH insulin. Review the procedure for preparing NPH and regular insulin if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 797). St. Louis: Saunders.

### 598. 2

**Rationale:** Insulin in unopened vials should be stored under refrigeration until needed. Vials should not be frozen. When stored unopened under refrigeration, insulin can be used up to the expiration date on the vial. Options 1, 3, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *store the unopened vials*. Remembering that insulin should not be frozen will assist in eliminating option 1. Options 3 and 4 are comparable or alike and should be eliminated. Review client teaching points related to insulin if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 793). St. Louis: Saunders.

### 599. 1

**Rationale:** When alcohol is combined with glimepiride (Amaryl), a disulfiram-like reaction may occur. This syndrome includes flushing, palpitations, and nausea. Alcohol can also potentiate the hypoglycemic effects of the medication. Clients need to be instructed to avoid alcohol consumption while taking this medication. The items in options 2, 3, and 4 do not need to be avoided.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 2, 3, and 4 because these food items are allowed in a diabetic diet. Remembering that alcohol can affect the action of many medications will assist in directing you to option 1. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 802). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 687). St. Louis: Saunders.

### 600. 3

**Rationale:** Sildenafil (Viagra) enhances the vasodilating effect of nitric oxide in the corpus cavernosum of the penis, thus sustaining an erection. Because of the effect of the medication, it is contraindicated with concurrent use of organic nitrates and nitroglycerin. Sildenafil is not contraindicated with the use of vitamins. Neuralgia and insomnia are side effects of the medication.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *would question the prescription*. Recalling the action of the medication will direct you to option 3. If you had difficulty with this question, review the contraindications associated with the use of this medication.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 1034). St. Louis: Saunders.

### 601. 2

**Rationale:** Exenatide (Byetta) is an incretin mimetic used for type 2 diabetes mellitus only. It is not recommended for clients taking insulin. Hence, the nurse should hold the medication and question the health care provider regarding this prescription. Although options 1 and 3 are correct statements about the medication, in this situation the medication should not be administered. The medication is packaged in prefilled pens ready for injection without the need for drawing it up into another syringe.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 4 because the medication is packaged in prefilled pens ready for injection without the need for drawing it up into another syringe. From the remaining options, focus on the data in the question. Although options 1 and 3 are appropriate when administering this medication, this client should not receive the medication. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Pharmacology

**References:** The Diabetes Monitor. (2007). *Exenatide (Byetta)*. Available at <http://www.diabetesmonitor.com/byetta.htm>. Retrieved February 2, 2010.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 680). St. Louis: Saunders.

### 602. 2

**Rationale:** Humulin NPH is an intermediate-acting insulin. The onset of action is 1.5 hours, it peaks in 4 to 12 hours, and its duration of action is 24 hours. Hypoglycemic reactions most likely occur during peak time.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the onset, peak, and duration of action for NPH insulin. Remember that NPH peaks in 4 to 12 hours. If you had difficulty with this question, review the characteristics of NPH insulin.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Endocrine

**References:** Edmunds, M. (2010). *Introduction to clinical pharmacology* (6th ed., p. 335). St. Louis: Mosby.

Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 795). St. Louis: Saunders.

### 603. 1

**Rationale:** Prednisone may decrease the effect of oral hypoglycemics, insulin, diuretics, and potassium supplements. Option 2, a monoamine oxidase inhibitor, and option 3, a  $\beta$ -blocker, have their own intrinsic hypoglycemic activity. Option 4 decreases urinary excretion of sulfonylurea agents, causing increased levels of the oral agents, which can lead to hypoglycemia.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject, an increase in the blood glucose level. Recalling that prednisone decreases the effects of oral hypoglycemics will direct you to the correct option. Review medication interactions with hypoglycemics if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Adult Health—Endocrine

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 855). St. Louis: Saunders.

### 604. 1

**Rationale:** Aspirin and other over-the-counter medications should not be taken unless the client consults with the physician. The client needs to take the medication at the same time every day and should be instructed not to stop the medication. A slight weight gain as a result of an improved appetite is expected, but after the dosage is stabilized, a weight gain of 5 pounds or more weekly should be reported to the physician. Caffeine-containing foods and fluids need to be avoided because they may contribute to steroid-ulcer development.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *further teaching is necessary*. These words indicate a negative event query and ask you to select an

option that is an incorrect statement. Remember that a client should not take other medications, especially over-the-counter medications, without first consulting with his or her physician. Review teaching points for the client taking prednisone if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Endocrine

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 855). St. Louis: Saunders.

### 605. 1

**Rationale:** Desmopressin promotes renal conservation of water. The hormone carries out this action by acting on the collecting ducts of the kidney to increase their permeability to water, which results in increased water reabsorption. The therapeutic effect of this medication would be manifested by a decreased urine output. Options 2, 3, and 4 are unrelated to the effects of this medication.

**Test-Taking Strategy:** Use the process of elimination. Focus on the diagnosis in the question to assist in answering the question. Recalling the manifestations related to the loss of large volumes of urine in this disorder will help direct you to option 1. Review diabetes insipidus and the action of desmopressin if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Pharmacology

**References:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 323). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 709). St. Louis: Saunders.

### 606. 2

**Rationale:** Water intoxication (overhydration) or hyponatremia is an adverse reaction to desmopressin. Early signs include drowsiness, listlessness, and headache. Decreased urination, rapid weight gain, confusion, seizures, and coma also may occur in overhydration.

**Test-Taking Strategy:** Use the process of elimination. Recalling that this medication is used to treat diabetes insipidus will assist you in eliminating options 3 and 4. Also, recalling the action of the medication will assist you in determining that water intoxication is an adverse reaction. This will direct you to option 2. Review the adverse effects related to this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 709). St. Louis: Saunders.

### 607. 3

**Rationale:** Oral doses of levothyroxine (Synthroid) should be taken on an empty stomach to enhance absorption. Dosing should be done in the morning before breakfast.

**Test-Taking Strategy:** Use the process of elimination. Note that options 1, 2, and 4 are comparable or alike in that these

options address administering the medication with food. Review client teaching points regarding the administration of levothyroxine if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 672). St. Louis: Saunders.

### 608. 2

**Rationale:** Excessive doses of levothyroxine (Synthroid) can produce signs and symptoms of hyperthyroidism. These include tachycardia, chest pain, tremors, nervousness, insomnia, hyperthermia, heat intolerance, and sweating. The client should be instructed to notify the physician if these occur. Options 1, 3, and 4 are signs of hypothyroidism.

**Test-Taking Strategy:** Use the process of elimination, recalling the symptoms associated with hypothyroidism, the purpose of administering levothyroxine, and the effects of the medication. Options 1, 3, and 4 are symptoms related to hypothyroidism. Review the adverse effects of this medication if you are unfamiliar with them.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 673). St. Louis: Saunders.

### 609. 2

**Rationale:** Propylthiouracil (PTU) inhibits thyroid hormone synthesis and is used to treat hyperthyroidism, or Graves' disease. Myxedema indicates hypothyroidism. Cushing's syndrome and Addison's disease are disorders related to adrenal function.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the action of the medication and treatment measures for Graves' disease to answer the question. Remember that propylthiouracil is used to treat Graves' disease. Review this medication and Graves' disease if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**References:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 957). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 699). St. Louis: Saunders.

### 610. 3

**Rationale:** Desmopressin administered by the intranasal route can cause a runny or stuffy nose. Options 1, 2, and 4 are side effects if the medication is administered by the intravenous route.

**Test-Taking Strategy:** Note the relationship between the words *intranasal* in the question and *runny nose* in option 3. Review this medication if you are unfamiliar with it.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 323). St. Louis: Saunders.

### 611. 3

**Rationale:** Corticosteroids (glucocorticoids) should be administered before 9 AM. Administration at this time helps minimize adrenal insufficiency and mimics the burst of glucocorticoids released naturally by the adrenal glands each morning. Options 1, 2, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Note the suffix *-sone* and recall that medication names that end with these letters are corticosteroids. This will direct you to option 3. If you had difficulty with this question, review the administration of glucocorticoids.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 934). St. Louis: Saunders.

### 612. 3

**Rationale:** Glucocorticoids can elevate blood glucose levels. Clients with diabetes mellitus may need their dosages of insulin or oral hypoglycemic medications increased during glucocorticoid therapy. Therefore, options 1, 2, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Recalling that glucocorticoids can increase blood glucose levels will direct you to option 3. Review the effects of glucocorticoids if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 855). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 613. 1, 2, 3, 4

**Rationale:** Repaglinide is a rapid-acting oral hypoglycemic agent that stimulates pancreatic insulin secretion that should be taken before meals, and that should be held if the client does not eat. Hypoglycemia is a side effect of repaglinide and the client should always be prepared by carrying a simple sugar with her or him at all times. Metformin is an oral hypoglycemic given in combination with repaglinide and works by decreasing hepatic glucose production. A common side effect of metformin is diarrhea. Muscle pain may occur as an adverse effect from metformin but it might signify a more serious condition that warrants physician notification, not the use of acetaminophen.

**Test-Taking Strategy:** Focus on the data in the question and the client's diagnosis to assist in answering the question. Also, recalling the actions and effects of these medications will assist in answering correctly. Review these medications if you are not familiar with them.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 674, 676). St. Louis: Saunders.

# UNIT XI

## The Adult Client With a Gastrointestinal Disorder

### PYRAMID TERMS

**ascites** The accumulation of fluid within the peritoneal cavity that results from venous congestion of the hepatic capillaries, which leads to plasma leaking directly from the liver surface and portal vein.

**asterixis** A coarse tremor characterized by rapid, nonrhythmic extensions and flexions in the wrist and fingers; also termed *liver flap*.

**Billroth I** Partial gastrectomy with the remaining segment being anastomosed to duodenum; also termed *gastroduodenostomy*.

**Billroth II** Partial gastrectomy with the remaining segment being anastomosed to the jejunum; also termed *gastrojejunostomy*.

**cholecystectomy** Removal of the gallbladder.

**cholecystitis** An inflammation of the gallbladder that may occur as an acute or chronic process. Acute inflammation is associated with gallstones (cholelithiasis). Chronic cholecystitis results when inefficient bile emptying and gallbladder muscle wall disease causes a fibrotic and contracted gallbladder.

**choledocholithotomy** Incision into the common bile duct to remove a gallstone.

**cirrhosis** A chronic progressive disease of the liver characterized by diffuse degeneration and destruction of hepatocytes. Repeated destruction of hepatic cells causes the formation of scar tissue.

**Crohn's disease** An inflammatory disease that can occur anywhere in the gastrointestinal tract but most often affects the terminal ileum; leads to thickening and scarring, narrowed lumen, fistulas, ulcerations, and abscesses. The disease is characterized by remissions and exacerbations.

**Cullen's sign** Bluish discoloration of the abdomen and periumbilical area seen in acute hemorrhagic pancreatitis.

**diverticulitis** Inflammation of one or more diverticula from penetration of fecal matter through the thin-walled diverticula, resulting in local abscess formation. A perforated diverticulum can progress to intra-abdominal perforation with generalized peritonitis.

**diverticulosis** Outpouching or herniations of the intestinal mucosa that can occur in any part of the intestine but is most common in the sigmoid colon.

**dumping syndrome** Rapid emptying of the gastric contents into the small intestine, which occurs following gastric resection.

**esophageal varices** Dilated and tortuous veins in the submucosa of the esophagus caused by portal hypertension, often associated with liver cirrhosis; at high risk for rupture if portal circulation pressure rises.

**fetor hepaticus** The fruity, musty breath odor associated with severe chronic liver disease.

**gastrectomy** Removal of the stomach with attachment of the esophagus to the jejunum or duodenum; also termed *esophagojejunostomy* or *esophagoduodenostomy*.

**gastric resection** Removal of the lower half of the stomach, usually including a vagotomy; also termed *antrectomy*.

**hepatitis** Inflammation of the liver caused by a virus, bacteria, or exposure to medications or hepatotoxins.

**hiatal hernia** A portion of the stomach that herniates through the diaphragm and into the thorax. Herniation results from weakening of the muscles of the diaphragm and is aggravated by factors that increase abdominal pressure, such as pregnancy, ascites, obesity, tumors, and heavy lifting; also termed *esophageal* or *diaphragmatic hernia*.

**Kock ileostomy (continent ileostomy)** An intraabdominal pouch constructed from the terminal ileum. The pouch is

connected to the stoma with a nipple-like valve constructed from a portion of the ileum. The stoma is flush with the skin.

**Murphy's sign** A sign of gallbladder disease consisting of pain on taking a deep breath when the examiner's fingers are on the approximate location of the gallbladder.

**pancreatitis** An acute or chronic inflammation of the pancreas, with associated escape of pancreatic enzymes into surrounding tissue. Acute pancreatitis can occur suddenly as one attack or can be recurrent with resolution. Chronic pancreatitis is a continual inflammation and destruction of the pancreas, with scar tissue replacing pancreatic tissue.

**peristalsis** Wave-like rhythmic contractions that propel material through the gastrointestinal tract.

**portal hypertension** A persistent increase in pressure within the portal vein that develops as a result of obstruction to flow.

**pyloroplasty** Enlarging the pylorus to prevent or decrease pyloric obstruction, thereby enhancing gastric emptying.

**Turner's sign** A gray-blue discoloration of the flanks seen in acute hemorrhagic pancreatitis.

**ulcerative colitis** Ulcerative and inflammatory disease of the bowel that results in poor absorption of nutrients. Acute ulcerative colitis results in vascular congestion, hemorrhage, edema, and ulceration of the bowel mucosa. Chronic ulcerative colitis causes muscular hypertrophy, fat deposits, and fibrous tissue with bowel thickening, shortening, and narrowing.

**vagotomy** Surgical division of the vagus nerve to eliminate the vagal impulses that stimulate hydrochloric acid secretion in the stomach.

## PYRAMID TO SUCCESS

Pyramid Points focus on diagnostic tests and nursing care related to the various gastric or intestinal tubes, gastric surgery, cirrhosis, hepatitis, pancreatitis, and colostomy care. Focus on preprocedure and postprocedure care of the client undergoing a gastrointestinal diagnostic test. Remember that an informed consent is required for any invasive procedure. Focus on diet restrictions before and after the diagnostic test and remember that the gag reflex or bowel sounds must return before allowing a client to consume food or fluids. Pyramid Points include instructions to the client and family regarding the prevention of gastrointestinal disorders and the complications associated with the disorder. Focus on teaching the client and family about diet and nutrition specific to the disorder, tube and wound care, preventing the transmission of infection such as with hepatitis, and care of a colostomy or ileostomy. Remember that body image disturbances can occur in clients with a gastrointestinal disorder. Specific focus relates to the client with a diversion, such as an ileostomy or colostomy, the social isolation issues that can occur, and effective coping strategies.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Consulting with other health care professionals regarding the client's nutritional status
- Ensuring that confidentiality issues related to the gastrointestinal disorder are maintained
- Establishing priorities of care
- Handling infectious drainage and secretions safely
- Maintaining standard precautions and other precautions as appropriate
- Obtaining informed consent for treatments and surgical procedures
- Obtaining referrals for home care and community services
- Preventing disease transmission

### Health Promotion and Maintenance

- Performing physical assessment techniques of the gastrointestinal system
- Preventing disease related to the gastrointestinal system
- Providing health screening and health promotion programs related to gastrointestinal disorders
- Teaching related to colostomy or ileostomy care
- Teaching related to preventing the transmission of disease
- Teaching related to prescribed dietary and other treatment measures

### Psychosocial Integrity

- Assessing coping mechanisms
- Considering end-of-life and grief and loss issues
- Identifying available support systems
- Monitoring for expected body image changes

### Physiological Integrity

- Administering medications as prescribed specific to the gastrointestinal disorder
- Assessing for signs and symptoms of infectious diseases of the gastrointestinal tract
- Assisting with personal hygiene
- Monitoring elimination patterns
- Monitoring for complications related to tests, procedures, and surgical interventions
- Monitoring for fluid and electrolyte imbalances
- Monitoring laboratory values related to gastrointestinal disorders
- Monitoring parenterally administered fluids, including parenteral nutrition
- Providing adequate nutrition and oral hydration
- Providing care for gastrointestinal tubes
- Providing nonpharmacological and pharmacological comfort measures
- Providing preprocedure and postprocedure care for diagnostic tests related to the gastrointestinal system

# Gastrointestinal System

## I. ANATOMY AND PHYSIOLOGY

### A. Functions of the gastrointestinal system

1. Process food substances
2. Absorb the products of digestion into the blood
3. Excrete unabsorbed materials
4. Provide an environment for microorganisms to synthesize nutrients, such as vitamin K
5. For risk factors associated with the gastrointestinal system, see Box 56-1.

### B. Mouth

1. Contains the lips, cheeks, palate, tongue, teeth, salivary glands, muscles, and maxillary bones
2. Saliva contains the enzyme amylase (ptyalin), which aids in digestion.

### C. Esophagus

1. Collapsible muscular tube about 10 inches long
2. Carries food from the pharynx to the stomach

### D. The stomach

1. Contains the cardia, fundus, the body, and the pylorus
2. Mucous glands are located in the mucosa and prevent autodigestion by providing an alkaline protective covering.
3. The lower esophageal (cardiac) sphincter prevents reflux of gastric contents into the esophagus.
4. The pyloric sphincter regulates the rate of stomach emptying into the small intestine.
5. Hydrochloric acid kills microorganisms, breaks food into small particles, and provides a chemical environment that facilitates gastric enzyme activation.
6. Pepsin is the chief coenzyme of gastric juice, which converts proteins into proteases and peptones.
7. Intrinsic factor is necessary for the absorption of vitamin B<sub>12</sub>.
8. Gastrin controls gastric acidity.

### E. Small intestine

1. The duodenum contains the openings of the bile and pancreatic ducts.
2. The jejunum is about 8 feet long.
3. The ileum is about 12 feet long.
4. The small intestine terminates in the cecum.

### F. Pancreatic intestinal juice enzymes

1. Amylase digests starch to maltose.
2. Maltase reduces maltose to monosaccharide glucose.
3. Lactase splits lactose into galactose and glucose.
4. Sucrase reduces sucrose to fructose and glucose.
5. Nucleases split nucleic acids to nucleotides.
6. Enterokinase activates trypsinogen to trypsin.

### G. Large intestine

1. About 5 feet long
2. Absorbs water and eliminates wastes
3. Intestinal bacteria play a vital role in the synthesis of some B vitamins and vitamin K.
4. Colon: Includes the ascending, transverse, descending, and sigmoid colons and rectum
5. The ileocecal valve prevents contents of the large intestine from entering the ileum.
6. The anal sphincters control the anal canal.

### H. Peritoneum: Lines the abdominal cavity and forms the mesentery that supports the intestines and blood supply

### I. Liver

1. The largest gland in the body, weighing 3 to 4 pounds
2. Contains Kupffer's cells, which remove bacteria in the portal venous blood
3. Removes excess glucose and amino acids from the portal blood
4. Synthesizes glucose, amino acids, and fats
5. Aids in the digestion of fats, carbohydrates, and proteins
6. Stores and filters blood (200 to 400 mL of blood stored)
7. Stores vitamins A, D, and B and iron
8. The liver secretes bile to emulsify fats (500 to 1000 mL of bile/day).
9. Hepatic ducts
  - a. Deliver bile to the gallbladder via the cystic duct and to the duodenum via the common bile duct.
  - b. The common bile duct opens into the duodenum, with the pancreatic duct at the ampulla of Vater.

**Box 56-1 Risk Factors Associated With the Gastrointestinal System**

Allergic reactions to food or medications  
 Cardiac, respiratory, and endocrine disorders that may lead to slowed gastrointestinal (GI) movement or constipation  
 Chronic alcohol use  
 Chronic high stress levels  
 Chronic laxative use  
 Chronic use of aspirin or nonsteroidal anti-inflammatory drugs  
 Diabetes mellitus, which may predispose to oral candidal infections or other GI disorders  
 Family history of GI disorders  
 Long-term GI conditions, such as ulcerative colitis, that may predispose to colorectal cancer  
 Neurological disorders that can impair movement, particularly with chewing and swallowing  
 Previous abdominal surgery or trauma, which may lead to adhesions  
 Tobacco use

- c. The sphincter prevents the reflux of intestinal contents into the common bile duct and pancreatic duct.

**J. Gallbladder**

1. Stores and concentrates bile and contracts to force bile into the duodenum during the digestion of fats
2. The cystic duct joins the hepatic duct to form the common bile duct.
3. The sphincter of Oddi is located at the entrance to the duodenum.
4. The presence of fatty materials in the duodenum stimulates the liberation of cholecystokinin, which causes contraction of the gallbladder and relaxation of the sphincter of Oddi.

**K. Pancreas**

1. Exocrine gland
  - a. Secretes sodium bicarbonate to neutralize the acidity of the stomach contents that enter the duodenum
  - b. Pancreatic juices contain enzymes for digesting carbohydrates, fats, and proteins.
2. Endocrine gland
  - a. Secretes glucagon to raise blood glucose levels and secretes somatostatin to exert a hypoglycemic effect
  - b. The islets of Langerhans secrete insulin.
  - c. Insulin is secreted into the bloodstream and is important for carbohydrate metabolism.

**II. DIAGNOSTIC PROCEDURES** (Box 56-2)

- A. Upper gastrointestinal tract study (barium swallow)**
  1. Description: Examination of the upper gastrointestinal tract under fluoroscopy after the client drinks barium sulfate

**Box 56-2 Gastrointestinal System Diagnostic Studies\***

Anoscopy, proctoscopy, and sigmoidoscopy  
 Cholecystography  
 Defecography  
 Endoscopic retrograde cholangiopancreatography  
 Fiberoptic colonoscopy  
 Gastric analysis  
 Gastrointestinal motility studies  
 Hydrogen and urea breath test  
 Laparoscopy (peritoneoscopy)  
 Liver and pancreas laboratory studies  
 Liver biopsy  
 Lower gastrointestinal tract study (barium enema)  
 Paracentesis  
 Percutaneous transhepatic cholangiography  
 Stool specimens  
 Upper gastrointestinal fiberoscopy or esophagogastroduodenoscopy  
 Upper gastrointestinal tract study (barium swallow)

\*Informed consent is obtained for a diagnostic study that is invasive.

2. Preprocedure: NPO after midnight the day of the test
3. Postprocedure
  - a. A laxative may be prescribed.
  - b. Instruct the client to increase oral fluid intake to help pass the barium.
  - c. Monitor stools for the passage of barium (stools will appear chalky white) because barium can cause a bowel obstruction.

**B. Lower gastrointestinal tract study (barium enema)**

1. Description
  - a. A fluoroscopic and radiographic examination of the large intestine is performed after rectal instillation of barium sulfate.
  - b. The study may be done with or without air.
2. Preprocedure
  - a. A low-fiber diet is given for 1 to 2 days before the test.
  - b. A clear liquid diet and laxative are given the evening before the test.
  - c. NPO after midnight the day of the test
  - d. Cleansing enemas may be prescribed on the morning of the test.
3. Postprocedure
  - a. Instruct the client to increase oral fluid intake to help pass the barium.
  - b. Administer a mild laxative as prescribed to facilitate emptying of the barium.
  - c. Monitor stools for the passage of barium.
  - d. Notify the physician if a bowel movement does not occur within 2 days.

**C. Gastric analysis**

1. Description
  - a. Gastric analysis requires the passage of a nasogastric tube into the stomach to aspirate gastric

contents for the analysis of acidity (pH), appearance, and volume; the entire gastric contents are aspirated, and then specimens are collected every 15 minutes for 1 hour.

- b. Histamine or pentagastrin may be administered subcutaneously to stimulate gastric secretions; these medications may produce a flushed feeling.
  - c. Esophageal reflux of gastric acid may be diagnosed by ambulatory pH monitoring; a probe is placed just above the lower esophageal sphincter and connected to an external recording device. It provides a computer analysis and graphic display of results.
2. Preprocedure
    - a. Fasting for 8 to 12 hours is required before the test.
    - b. Use of tobacco and chewing gum are avoided for 6 hours before the test.
    - c. Medications that stimulate gastric secretions are withheld for 24 to 48 hours.
  3. Postprocedure
    - a. Client may resume normal activities.
    - b. Refrigerate gastric samples if not tested within 4 hours.

#### D. Upper gastrointestinal fiberoscopy

1. Description
  - a. Also known as esophagogastroduodenoscopy
  - b. Following sedation, an endoscope is passed down the esophagus to view the gastric wall, sphincters, and duodenum; tissue specimens can be obtained.
2. Preprocedure
  - a. The client must be NPO for 6 to 12 hours before the test.
  - b. A local anesthetic (spray or gargle) is administered along with medication that provides conscious sedation and relieves anxiety, such as intravenous (IV) midazolam (Versed), just before the scope is inserted.
  - c. Atropine sulfate may be administered to reduce secretions, and glucagon may be administered to relax smooth muscle.
  - d. Client is positioned on the left side to facilitate saliva drainage and to provide easy access of the endoscope.
  - e. Airway patency is monitored during the test and pulse oximetry is used to monitor oxygen saturation; emergency equipment should be readily available.
3. Postprocedure
  - a. Client must be NPO until the gag reflex returns (1 to 2 hours).
  - b. Monitor for signs of perforation (pain, bleeding, unusual difficulty swallowing, elevated temperature).
  - c. Maintain bedrest for the sedated client until alert.

d. Lozenges, saline gargles, or oral analgesics can relieve a minor sore throat (not given to the client until the gag reflex returns).

- E. Anoscopy, proctoscopy, and sigmoidoscopy
  1. Description
    - a. Anoscopy requires the use of a rigid scope to examine the anal canal; the client is placed in the knee-chest or left lateral position.
    - b. Proctoscopy and sigmoidoscopy require the use of a flexible scope to examine the rectum and sigmoid colon; the client is placed on the left side with the right leg bent and placed anteriorly.
    - c. Biopsies and polypectomies can be performed.
  2. Preprocedure: Enemas are administered to cleanse the bowel.
  3. Postprocedure: Monitor for rectal bleeding and signs of perforation and peritonitis (Box 56-3).
- F. Fiberoptic colonoscopy
  1. Description
    - a. Colonoscopy is a fiberoptic endoscopy study in which the lining of the large intestine is visually examined; biopsies and polypectomies can be performed.
    - b. Cardiac and respiratory function are monitored continuously during the test.
    - c. Colonoscopy is performed with the client lying on the left side with the knees drawn up to the chest; position may be changed during the test to facilitate passing of the scope.
  2. Preprocedure
    - a. Adequate cleansing of the colon is necessary, as prescribed by the physician.
    - b. A clear liquid diet is started at noon on the day before the test.
    - c. Consult with the physician regarding medications that must be withheld before the test.
    - d. Client is NPO after midnight on the day of the test.
    - e. A mild sedative is administered intravenously.
    - f. Glucagon may be administered to relax smooth muscle.
  3. Postprocedure
    - a. Provide bedrest until alert.
    - b. Monitor for signs of bowel perforation and peritonitis (see Box 56-3).

#### Box 56-3 Signs of Bowel Perforation and Peritonitis

Guarding of the abdomen  
 Increased fever and chills  
 Pallor  
 Progressive abdominal distention and abdominal pain  
 Restlessness  
 Tachycardia and tachypnea

- c. Instruct the client to report any bleeding to the physician.

 The client receiving enemas is at risk for fluid and electrolyte imbalances.

- G.** Laparoscopy (peritoneoscopy) is performed with a fiberoptic laparoscope that allows direct visualization of organs and structures within the abdomen; biopsies may be obtained.

- H.** Cholecystography

1. Description: Performed to detect gallstones and assess the ability of the gallbladder to fill, concentrate its contents, contract, and empty
2. Preprocedure
  - a. Assess for allergies to iodine or seafood.
  - b. Contrast agents may be administered 10 to 12 hours (evening before) before the test.
  - c. Client is NPO after the contrast agent is administered.
  - d. Instruct the client that if a rash, itching, hives, or difficulty in breathing occurs after taking the contrast agent to report to the emergency department.
3. Postprocedure
  - a. Inform the client that dysuria is common because the contrast agent is excreted in the urine.
  - b. A normal diet may be resumed (a fatty meal may enhance excretion of the contrast agent).

- I.** Endoscopic retrograde cholangiopancreatography (ERCP)

1. Description
  - a. Examination of the hepatobiliary system is performed via a flexible endoscope inserted into the esophagus to the descending duodenum; multiple positions are required during the procedure to pass the endoscope.
  - b. If medication is administered before the procedure, the client is monitored closely for signs of respiratory and central nervous system depression, hypotension, oversedation, and vomiting.
2. Preprocedure
  - a. Client is NPO for several hours before the procedure.
  - b. Sedation is administered before the procedure.
3. Postprocedure
  - a. Monitor vital signs.
  - b. Monitor for the return of the gag reflex.
  - c. Monitor for signs of perforation (see Box 56-3) or peritonitis.

- J.** Endoscopic ultrasonography

1. Description: provides images of the GI wall and digestive organs.
2. Preprocedure and postprocedure: Care is similar to that implemented for endoscopy.

 Following endoscopic procedures, monitor for the return of a gag reflex before giving the client any oral substance. If the gag reflex has not returned, the client could aspirate.

- K.** Percutaneous transhepatic cholangiography

1. Description
  - a. The examination involves the injection of dye directly into the biliary tree.
  - b. The hepatic ducts within the liver, the entire length of the common bile duct, the cystic duct, and the gallbladder are outlined clearly.
2. Preprocedure
  - a. Client is NPO.
  - b. Sedating medication is administered.
3. Postprocedure
  - a. Monitor vital signs.
  - b. Monitor for signs of bleeding, peritonitis (see Box 56-3), and septicemia; report the presence of pain immediately.
  - c. Administer antibiotics as prescribed to reduce the risk of sepsis.

- L.** Paracentesis (see Priority Nursing Actions)

1. Description: Transabdominal removal of fluid from the peritoneal cavity for analysis 
2. Preprocedure
  - a. Have the client void before the start of procedure to empty the bladder and to move the bladder out of the way of the paracentesis needle. 
  - b. Measure abdominal girth, weight, and baseline vital signs. 
  - c. Note that the client is positioned upright on the edge of the bed, with the back supported and the feet resting on a stool (or Fowler's position in bed). 

 The rapid removal of fluid from the abdominal cavity during paracentesis leads to decreased abdominal pressure, which can cause vasodilation and resultant shock.

3. Postprocedure
  - a. Monitor vital signs.
  - b. Measure fluid collected, describe, and record.
  - c. Label fluid samples and send to the laboratory for analysis.
  - d. Apply a dry sterile dressing to the insertion site; monitor site for bleeding.
  - e. Measure abdominal girth and weight. 
  - f. Monitor for hypovolemia, electrolyte loss, mental status changes, or encephalopathy.
  - g. Monitor for hematuria caused by bladder trauma. 
  - h. Instruct the client to notify the physician if the urine becomes bloody, pink, or red. 

### PRIORITY NURSING ACTIONS!

#### Actions to Take in Caring for a Client With a Paracentesis

1. Ensure that the client understands the procedure and that informed consent has been obtained.
2. Obtain vital signs, including weight.
3. Have the client void.
4. Position the client upright.
5. Assist the physician, monitor vital signs, and provide comfort and support during the procedure.
6. Apply a dressing to the site of puncture.
7. Monitor vital signs, weigh the client, and maintain the client on bedrest.
8. Measure the amount of fluid removed.
9. Label and send the fluid for laboratory analysis.
10. Document the event, client's response, appearance and amount of fluid removed.

Paracentesis is the transabdominal removal of fluid from the peritoneal cavity. The nurse first ensures that the client understands the procedure and that informed consent has been obtained because the procedure is invasive. The nurse next obtains preprocedure vital signs, including weight so that a baseline is obtained. Weight is taken before and after the procedure to provide an indication of the effectiveness of the procedure in fluid removal. The client is positioned upright on the edge of the bed with the back supported and the feet resting on a stool or in a Fowler's position in bed. The nurse assists the physician, monitors vital signs per protocol, and provides comfort and support to the client during the procedure. Once the procedure is complete the nurse applies a dressing to the site of puncture and monitors for leakage or bleeding. The client is placed in a position of comfort, bedrest is maintained as prescribed, and vital signs are monitored to assess for complications. The fluid removed from the client is measured, labeled and sent to the laboratory for analysis. The nurse documents the event, the client's response, the appearance and amount of fluid removed, and any additional pertinent data.

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care*. (6th ed., p. 1352). St. Louis: Saunders.

#### M. Liver biopsy

1. Description: A needle is inserted through the abdominal wall to the liver to obtain a tissue sample for biopsy and microscopic examination.
2. Preprocedure
  - a. Assess results of coagulation tests (prothrombin time, partial thromboplastin time, platelet count).
  - b. Administer a sedative as prescribed.
  - c. Note that the client is placed in the supine or left lateral position during the procedure to expose the right side of the upper abdomen.
3. Postprocedure
  - a. Assess vital signs.
  - b. Assess biopsy site for bleeding.

- c. Monitor for peritonitis (see Box 56-3).
- d. Maintain bedrest for several hours.
- e. Place the client on the right side with a pillow under the costal margin to decrease the risk of hemorrhage, and instruct the client to avoid coughing and straining.
- f. Instruct the client to avoid heavy lifting and strenuous exercise for 1 week.

 Following a liver biopsy, place the client on the right side with a pillow under the costal margin at the anatomical location of the liver to decrease the risk of hemorrhage.

#### N. Stool specimens

1. Testing of stool specimens includes inspecting the specimen for consistency and color and testing for occult blood.
2. Tests for fecal urobilinogen, fat, nitrogen, parasites, pathogens, food substances, and other substances may be performed; these tests require that the specimen be sent to the laboratory.
3. Random specimens are sent promptly to the laboratory.
4. Quantitative 24- to 72-hour collections must be kept refrigerated until they are taken to the laboratory.
5. Some specimens require that a certain diet be followed or that certain medications be withheld; check agency guidelines regarding specific procedures.

#### O. Urea breath test

1. The urea breath test detects the presence of *Helicobacter pylori*, the bacteria that cause peptic ulcer disease.
2. The client consumes a capsule of carbon-labeled urea and provides a breath sample 10 to 20 minutes later.
3. Certain medications may need to be avoided before testing; these may include antibiotics or bismuth subsalicylate (Pepto-Bismol) for 1 month before the test; sucralfate (Carafate) and omeprazole (Prilosec) for 1 week before the test; and cimetidine (Tagamet), famotidine (Pepcid), ranitidine (Zantac), or nizatidine (Axid) for 24 hours before breath testing.
4. *H. pylori* can also be detected by assessing serum antibody levels.

#### P. Liver and pancreas laboratory studies (see Chapter 11)

1. Alkaline phosphatase is released during liver damage or biliary obstruction.
2. Prothrombin time is prolonged with liver damage.
3. The serum ammonia level assesses the ability of the liver to deaminate protein by-products.
4. Liver enzyme levels (transaminase studies) are elevated with liver damage.
5. An increase in cholesterol level indicates **pancreatitis** or biliary obstruction.

6. An increase in bilirubin level indicates liver damage or biliary obstruction.
7. Increased values for amylase and lipase levels indicate **pancreatitis**.

**III. ASSESSMENT** (See Chapter 34 for abdominal assessment techniques.)

**IV. GASTROINTESTINAL TUBES** (See Chapter 21 for information regarding these tubes.)

### V. GASTROESOPHAGEAL REFLUX DISEASE

#### A. Description

1. Gastroesophageal reflux is the backflow of gastric and duodenal contents into the esophagus.
2. The reflux is caused by an incompetent lower esophageal sphincter, pyloric stenosis, or motility disorder.

#### B. Assessment

1. Heartburn
2. Epigastric pain
3. Dyspepsia
4. Regurgitation
5. Pain and difficulty with swallowing
6. Hypersalivation

#### C. Interventions

1. Instruct the client to avoid factors that decrease lower esophageal sphincter pressure or cause esophageal irritation such as peppermint, chocolate, coffee, fried or fatty foods, carbonated beverages, alcoholic beverages, and cigarette smoking.
2. Instruct the client to eat a low-fat, high-fiber diet and to avoid eating and drinking 2 hours before bedtime, and wearing tight clothes; also, elevate the head of the bed on 6- to 8-inch blocks.
3. Avoid the use of anticholinergics, which delay stomach emptying; also, nonsteroidal anti-inflammatory medications and other medications that contain acetylsalicylic acid need to be avoided.
4. Instruct the client regarding prescribed medications, such as antacids, H<sub>2</sub>-receptor antagonists, or proton pump inhibitors.
5. Instruct the client regarding the administration of prokinetic medications, if prescribed, which accelerate gastric emptying.
6. If medical management is unsuccessful, surgery may be required; this involves a fundoplication (wrapping a portion of the gastric fundus around the sphincter area of the esophagus); surgery may be performed by laparoscopy.

### VI. GASTRITIS

#### A. Description

1. Inflammation of the stomach or gastric mucosa
2. Acute gastritis is caused by the ingestion of food contaminated with disease-causing

### Box 56-4 Assessment Findings in Acute and Chronic Gastritis

#### Acute

Abdominal discomfort  
Anorexia, nausea, and vomiting  
Headache  
Hiccupping

#### Chronic

Anorexia, nausea, and vomiting  
Belching  
Heartburn after eating  
Sour taste in the mouth  
Vitamin B<sub>12</sub> deficiency

microorganisms or food that is irritating or too highly seasoned, the overuse of aspirin or other nonsteroidal anti-inflammatory drugs (NSAIDs), excessive alcohol intake, bile reflux, or radiation therapy.

3. Chronic gastritis is caused by benign or malignant ulcers or by the bacteria *H. pylori*, and also may be caused by autoimmune diseases, dietary factors, medications, alcohol, smoking, or reflux.

#### B. Assessment (Box 56-4)

#### C. Interventions

1. Acute gastritis: Food and fluids may be withheld until symptoms subside; afterward, ice chips can be given, followed by clear liquids, and then solid food.
2. Monitor for signs of hemorrhagic gastritis such as hematemesis, tachycardia, and hypotension, and notify the physician if these signs occur.
3. Instruct the client to avoid irritating foods, fluids, and other substances, such as spicy and highly seasoned foods, caffeine, alcohol, and nicotine.
4. Instruct the client in the use of prescribed medications, such as antibiotics and antacids.
5. Provide the client with information about the importance of vitamin B<sub>12</sub> injections if a deficiency is present.

### VII. PEPTIC ULCER DISEASE

#### A. Description

1. A peptic ulcer is an ulceration in the mucosal wall of the stomach, pylorus, duodenum, or esophagus in portions accessible to gastric secretions; erosion may extend through the muscle.
2. The ulcer may be referred to as gastric, duodenal, or esophageal, depending on its location.
3. The most common peptic ulcers are gastric ulcers and duodenal ulcers.

#### B. Gastric ulcers

##### 1. Description

- a. A gastric ulcer involves ulceration of the mucosal lining that extends to the submucosal layer of the stomach.
- b. Predisposing factors include stress, smoking, the use of corticosteroids, NSAIDs, alcohol,

### Box 56-5 Assessment: Gastric and Duodenal Ulcers

#### Gastric

Gnawing, sharp pain in or left of the midepigastic region occurs 30 to 60 minutes after a meal (food ingestion accentuates the pain).

Hematemesis is more common than melena.

#### Duodenal

Burning pain occurs in the midepigastic area 1½ to 3 hours after a meal and during the night (often awakens the client).

Melena is more common than hematemesis.

Pain is often relieved by the ingestion of food.

history of gastritis, family history of gastric ulcers, or infection with *H. pylori*.

- c. Complications include hemorrhage, perforation, and pyloric obstruction.

#### 2. Assessment (Box 56-5)

#### 3. Interventions

- a. Monitor vital signs and for signs of bleeding.
- b. Administer small, frequent bland feedings during the active phase.
- c. Administer H<sub>2</sub>-receptor antagonists or proton pump inhibitors as prescribed to decrease the secretion of gastric acid.
- d. Administer antacids as prescribed to neutralize gastric secretions.
- e. Administer anticholinergics as prescribed to reduce gastric motility.
- f. Administer mucosal barrier protectants as prescribed 1 hour before each meal.
- g. Administer prostaglandins as prescribed for their protective and antisecretory actions.

#### 4. Client education

- a. Avoid consuming alcohol and substances that contain caffeine or chocolate.
- b. Avoid smoking.
- c. Avoid aspirin or NSAIDs.
- d. Obtain adequate rest and reduce stress.

#### 5. Interventions during active bleeding

- a. Monitor vital signs closely.
- b. Assess for signs of dehydration, hypovolemic shock, sepsis, and respiratory insufficiency.
- c. Maintain NPO status and administer IV fluid replacement as prescribed; monitor intake and output.
- d. Monitor hemoglobin and hematocrit.
- e. Administer blood transfusions as prescribed.
- f. Prepare to assist with administering medications as prescribed to induce vasoconstriction and reduce bleeding.

#### 6. Surgical interventions

- a. Total **gastrectomy**: Removal of the stomach with attachment of the esophagus to the

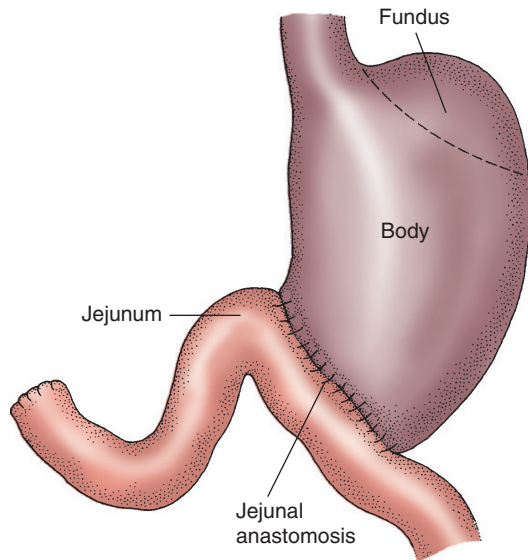

▲ **FIGURE 56-1** The Billroth I procedure (gastroduodenostomy). The distal portion of the stomach is removed, and the remainder is anastomosed to the duodenum. (From Ignatavicius, D., & Workman, M. [2006]. *Medical-surgical nursing: Critical thinking for collaborative care* [5th ed.]. St. Louis: Saunders.)

jejunum or duodenum; also called *esophago-jejunosomy* or *esophagoduodenostomy*

- b. **Vagotomy**: Surgical division of the vagus nerve to eliminate the vagal impulses that stimulate hydrochloric acid secretion in the stomach
- c. **Gastric resection**: Removal of the lower half of the stomach and usually includes a **vagotomy**; also called *antrectomy*
- d. **Billroth I**: Partial **gastrectomy**, with the remaining segment anastomosed to the duodenum; also called *gastroduodenostomy* (Fig. 56-1)
- e. **Billroth II**: Partial **gastrectomy**, with the remaining segment anastomosed to the jejunum; also called *gastrojejunosomy* (Fig. 56-2)
- f. **Pyloroplasty**: Enlargement of the pylorus to prevent or decrease pyloric obstruction, thereby enhancing gastric emptying

#### 7. Postoperative interventions

- a. Monitor vital signs.
- b. Place in a Fowler's position for comfort and to promote drainage.
- c. Administer fluids and electrolyte replacements intravenously as prescribed; monitor intake and output.
- d. Assess bowel sounds.
- e. Monitor nasogastric suction as prescribed.
- f. Maintain NPO status as prescribed for 1 to 3 days until **peristalsis** returns.
- g. Progress the diet from NPO to sips of clear water to six small bland meals a day, as prescribed when bowel sounds return.
- h. Monitor for postoperative complications of hemorrhage, **dumping syndrome**, diarrhea, hypoglycemia, and vitamin B<sub>12</sub> deficiency.

**▲ FIGURE 56-2** The Billroth II procedure (gastrojejunostomy). The lower portion of the stomach is removed, and the remainder is anastomosed to the jejunum. (From Ignatavicius, D., & Workman, M. [2006]. *Medical-surgical nursing: Critical thinking for collaborative care* [5th ed.]. St. Louis: Saunders.)

**⚠** Following gastric surgery, do not irrigate or remove the nasogastric (NG) tube unless specifically prescribed because of the risk for disruption of the gastric sutures. Monitor closely to ensure proper functioning of the NG tube to prevent strain on the anastomosis site. Contact the physician if the tube is not functioning properly.

### C. Duodenal ulcers

#### 1. Description

- A duodenal ulcer is a break in the mucosa of the duodenum.
- Risk factors and causes include infection with *H. pylori*; alcohol intake; smoking; stress; caffeine; the use of aspirin, corticosteroids, and NSAIDs.
- Complications include bleeding, perforation, gastric outlet obstruction, and intractable disease.

#### 2. Assessment (see Box 56-5)

#### 3. Interventions

- Monitor vital signs.
- Instruct the client about a bland diet, with small frequent meals.
- Provide for adequate rest.
- Encourage the cessation of smoking.
- Instruct the client to avoid alcohol intake, caffeine, the use of aspirin, corticosteroids, and NSAIDs.
- Administer medications to treat *H. pylori* and antacids to neutralize acid secretions as prescribed.

### Box 56-6 Client Education: Preventing Dumping Syndrome

Avoid sugar, salt, and milk.

Eat a high-protein, high-fat, low-carbohydrate diet.

Eat small meals and avoid consuming fluids with meals.

Lie down after meals.

Take antispasmodic medications as prescribed to delay gastric emptying.

- Administer H<sub>2</sub>-receptor antagonists or proton pump inhibitors as prescribed to block the secretion of acid.
- Surgical interventions: Surgery is performed only if the ulcer is unresponsive to medications or if hemorrhage, obstruction, or perforation occurs.

### D. Dumping syndrome

- Description: The rapid emptying of the gastric contents into the small intestine that occurs following **gastric resection**
- Assessment
  - Symptoms occurring 30 minutes after eating
  - Nausea and vomiting
  - Feelings of abdominal fullness and abdominal cramping
  - Diarrhea
  - Palpitations and tachycardia
  - Perspiration
  - Weakness and dizziness
  - Borborygmi (loud gurgles indicating hyperperistalsis)
- Client education (Box 56-6)

## VIII. VITAMIN B<sub>12</sub> DEFICIENCY

### A. Description

- Vitamin B<sub>12</sub> deficiency results from an inadequate intake of vitamin B<sub>12</sub> or a lack of absorption of ingested vitamin B<sub>12</sub> from the intestinal tract.
- Pernicious anemia results from a deficiency of intrinsic factor, necessary for intestinal absorption of vitamin B<sub>12</sub>; gastric disease or surgery can result in a lack of intrinsic factor.

### B. Assessment

- Severe pallor
- Fatigue
- Weight loss
- Smooth, beefy red tongue
- Slight jaundice
- Paresthesias of the hands and feet
- Disturbances with gait and balance

### C. Interventions

- Increase dietary intake of foods rich in vitamin B<sub>12</sub> if the anemia is the result of a dietary deficiency (Box 56-7).

**Box 56-7 Foods Rich in Vitamin B<sub>12</sub>**

|                         |             |
|-------------------------|-------------|
| Brewer's yeast          | Liver       |
| Citrus fruits           | Nuts        |
| Dried beans             | Organ meats |
| Green, leafy vegetables |             |

**Box 56-8 Community Resources Following Bariatric Surgery**

American Obesity Association  
 American Society of Bariatric Surgery  
 Overeaters Anonymous

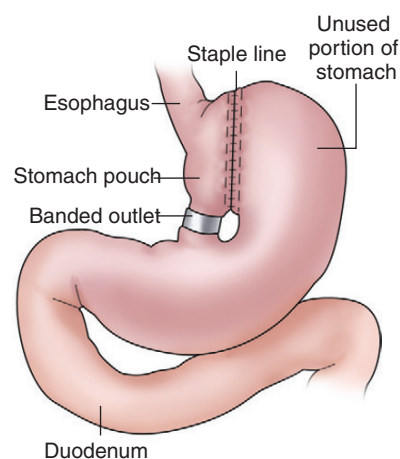

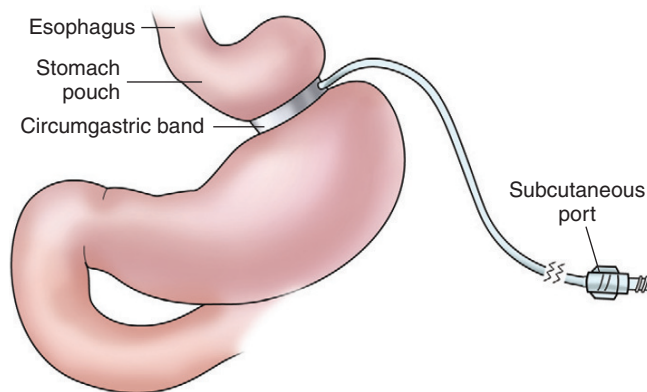

- Administer vitamin B<sub>12</sub> injections as prescribed weekly initially and then monthly for maintenance (lifelong) if the anemia is the result of a deficiency of intrinsic factor or disease or surgery of the ileum.

**IX. BARIATRIC SURGERY****A. Description**

- Surgical reduction of gastric capacity that may be performed on a client with morbid obesity to produce permanent weight loss
- Surgery may be performed by laparoscope; the decision is based on the client's weight, body build, history of abdominal surgery, and current medical disorders.
- Obese clients are at increased postoperative risk for pulmonary and thromboembolic complications and death.
- Surgery can prevent the complications of obesity, such as diabetes mellitus, hypertension and other cardiovascular disorders, depression, or sleep apnea.
- The client needs to agree to modify his or her lifestyle, lose weight and keep the weight off, and obtain support from available community resources (Box 56-8).

**B. Types (Fig. 56-3)**

- Gastric restrictive surgery
  - Allows for normal digestion without the risk of nutritional deficiency
  - A vertical banded gastroplasty may be performed; the surgeon places a vertical line of staples to create a small stomach pouch to which the band is connected to provide an outlet to the small intestine.
  - A circumgastric banding may be performed; an inflatable band is placed around the stomach to limit stomach size; the band can be inflated or deflated through a subcutaneous port to change the size of the stomach as the client loses weight.
- Gastric restriction combined with malabsorption surgery

**Gastric Bypass****Vertical Banded Gastroplasty****Circumgastric Banding**

**▲ FIGURE 56-3** Bariatric surgical procedures. (From Ignatavicius, D., & Workman, M. [2006]. *Medical-surgical nursing: Critical thinking for collaborative care* [5th ed.]. St. Louis: Saunders.)

- Known as a gastric bypass or Roux-en-Y gastric bypass
- In addition to stapling, the stomach, duodenum, and part of the ileum are bypassed so that fewer calories can be absorbed.

### Box 56-9 Dietary Measures for the Client Following Bariatric Surgery

Avoid alcohol, high-protein foods, and foods high in sugar and fat.

Eat slowly and chew food well.

Progress food types and amounts as prescribed.

Take nutritional supplements as prescribed, which may include calcium, iron, multivitamins, and vitamin B<sub>12</sub>.

Monitor and report signs and symptoms of complications, such as dehydration.

#### C. Postoperative interventions

- Care is similar to that for the client undergoing abdominal surgery.
- Clear liquids are introduced slowly once bowel sounds have returned and the client passes flatus (1-oz cups are used for each serving).
- Clear fluids are followed by puréed foods, juices, thin soups, and milk 24 to 48 hours after clear fluids are tolerated (the diet is usually limited to liquids or puréed foods for 6 weeks); then the diet is progressed to nutrient-dense regular food.

#### D. Client teaching points about diet (Box 56-9)

### X. GASTRIC CANCER (see Chapter 52)

### XI. HIATAL HERNIA

#### A. Description

- A **hiatal hernia** is also known as esophageal or diaphragmatic hernia.
- A portion of the stomach herniates through the diaphragm and into the thorax.
- Herniation results from weakening of the muscles of the diaphragm and is aggravated by factors that increase abdominal pressure such as pregnancy, **ascites**, obesity, tumors, and heavy lifting.
- Complications include ulceration, hemorrhage, regurgitation and aspiration of stomach contents, strangulation, and incarceration of the stomach in the chest with possible necrosis, peritonitis, and mediastinitis.

#### B. Assessment

- Heartburn
- Regurgitation or vomiting
- Dysphagia
- Feeling of fullness

#### C. Interventions

- Medical and surgical management are similar to those for gastroesophageal reflux disease.
- Provide small frequent meals and limit the amount of liquids taken with meals.
- Advise the client not to recline for 1 hour after eating.
- Avoid anticholinergics, which delay stomach emptying.

### XII. CHOLECYSTITIS

#### A. Description

- Inflammation of the gallbladder that may occur as an acute or chronic process
- Acute inflammation is associated with gallstones (cholelithiasis).
- Chronic **cholecystitis** results when inefficient bile emptying and gallbladder muscle wall disease cause a fibrotic and contracted gallbladder.
- Acalculous **cholecystitis** occurs in the absence of gallstones and is caused by bacterial invasion via the lymphatic or vascular system.

#### B. Assessment

- Nausea and vomiting
- Indigestion
- Belching
- Flatulence
- Epigastric pain that radiates to the scapula 2 to 4 hours after eating fatty foods and may persist for 4 to 6 hours
- Pain localized in right upper quadrant
- Guarding, rigidity, and rebound tenderness
- Mass palpated in the right upper quadrant
- Murphy's sign** (cannot take a deep breath when the examiner's fingers are passed below the hepatic margin because of pain)
- Elevated temperature
- Tachycardia
- Signs of dehydration

#### C. Biliary obstruction

- Jaundice
- Dark orange and foamy urine
- Steatorrhea and clay-colored feces
- Pruritus

#### D. Interventions

- Maintain NPO status during nausea and vomiting episodes.
- Maintain nasogastric decompression as prescribed for severe vomiting.
- Administer antiemetics as prescribed for nausea and vomiting.
- Administer analgesics as prescribed to relieve pain and reduce spasm.
- Administer antispasmodics (anticholinergics) as prescribed to relax smooth muscle.
- Instruct the client with chronic **cholecystitis** to eat small, low-fat meals.
- Instruct the client to avoid gas-forming foods.
- Prepare the client for nonsurgical and surgical procedures as prescribed.

#### E. Surgical interventions

- Cholecystectomy** is the removal of the gallbladder.
- Choledocholithotomy** requires incision into the common bile duct to remove the stone.
- Surgical procedures may be performed by laparoscopy.

**Box 56-10 Care of a T-Tube****Purpose and Description**

A T-tube is placed after surgical exploration of the common bile duct. The tube preserves the patency of the duct and ensures drainage of bile until edema resolves and bile is effectively draining into the duodenum. A gravity drainage bag is attached to the T-tube to collect the drainage.

**Interventions**

Position the client in a semi-Fowler's position to facilitate drainage.

Monitor the amount, color, consistency, and odor of the drainage.

Report sudden increases in bile output to the physician. Monitor for inflammation and protect the skin from irritation. Keep the drainage system below the level of the gallbladder. Monitor for foul odor and purulent drainage and report its presence to the physician.

Avoid irrigation, aspiration, or clamping of the T-tube without a physician's prescription.

As prescribed, clamp the tube before a meal and observe for abdominal discomfort and distention, nausea, chills, or fever; unclamp the tube if nausea or vomiting occurs.

**Box 56-11 Types of Cirrhosis****Laënnec's Cirrhosis**

Cirrhosis is alcohol-induced, nutritional, or portal. Cellular necrosis causes eventual widespread scar tissue, with fibrotic infiltration of the liver.

**Postnecrotic Cirrhosis**

Cirrhosis occurs after massive liver necrosis.

Cirrhosis results as a complication of hepatitis or exposure to hepatotoxins.

Scar tissue causes destruction of liver lobules and entire lobes.

**Biliary Cirrhosis**

Cirrhosis develops from chronic biliary obstruction, bile stasis, and inflammation, resulting in severe obstructive jaundice.

**Cardiac Cirrhosis**

Cirrhosis is associated with severe, right-sided congestive heart failure and results in an enlarged, edematous, congested liver.

The liver becomes anoxic, resulting in liver cell necrosis and fibrosis.

**F. Postoperative interventions**

1. Monitor for respiratory complications caused by pain at the incisional site.
2. Encourage coughing and deep breathing.
3. Encourage early ambulation.
4. Instruct the client about splinting the abdomen to prevent discomfort during coughing.
5. Administer antiemetics as prescribed for nausea and vomiting.
6. Administer analgesics as prescribed for pain relief.
7. Maintain NPO status and nasogastric tube suction as prescribed.
8. Advance diet from clear liquids to solids when prescribed and as tolerated by the client.
9. Maintain and monitor drainage from the T-tube, if present (Box 56-10).

**XIII. CIRRHOSIS (Box 56-11)****A. Description**

1. A chronic, progressive disease of the liver characterized by diffuse degeneration and destruction of hepatocytes
2. Repeated destruction of hepatic cells causes the formation of scar tissue.

**B. Complications**

1. **Portal hypertension:** A persistent increase in pressure in the portal vein that develops as a result of obstruction to flow
2. **Ascites**
  - a. Accumulation of fluid in the peritoneal cavity that results from venous congestion of the hepatic capillaries

- b. Capillary congestion leads to plasma leaking directly from the liver surface and portal vein.
3. Bleeding **esophageal varices:** Fragile, thin-walled, distended esophageal veins that become irritated and rupture
4. Coagulation defects
  - a. Decreased synthesis of bile fats in the liver prevents the absorption of fat-soluble vitamins.
  - b. Without vitamin K and clotting factors II, VII, IX, and X, the client is prone to bleeding.
5. Jaundice: Occurs because the liver is unable to metabolize bilirubin and because the edema, fibrosis, and scarring of the hepatic bile ducts interfere with normal bile and bilirubin secretion
6. Portal systemic encephalopathy: End-stage hepatic failure characterized by altered level of consciousness, neurological symptoms, impaired thinking, and neuromuscular disturbances; caused by failure of the diseased liver to detoxify neurotoxic agents such as ammonia.
7. Hepatorenal syndrome
  - a. Progressive renal failure associated with hepatic failure
  - b. Characterized by a sudden decrease in urinary output, elevated blood urea nitrogen and creatinine levels, decreased urine sodium excretion, and increased urine osmolarity

**C. Assessment (Fig. 56-4)****D. Interventions**

1. Elevate the head of the bed to minimize shortness of breath.
2. If **ascites** and edema are absent and the client does not exhibit signs of impending coma, a

Some dermatologic manifestations are noted in color (and marked with asterisks). (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

high-protein diet supplemented with vitamins is prescribed.

3. Provide supplemental vitamins (B complex, vitamins A, C, and K, folic acid, and thiamine) as prescribed.
4. Restrict sodium intake and fluid intake as prescribed.
5. Initiate enteral feedings or parenteral nutrition as prescribed.
6. Administer diuretics as prescribed to treat **ascites**.
7. Monitor intake and output and electrolyte balance.
8. Weigh client and measure abdominal girth daily (Fig. 56-5).
9. Monitor level of consciousness; assess for pre-coma state (tremors, delirium).

10. Monitor for **asterixis**, a coarse tremor characterized by rapid, nonrhythmic extensions and flexions in the wrist and fingers (Fig. 56-6).
11. Monitor for **fetor hepaticus**, the fruity, musty breath odor of severe chronic liver disease.
12. Maintain gastric intubation to assess bleeding or esophagogastric balloon tamponade to control bleeding varices if prescribed.
13. Administer blood products as prescribed.
14. Monitor coagulation laboratory results; administer vitamin K if prescribed.
15. Administer antacids as prescribed.
16. Administer lactulose (Constulose, Enulose) as prescribed, which decreases the pH of the bowel, decreases production of ammonia by bacteria in the bowel, and facilitates the excretion of ammonia.

▲ **FIGURE 56-5** How to measure abdominal girth. With the client supine, bring the tape measure around the client and take a measurement at the level of the umbilicus. Before removing the tape, mark the client's abdomen along the sides of tape on the client's flanks (sides) and midline to ensure that later measurements are taken at the same place. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

▲ **FIGURE 56-6** Eliciting asterixis (flapping tremor). Have the client extend the arm, dorsiflex the wrist, and extend the fingers. Observe for rapid, nonrhythmic extensions and flexions. (From Ignatavicius, D., & Workman, M. [2006]. *Medical-surgical nursing: Critical thinking for collaborative care* [5th ed.]. St. Louis: Saunders.)

#### XIV. ESOPHAGEAL VARICES

##### A. Description

1. Dilated and tortuous veins in the submucosa of the esophagus.
2. Caused by **portal hypertension**, often associated with liver **cirrhosis**; are at high risk for rupture if portal circulation pressure rises
3. Bleeding varices are an emergency.
4. The goal of treatment is to control bleeding, prevent complications, and prevent the recurrence of bleeding.

##### B. Assessment

1. Hematemesis
2. Melena
3. Tarry stools
4. **Ascites**
5. Jaundice
6. Hepatomegaly and splenomegaly
7. Dilated abdominal veins
8. Signs of shock

▲ **Rupture and resultant hemorrhage of the esophageal varices is the primary concern because it is a life-threatening situation.**

##### C. Interventions

1. Monitor vital signs.
2. Elevate the head of the bed.
3. Monitor for orthostatic hypotension.
4. Monitor lung sounds and for the presence of respiratory distress.
5. Administer oxygen as prescribed to prevent tissue hypoxia.
6. Monitor level of consciousness.
7. Maintain NPO status.
8. Administer fluids intravenously as prescribed to restore fluid volume and electrolyte imbalances; monitor intake and output.
9. Monitor hemoglobin and hematocrit values and coagulation factors.
10. Administer blood transfusions or clotting factors as prescribed.
11. Assist in inserting a nasogastric tube or a balloon tamponade as prescribed; balloon tamponade is not used frequently because it is very uncomfortable for the client and its use is associated with complications.
12. Prepare to assist with administering medications to induce vasoconstriction and reduce bleeding.
13. Instruct the client to avoid activities that will initiate vasovagal responses.
14. Prepare the client for endoscopic procedures or surgical procedures as prescribed.

##### D. Endoscopic injection (sclerotherapy)

1. The procedure involves the injection of a sclerosing agent into and around bleeding varices.

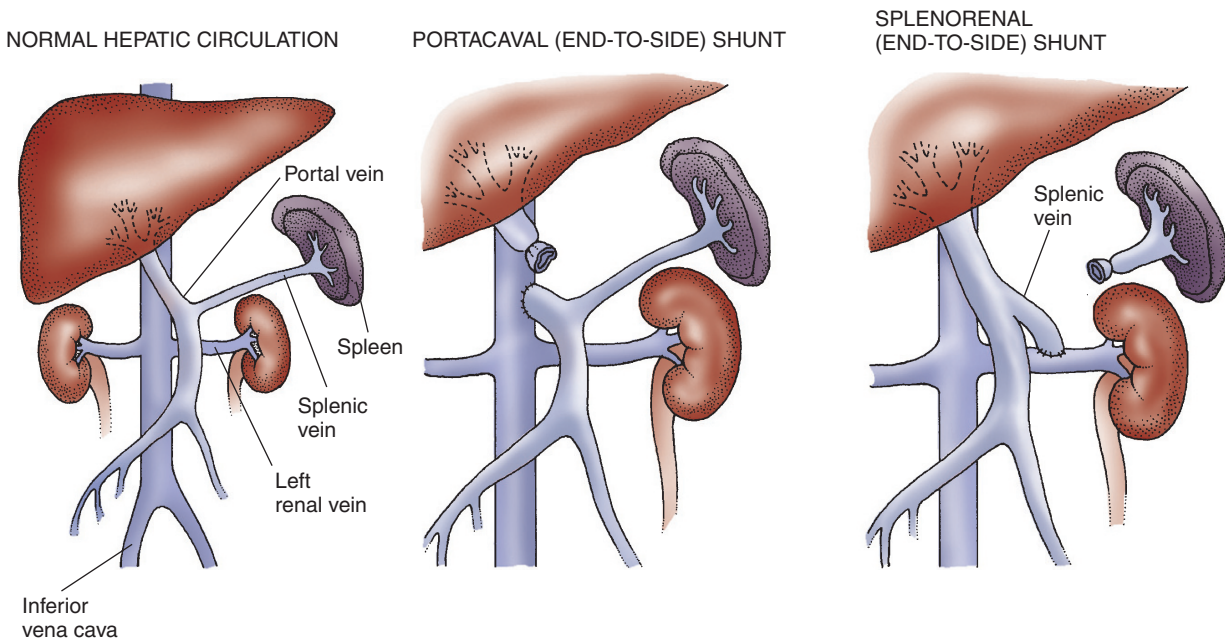

17. Administer antibiotics as prescribed to inhibit protein synthesis in bacteria and decrease the production of ammonia.

18. Avoid medications such as opioids, sedatives, and barbiturates and any hepatotoxic medications or substances.

19. Instruct the client about the importance of abstinence of alcohol intake.

20. Prepare the client for paracentesis to remove abdominal fluid.

21. Prepare the client for surgical shunting procedures if prescribed to divert fluid from **ascites** into the venous system.

▲ **FIGURE 56-7** Surgical shunting diverts portal venous blood flow from the liver to decrease portal and esophageal pressure. (From Ignatavicius, D., & Workman, M. [2006]. *Medical-surgical nursing: Critical thinking for collaborative care* [5th ed.]. St. Louis: Saunders.)

▲ **FIGURE 56-8** Total portal diversion after transjugular intrahepatic portosystemic shunt (TIPS). **A**, Portal venogram before TIPS shows filling of large esophageal varices (arrows). **B**, After insertion of a TIPS, flow to varices is eliminated. Intrahepatic portal vein flow is now reversed, with the direction of intrahepatic flow toward the TIPS. (From Lewis, S., Heitkemper, M., Dirksen, S., O'Brien, P., & Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

2. Complications include chest pain, pleural effusion, aspiration pneumonia, esophageal stricture, and perforation of the esophagus.
- E. Endoscopic variceal ligation**
1. The procedure involves ligation of the varices with an elastic rubber band.
  2. Sloughing, followed by superficial ulceration, occurs in the area of ligation within 3 to 7 days.
- F. Shunting procedures**
1. Description: Shunt blood away from the **esophageal varices**
  2. Portacaval shunt involves anastomosis of the portal vein to the inferior vena cava, diverting blood from the portal system to the systemic circulation (Fig. 56-7)
  3. Distal splenoportal shunt (see Fig. 56-7)
    - a. The shunt involves anastomosis of the splenic vein to the left renal vein.
      - b. The spleen conducts blood from the high pressure varices to the low pressure renal vein.
  4. Mesocaval shunting involves a side anastomosis of the superior mesenteric vein to the proximal end of the inferior vena cava.
  5. Transjugular intrahepatic portosystemic shunt (TIPS; Fig. 56-8)
    - a. The nonsurgical procedure uses the normal vascular anatomy of the liver to create a shunt with the use of a metallic stent.
    - b. The shunt is between the portal and systemic venous system in the liver and is aimed at relieving **portal hypertension**.

## XV. HEPATITIS

### A. Description

1. Inflammation of the liver caused by a virus, bacteria, or exposure to medications or hepatotoxins

2. The goals of treatment include resting the inflamed liver to reduce metabolic demands and increasing the blood supply, thus promoting cellular regeneration and preventing complications.

**B. Types of hepatitis**

1. **Hepatitis A virus (HAV)**
2. **Hepatitis B virus (HBV)**
3. **Hepatitis C virus (HCV)**
4. **Hepatitis D virus (HDV)**
5. **Hepatitis E virus (HEV)**

 **C. Stages of viral hepatitis (Box 56-12)**

**D. Assessment**

1. Preicteric stage
  - a. Flu-like symptoms—malaise, fatigue
  - b. Anorexia, nausea, vomiting, diarrhea
  - c. Pain—headache, muscle aches, polyarthrititis
  - d. Serum bilirubin and enzyme levels are elevated.
2. Icteric stage
  - a. Jaundice
  - b. Pruritus
  - c. Dark or tea-colored urine
  - d. Clay colored stools
  - e. Decrease in preicteric-phase symptoms
3. Posticteric stage
  - a. Increased energy levels
  - b. Subsiding of pain
  - c. Minimal to absent gastrointestinal symptoms
  - d. Serum bilirubin and enzyme levels return to normal.

**E. Laboratory assessment**

1. Alanine aminotransferase level: Elevated into the thousands (normal, 4 to 36 international units/L)
2. Aspartate aminotransferase level: Elevated into the thousands (normal, 8 to 33 units/L).
3. Alkaline phosphatase levels: May be normal or mildly elevated (normal, 4.5 to 13 King-Armstrong units/dL).
4. Total bilirubin levels: Elevated in the serum and urine (normal, lower than 1.5 mg/dL)

### Box 56-12 Stages of Viral Hepatitis

#### Preicteric Stage

The first stage of hepatitis preceding the appearance of jaundice; includes flu-like symptoms

#### Icteric Stage

The second stage of hepatitis; includes the appearance of jaundice and associated symptoms such as elevated bilirubin levels, dark or tea-colored urine, and clay-colored stools

#### Posticteric Stage

The convalescent stage of hepatitis, in which the jaundice decreases and the color of the urine and stool return to normal

## XVI. HEPATITIS A

**A. Description**

1. Formerly known as infectious **hepatitis**
2. Commonly seen during the fall and early winter

**B. Individuals at increased risk**

1. Commonly seen in young children
2. Individuals in institutionalized settings
3. Health care personnel

**C. Transmission**

1. Fecal-oral route
2. Person-to-person contact
3. Parenteral
4. Contaminated fruits, vegetables, or uncooked shellfish
5. Contaminated water or milk
6. Poorly washed utensils

**D. Incubation and infectious period**

1. Incubation period is 2 to 6 weeks.
2. Infectious period is 2 to 3 weeks before and 1 week after development of jaundice.

**E. Testing**

1. Infection is established by the presence of HAV antibodies (anti-HAV) in the blood.
2. Immunoglobulin M (IgM) and IgG are normally present in the blood, and increased levels indicate infection and inflammation.
3. Ongoing inflammation of the liver is evidenced by the presence of elevated levels of IgM antibodies, which persist in the blood for 4 to 6 weeks.
4. Previous infection is indicated by the presence of elevated levels of IgG antibodies.

**F. Complication: Fulminant (severe acute and often fatal) hepatitis**

**G. Prevention**

1. Strict handwashing
2. Stool precautions
3. Treatment of municipal water supplies
4. Serological screening of food handlers
5. **Hepatitis A vaccine (Havrix VAQTA)**
6. Immune globulin: For individuals exposed to HAV who have never received the **hepatitis A vaccine**; administer immune globulin during the period of incubation and within 2 weeks of exposure.
7. Immune globulin and **hepatitis A vaccine** are recommended for household members and sexual contacts of individuals with **hepatitis A**.
8. Preexposure prophylaxis with immunoglobulin is recommended to individuals traveling to countries with poor or uncertain sanitation conditions.

 **Strict and frequent handwashing is key to preventing the spread of all types of hepatitis.**

**XVII. HEPATITIS B**

- A. Description**
1. **Hepatitis B** is nonseasonal.
  2. All age groups are affected.
- B. Individuals at increased risk**
1. IV drug user
  2. Clients undergoing long-term hemodialysis
  3. Health care personnel
- C. Transmission**
1. Blood or body fluid contact
  2. Infected blood products
  3. Infected saliva or semen
  4. Contaminated needles
  5. Sexual contact
  6. Parenteral
  7. Perinatal period
  8. Blood or body fluids contact at birth
- D. Incubation period: 6 to 24 weeks**
- E. Testing**
1. Infection is established by the presence of **hepatitis B** antigen-antibody systems in the blood.
  2. Presence of **hepatitis B** surface antigen (HBsAg) is the serological marker to establish the diagnosis of **hepatitis B**.
  3. The client is considered infectious if these antigens are present in the blood.
  4. If the serological marker (HBsAg) is present after 6 months, it indicates a carrier state or chronic **hepatitis**.
  5. Normally, the serological marker (HBsAg) level declines and disappears after the acute **hepatitis B** episode.
  6. The presence of antibodies to HBsAg (anti-HBs) indicates recovery and immunity to **hepatitis B**.
  7. **Hepatitis B** early antigen (HBeAg) is detected in the blood about 1 week after the appearance of HBsAg and its presence determines the infective state of the client.
- F. Complications**
1. Fulminant **hepatitis**
  2. Chronic liver disease
  3. **Cirrhosis**
  4. Primary hepatocellular carcinoma
- G. Prevention**
1. Strict handwashing
  2. Screening blood donors
  3. Testing of all pregnant women
  4. Needle precautions
  5. Avoiding intimate sexual contact if test for **hepatitis B** surface antigen (HBsAg) is positive.
  6. **Hepatitis B** vaccine: Engerix-B (adult), Recombivax HB (pediatric); there is also an adult vaccine that protects against **hepatitis A** and **B** known as Twinrix.
  7. **Hepatitis B** immune globulin is for individuals exposed to HBV through sexual contact or

through the percutaneous or transmucosal routes who have never had **hepatitis B** and have never received **hepatitis B** vaccine.

**XVIII. HEPATITIS C**

- A. Description**
1. **Hepatitis C** virus infection occurs year-round.
  2. Infection can occur in any age group.
  3. Infection with HCV is common among IV drug users and is the major cause of post-transfusion **hepatitis**.
  4. Risk factors are similar to those for HBV because **hepatitis C** is also transmitted parenterally.
- B. Individuals at increased risk**
1. Parenteral drug users
  2. Clients receiving frequent transfusions
  3. Health care personnel
- C. Transmission: Same as for HBV, primarily through blood**
- D. Incubation period: 5 to 10 weeks**
- E. Testing: Anti-HCV is the antibody to HCV and is measured to detect chronic states of hepatitis C.**
- F. Complications**
1. Chronic liver disease
  2. **Cirrhosis**
  3. Primary hepatocellular carcinoma
- G. Prevention**
1. Strict handwashing
  2. Needle precautions
  3. Screening of blood donors

**XIX. HEPATITIS D**

- A. Description**
1. **Hepatitis D** is common in the Mediterranean and Middle Eastern areas.
  2. **Hepatitis D** occurs with **hepatitis B** and causes infection only in the presence of active HBV infection.
  3. Coinfection with the delta agent (HDV) intensifies the acute symptoms of **hepatitis B**.
  4. Transmission and risk of infection are the same as for HBV via contact with blood and blood products.
  5. Prevention of HBV infection with vaccine also prevents HDV infection, because HDV depends on HBV for replication.
- B. High-risk individuals**
1. Drug users
  2. Clients receiving hemodialysis
  3. Clients receiving frequent blood transfusions
- C. Transmission: Same as for HBV**
- D. Incubation period: 7 to 8 weeks**
- E. Testing: Serological HDV determination is made by detection of the hepatitis D antigen (HDAg) early in the course of the infection and by detection of anti-HDV antibody in the later disease stages.**

**Box 56-13 Home Care Instructions About Hepatitis**

Handwashing must be strict and frequent.

Do not share bathrooms unless the client strictly adheres to personal hygiene measures.

Individual washcloths, towels, drinking and eating utensils, and toothbrushes and razors must be labeled and identified.

The client must not prepare food for other family members. The client should avoid alcohol and over-the-counter medications, particularly acetaminophen (Tylenol) and sedatives, because these medications are hepatotoxic.

The client should increase activity gradually to prevent fatigue.

The client should consume small, frequent meals consisting of high-carbohydrate, low-fat foods.

The client is not to donate blood.

The client may maintain normal contact with persons as long as proper personal hygiene is maintained.

Close personal contact such as kissing should be discouraged until hepatitis B surface antigen test results are negative.

The client is to avoid sexual activity until hepatitis B surface antigen results are negative.

The client needs to carry a Medic-Alert card noting the date of hepatitis onset.

The client needs to inform other health professionals, such as medical or dental personnel, of the onset of hepatitis.

The client needs to keep follow-up appointments with the health care provider.

**F. Complications**

1. Chronic liver disease
2. Fulminant **hepatitis**

 **G. Prevention:** Because **hepatitis D** must coexist with **hepatitis B**, the precautions that help prevent **hepatitis B** are also useful in preventing delta **hepatitis**.

**XX. HEPATITIS E****A. Description**

1. **Hepatitis E** is a waterborne virus.
2. **Hepatitis E** is prevalent in areas where sewage disposal is inadequate or where communal bathing in contaminated rivers is practiced.
3. Risk of infection is the same as for HAV.
4. Infection with HEV presents as a mild disease except in infected women in the third trimester of pregnancy, who have a high mortality rate.

**B. Individuals with increased risk**

1. Travelers to countries that have a high incidence of **hepatitis E** such as India, Burma (Myanmar), Afghanistan, Algeria, and Mexico
2. Eating or drinking of food or water contaminated with the virus

 **C. Transmission:** Same as for HAV

**D. Incubation period:** 2 to 9 weeks

**E. Testing:** Specific serological tests for HEV include detection of IgM and IgG antibodies to **hepatitis E** (anti-HEV).

**F. Complications**

1. High mortality rate in pregnant women
2. Fetal demise

 **G. Prevention**

1. Strict handwashing
2. Treatment of water supplies and sanitation measures

**XXI. HEPATITIS G**

**A. Hepatitis G** is non-A, non-B, non-C **hepatitis**.

**B. Autoantibodies** are absent.

**C. Risk factors** are similar to those for **hepatitis C**.

**D. Hepatitis G** virus has been found in some blood donors, IV drug users, hemodialysis clients, and clients with hemophilia; however, **hepatitis G** virus does not appear to cause significant liver disease.

**XXII. CLIENT AND FAMILY HOME CARE INSTRUCTIONS FOR HEPATITIS (Box 56-13)****XXIII. PANCREATITIS****A. Description**

1. Acute or chronic inflammation of the pancreas, with associated escape of pancreatic enzymes into surrounding tissue
2. Acute **pancreatitis** occurs suddenly as one attack or can be recurrent, with resolutions.
3. Chronic **pancreatitis** is a continual inflammation and destruction of the pancreas, with scar tissue replacing pancreatic tissue.
4. Precipitating factors include trauma, the use of alcohol, biliary tract disease, viral or bacterial disease, hyperlipidemia, hypercalcemia, cholelithiasis, hyperparathyroidism, ischemic vascular disease, and peptic ulcer disease.

**B. Acute pancreatitis**

1. Assessment
  - a. Abdominal pain, including a sudden onset at a midepigastic or left upper quadrant location with radiation to the back 
  - b. Pain aggravated by a fatty meal, alcohol, or lying in a recumbent position 
  - c. Abdominal tenderness and guarding
  - d. Nausea and vomiting
  - e. Weight loss
  - f. Absent or decreased bowel sounds 
  - g. Elevated white blood cell count, and glucose, bilirubin, alkaline phosphatase, and urinary amylase levels 
  - h. Elevated serum lipase and amylase levels 

 Cullen's sign is the discoloration of the abdomen and periumbilical area. Turner's sign is the bluish discoloration of the flanks. Both signs are indicative of pancreatitis.

## 2. Interventions

- a. Maintain NPO status and maintain hydration with IV fluids as prescribed.
- b. Administer parenteral nutrition for severe nutritional depletion.
- c. Administer supplemental preparations and vitamins and minerals to increase caloric intake if prescribed.
- d. Maintain nasogastric tube to decrease gastric distention and suppress pancreatic secretion.
- e. Administer meperidine hydrochloride (Demerol) as prescribed for pain because it causes less incidence of smooth muscle spasm of the pancreatic ducts and sphincter of Oddi than some other medications.
- f. Administer antacids as prescribed to neutralize gastric secretions.
- g. Administer H<sub>2</sub>-receptor antagonists or proton pump inhibitors as prescribed to decrease hydrochloric acid production and prevent activation of pancreatic enzymes.
- h. Administer anticholinergics as prescribed to decrease vagal stimulation, decrease gastrointestinal motility, and inhibit pancreatic enzyme secretion.
- i.  Instruct the client in the importance of avoiding alcohol.
- j.  Instruct the client in the importance of follow-up visits with the physician.
- k.  Instruct the client to notify the physician if acute abdominal pain, jaundice, clay-colored stools, or dark-colored urine develops.

## C. Chronic pancreatitis

### 1. Assessment

- a.  Abdominal pain and tenderness
- b.  Left upper quadrant mass
- c.  Steatorrhea and foul-smelling stools that may increase in volume as pancreatic insufficiency increases
- d.  Weight loss
- e.  Muscle wasting
- f.  Jaundice
- g.  Signs and symptoms of diabetes mellitus

### 2. Interventions

- a.  Instruct the client in the prescribed dietary measures (fat and protein intake may be limited).
- b.  Instruct the client to avoid heavy meals.
- c.  Instruct the client about the importance of avoiding alcohol.
- d.  Provide supplemental preparations and vitamins and minerals to increase caloric intake.

- e.  Administer pancreatic enzymes as prescribed to aid in the digestion and absorption of fat and protein.
- f.  Administer insulin or oral hypoglycemic medications as prescribed to control diabetes mellitus, if present.
- g.  Instruct the client in the use of pancreatic enzyme medications.
- h.  Instruct the client in the treatment plan for glucose management.
- i.  Instruct the client to notify the physician if increased steatorrhea, abdominal distention or cramping, or skin breakdown develops.
- j.  Instruct the client in the importance of follow-up visits.

## XXIV. PANCREATIC TUMORS, INTESTINAL TUMORS, AND BOWEL OBSTRUCTIONS (See Chapter 52)

### XXV. ULCERATIVE COLITIS

#### A. Description

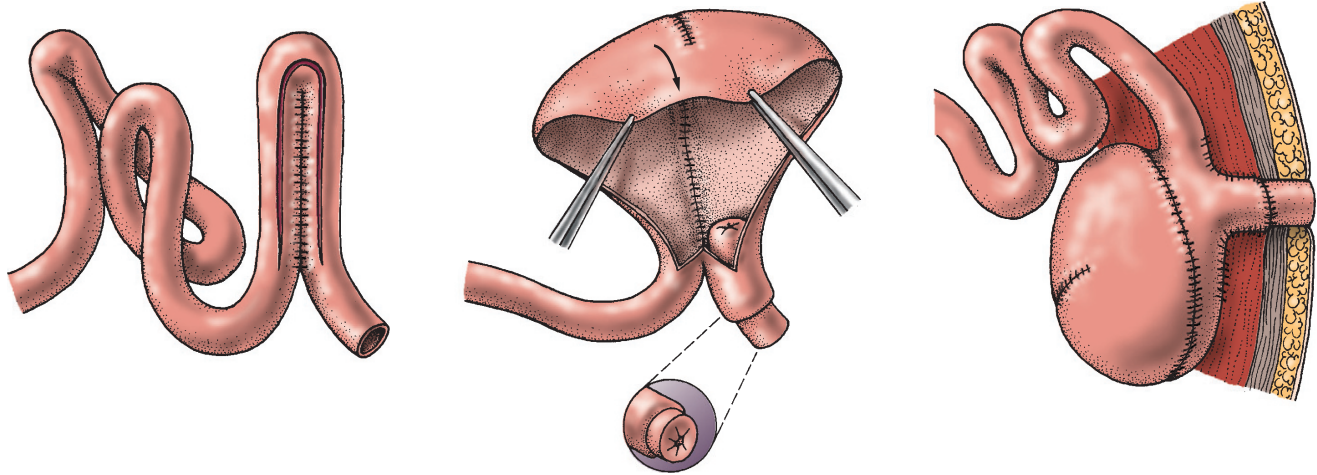

1. An ulcerative and inflammatory disease of the bowel that results in poor absorption of nutrients.
2. Commonly begins in the rectum and spreads upward toward the cecum
3. The colon becomes edematous and may develop bleeding lesions and ulcers; the ulcers may lead to perforation.
4. Scar tissue develops and causes loss of elasticity and loss of the ability to absorb nutrients.
5. Colitis is characterized by various periods of remissions and exacerbations.
6. Acute **ulcerative colitis** results in vascular congestion, hemorrhage, edema, and ulceration of the bowel mucosa.
7. Chronic **ulcerative colitis** causes muscular hypertrophy, fat deposits, and fibrous tissue, with bowel thickening, shortening, and narrowing.

#### B. Assessment

1.  Anorexia
2.  Weight loss
3.  Malaise
4.  Abdominal tenderness and cramping
5.  Severe diarrhea that may contain blood and mucus
6.  Malnutrition, dehydration, and electrolyte imbalances
7.  Anemia
8.  Vitamin K deficiency

#### C. Interventions

1.  Acute phase: Maintain NPO status and administer fluids and electrolytes intravenously or via parenteral nutrition as prescribed.
2.  Restrict the client's activity to reduce intestinal activity.
3.  Monitor bowel sounds and for abdominal tenderness and cramping.

1. A reservoir, in which the client will retain stool until draining it, is constructed from a loop of ileum folded and sutured together, then cut.

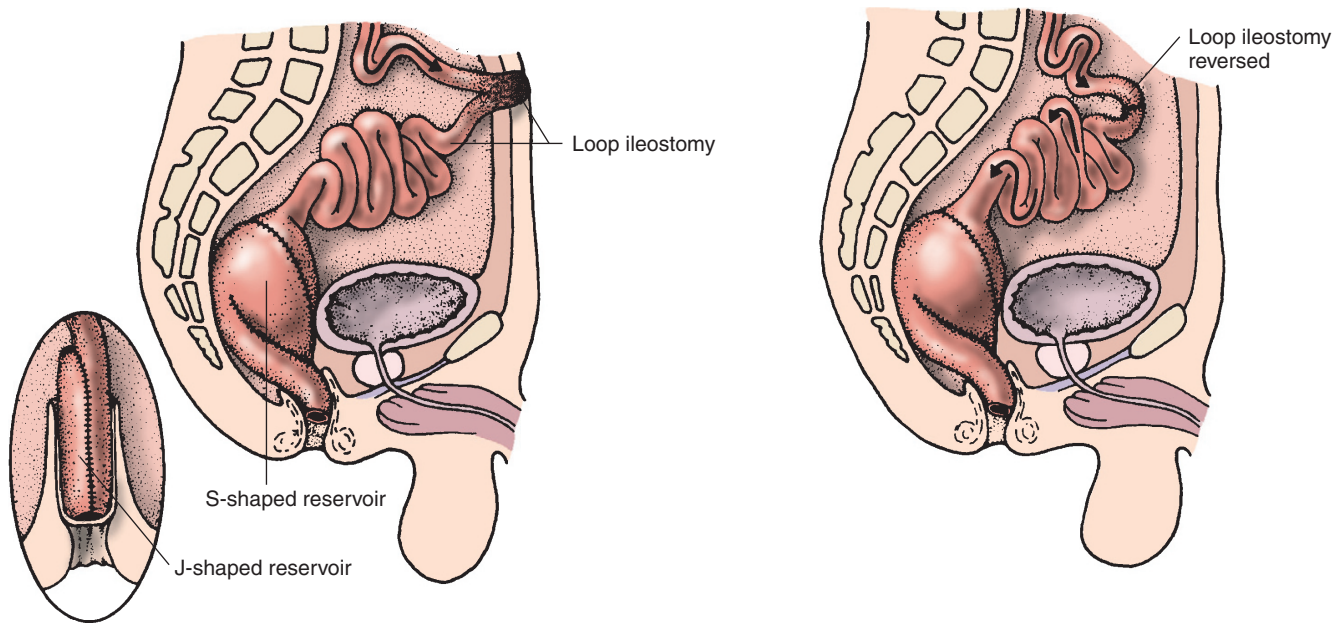

2. A portion of the ileum is intussuscepted to form a nipple valve, and the upper part of the stitched and cut ileum is pulled down and sutured to form a pouch.

3. The nipple valve, which shuts tight against pressure from a filled pouch, is pulled through the stoma and sutured flush with the abdomen.

▲ **FIGURE 56-9** Creation of a Kock (continent) ileostomy. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [5th ed.]. St. Louis: Saunders.)

4. Monitor stools, noting color, consistency, and the presence or absence of blood.
  5. Monitor for bowel perforation, peritonitis (see Box 56-3), and hemorrhage.
  6. Following the acute phase, the diet progresses from clear liquids to a low-fiber diet as tolerated.
  7. Instruct the client about diet; usually a low-fiber, high-protein diet with vitamins and iron supplements are prescribed.
  8. Instruct the client to avoid gas-forming foods, milk products, and foods such as whole wheat grains, nuts, raw fruits and vegetables, pepper, alcohol, and caffeine-containing products.
  9. Instruct the client to avoid smoking.
  10. Administer medications as prescribed, which may include a combination of medications such as salicylate compounds, corticosteroids, immunosuppressants, and antidiarrheals.
- D. Surgical interventions**
1. Total proctocolectomy with permanent ileostomy
    - a. The procedure is curative and involves the removal of the entire colon (colon, rectum, and anus, with anal closure).
    - b. The end of the terminal ileum forms the stoma, which is located in the right lower quadrant.
  2. **Kock ileostomy** (continent ileostomy) (Fig. 56-9)
    - a. The **Kock ileostomy** is an intra-abdominal pouch that stores the feces and is constructed from the terminal ileum.
    - b. The pouch is connected to the stoma with a nipple-like valve constructed from a portion of the ileum; the stoma is flush with the skin.
  3. A catheter is used to empty the pouch, and a small dressing or adhesive bandage is worn over the stoma between emptyings.
  3. Ileoanal reservoir (Fig. 56-10)
    - a. Creation of an ileoanal reservoir is a two-stage procedure that involves the excision of the rectal mucosa, an abdominal colectomy, construction of a reservoir to the anal canal, and a temporary loop ileostomy.
    - b. The ileostomy is closed in 3 to 4 months after the capacity of the reservoir is increased and has had time to heal.
  4. Ileoanal anastomosis (ileorectostomy)
    - a. Ileorectostomy does not require an ileostomy.
    - b. A 12- to 15-cm rectal stump is left after the colon is removed, and the small intestine is inserted into this rectal sleeve and anastomosed.
    - c. Ileorectostomy requires a large, compliant rectum.
  5. Preoperative colostomy and ileostomy interventions
    - a. Consult with the enterostomal therapist to help identify optimal placement of the ostomy.
    - b. Instruct the client to eat a low-fiber diet for 1 to 2 days before surgery as prescribed.
    - c. Administer intestinal antiseptics and antibiotics as prescribed to cleanse the bowel and to decrease the bacterial content of the colon.
    - d. Administer laxatives and enemas as prescribed.
  6. Postoperative colostomy interventions
    - a. Place a petrolatum gauze over the stoma as prescribed to keep it moist, followed by a dry sterile dressing if a pouch (external) system is not in place.

**Stage 1.**

After removal of the colon, a temporary loop ileostomy is created and an ileoanal reservoir is formed. The reservoir is created in an S-shaped reservoir (using three loops of ileum) or a J-shaped reservoir (suturing a portion of ileum to the rectal cuff, with an upward loop).

**▲ FIGURE 56-10** Creation of an ileoanal reservoir. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

**Stage 2.**

After the reservoir has had time to heal—usually several months—the temporary loop ileostomy is reversed, and stool is allowed to drain into the reservoir.

- b. Place a pouch system on the stoma as soon as possible.
  - c. Monitor the stoma for size, unusual bleeding, or necrotic tissue.
  - d. Monitor for color changes in the stoma.
  - e. Note that the normal stoma color is pink to bright red and shiny, indicating high vascularity.
  - f. Note that a pale pink stoma indicates low hemoglobin and hematocrit levels and a purple-black stoma indicates compromised circulation, requiring physician notification.
  - g. Assess the functioning of the colostomy.
  - h. Expect that stool is liquid in the immediate postoperative period but becomes more solid depending on the area of the colostomy—ascending colon, liquid; transverse colon, loose to semifformed; and descending colon, close to normal.
  - i. Monitor the pouch system for proper fit and signs of leakage.
  - j. Empty the pouch when it is one-third full.
  - k. Fecal matter should not be allowed to remain on the skin.
  - l. Administer analgesics and antibiotics as prescribed.
  - m. Irrigate the perineal wound (if present) as prescribed and monitor for signs of infection.
  - n. Instruct the client to avoid foods that cause excess gas formation and odor.
  - o. Instruct the client about stoma care and irrigations as prescribed (Box 56-14).
  - p. Instruct the client that normal activities may be resumed when approved by the physician.
7. Postoperative ileostomy interventions
- a. Note that normal stool is liquid.
  - b. Monitor for dehydration and electrolyte imbalance.
- ▲** A stoma that is purple-black in color indicates compromised circulation, requiring immediate physician notification.

**XXVI. CROHN'S DISEASE****A. Description**

1. An inflammatory disease that can occur anywhere in the gastrointestinal tract but most often affects the terminal ileum and leads to thickening and scarring, a narrowed lumen, fistulas, ulcerations, and abscesses
2. Characterized by remissions and exacerbations

**B. Assessment**

1. Fever
2. Cramp-like and colicky pain after meals

**Box 56-14 Colostomy Irrigation****Purpose**

An enema is given through the stoma to stimulate bowel emptying.

**Description**

Irrigation is performed by instilling 500 to 1000 mL of lukewarm tap water through the stoma and allowing the water and stool to drain into a collection bag.

**Procedure**

If ambulatory, position the client sitting on the toilet.

If on bedrest, position the client on his or her side.

Hang the irrigation bag so that the bottom of the bag is at the level of the client's shoulder or slightly higher.

Insert the irrigation tube carefully without force.

Begin the flow of irrigation.

Clamp the tubing if cramping occurs; release the tubing as cramping subsides.

Avoid frequent irrigations, which can lead to loss of fluids and electrolytes.

Perform irrigation at about the same time each day.

Perform irrigation preferably 1 hour after a meal.

To enhance effectiveness of the irrigation, massage the abdomen gently.

3. Diarrhea (semisolid), which may contain mucus and pus

4. Abdominal distention

5. Anorexia, nausea, and vomiting

6. Weight loss

7. Anemia

8. Dehydration

9. Electrolyte imbalances

10. Malnutrition (may be worse than that seen in **ulcerative colitis**)

**C.** Interventions: Care is similar to that for the client with **ulcerative colitis**; however, surgery may be necessary but is avoided for as long possible because recurrence of the disease process in the same region is likely to occur.

**XXVII. APPENDICITIS****A.** Description

1. Inflammation of the appendix.

2. When the appendix becomes inflamed or infected, rupture may occur within a matter of hours, leading to peritonitis and sepsis.

**B.** Assessment

1. Pain in the periumbilical area that descends to the right lower quadrant

2. Abdominal pain that is most intense at McBurney's point

3. Rebound tenderness and abdominal rigidity

4. Low-grade fever

5. Elevated white blood cell count

6. Anorexia, nausea, and vomiting

7. Client in side-lying position, with abdominal guarding and legs flexed

8. Constipation or diarrhea

**C.** Peritonitis: Inflammation of the peritoneum (see Box 56-3)

**D.** Appendectomy: Surgical removal of the appendix

1. Preoperative interventions

a. Maintain NPO status.

b. Administer fluids intravenously to prevent dehydration.

c. Monitor for changes in level of pain.

d. Monitor for signs of ruptured appendix and peritonitis (see Box 56-3).

e. Position the client in a right side-lying or low to semi-Fowler's position to promote comfort.

f. Monitor bowel sounds.

g. Avoid the application of heat to the abdomen.

h. Apply ice packs to the abdomen for 20 to 30 minutes every hour as prescribed.

i. Administer antibiotics as prescribed.

j. Avoid laxatives or enemas.

**!** Avoid the application of heat to the abdomen of a client with appendicitis. Heat can cause rupture of the appendix leading to peritonitis, a life-threatening condition.

2. Postoperative interventions

a. Monitor temperature for signs of infection.

b. Assess incision for signs of infection such as redness, swelling, and pain.

c. Maintain NPO status until bowel function has returned.

d. Advance diet gradually as tolerated and as prescribed, when bowel sounds return.

e. If rupture of the appendix occurred, expect a Penrose drain to be inserted, or the incision may be left open to heal from the inside out.

f. Expect that drainage from the Penrose drain may be profuse for the first 12 hours.

g. Position the client in a right side-lying or low to semi-Fowler's position, with legs flexed, to facilitate drainage.

h. Change the dressing as prescribed and record the type and amount of drainage.

i. Perform wound irrigations if prescribed.

j. Maintain nasogastric suction and patency of the nasogastric tube if present.

k. Administer antibiotics and analgesics as prescribed.

**XXVIII. DIVERTICULOSIS AND DIVERTICULITIS****A.** Description

1. **Diverticulosis**

a. **Diverticulosis** is an outpouching or herniation of the intestinal mucosa.

b. The disorder can occur in any part of the intestine but is most common in the sigmoid colon.

## 2. Diverticulitis

a. **Diverticulitis** is the inflammation of one or more diverticula that occurs from penetration of fecal matter through the thin-walled diverticula; it can result in local abscess formation and perforation.

b. A perforated diverticulum can progress to intra-abdominal perforation with generalized peritonitis.

### B. Assessment

1. Left lower quadrant abdominal pain that increases with coughing, straining, or lifting
2. Elevated temperature
3. Nausea and vomiting
4. Flatulence
5. Cramp-like pain
6. Abdominal distention and tenderness
7. Palpable, tender rectal mass may be present.
8. Blood in the stools

### C. Interventions

1. Provide bedrest during the acute phase.
2. Maintain NPO status or provide clear liquids during the acute phase as prescribed.
3. Introduce a fiber-containing diet gradually, when the inflammation has resolved.
4. Administer antibiotics, analgesics, and anticholinergics to reduce bowel spasms as prescribed.
5. Instruct the client to refrain from lifting, straining, coughing, or bending to avoid increased intra-abdominal pressure.
6. Monitor for perforation (see Box 56-3), hemorrhage, fistulas, and abscesses.
7. Instruct the client to increase fluid intake to 2500 to 3000 mL daily, unless contraindicated.
8. Instruct the client to eat soft high-fiber foods, such as whole grains; the client should avoid high-fiber foods when inflammation occurs because these foods will irritate the mucosa further.
9. Instruct the client to avoid gas-forming foods or foods containing indigestible roughage, seeds, or nuts because these food substances become trapped in diverticula and cause inflammation.
10. Instruct the client to consume a small amount of bran daily and to take bulk-forming laxatives as prescribed to increase stool mass.

### D. Surgical interventions

1. Colon resection with primary anastomosis may be an option.
2. Temporary or permanent colostomy may be required for increased bowel inflammation.

## XXIX. HEMORRHOIDS

### A. Description

1. Dilated varicose veins of the anal canal
2. May be internal, external, or prolapsed

3. Internal hemorrhoids lie above the anal sphincter and cannot be seen on inspection of the perianal area.

4. External hemorrhoids lie below the anal sphincter and can be seen on inspection.

5. Prolapsed hemorrhoids can become thrombosed or inflamed.

6. Hemorrhoids are caused from **portal hypertension**, straining, irritation, or increased venous or abdominal pressure.

### B. Assessment

1. Bright red bleeding with defecation
2. Rectal pain
3. Rectal itching

### C. Interventions

1. Apply cold packs to the anal-rectal area followed by sitz baths as prescribed.
2. Apply witch hazel soaks and topical anesthetics as prescribed.
3. Encourage a high-fiber diet and fluids to promote bowel movements without straining.
4. Administer stool softeners as prescribed.

**D. Surgical interventions:** May include ultrasound, sclerotherapy, circular stapling, band ligation, or simple resection of the hemorrhoids (hemorrhoidectomy)

### E. Postoperative interventions following hemorrhoidectomy

1. Assist the client to a prone or side-lying position to prevent bleeding.
2. Maintain ice packs over the dressing as prescribed until the packing is removed by the physician.
3. Monitor for urinary retention.
4. Administer stool softeners as prescribed.
5. Instruct the client to increase fluids and high-fiber foods.
6. Instruct the client to limit sitting to short periods of time.
7. Instruct the client in the use of sitz baths three or four times a day as prescribed.

## MORE QUESTIONS ON THE CD!

### Practice Questions

**614.** The nurse is monitoring a client admitted to the hospital with a diagnosis of appendicitis who is scheduled for surgery in 2 hours. The client begins to complain of increased abdominal pain and begins to vomit. On assessment, the nurse notes that the abdomen is distended and bowel sounds are diminished. Which is the appropriate nursing intervention?

1. Notify the physician.
2. Administer the prescribed pain medication.
3. Call and ask the operating room team to perform the surgery as soon as possible.
4. Reposition the client and apply a heating pad on warm setting to the client's abdomen.

- 615.** The client has been admitted to the hospital with a diagnosis of acute pancreatitis and the nurse is assessing the client's pain. What type of pain is consistent with this diagnosis?
1. Burning and aching, located in the left lower quadrant and radiating to the hip
  2. Severe and unrelenting, located in the epigastric area and radiating to the back
  3. Burning and aching, located in the epigastric area and radiating to the umbilicus
  4. Severe and unrelenting, located in the left lower quadrant and radiating to the groin
- 616.** The nurse is assessing a client who is experiencing an acute episode of cholecystitis. Where should the nurse anticipate the location of the pain?
1. Right lower quadrant, radiating to the back
  2. Right lower quadrant, radiating to the umbilicus
  3. Right upper quadrant, radiating to the left scapula and shoulder
  4. Right upper quadrant, radiating to the right scapula and shoulder
- 617.** The client is admitted to the hospital with viral hepatitis, complaining of "no appetite" and "losing my taste for food." What instruction should the nurse give the client to provide adequate nutrition?
1. Select foods high in fat.
  2. Increase intake of fluids, including juices.
  3. Eat a good supper when anorexia is not as severe.
  4. Eat less often, preferably only three large meals daily.
- 618.** A client has developed hepatitis A after eating contaminated oysters. The nurse assesses the client for which of the following?
1. Malaise
  2. Dark stools
  3. Weight gain
  4. Left upper quadrant discomfort
- 619.** A client has just had a hemorrhoidectomy. What nursing intervention is appropriate for this client?
1. Instruct the client to limit fluid intake to avoid urinary retention.
  2. Instruct the client to eat low-fiber foods to decrease the bulk of the stool.
  3. Apply and maintain ice packs over the dressing until the packing is removed.
  4. Help the client to a Fowler's position to place pressure on the rectal area and decrease bleeding.
- 620.** The nurse is planning to teach the client with gastroesophageal reflux disease about substances that will increase the lower esophageal sphincter pressure. Which item should the nurse include on this list?
1. Coffee
  2. Chocolate
  3. Fatty foods
  4. Nonfat milk
- 621.** The client has undergone esophagogastroduodenoscopy. The nurse places highest priority on which item as part of the client's care plan?
1. Monitoring the temperature
  2. Monitoring complaints of heartburn
  3. Giving warm gargles for a sore throat
  4. Assessing for the return of the gag reflex
- 622.** The nurse has taught the client about an upcoming endoscopic retrograde cholangiopancreatography procedure. The nurse determines that the client needs further information if the client makes which statement?
1. "I know I must sign the consent form."
  2. "I hope the throat spray keeps me from gagging."
  3. "I'm glad I don't have to lie still for this procedure."
  4. "I'm glad some IV medication will be given to relax me."
- 623.** The physician has determined that the client with hepatitis has contracted the infection from contaminated food. The nurse understands that this client is most likely experiencing what type of hepatitis?
1. Hepatitis A
  2. Hepatitis B
  3. Hepatitis C
  4. Hepatitis D
- 624.** The nurse is caring for a client with a diagnosis of chronic gastritis. The nurse monitors the client knowing that this client is at risk for which vitamin deficiency?
1. Vitamin A
  2. Vitamin B<sub>12</sub>
  3. Vitamin C
  4. Vitamin E
- 625.** The nurse is assessing a client 24 hours following a cholecystectomy. The nurse notes that the T-tube has drained 750 mL of green-brown drainage since the surgery. Which nursing intervention is appropriate?
1. Clamp the T-tube.
  2. Irrigate the T-tube.
  3. Notify the physician.
  4. Document the findings.
- 626.** The nurse is monitoring a client with a diagnosis of peptic ulcer. Which assessment finding would most likely indicate perforation of the ulcer?

1. Bradycardia
  2. Numbness in the legs
  3. Nausea and vomiting
  4. A rigid, board-like abdomen
- 627.** The nurse is caring for a client following a Billroth II procedure. Which postoperative prescription should the nurse question and verify?
1. Leg exercises
  2. Early ambulation
  3. Irrigating the nasogastric tube
  4. Coughing and deep-breathing exercises
- 628.** The nurse is providing discharge instructions to a client following gastrectomy and instructs the client to take which measure to assist in preventing dumping syndrome?
1. Ambulate following a meal.
  2. Eat high carbohydrate foods.
  3. Limit the fluids taken with meals.
  4. Sit in a high Fowler's position during meals.
- 629.** The nurse is monitoring a client for the early signs and symptoms of dumping syndrome. Which of the following indicate this occurrence?
1. Sweating and pallor
  2. Bradycardia and indigestion
  3. Double vision and chest pain
  4. Abdominal cramping and pain
- 630.** The nurse is reviewing the record of a client with Crohn's disease. Which stool characteristic should the nurse expect to note documented in the client's record?
1. Diarrhea
  2. Chronic constipation
  3. Constipation alternating with diarrhea
  4. Stool constantly oozing from the rectum
- 631.** The nurse is reviewing the record of a client with a diagnosis of cirrhosis and notes that there is documentation of the presence of asterixis. How should the nurse assess for its presence?
1. Dorsiflex the client's foot.
  2. Measure the abdominal girth.
  3. Ask the client to extend the arms.
  4. Instruct the client to lean forward.
- 632.** The nurse is reviewing the laboratory results in a client with cirrhosis and notes that the ammonia level is elevated. Which diet does the nurse anticipate to be prescribed for this client?
1. Low-protein diet
  2. High-protein diet
  3. Moderate-fat diet
  4. High-carbohydrate diet
- 633.** The nurse is doing an admission assessment on a client with a history of duodenal ulcer. To determine whether the problem is currently active, the nurse should assess the client for which symptom(s) of duodenal ulcer?
1. Weight loss
  2. Nausea and vomiting
  3. Pain relieved by food intake
  4. Pain radiating down the right arm
- 634.** The client with hiatal hernia chronically experiences heartburn following meals. The nurse plans to teach the client to avoid which action because it is contraindicated with a hiatal hernia?
1. Lying recumbent following meals
  2. Taking in small, frequent, bland meals
  3. Raising the head of bed on 6-inch blocks
  4. Taking H<sub>2</sub>-receptor antagonist medication
- 635.** The nurse is assessing for stoma prolapse in a client with a colostomy. What should the nurse observe if stoma prolapse occurs?
1. Protruding stoma
  2. Sunken and hidden stoma
  3. Narrowed and flattened stoma
  4. Dark- and bluish-colored stoma
- 636.** The client had a new colostomy created 2 days earlier and is beginning to pass malodorous flatus from the stoma. What is the correct interpretation by the nurse?
1. This is a normal, expected event.
  2. The client is experiencing early signs of ischemic bowel.
  3. The client should not have the nasogastric tube removed.
  4. This indicates inadequate preoperative bowel preparation.
- 637.** The client has just had surgery to create an ileostomy. The nurse assesses the client in the immediate postoperative period for which most frequent complication of this type of surgery?
1. Folate deficiency
  2. Malabsorption of fat
  3. Intestinal obstruction
  4. Fluid and electrolyte imbalance
- 638.** The nurse is doing preoperative teaching with the client who is about to undergo creation of a Kock pouch. The nurse interprets that the client has the best understanding of the nature of the surgery if the client makes which statement?
1. "I will be able to pass stool by the rectum eventually."
  2. "The drainage from this type of ostomy will be formed."

3. "I will need to drain the pouch regularly with a catheter."
4. "I will need to wear a drainage bag for the rest of my life."

### Alternate Item Format: Multiple Response

**639.** A nurse is reviewing the prescription for a client admitted to the hospital with a diagnosis of acute pancreatitis. Which of the following

interventions would the nurse expect to be prescribed for the client? **Select all that apply.**

- 1. Administer antacids as prescribed.
- 2. Encourage coughing and deep breathing.
- 3. Administer anticholinergics as prescribed.
- 4. Give small, frequent high-calorie feedings.
- 5. Maintain the client in a supine and flat position.
- 6. Give Meperidine (Demerol) as prescribed for pain.

## ANSWERS

### 614. 1

**Rationale:** Based on the signs and symptoms presented in the question, the nurse should suspect peritonitis and notify the physician. Administering pain medication is not an appropriate intervention. Heat should never be applied to the abdomen of a client with suspected appendicitis because of the risk of rupture. Scheduling surgical time is not within the scope of nursing practice, although the physician probably would perform the surgery earlier than the prescheduled time.

**Test-Taking Strategy:** Use the process of elimination. Options 3 and 4 can be eliminated easily. Focus on the signs and symptoms in the question and consider the complications that can occur with appendicitis. Noting that the signs presented in the question indicate a complication will assist in directing you to option 1. Review care of the client with appendicitis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., pp. 430–431). St. Louis: Mosby.

### 615. 2

**Rationale:** The pain associated with acute pancreatitis is often severe and unrelenting, is located in the epigastric region, and radiates to the back. The other options are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Noting the strategic word *acute* will assist in eliminating options 1 and 3. From the remaining options, recalling the anatomical location of the pancreas will direct you to option 2. Review the manifestations in acute pancreatitis if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 469). St. Louis: Mosby.

### 616. 4

**Rationale:** During an acute episode of cholecystitis, the client may complain of severe right upper quadrant pain that

radiates to the right scapula and shoulder. This is determined by the pattern of dermatomes in the body. The other options are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Recalling the anatomical location of the gallbladder will direct you to option 4. Review the characteristics of the pain associated with cholecystitis if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Gastrointestinal

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1368). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 433). St. Louis: Mosby.

### 617. 2

**Rationale:** Although no special diet is required to treat viral hepatitis, it is generally recommended that clients consume a low-fat diet because fat may be tolerated poorly because of decreased bile production. Small frequent meals are preferable and may even prevent nausea. Frequently, appetite is better in the morning, so it is easier to eat a good breakfast. An adequate fluid intake of 2500 to 3000 mL/day that includes nutritional juices is also important.

**Test-Taking Strategy:** Use the process of elimination. Knowledge regarding the nutritional problems associated with hepatitis and focusing on the client's complaints will assist in directing you to the correct option. Review measures to provide adequate nutrition in the client with hepatitis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Gastrointestinal

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1360). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 464). St. Louis: Mosby.

### 618. 1

**Rationale:** Hepatitis causes gastrointestinal symptoms such as anorexia, nausea, right upper quadrant discomfort, and weight loss. Fatigue and malaise are common. Stools will be

light- or clay-colored if conjugated bilirubin is unable to flow out of the liver because of inflammation or obstruction of the bile ducts.

**Test-Taking Strategy:** Use the process of elimination. Recalling the function of the liver will easily direct you to option 1. Remember that fatigue and malaise are common. If you had difficulty with this question, review the signs and symptoms of hepatitis.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1359). St. Louis: Saunders.

### 619. 3

**Rationale:** Nursing interventions after a hemorrhoidectomy are aimed at management of pain and avoidance of bleeding. An ice pack will increase comfort and decrease bleeding. Options 1, 2, and 4 are incorrect interventions.

**Test-Taking Strategy:** Use the process of elimination. Decreasing fluid intake and avoiding high-fiber foods will cause difficulty with defecation because of hard stool, eliminating options 1 and 2. Fowler's position will increase pressure in the rectal area, causing increased bleeding and increased pain, eliminating option 4. Knowing that an ice pack will decrease swelling and cause vasoconstriction leads you to option 3. Review care of the client following hemorrhoidectomy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 722). St. Louis: Saunders.

### 620. 4

**Rationale:** Foods that increase lower esophageal sphincter (LES) pressure will decrease reflux and lessen the symptoms of gastroesophageal reflux disease (GERD). The food that will increase LES pressure is nonfat milk. The other substances listed decrease LES pressure, thus increasing reflux symptoms. Aggravating substances include chocolate, coffee, fatty foods, and alcohol.

**Test-Taking Strategy:** Use the process of elimination and knowledge of the effect of various foods on LES pressure and GERD. However, if you were unsure, select the option that identifies the most healthful food item. Review the dietary regimen for a client with GERD if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Gastrointestinal

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1244). St. Louis: Saunders.

Nix, S. (2009). *Williams' basic nutrition and diet therapy* (13th ed., p. 342). St. Louis: Mosby.

### 621. 4

**Rationale:** The nurse places highest priority on assessing for return of the gag reflex. This assessment addresses the client's airway. The nurse also monitors the client's vital signs and for a sudden increase in temperature, which could indicate perforation of the gastrointestinal tract. This complication would be accompanied by other signs as well, such as pain. Monitoring for sore throat and heartburn are also important; however, the client's airway is the priority.

**Test-Taking Strategy:** Use the ABCs—airway, breathing, and circulation. Note the strategic words *highest priority*. Option 4 addresses the airway. Review care of the client following esophagogastroduodenoscopy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Gastrointestinal

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1227). St. Louis: Saunders.

Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed., p. 407). St. Louis: Mosby.

### 622. 3

**Rationale:** The client does have to lie still for endoscopic retrograde cholangiopancreatography (ERCP), which takes about 1 hour to perform. The client also has to sign a consent form. Intravenous sedation is given to relax the client, and an anesthetic spray is used to help keep the client from gagging as the endoscope is passed.

**Test-Taking Strategy:** Note the strategic words *needs further information*. These words indicate a negative event query and ask you to select an option that is incorrect. Invasive procedures require consent, so option 1 can be eliminated. Noting the name of the procedure and considering the anatomical location will assist you in eliminating options 2 and 4. Review this procedure if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Gastrointestinal

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1227). St. Louis: Saunders.

Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed., pp. 389–392). St. Louis: Mosby.

### 623. 1

**Rationale:** Hepatitis A is transmitted by the fecal-oral route via contaminated food or infected food handlers. Hepatitis B, C, and D are transmitted most commonly via infected blood or body fluids.

**Test-Taking Strategy:** Knowledge regarding the modes of transmission of the various types of hepatitis is required to answer this question. Remember that hepatitis A is transmitted by the fecal-oral route. Review the methods of transmission of hepatitis if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Gastrointestinal

**References:** Copstead-Kirkhorn, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., pp. 885–886). St. Louis: Mosby.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1356–1357). St. Louis: Saunders.

#### 624. 2

**Rationale:** Chronic gastritis causes deterioration and atrophy of the lining of the stomach, leading to the loss of the function of the parietal cells. The source of the intrinsic factor is lost, which results in the inability to absorb vitamin B<sub>12</sub>. This leads to the development of pernicious anemia. The client is not at risk for vitamin A, C, or E deficiency.

**Test-Taking Strategy:** Recalling the pathophysiology related to pernicious anemia and vitamin B<sub>12</sub> deficiency will direct you to option 2. If you are unfamiliar with vitamin B<sub>12</sub> deficiency and its relationship to gastric disorders, review this content.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1268). St. Louis: Saunders.

#### 625. 4

**Rationale:** Following cholecystectomy, drainage from the T-tube is initially bloody and then turns to a greenish-brown color. The drainage is measured as output. The amount of expected drainage will range from 500 to 1000 mL/day. The nurse would document the output.

**Test-Taking Strategy:** Use the process of elimination. Options 1 and 2 can be eliminated because a T-tube is not irrigated and would not be clamped with this amount of drainage. From the remaining options, you must know normal expected findings following this surgical procedure. Review postoperative assessment findings following cholecystectomy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1370). St. Louis: Saunders.

#### 626. 4

**Rationale:** Perforation of an ulcer is a surgical emergency and is characterized by sudden, sharp, intolerable severe pain beginning in the midepigastic area and spreading over the abdomen, which becomes rigid and board-like. Nausea and vomiting may occur. Tachycardia may occur as hypovolemic shock develops. Numbness in the legs is not an associated finding.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *most likely*. Option 2 can be eliminated easily because it is not related to perforation. Eliminate option 1 next because tachycardia rather than bradycardia would develop if perforation occurs. From the remaining

options, focusing on the strategic words will help direct you to option 4. Review the signs of a perforated ulcer if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Gastrointestinal

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 633). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1272). St. Louis: Saunders.

#### 627. 3

**Rationale:** In a Billroth II procedure, the proximal remnant of the stomach is anastomosed to the proximal jejunum. Patency of the nasogastric tube is critical for preventing the retention of gastric secretions. The nurse should never irrigate or reposition the gastric tube after gastric surgery, unless specifically prescribed by the physician. In this situation, the nurse should clarify the prescription. Options 1, 2, and 4 are appropriate postoperative interventions.

**Test-Taking Strategy:** Note the strategic words *question and verify*. Eliminate options 1, 2, and 4 because they are general postoperative measures. Consider the anatomical location of the surgical procedure to assist in directing you to option 3. Review postoperative measures following a Billroth II procedure if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Adult Health—Gastrointestinal

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 639). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1285). St. Louis: Saunders.

#### 628. 3

**Rationale:** *Dumping syndrome* is a term that refers to a constellation of vasomotor symptoms that occurs after eating, especially following a Billroth II procedure. Early manifestations usually occur within 30 minutes of eating and include vertigo, tachycardia, syncope, sweating, pallor, palpitations, and the desire to lie down. The nurse should instruct the client to decrease the amount of fluid taken at meals and to avoid high-carbohydrate foods, including fluids such as fruit nectars; to assume a low Fowler's position during meals; to lie down for 30 minutes after eating to delay gastric emptying; and to take antispasmodics as prescribed.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 4 first because these measures will promote gastric emptying. From the remaining options, select option 3 because this measure will delay gastric emptying. If you are unfamiliar with this syndrome, review the important client teaching points.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Gastrointestinal

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 637). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1285). St. Louis: Saunders.

### 629. 1

**Rationale:** Early manifestations of dumping syndrome occur 5 to 30 minutes after eating. Symptoms include vertigo, tachycardia, syncope, sweating, pallor, palpitations, and the desire to lie down.

**Test-Taking Strategy:** Use the process of elimination and recall the pathophysiology associated with dumping syndrome. Focus on the strategic word *early* to direct you to option 1. Review the early manifestations of this syndrome if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Gastrointestinal

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 637). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1285). St. Louis: Saunders.

### 630. 1

**Rationale:** Crohn's disease is characterized by nonbloody diarrhea of usually not more than four to five stools daily. Over time, the diarrhea episodes increase in frequency, duration, and severity. Options 2, 3, and 4 are not characteristics of Crohn's disease.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 4 first as the most unlikely occurrence. From the remaining options, think about the pathophysiology associated with Crohn's disease to direct you to option 1. If you are unfamiliar with this disorder, review this content.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 445). St. Louis: Mosby.

### 631. 3

**Rationale:** Asterixis is irregular flapping movements of the fingers and wrists when the hands and arms are outstretched, with the palms down, wrists bent up, and fingers spread. Asterixis is the most common and reliable sign that hepatic encephalopathy is developing. Options 1, 2, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the procedure for this assessment to answer this question. Remember that asterixis is irregular flapping movements of the fingers and wrists. This will direct you to the correct option. Review this assessment procedure if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Gastrointestinal

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1166–1167). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1349). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 437). St. Louis: Mosby.

### 632. 1

**Rationale:** Cirrhosis is a chronic, progressive disease of the liver characterized by diffuse degeneration and destruction of hepatocytes. Most of the ammonia in the body is found in the gastrointestinal tract. Protein provided by the diet is transported to the liver by the portal vein. The liver breaks down protein, which results in the formation of ammonia. If the client has hepatic encephalopathy, a low-protein diet would be prescribed.

**Test-Taking Strategy:** Recall the physiology of the liver in answering this question. You should be directed easily to option 1. Also, note that options 1 and 2 are opposite, which should provide you with the clue that one of these options is correct. Review dietary measures for the client with a high ammonia level if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

### 633. 3

**Rationale:** A frequent symptom of duodenal ulcer is pain that is relieved by food intake. These clients generally describe the pain as a burning, heavy, sharp, or "hungry" pain that often localizes in the midepigastic area. The client with duodenal ulcer usually does not experience weight loss or nausea and vomiting. These symptoms are more typical in the client with a gastric ulcer.

**Test-Taking Strategy:** Use the process of elimination. To answer this question accurately, you must be able to discriminate between symptoms of duodenal and gastric ulcer. This will allow you to eliminate options 1 and 2 first. Choose option 3 over option 4, knowing that the pain does not radiate down the right arm and that a pattern of pain-food-relief occurs with duodenal ulcer. Review the clinical manifestations of a duodenal ulcer if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Content Area:** Adult Health—Gastrointestinal

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 629, 631). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1273). St. Louis: Saunders.

**634. 1**

**Rationale:** Hiatal hernia is caused by a protrusion of a portion of the stomach above the diaphragm where the esophagus usually is positioned. The client usually experiences pain from reflux caused by ingestion of irritating foods, lying flat following meals or at night, and eating large or fatty meals. Relief is obtained with the intake of small, frequent, and bland meals, use of H<sub>2</sub>-receptor antagonists and antacids, and elevation of the thorax following meals and during sleep.

**Test-Taking Strategy:** Use the process of elimination noting the strategic word *contraindicated*. Thinking about the pathophysiology that occurs in hiatal hernia will direct you to option 1. Review this pathophysiology if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Gastrointestinal

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 610). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1254). St. Louis: Saunders.

**635. 1**

**Rationale:** A prolapsed stoma is one in which the bowel protrudes through the stoma. A stoma retraction is characterized by sinking of the stoma. Ischemia of the stoma would be associated with a dusky or bluish color. A stoma with a narrowed opening at the level of the skin or fascia is said to be *stenosed*.

**Test-Taking Strategy:** Focus on the subject and the strategic word *prolapse*. This will direct you to option 1. If this question was difficult, review the complications associated with a colostomy stoma.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Gastrointestinal

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1299). St. Louis: Saunders.

Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 925). St. Louis: Mosby.

**636. 1**

**Rationale:** As peristalsis returns following creation of a colostomy, the client begins to pass malodorous flatus. This indicates returning bowel function and is an expected event. Within 72 hours of surgery, the client should begin passing stool via the colostomy. Options 2, 3, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Recalling the normal progression of bowel activity following ostomy formation will direct you to option 1. Review the expected findings following creation of a colostomy if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Gastrointestinal

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 706). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 458). St. Louis: Mosby.

**637. 4**

**Rationale:** A frequent complication that occurs following ileostomy is fluid and electrolyte imbalance. The client requires constant monitoring of intake and output to prevent this from occurring. Losses require replacement by intravenous infusion until the client can tolerate a diet orally. Intestinal obstruction is a less frequent complication. Fat malabsorption and folate deficiency are complications that could occur later in the postoperative period.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *ileostomy*, *immediate postoperative period*, and *complication*. This tells you that the correct option occurs early in the postoperative course, with relative frequency. Remember that ileostomy drainage is liquid, placing the client at risk for fluid and electrolyte imbalance. If you had difficulty with this question, review the postoperative complications following this surgical procedure.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1323). St. Louis: Saunders.

**638. 3**

**Rationale:** A Kock pouch is a continent ileostomy. As the ileostomy begins to function, the client drains it every 3 to 4 hours and then decreases the draining to about three times a day, or as needed when full. The client does not need to wear a drainage bag but should wear an absorbent dressing to absorb mucous drainage from the stoma. Ileostomy drainage is liquid. The client would be able to pass stool only from the rectum if an ileal-anal pouch or anastomosis were created. This type of operation is a two-stage procedure.

**Test-Taking Strategy:** Use the process of elimination. Focusing on the strategic word *pouch* will assist in directing you to option 3. If this question was difficult, review this content.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1326). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

**639. 1, 2, 3, 6**

**Rationale:** The client with acute pancreatitis normally is placed on NPO status to rest the pancreas and suppress gastrointestinal secretions. Because abdominal pain is a prominent symptom of pancreatitis, pain medication such as

meperidine is prescribed. Some clients experience lessened pain by assuming positions that flex the trunk, with the knees drawn up to the chest. A side-lying position with the head elevated 45 degrees decreases tension on the abdomen and may help ease the pain. The client is susceptible to respiratory infections because the retroperitoneal fluid raises the diaphragm, which causes the client to take shallow, guarded abdominal breaths. Therefore measures such as turning, coughing, and deep breathing are instituted. Antacids and anticholinergics may be prescribed to suppress gastrointestinal secretions.

**Test-Taking Strategy:** Focus on the pathophysiology associated with pancreatitis and note the strategic word *acute*. This

will assist in answering the question. Review treatment measures for acute pancreatitis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Adult Health—Gastrointestinal

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1375–1376). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 472). St. Louis: Mosby.

# Gastrointestinal Medications

## I. ANTACIDS (Table 57-1; Fig. 57-1)

- A. React with gastric acid to produce neutral salts or salts of low acidity
- B. Inactivate pepsin and enhance mucosal protection but do not coat the ulcer crater.
- C. These medications are used for peptic ulcer disease and gastroesophageal reflux disease.
-  D. These medications should be taken on a regular schedule; some are prescribed to be taken 1 and 3 hours after each meal and at bedtime.
-  E. To provide maximum benefit, treatment should elevate the gastric pH above 5.
-  F. Antacid tablets should be chewed thoroughly and followed with a glass of water or milk.
- G. Liquid preparations should be shaken before dispensing.

 **To prevent interactions with other medications and the interference with the action of other medications, allow 1 hour between antacid administration and the administration of other medications.**

## II. GASTRIC PROTECTANTS (Box 57-1)

- A. Misoprostol (Cytotec)
  - 1. An antisecretory medication that enhances mucosal defenses
  - 2. Suppresses secretion of gastric acid and maintains submucosal blood flow by promoting vasodilation
  - 3. Used to prevent gastric ulcers caused by nonsteroidal anti-inflammatory drugs and aspirin.
  -  4. Administered with meals
  - 5. Causes diarrhea and abdominal pain
  - 6. Contraindicated for use in pregnancy
- B. Sucralfate (Carafate)
  -  1. Creates a protective barrier against acid and pepsin.
  -  2. Administered orally; should be taken on an empty stomach
  -  3. May cause constipation
  - 4. May impede absorption of warfarin sodium (Coumadin), phenytoin (Dilantin), theophylline, digoxin (Lanoxin), and some antibiotics; should be administered at least 2 hours apart from these medications.

## III. MUSCARINIC ANTAGONIST

- A. Description: Suppresses acid secretion by blocking muscarinic cholinergic receptors
- B. Medication: Pirenzepine (Gastrozepine)

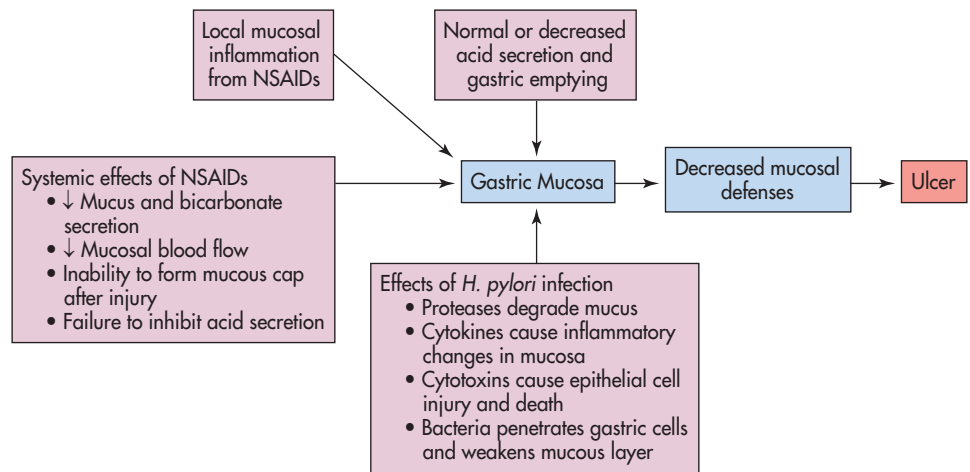

## IV. HISTAMINE 2 (H<sub>2</sub>)-RECEPTOR ANTAGONISTS (Box 57-2)

- A. Description
  - 1. Suppress secretion of gastric acid
  - 2. Alleviate symptoms of heartburn and assist in preventing complications of peptic ulcer disease
  - 3. Prevent stress ulcers and reduce the recurrence of all ulcers
  - 4. Promote healing in gastroesophageal reflux disease
  - 5. Are contraindicated in hypersensitive clients
  - 6. Should be used with caution in clients with impaired renal or hepatic function 
- B. Cimetidine (Tagamet)
  - 1. Can be administered orally, intramuscularly, or intravenously
  - 2. Food reduces the rate of absorption; if taken with meals, absorption will be slowed. 
  - 3. Intravenous administration can cause hypotension and dysrhythmias.
  - 4. Antacids can decrease the absorption of oral cimetidine. 
  - 5. Cimetidine and antacids should be administered at least 1 hour apart from each other. 
  - 6. Cimetidine passes the blood-brain barrier, and central nervous system side effects can occur; it may cause mental confusion, agitation, psychosis, depression, anxiety, and disorientation. 
  - 7. Dosage should be reduced in clients with renal impairment. 
  - 8. If cimetidine is administered with warfarin sodium (Coumadin), phenytoin (Dilantin), theophylline, or lidocaine, the dosages of these medications should be reduced.
- C. Ranitidine (Zantac)
  - 1. Can be administered orally, intramuscularly, or intravenously

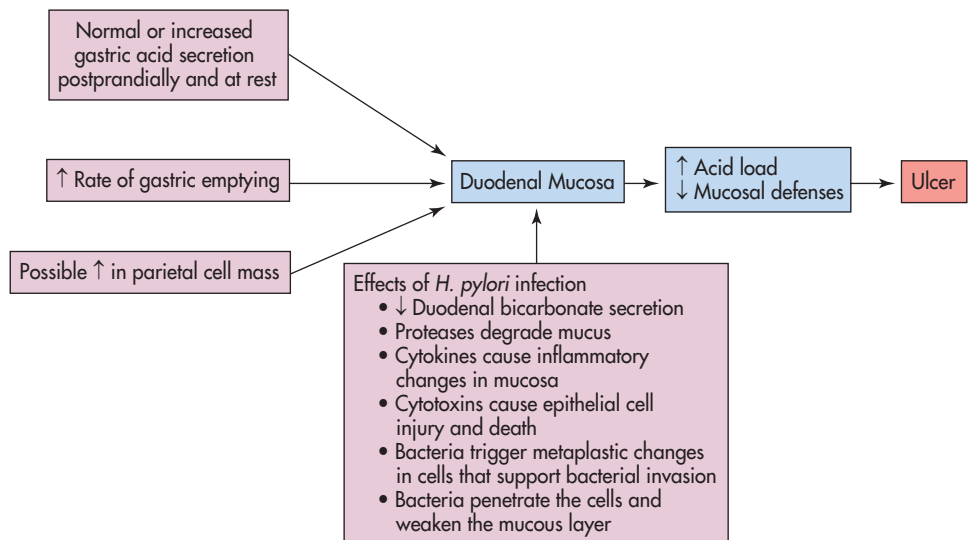

**TABLE 57-1** Classification of Antacids and Considerations

| Classification      | Consideration   |
|---------------------|---|
| Aluminum compounds  | Aluminum hydroxide is used to treat hyperphosphatemia; therefore it can cause hypophosphatemia. Aluminum hydroxide can reduce the effects of tetracyclines, warfarin sodium (Coumadin), and digoxin (Lanoxin) and can reduce phosphate absorption and thereby cause hypophosphatemia. Aluminum compounds contain significant amounts of sodium; they should be used with caution in clients with hypertension and heart failure. The most common side effect is constipation. |
| Magnesium compounds | Magnesium hydroxide is also a saline laxative and the most prominent side effect is diarrhea; it is usually administered in combination with aluminum hydroxide, an antacid that assists in preventing diarrhea. Magnesium compounds are contraindicated in clients with intestinal obstruction, appendicitis, or undiagnosed abdominal pain. In clients with renal impairment, magnesium can accumulate to high levels, causing signs of toxicity.                           |
| Calcium compounds   | Calcium carbonate can cause acid rebound. Calcium compounds are rapid-acting and release carbon dioxide in the stomach, causing belching and flatulence. A common side effect is constipation. Milk-alkali syndrome (headache, urinary frequency, anorexia, nausea/vomiting, fatigue) can occur (the client should avoid milk products and vitamin D supplements).  |
| Sodium bicarbonate  | Sodium bicarbonate has a rapid onset, liberates carbon dioxide, increases intra-abdominal pressure, and promotes flatulence. Sodium bicarbonate should be used with caution in clients with hypertension and heart failure. Sodium bicarbonate can cause systemic alkalosis in clients with renal impairment. Sodium bicarbonate is useful for treating acidosis and elevating urinary pH to promote excretion of acidic medications following overdose.                      |

**Gastric Ulcer**

**Duodenal Ulcer**

**▲ FIGURE 57-1** Pathophysiological components of peptic ulcer. (From Monahan, F., Sands, J., Neighbors, M., Marek, J., & Green, C. [2007] *Phipps' medical-surgical nursing: Health and illness perspectives* [8th ed.]. St. Louis: Mosby.)

**Box 57-1 Gastric Protectants**

|                       |                       |
|-----------------------|-----------------------|
| Misoprostol (Cytotec) | Sucralfate (Carafate) |
|-----------------------|-----------------------|

**Box 57-2 H<sub>2</sub>-Receptor Antagonists**

|                      |                     |
|----------------------|---------------------|
| Cimetidine (Tagamet) | Nizatidine (Axid)   |
| Famotidine (Pepcid)  | Ranitidine (Zantac) |

**Box 57-3 Proton Pump Inhibitors**

|                         |                         |
|-------------------------|-------------------------|
| Esomeprazole (Nexium)   | Pantoprazole (Protonix) |
| Lansoprazole (Prevacid) | Rabeprazole (Aciphex)   |
| Omeprazole (Prilosec)   |                         |

**Box 57-4 Medication Regimens for Treating *Helicobacter Pylori* Infections****Triple Therapy**

Esomeprazole (Nexium), amoxicillin (Amoxil), clarithromycin (Biaxin)

**Quadruple Therapies**

Esomeprazole (Nexium), metronidazole (Flagyl), tetracycline, bismuth subsalicylate

Ranitidine (Zantac), metronidazole (Flagyl), tetracycline, bismuth subsalicylate

Additional medications may be prescribed for each level of therapy.

**Box 57-5 Bile Acid Sequestrants**

|                                      |
|--------------------------------------|
| Colesevelam (Welchol)                |
| Cholestyramine (Questran, Prevalite) |
| Colestipol (Colestid)                |

- Side effects are uncommon and does not penetrate the blood-brain barrier as cimetidine does.
- Ranitidine is not affected by food.

**D. Famotidine (Pepcid) and nizatidine (Axid)**

- Famotidine and nizatidine are similar to ranitidine and cimetidine.

- These medications do not need to be administered with food.

**V. PROTON PUMP INHIBITORS (Box 57-3)**

- Suppress gastric acid secretion
- Used to treat active ulcer disease, erosive esophagitis, and pathological hypersecretory conditions
- Contraindicated in hypersensitivity
- Common side effects include headache, diarrhea, abdominal pain, and nausea

**VI. MEDICATION REGIMENS TO TREAT *HELICOBACTER PYLORI* INFECTIONS (Box 57-4)**

- An antibacterial agent alone is not effective for eradicating *Helicobacter pylori* because the bacterium readily becomes resistant to the agent.
- Triple or quadruple therapy with a variety of medication combinations is used (if triple therapy fails, quadruple therapy is recommended).

**VII. PROKINETIC AGENT**

- Medication: Metoclopramide (Reglan)
- Stimulates motility of the upper gastrointestinal tract and increases the rate of gastric emptying without stimulating gastric, biliary, or pancreatic secretions
- Used to treat gastroesophageal reflux and paralytic ileus
- May cause restlessness, drowsiness, extrapyramidal reactions, dizziness, insomnia, and headache
- Usually administered 30 minutes before meals and at bedtime
- Contraindicated in clients with sensitivity and in clients with mechanical obstruction, perforation, or gastrointestinal hemorrhage

- Can precipitate hypertensive crisis in clients with pheochromocytoma

- Safety in pregnancy is not established

- Metoclopramide (Reglan) can cause parkinsonian reactions; if this occurs, the medication will be discontinued by the physician.

- Anticholinergics and opioid analgesics antagonize the effects of metoclopramide.

- Alcohol, sedatives, cyclosporine (Sandimmune), and tranquilizers produce an additive effect.

**VIII. BILE ACID SEQUESTRANTS (Box 57-5)**

- Act by absorbing and combining with intestinal bile salts, which then are secreted in the feces, preventing intestinal reabsorption

- Used to treat hypercholesterolemia in adults, biliary obstruction, and pruritus associated with biliary disease

- With powdered forms, taste and palatability are often reasons for noncompliance and can be improved by the use of flavored products or mixing the medication with various juices.

- Side effects include nausea, bloating, and constipation; fecal impaction and intestinal obstruction can result.

- Stool softeners and other sources of fiber can be used to abate the gastrointestinal side effects.

Bile acid sequestrants should be used cautiously in clients with suspected bowel obstruction or severe constipation because they can worsen these conditions.

**IX. TREATING HEPATIC ENCEPHALOPATHY**

- Medication: Lactulose (Constulose, Enulose)

**Box 57-6 Pancreatic Enzyme Replacements**

Pancreatin

Pancrelipase (Pancrease MT, Viokase, Lipram, Pancrecarb MS)

**Box 57-7 Medications to Treat Inflammatory Bowel Disease****Antimicrobials**

Ciprofloxacin (Cipro)

Metronidazole (Flagyl)

**5-Aminosalicylates**

Balsalazide (Colazal)

Mesalamine (Rowasa, Asacol, Pentasa, Canasa)

Olsalazine (Dipentum)

Sulfasalazine (Azulfidine)

**Corticosteroids**

Budesonide (Entocort-EC)

Prednisone

**Immunosuppressants**

Azathioprine (Imuran)

Cyclosporine (Sandimmune, Neoral, Gengraf)

Mercaptopurine (Purinethol)

**Immunomodulators**

Adalimumab (Humira)

Certolizumab (Cimzia)

Infliximab (Remicade)

Natalizumab (Tysabri)

- B. Used in the prevention and treatment of portal systemic encephalopathy including hepatic precoma and coma; also used in the treatment of chronic constipation
- C. Promotes increased **peristalsis** and bowel evacuation, expelling ammonia from the colon and thus lowering the ammonia level
- D. Improves protein tolerance in clients with advanced hepatic **cirrhosis**
- E. Administered orally in the form of a syrup or rectally

**X. PANCREATIC ENZYME REPLACEMENTS** (Box 57-6)

- A. Used to supplement or replace pancreatic enzymes and thus improve nutritional status and reduce the amount of fatty stools (a deficiency of pancreatic enzymes can compromise digestion, especially the digestion of fats).
- B. Should be taken with all meals and snacks
- C. Side effects include abdominal cramps or pain, nausea, and diarrhea.
- D. Products that contain calcium carbonate or magnesium hydroxide interfere with the action of the medication.

**XI. TREATMENT FOR INFLAMMATORY BOWEL DISEASE** (Box 57-7)

- A. Inflammatory bowel disease has two forms including **Crohn's disease** and **ulcerative colitis**.

- B. Antimicrobials: may be prescribed to prevent or treat secondary infection (see Chapter 71 for information on antimicrobials)
- C. 5-Aminosalicylates (5-ASA): Decrease gastrointestinal inflammation; adverse effects include nausea, rash, arthralgia, and hematological disorders.
- D. Corticosteroids: Act as an anti-inflammatory to decrease gastrointestinal inflammation (see Chapter 55 for information on glucocorticoids and corticosteroids).
- E. Immunosuppressants: Suppress the immune system; can cause **pancreatitis** and neutropenia secondary to bone marrow depression and their use is reserved for those who have not responded to other traditional therapies (see Chapter 71 for information on immunosuppressants).
- F. Immunomodulators: Monoclonal antibodies that modulate the immune response to induce and maintain remission

**XII. TREATMENT FOR IRRITABLE BOWEL SYNDROME (IBS)**

- A. Irritable bowel syndrome is a gastrointestinal disorder that is characterized by crampy abdominal pain accompanied by diarrhea, constipation, or both.
- B. Symptomatic relief is sometimes provided with the use of antispasmodics that relax the smooth muscle of the gastrointestinal tract, bulk-forming medications, antidiarrheals, and antidepressants.
- C. Alosetron (Lotronex)
  - 1. Used for severe IBS.
  - 2. Can cause severe adverse effects such as constipation, impaction, bowel obstruction, perforation of the bowel, and ischemic colitis.
  - 3. A strict risk management procedure must be followed by both the prescriber of the medication and the client, which includes several guidelines that must be followed including monitoring for serious adverse effects, reporting them, and immediate discontinuation of the medication if they arise.
- D. Lubiprostone (Amitiza)
  - 1. Increases intestinal motility and increases the passage of stool, thereby, reducing abdominal pain
  - 2. Side effects include nausea, headache, diarrhea, flatulence; adverse effects include urinary tract infection and upper respiratory tract infection.
- E. Tegaserod (Zelnorm)
  - 1. Decreases visceral sensation and increases gastrointestinal motility and secretions.
  - 2. Most serious adverse effect is diarrhea and cardiovascular events such as myocardial infarction and stroke.
  - 3. Use of the medication is restricted; only those who do not have cardiovascular disease and have not responded to an alternative treatment may be eligible for treatment with this medication.

**Box 57-8 Commonly Administered Antiemetics****Serotonin Antagonists**

Dolasetron (Anzemet)  
 Granisetron (Kytril)  
 Ondansetron (Zofran)  
 Palonosetron (Aloxi)

**Glucocorticoids**

Dexamethasone (Decadron)  
 Methylprednisolone (Solu-Medrol)

**Substance P/Neurokinin 1 Antagonists**

Aprepitant (Emend)  
 Fosaprepitant (Emend)

**Benzodiazepines**

Lorazepam (Ativan)  
 Diazepam (Valium)

**Dopamine Antagonists****Phenothiazines**

Chlorpromazine (Thorazine)  
 Perphenazine (Trilafon)  
 Prochlorperazine (Compazine)  
 Promethazine (Phenergan)

**Butyrophenones**

Haloperidol (Haldol)  
 Droperidol (Inapsine)

**Others**

Metoclopramide (Reglan)  
 Domperidone (Motilium)

**Cannabinoids**

Dronabinol (Marinol)  
 Nabilone (Cesamet)

**Anticholinergics****Antihistamines**

Cyclizine (Marezine)  
 Dimenhydrinate (Dramamine)  
 Diphenhydramine (Benadryl)  
 Hydroxyzine (Vistaril, Atarax)  
 Meclizine hydrochloride (Bonine, Antivert)

**Others**

Scopolamine transdermal (Transderm Scop)

Modified from Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 937). St. Louis: Saunders.

**XIII. ANTIEMETICS** (Box 57-8)

- A. Medications used to control vomiting and motion sickness.
- B. The choice of the antiemetic is determined by the cause of the nausea and vomiting.
-  C. Monitor for drowsiness and protect the client from injury.
- D. Monitor vital signs and intake and output.
- E. Limit odors in the client's room when the client is nauseated or vomiting.
- F. Limit oral intake to clear liquids when the client is nauseated or vomiting.

 **Antiemetics can cause drowsiness; therefore a priority intervention is to protect the client from injury.**

**XIV. LAXATIVES** (Box 57-9)

- A. Bulk-forming
  1. Description
    - a. Absorb water into the feces and increase bulk to produce large and soft stools
    - b. Contraindicated in bowel obstruction
    - c. Dependency can occur with long-term use.
  2. Side effects include gastrointestinal disturbances, dehydration, and electrolyte imbalances.
- B. Stimulants: Stimulate motility of large intestine
- C. Surfactants
  1. Inhibit absorption of water so fecal mass remains large and soft
  2. Used to avoid straining

**Box 57-9 Laxatives****Bulk-Forming**

Methylcellulose (Citrucel)  
 Polycarbophil (FiberCon)  
 Psyllium (Metamucil, others)

**Stimulants**

Bisacodyl (Correctol, Dulcolax, Feen-a-mint, Fleet laxative, others)  
 Senna (Senokot Ex-Lax, others), Cascara sagrada

**Surfactant**

Docusate sodium (Colace, others)

**Osmotics**

Magnesium hydroxide (Milk of Magnesia)  
 Magnesium citrate (Citrinate of Magnesia)  
 Sodium phosphates (Fleet enema, Fleet Phospho-Soda)  
 Polyethylene glycol and electrolytes (GoLYTELY)

**Lubricant**

Mineral oil

- D. Osmotics: Attract water into the large intestine to produce bulk and stimulate **peristalsis**
- E. Lubricants
  1. Act to soften the feces, ease the strain of passing stool, and lessen irritation to hemorrhoids
  2. Mineral oil: Interferes with absorption of the fat-soluble vitamins A, D, E, and K and can cause lipid pneumonia if accidentally aspirated 

**Box 57-10 Medications to Control Diarrhea****Opioids and Related Medications**

Difenoxin with atropine sulfate (Motofen)  
 Diphenoxylate with atropine sulfate (Lomotil)  
 Loperamide (Imodium)  
 Paregoric (camphorated tincture of opium)  
 Tincture of opium

**Other Antidiarrheals**

Bismuth subsalicylate (Pepto-Bismol, Kaopectate, Kapectolin)  
 Bulk-forming medications  
 Anticholinergic antispasmodics

 The client receiving a laxative needs to increase fluid intake to prevent dehydration.

**XV. MEDICATIONS TO CONTROL DIARRHEA**

(Box 57-10)

- A.** Goals: Identify and treat the underlying cause, treat dehydration, replace fluids and electrolytes, relieve abdominal discomfort and cramping, and reduce the passage of stool
- B.** Opioids
1. Opioids are effective antidiarrheal medications that decrease intestinal motility and peristalsis.
  2. When poisons, infections, or bacterial toxins are the cause of the diarrhea, opioids worsen the condition by delaying the elimination of toxins.
  3. Tincture of opium has an unpleasant taste and can be diluted with 15 to 30 mL of water for administration.
- C.** Other antidiarrheals: See Box 57-10.

 **MORE QUESTIONS ON THE CD!**
**Practice Questions**

- 640.** A client with Crohn's disease is scheduled to receive an infusion of infliximab (Remicade). What intervention by the nurse will determine the effectiveness of treatment?
1. Monitoring the leukocyte count for 2 days after the infusion
  2. Checking the frequency and consistency of bowel movements
  3. Checking serum liver enzyme levels before and after the infusion
  4. Carrying out a Hematest on gastric fluids after the infusion is completed
- 641.** The client has a PRN prescription for loperamide hydrochloride (Imodium). For which condition should the nurse plan to administer this medication?
1. Constipation
  2. Abdominal pain
  3. An episode of diarrhea
  4. Hematest-positive nasogastric tube drainage
- 642.** The client has a PRN prescription for ondansetron (Zofran). For which condition should the nurse administer this medication to the postoperative client?
1. Paralytic ileus
  2. Incisional pain
  3. Urinary retention
  4. Nausea and vomiting
- 643.** The client has begun medication therapy with pancrelipase (Pancrease). The nurse evaluates that the medication is having the optimal intended benefit if which effect is observed?
1. Weight loss
  2. Relief of heartburn
  3. Reduction of steatorrhea
  4. Absence of abdominal pain
- 644.** An older client recently has been taking cimetidine (Tagamet). The nurse monitors the client for which most frequent central nervous system side effect of this medication?
1. Tremors
  2. Dizziness
  3. Confusion
  4. Hallucinations
- 645.** The client with a gastric ulcer has a prescription for sucralfate (Carafate), 1 g by mouth 4 times daily. The nurse schedules the medication for which times?
1. With meals and at bedtime
  2. Every 6 hours around the clock
  3. One hour after meals and at bedtime
  4. One hour before meals and at bedtime
- 646.** The client who chronically uses nonsteroidal anti-inflammatory drugs (NSAIDs) has been taking misoprostol (Cytotec). The nurse determines that the medication is having the intended therapeutic effect if which of the following is noted?
1. Resolved diarrhea
  2. Relief of epigastric pain
  3. Decreased platelet count
  4. Decreased white blood cell count
- 647.** The client has been taking omeprazole (Prilosec) for 4 weeks. The ambulatory care nurse evaluates that the client is receiving optimal intended effect of the medication if the client reports the absence of which symptom?

1. Diarrhea
2. Heartburn
3. Flatulence
4. Constipation

**648.** A client with a peptic ulcer is diagnosed with a *Helicobacter pylori* infection. The nurse is teaching the client about the medications prescribed, including clarithromycin (Biaxin), esomeprazole (Nexium), and amoxicillin (Amoxil). Which statement by the client indicates the best understanding of the medication regimen?

1. "My ulcer will heal because these medications will kill the bacteria."
2. "These medications are only taken when I have pain from my ulcer."
3. "The medications will kill the bacteria and stop the acid production."
4. "These medications will coat the ulcer and decrease the acid production in my stomach."

**649.** The client has a new prescription for metoclopramide (Reglan). On review of the chart, the nurse identifies that this medication can be safely administered with which condition?

1. Intestinal obstruction
2. Peptic ulcer with melena

3. Diverticulitis with perforation
4. Vomiting following cancer chemotherapy

**650.** The nurse has given instructions to a client who has just been prescribed cholestyramine (Questran). Which statement by the client indicates a need for further instructions?

1. I will continue taking vitamin supplements.
2. This medication will help lower my cholesterol.
3. This medication should only be taken with water.
4. A high-fiber diet is important while taking this medication.

### Alternate Item Format: Multiple Response

**651.** A histamine (H<sub>2</sub>)-receptor antagonist will be prescribed for a client. The nurse understands that which medications are H<sub>2</sub>-receptor antagonists? **Select all that apply.**

- 1. Nizatidine (Axid)
- 2. Ranitidine (Zantac)
- 3. Famotidine (Pepcid)
- 4. Cimetidine (Tagamet)
- 5. Esomeprazole (Nexium)
- 6. Lansoprazole (Prevacid)

## ANSWERS

### 640. 2

**Rationale:** The principal manifestations of Crohn's disease are diarrhea and abdominal pain. Infliximab (Remicade) is an immunomodulator that reduces the degree of inflammation in the colon, thereby reducing the diarrhea. Options 1, 3, and 4 are unrelated to this medication.

**Test-Taking Strategy:** Focus on the client's diagnosis, Crohn's disease. Eliminate option 4 because gastric bleeding is not a characteristic of Crohn's disease. Monitoring the leukocyte count and liver enzyme levels is appropriate when infliximab (Remicade) is given but not to evaluate the effectiveness of treatment, eliminating options 1 and 3. Review the manifestations of Crohn's disease and the actions of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Pharmacology

**References:** Gahart, B., & Nazareno, A. (2010). *2010 Intravenous medications* (26th ed., p. 748). St. Louis: Mosby.

Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (pp. 597–599). St. Louis: Saunders.

### 641. 3

**Rationale:** Loperamide is an antidiarrheal agent. It is used to manage acute and chronic diarrhea in conditions such as inflammatory bowel disease. Loperamide also can be used

to reduce the volume of drainage from an ileostomy. It is not used for the conditions in options 1, 2, and 4.

**Test-Taking Strategy:** Focus on the name of the medication. Recalling that this medication is an antidiarrheal agent will direct you to option 3. Review the action of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 941). St. Louis: Saunders.

### 642. 4

**Rationale:** Ondansetron is an antiemetic used to treat post-operative nausea and vomiting, as well as nausea and vomiting associated with chemotherapy. The other options are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Recalling that this medication is an antiemetic will direct you to option 4. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 937–938). St. Louis: Saunders.

**643. 3**

**Rationale:** Pancrelipase (Pancrease) is a pancreatic enzyme used in clients with pancreatitis as a digestive aid. The medication should reduce the amount of fatty stools (steatorrhea). Another intended effect could be improved nutritional status. It is not used to treat abdominal pain or heartburn. Its use could result in weight gain but should not result in weight loss if it is aiding in digestion.

**Test-Taking Strategy:** Use the process of elimination and focus on the name of the medication. Use knowledge of physiology of the pancreas to assist in directing you to the correct option. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Pharmacology

**References:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 876). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 949). St. Louis: Saunders.

**644. 3**

**Rationale:** Cimetidine is a histamine 2 (H<sub>2</sub>)-receptor antagonist. Older clients are especially susceptible to central nervous system side effects of cimetidine. The most frequent of these is confusion. Less common central nervous system side effects include headache, dizziness, drowsiness, and hallucinations.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *most frequent*. Use knowledge of the older client and medication effects to direct you to option 3. Review the side effects of cimetidine if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 236). St. Louis: Saunders.

**645. 4**

**Rationale:** Sucralfate is a gastric protectant. The medication should be scheduled for administration 1 hour before meals and at bedtime. The medication is timed to allow it to form a protective coating over the ulcer before food intake stimulates gastric acid production and mechanical irritation. The other options are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Focusing on the client's diagnosis and thinking about the pathophysiology associated with a gastric ulcer will assist in directing you to option 4. Review the administration of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 1061). St. Louis: Saunders.

**646. 2**

**Rationale:** The client who chronically uses nonsteroidal anti-inflammatory drugs (NSAIDs) is prone to gastric mucosal

injury. Misoprostol is a gastric protectant and is given specifically to prevent this occurrence. Diarrhea can be a side effect of the medication but is not an intended effect. Options 3 and 4 are incorrect.

**Test-Taking Strategy:** The strategic words in this question are *intended therapeutic effect*. This tells you that the medication is being given to prevent the occurrence of specific symptoms. Recalling that NSAIDs can cause gastric mucosal injury will direct you to option 2. Review this medication and the side effects of NSAIDs if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (pp. 762–763). St. Louis: Saunders.

**647. 2**

**Rationale:** Omeprazole is a proton pump inhibitor classified as an antiulcer agent. The intended effect of the medication is relief of pain from gastric irritation, often called heartburn by clients. Omeprazole is not used to treat the conditions identified in options 1, 3, and 4.

**Test-Taking Strategy:** Use the process of elimination. Recalling that this medication is a proton pump inhibitor will direct you to option 2. Review the action of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (pp. 848–849). St. Louis: Saunders.

**648. 3**

**Rationale:** Triple therapy for *Helicobacter pylori* infection usually includes two antibacterial drugs and a proton pump inhibitor. Clarithromycin and amoxicillin are antibacterials. Esomeprazole is a proton pump inhibitor. These medications will kill the bacteria and decrease acid production.

**Test-Taking Strategy:** Focus on the name of the medications and their actions. Eliminate option 1 because the medications do more than kill the bacteria. These medications are taken not only when there is pain but continually until gone, usually for 1 to 2 weeks. This will eliminate option 2. These medications do not coat the ulcer, eliminating option 4. Review the medication regimens for treatment of *H. pylori* and their actions if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Pharmacology

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1274–1275). St. Louis: Saunders.

Kee, J., Hayes, E., & McCuistion, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 724). St. Louis: Saunders.

**649. 4**

**Rationale:** Metoclopramide is a gastrointestinal stimulant and antiemetic. Because it is a gastrointestinal stimulant, it

is contraindicated with gastrointestinal obstruction, hemorrhage, or perforation. It is used in the treatment of emesis after surgery, chemotherapy, and radiation.

**Test-Taking Strategy:** Use the process of elimination. Recalling the classification and action of this medication and that it is an antiemetic will direct you to option 4. Review the action of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**References:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (pp. 741–743). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 947). St. Louis: Saunders.

### 650. 3

**Rationale:** Cholestyramine (Questran) is a bile acid sequestrant used to lower the cholesterol level and client compliance is a problem because of its taste and palatability. The use of flavored products or fruit juices can improve the taste. Some side effects of bile acid sequestrants include constipation and decreased vitamin absorption.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *need for further instructions*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Noting the close-ended word *only* in option 3 will direct you to this option. Review the action and side effects of this class of medications if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 229). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 651. 1, 2, 3, 4

**Rationale:** H<sub>2</sub>-receptor antagonists suppress secretion of gastric acid, alleviate symptoms of heartburn, and assist in preventing complications of peptic ulcer disease. These medications also suppress gastric acid secretions and are used in active ulcer disease, erosive esophagitis, and pathological hypersecretory conditions. The other medications listed are proton pump inhibitors.

**Test-Taking Strategy:** Focus on the subject, H<sub>2</sub>-receptor antagonists. Recalling that these medication names end with *-dine* will assist in answering this question. Also, recall that proton pump inhibitor medication names end with *-zole*. Review the H<sub>2</sub>-receptor antagonists if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 731). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 919–920). St. Louis: Saunders.

## UNIT XII

# The Adult Client With a Respiratory Disorder

### PYRAMID TERMS

**asthma** A chronic inflammatory disorder of the airways marked by airway hyperresponsiveness. Asthma causes recurrent episodes of wheezing, breathlessness, chest tightness, and coughing associated with airflow obstruction that is often reversible with treatment.

**bacille Calmette-Guérin vaccine** A vaccine containing attenuated tubercle bacilli that may be given to persons in foreign countries or to those traveling to foreign countries to produce increased resistance to tuberculosis.

**chronic obstructive pulmonary disease** A disease state characterized by pulmonary airflow obstruction that is usually progressive, not fully reversible, and sometimes accompanied by airway hyperreactivity. Airflow obstruction may be caused by chronic bronchitis and/or emphysema. In chronic hypercapnia, the stimulus to breathe is a low  $P_{O_2}$  instead of an increased  $P_{CO_2}$ .

**emphysema** Abnormal permanent enlargement of air spaces distal to the terminal bronchioles, with destruction of alveolar walls without obvious fibrosis.

**Mantoux skin test** The most reliable determinant of infection with tuberculosis. A small amount (0.1 mL) of intermediate-strength purified protein derivative containing 5 tuberculin units is given intradermally in the forearm. An area of induration measuring 10 mm or more in diameter, 48 to 72 hours after injection, indicates that the individual has been exposed to tuberculosis.

**mechanical ventilation** The use of a ventilator to move room air or oxygen-enriched air into and out of the lungs mechanically to maintain proper levels of oxygen and carbon dioxide in the blood. Types of ventilators include negative-pressure and positive-pressure ventilators. Various ventilator modes are adjusted to the client's individual needs.

**multidrug-resistant strain** A multidrug-resistant strain of tuberculosis (MDR-TB) can occur as a result of improper

or noncompliant use of treatment programs and the development of mutations in the tubercle bacilli.

**Mycobacterium tuberculosis** The causative organism (bacillus) of tuberculosis; an aerobic bacterium that is a nonmotile, nonsporulating, acid-fast rod that secretes niacin.

**pneumothorax** The accumulation of atmospheric air in the pleural space caused by a rupture in the visceral or parietal pleura. The loss of negative intrapleural pressure results in collapse of the lung. Diagnosis of pneumothorax is made by chest radiography.

**suctioning** A sterile procedure involving the removal of respiratory secretions that accumulate in the tracheobronchial airway when the client is unable to expectorate secretions; performed to maintain a patent airway.

**tuberculosis** A highly communicable disease caused by *Mycobacterium tuberculosis*. Tuberculosis is transmitted by the airborne route via droplet infection.

### PYRAMID TO SUCCESS

The Pyramid to Success focuses on respiratory acid-base imbalances and reading arterial blood gas results, infectious diseases, particularly tuberculosis, and respiratory care in relation to oxygen delivery systems and mechanical ventilation. Pyramid Points focus on the client with pneumonia, respiratory failure, chronic obstructive pulmonary disease, pneumothorax, influenza, and tuberculosis. The Pyramid to Success includes the care of the client with tuberculosis, especially regarding the importance of the medication regimen, providing adequate nutrition and adequate rest to promote the healing process, and prevention of the progression of the disease. Focus on assisting the client to cope with the social

isolation issues that exist during the period of illness and on teaching the client and family the critical measures of screening and of preventing respiratory disease and the transmission of disease.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Collaborating with the multidisciplinary team in the management of the respiratory disorder
- Discussing consultations and referrals related to the respiratory disorder
- Establishing priorities
- Handling infectious materials such as sputum or body fluids safely
- Maintaining asepsis when caring for wounds or tracheostomy sites and during mechanical ventilation or suctioning
- Maintaining confidentiality related to the respiratory disorder
- Maintaining respiratory precautions, standard precautions, and other precautions
- Obtaining informed consent related to diagnostic and surgical procedures
- Upholding client rights

### Health Promotion and Maintenance

- Educating the client about adequate fluid and nutritional intake
- Educating the client about breathing exercises and respiratory therapy and care
- Educating the client about medication administration
- Educating the client about the need for follow-up care

- Educating the client about the prevention of transmission of infection
- Informing the client about health promotion programs
- Performing respiratory assessment techniques
- Preventing respiratory disorders and infectious diseases
- Providing health screening related to risks for respiratory disorders

### Psychosocial Integrity

- Considering religious, cultural, and spiritual influences when providing care
- Discussing body image changes related to tracheostomy if performed
- Discussing end-of-life and grief and loss issues
- Discussing situational role changes
- Identifying coping mechanisms
- Identifying support systems
- Informing the client about community resources

### Physiological Integrity

- Administering medications
- Caring for the client on mechanical ventilation
- Caring for the client receiving respiratory care and oxygen
- Managing illnesses
- Monitoring for acid-base imbalances
- Monitoring for alterations in body systems
- Monitoring for infectious diseases
- Providing comfort
- Providing nutrition and oral hygiene
- Providing personal hygiene and promoting rest and sleep
- Reading arterial blood gas results

# Respiratory System

## I. ANATOMY AND PHYSIOLOGY

- A.** Primary functions of the respiratory system
  1. Provides oxygen for metabolism in the tissues
  2. Removes carbon dioxide, the waste product of metabolism
- B.** Secondary functions of the respiratory system
  1. Facilitates sense of smell
  2. Produces speech
  3. Maintains acid-base balance
  4. Maintains body water levels
  5. Maintains heat balance
- C.** Upper respiratory tract
  1. Nose: Humidifies, warms, and filters inspired air
  2. Sinuses: Air-filled cavities within the hollow bones that surround the nasal passages and provide resonance during speech
  3. Pharynx
    - a. Passageway for the respiratory and digestive tracts located behind the oral and nasal cavities
    - b. Divided into the nasopharynx, oropharynx, and laryngopharynx
  4. Larynx
    - a. Located above the trachea, just below the pharynx at the root of the tongue; commonly called the voice box
    - b. Contains two pairs of vocal cords, the false and true cords
    - c. The opening between the true vocal cords is the glottis.
    - d. The glottis plays an important role in coughing, which is the most fundamental defense mechanism of the lungs.
  5. Epiglottis
    - a. Leaf-shaped elastic structure attached along one end to the top of the larynx
    - b. Prevents food from entering the tracheobronchial tree by closing over the glottis during swallowing
- D.** Lower respiratory tract
  1. Trachea: Located in front of the esophagus; branches into the right and left mainstem bronchi at the carina
  2. Mainstem bronchi
    - a. Begin at the carina
    - b. The right bronchus is slightly wider, shorter, and more vertical than the left bronchus.
    - c. The mainstem bronchi divide into secondary or lobar bronchi that enter each of the five lobes of the lung.
    - d. The bronchi are lined with cilia, which propel mucus up and away from the lower airway to the trachea, where it can be expectorated or swallowed.
  3. Bronchioles
    - a. Branch from the secondary bronchi and subdivide into the small terminal and respiratory bronchioles
    - b. The bronchioles contain no cartilage and depend on the elastic recoil of the lung for patency.
    - c. The terminal bronchioles contain no cilia and do not participate in gas exchange.
  4. Alveolar ducts and alveoli
    - a. *Acinus* (plural *acini*) is a term used to indicate all structures distal to the terminal bronchiole.
    - b. Alveolar ducts branch from the respiratory bronchioles.
    - c. Alveolar sacs, which arise from the ducts, contain clusters of alveoli, which are the basic units of gas exchange.
    - d. Type II alveolar cells in the walls of the alveoli secrete surfactant, a phospholipid protein that reduces the surface tension in the alveoli; without surfactant, the alveoli would collapse. 
  5. Lungs 
    - a. Located in the pleural cavity in the thorax
    - b. Extend from just above the clavicles to the diaphragm, the major muscle of inspiration
    - c. The right lung, which is larger than the left, is divided into three lobes: the upper, middle, and lower lobes.
    - d. The left lung, which is narrower than the right lung to accommodate the heart, is divided into two lobes.

- e. The respiratory structures are innervated by the phrenic nerve, the vagus nerve, and the thoracic nerves.
  - f. The parietal pleura lines the inside of the thoracic cavity, including the upper surface of the diaphragm.
  - g. The visceral pleura covers the pulmonary surfaces.
  - h. A thin fluid layer, which is produced by the cells lining the pleura, lubricates the visceral pleura and the parietal pleura, allowing them to glide smoothly and painlessly during respiration.
  - i. Blood flows through the lungs via the pulmonary system and the bronchial system.
6. Accessory muscles of respiration include the scalene muscles, which elevate the first two ribs, the sternocleidomastoid muscles, which raise the sternum, and the trapezius and pectoralis muscles, which fix the shoulders.
7. The respiratory process
- a. The diaphragm descends into the abdominal cavity during inspiration, causing negative pressure in the lungs.
  - b. The negative pressure draws air from the area of greater pressure, the atmosphere, into the area of lesser pressure, the lungs.
  - c. In the lungs, air passes through the terminal bronchioles into the alveoli to oxygenate the body tissues.
  - d. At the end of inspiration, the diaphragm and intercostal muscles relax and the lungs recoil.
  - e. As the lungs recoil, pressure within the lungs becomes higher than atmospheric pressure, causing the air, which now contains the cellular waste products carbon dioxide and water, to move from the alveoli in the lungs to the atmosphere.
  - f. Effective gas exchange depends on distribution of gas (ventilation) and blood (perfusion) in all portions of the lungs.

## II. DIAGNOSTIC TESTS

- A. Risk factors for respiratory disorders (Box 58-1)
- B. Chest x-ray film (radiograph)
  1. Description: Provides information regarding the anatomical location and appearance of the lungs
  2. Preprocedure
    - a. Remove all jewelry and other metal objects from the chest area.
    - b. Assess the client's ability to inhale and hold his or her breath.
  3. Postprocedure: Help the client get dressed.

 **Question women regarding pregnancy or the possibility of pregnancy before performing radiography studies.**

### Box 58-1 Risk Factors for Respiratory Disorders

Allergies  
 Chest injury  
 Crowded living conditions  
 Exposure to chemicals and environmental pollutants  
 Family history of infectious disease  
 Frequent respiratory illnesses  
 Geographic residence and travel to foreign countries  
 Smoking  
 Surgery  
 Use of chewing tobacco  
 Viral syndromes

- C. Sputum specimen
1. Description: Specimen obtained by expectoration or tracheal **suctioning** to assist in the identification of organisms or abnormal cells (see Priority Nursing Actions)

### PRIORITY NURSING ACTIONS!

#### Actions to Take to Perform Respiratory Suctioning

1. Explain the procedure to the client.
2. Assist the client to an upright position.
3. Perform hand hygiene and don protective garb.
4. Prepare suctioning equipment and turn on the suction.
5. Hyperoxygenate the client.
6. Insert the catheter without suction applied.
7. Once inserted, apply suction intermittently while rotating and withdrawing the catheter.
8. Hyperoxygenate the client.
9. Listen to breath sounds.
10. Document the procedure, client response, and effectiveness.

Once the nurse has assessed the client, the nurse would explain the procedure. The client is assisted to a sitting upright position such as semi-Fowler's with the head hyperextended (unless contraindicated). The nurse next performs hand hygiene and applies appropriate protective garb using aseptic technique. The nurse prepares the needed suctioning equipment, turns on the suction device, and sets it to the appropriate pressure. The nurse hyperoxygenates the client by a resuscitation bag, increasing the oxygen flow rate, or asking the client to take deep breaths. The nurse next lubricates the catheter with sterile water or water-soluble lubricant (per agency procedure), inserts the catheter without the application of suction, and then applies intermittent suction for up to 10 seconds while rotating and withdrawing the catheter. After suctioning, the nurse hyperoxygenates the client and encourages the client to take deep breaths if possible. During the procedure the nurse monitors the client for toleration of the procedure and the presence of complications. Finally, the nurse listens to breath sounds to assist in determining effectiveness and documents the procedure, the client's response, and effectiveness.

**Reference:** Perry, A., & Potter, P. (2006). *Clinical nursing skills & techniques* (6th ed., pp. 824-828). St. Louis: Mosby.

## 2. Preprocedure

- a. Determine specific purpose of collection and check with institutional policy for appropriate method for collection of a specimen.
- b. Obtain an early morning sterile specimen from **suctioning** or expectoration after a respiratory treatment if a treatment is prescribed.
- c. Instruct the client to rinse the mouth with water before collection.
- d. Obtain 15 mL of sputum.
- e. Instruct the client to take several deep breaths and then cough deeply to obtain sputum.
- f. Always collect the specimen before the client begins antibiotic therapy.

## 3. Postprocedure

- a. If a culture of sputum is prescribed, transport the specimen to the laboratory immediately.
- b. Assist the client with mouth care.

## D. Laryngoscopy and bronchoscopy

## 1. Description: Direct visual examination of the larynx, trachea, and bronchi with a fiberoptic bronchoscope

## 2. Preprocedure

- a. Obtain informed consent.
- b. Maintain NPO status for the client from mid-night before the procedure.
- c. Obtain vital signs.
- d. Assess the results of coagulation studies.
- e. Remove dentures and eyeglasses.
- f. Prepare suction equipment.
- g. Establish an intravenous (IV) access as necessary and administer medication for sedation as prescribed.
- h. Have emergency resuscitation equipment readily available.

## 3. Postprocedure

- a. Monitor vital signs.
- b. Maintain the client in a semi-Fowler's position.
- c. Assess for the return of the gag reflex.
- d. Maintain NPO status until the gag reflex returns.
- e. Have an emesis basin readily available for the client to expectorate sputum.
- f. Monitor for bloody sputum.
- g. Monitor respiratory status, particularly if sedation has been administered.
- h. Monitor for complications, such as bronchospasm or bronchial perforation, indicated by facial or neck crepitus, dysrhythmias, hemorrhage, hypoxemia, and **pneumothorax**.
- i. Notify the physician if fever, difficulty in breathing, or other signs of complications occur following the procedure.

## E. Mediastinoscopy

1. Insertion of a flexible tube through the chest wall above the sternum into the area of the upper chest between the lungs.
2. Performed in the operating room under general anesthesia.
3. Done to look for the presence of tumors and to obtain tissue samples for biopsy and culture.
4. Complications relate to anesthetic mediations and bleeding.

## F. Pulmonary angiography

## 1. Description

- a. An invasive fluoroscopic procedure in which a catheter is inserted through the antecubital or femoral vein into the pulmonary artery or one of its branches
- b. Involves an injection of iodine or radiopaque contrast material

## 2. Preprocedure

- a. Obtain informed consent.
- b. Assess for allergies to iodine, seafood, or other radiopaque dyes.
- c. Maintain NPO status of the client for 8 hours before the procedure.
- d. Monitor vital signs.
- e. Assess results of coagulation studies.
- f. Establish an intravenous access.
- g. Administer sedation as prescribed.
- h. Instruct the client to lie still during the procedure.
- i. Instruct the client that he or she may feel an urge to cough, flushing, nausea, or a salty taste following injection of the dye.
- j. Have emergency resuscitation equipment available.

## 3. Postprocedure

- a. Monitor vital signs.
- b. Avoid taking blood pressures for 24 hours in the extremity used for the injection.
- c. Monitor peripheral neurovascular status of the affected extremity.
- d. Assess insertion site for bleeding.
- e. Monitor for delayed reaction to the dye.

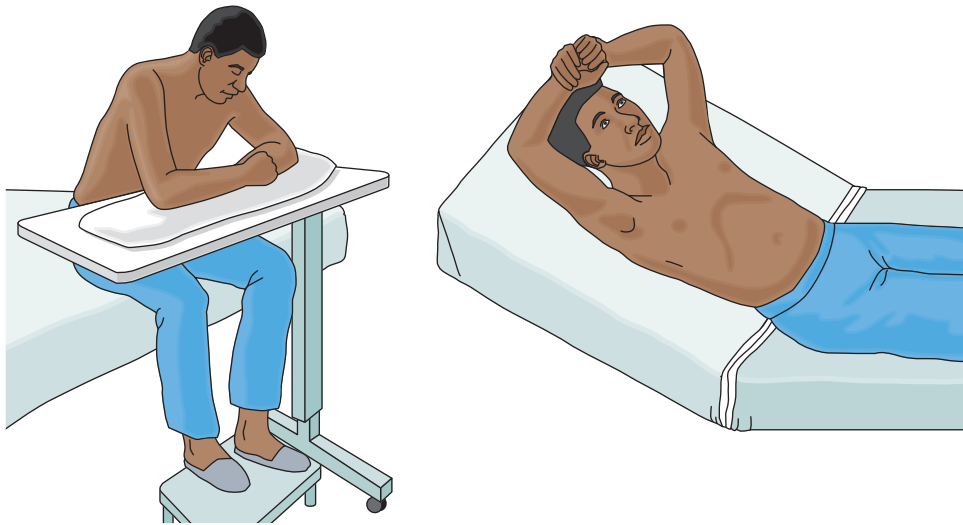

## G. Thoracentesis

## 1. Description: Removal of fluid or air from the pleural space via a transthoracic aspiration

## 2. Preprocedure

- a. Obtain informed consent.
- b. Obtain vital signs.
- c. Prepare the client for ultrasound or chest radiograph, if prescribed, before procedure.
- d. Assess results of coagulation studies.
- e. Note that the client is positioned sitting upright, with the arms and shoulders supported by a table at the bedside during the procedure (Fig. 58-1).

▲ **FIGURE 58-1** Positions for thoracentesis. (From Ignatavicius, D., & Workman, M. [2006]. *Medical-surgical nursing: Critical thinking for collaborative care* [5th ed.]. St. Louis: Saunders.)

- f. If the client cannot sit up, the client is placed lying in bed toward the unaffected side, with the head of the bed elevated.
- g. Instruct the client not to cough, breathe deeply, or move during the procedure.
- 3. Postprocedure
  - a. Monitor vital signs.
  - b. Monitor respiratory status.
  - c. Apply a pressure dressing, and assess the puncture site for bleeding and crepitus.
  - d. Monitor for signs of **pneumothorax**, air embolism, and pulmonary edema.
- H. Pulmonary function tests**
  - 1. Description: Tests used to evaluate lung mechanics, gas exchange, and acid-base disturbance through spirometric measurements, lung volumes, and arterial blood gas levels.
  - 2. Preprocedure
    - a. Determine whether an analgesic that may depress the respiratory function is being administered.
    - b. Consult with the physician regarding holding bronchodilators before testing.
    - c. Instruct the client to void before the procedure and to wear loose clothing.
    - d. Remove dentures.
    - e. Instruct the client to refrain from smoking or eating a heavy meal for 4 to 6 hours before the test.
  - 3. Postprocedure: Client may resume normal diet and any bronchodilators and respiratory treatments that were held before the procedure.
- I. Lung biopsy**
  - 1. Description
    - a. A transbronchial biopsy and a transbronchial needle aspiration may be performed to obtain tissue for analysis by culture or cytological examination.
    - b. An open lung biopsy is performed in the operating room.
  - 2. Preprocedure
    - a. Obtain informed consent.
    - b. Maintain NPO status of the client before the procedure.
    - c. Inform the client that a local anesthetic will be used for a needle biopsy but a sensation of pressure during needle insertion and aspiration may be felt.
    - d. Administer analgesics and sedatives as prescribed.
  - 3. Postprocedure
    - a. Monitor vital signs.
    - b. Apply a dressing to the biopsy site and monitor for drainage or bleeding.
    - c. Monitor for signs of respiratory distress, and notify the physician if they occur.
    - d. Monitor for signs of **pneumothorax** and air emboli, and notify the physician if they occur.
    - e. Prepare the client for chest radiography if prescribed.
- J. Ventilation-perfusion lung scan**
  - 1. Description
    - a. The perfusion scan evaluates blood flow to the lungs.
    - b. The ventilation scan determines the patency of the pulmonary airways and detects abnormalities in ventilation.
    - c. A radionuclide may be injected for the procedure.
  - 2. Preprocedure
    - a. Obtain informed consent.
    - b. Assess the client for allergies to dye, iodine, or seafood.
    - c. Remove jewelry around the chest area.
    - d. Review breathing methods that may be required during testing.

- e. Establish an intravenous access.
- f. Administer sedation if prescribed.
- g. Have emergency resuscitation equipment available.

### 3. Postprocedure

- a. Monitor client for reaction to the radionuclide.
- b. Instruct the client that the radionuclide clears from the body in about 8 hours.

**K.** Skin tests: A skin test uses an intradermal injection to help diagnose various infectious diseases (Box 58-2)

**L.** Arterial blood gases (ABGs) (Box 58-3)

1. Description: Measurement of the dissolved oxygen and carbon dioxide in the arterial blood helps indicate the acid-base state and how well oxygen is being carried to the body.

### 2. Preprocedure

- a. Perform Allen's test before drawing radial artery specimens.
- b. Have the client rest for 30 minutes before specimen collection to ensure accurate measurement of body oxygenation.
- c. Do not turn off oxygen unless the ABG sample is prescribed to be drawn with the client breathing room air.

**!** Avoid suctioning the client before drawing an ABG sample because the suctioning procedure will deplete the client's oxygen resulting in inaccurate ABG results.

### Box 58-2 Skin Test Procedure

Determine hypersensitivity or previous reactions to skin tests.

Use a skin site that is free of excessive body hair, dermatitis, and blemishes.

Apply the injection at the upper third of the inner surface of the left arm.

Circle and mark the injection test site.

Document the date, time, and test site.

Advise the client not to scratch the test site to prevent infection and possible abscess formation.

Instruct the client to avoid washing the test site.

Interpret the reaction at the injection site 24 to 72 hours after administration of the test antigen.

Assess the test site for the amount of induration (hard swelling) in millimeters and for the presence of erythema and vesiculation (small blister-like elevations).

### Box 58-3 Normal Arterial Blood Gas Values

pH: 7.35 to 7.45

P<sub>CO<sub>2</sub></sub>: 35 to 45 mm Hg

HCO<sub>3</sub><sup>-</sup>: 22 to 27 mEq/L

P<sub>O<sub>2</sub></sub>: 80 to 100 mm Hg

O<sub>2</sub> saturation: 96% to 100%

Oxyhemoglobin dissociation curve: No shift

### 3. Postprocedure

- a. Place the specimen on ice.
- b. Note the client's temperature on the laboratory form.
- c. Note the oxygen and type of ventilation that the client is receiving on the laboratory form.
- d. Apply pressure to the puncture site for 5 to 10 minutes or longer if the client is receiving anticoagulant therapy or has a bleeding disorder.
- e. Transport the specimen to the laboratory within 15 minutes.
- f. See Chapter 10 for discussion of the analysis of ABG results.

### M. Pulse oximetry

#### 1. Description

- a. Pulse oximetry is a noninvasive test that registers the oxygen saturation of the client's hemoglobin.
- b. The capillary oxygen saturation (SaO<sub>2</sub>) is recorded as a percentage.
- c. The normal value is 96% to 100%.
- d. After a hypoxic client uses up the readily available oxygen (measured as the arterial oxygen pressure, PaO<sub>2</sub>, on ABG testing), the reserve oxygen, that oxygen attached to the hemoglobin (SaO<sub>2</sub>), is drawn on to provide oxygen to the tissues.
- e. A pulse oximeter reading can alert the nurse to hypoxemia before clinical signs occur.

#### 2. Procedure

- a. A sensor is placed on the client's finger, toe, nose, ear lobe, or forehead to measure oxygen saturation, which then is displayed on a monitor.
- b. Maintain the transducer at heart level.
- c. Do not select an extremity with an impediment to blood flow.

**!** A pulse oximetry reading lower than 91% necessitate physician notification; if the reading is lower than 85%, oxygenation to body tissues is compromised, and a reading lower than 70% is life-threatening.

## III. RESPIRATORY TREATMENTS

**A.** Breathing retraining (Box 58-4)

**B.** Chest physiotherapy (CPT) (Fig. 58-2)

1. Description: Percussion, vibration, and postural drainage techniques are performed over the thorax to loosen secretions in the affected area of the lungs and move them into more central airways.
2. Interventions (Box 58-5)
3. Contraindications
  - a. Unstable vital signs
  - b. Increased intracranial pressure
  - c. Bronchospasm

**Box 58-4 Client Education: Breathing Retraining and Huff Coughing****Breathing Retraining**

This includes exercises to decrease the use of accessory muscles of breathing, to decrease fatigue, and to promote CO<sub>2</sub> elimination.

The main types of exercises include pursed-lip breathing and diaphragmatic breathing.

The client should inhale slowly through the nose.

The client should place the hand over the abdomen while inhaling; the abdomen should expand with inhalation and contract during exhalation.

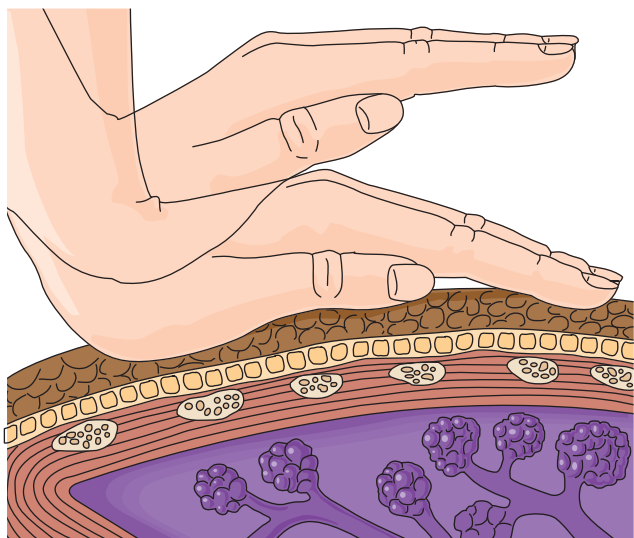

The client should exhale three times longer than inhalation by blowing through pursed lips.

**Huff Coughing**

This is an effective coughing technique that conserves energy, reduces fatigue, and facilitates mobilization of secretions.

The client should take three or four deep breaths using pursed-lip and diaphragmatic breathing. Leaning slightly forward, the client should cough three to four times during exhalation.

The client may need to splint the thorax or abdomen to achieve a maximum cough.

**▲ FIGURE 58-2** Chest physiotherapy (CPT) and postural drainage. *Left*, Percussion and vibration techniques. The nurse may use one or two hands with vibration, which is performed when the client exhales or coughs. *Right*, Positions for postural drainage of respiratory secretions. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

**Box 58-5 Chest Physiotherapy Procedure**

Perform chest physiotherapy (CPT) in the morning on arising, 1 hour before meals, or 2 to 3 hours after meals. Stop CPT if pain occurs.

If the client is receiving a tube feeding, stop the feeding and aspirate the residual before beginning CPT.

Administer the bronchodilator (if prescribed) 15 minutes before the procedure.

Place a layer of material (gown or pajamas) between the hands or percussion device and the client's skin.

Position the client for postural drainage based on assessment.

Percuss the area for 1 to 2 minutes.

Vibrate the same area while the client exhales four or five deep breaths.

Monitor for respiratory tolerance to the procedure.

Stop the procedure if cyanosis or exhaustion occurs.

Maintain the position for 5 to 20 minutes after the procedure.

Repeat in all necessary positions until the client no longer expectorates mucus.

Dispose of sputum properly.

Provide mouth care after the procedure.

**Box 58-6 Client Instructions for Incentive Spirometry**

Instruct the client to assume a sitting or upright position.

Instruct the client to place the mouth tightly around the mouthpiece of the device.

Instruct the client to inhale slowly to raise and maintain the flow rate indicator between the 600 and 900 marks.

Instruct the client to hold the breath for 5 seconds and then to exhale through pursed lips.

Instruct the client to repeat this process 10 times every hour.

- d. History of pathological fractures
- e. Rib fractures
- f. Chest incisions

**C. Incentive spirometry (Box 58-6)****IV. OXYGEN****A. Interventions**

1. Assess color and vital signs before and during treatment.
2. Place an *Oxygen in Use* sign at the client's bedside.
3. Assess for the presence of chronic lung problems.
4. Humidify the oxygen if indicated.

**B. Nasal cannula (nasal prongs) (Box 58-7 and Fig. 58-3)****1. Description**

- a. A nasal cannula is used at a flow rate of 1 to 6 L/min, providing approximate oxygen concentrations of 24% (at 1 L/min) to 44% (at 6 L/min).

**Box 58-7 Fraction of Inspired Oxygen Delivered via Nasal Cannula**

|                |                |
|----------------|----------------|
| 24% at 1 L/min | 36% at 4 L/min |
| 28% at 2 L/min | 40% at 5 L/min |
| 32% at 3 L/min | 44% at 6 L/min |

▲ **FIGURE 58-3** A nasal cannula (prongs). (From Ignatavicius, D., & Workman, M. [2006]. *Medical-surgical nursing: Critical thinking for collaborative care* [5th ed.]. St. Louis: Saunders.)

- b. Flow rates higher than 6 L/min do not significantly increase oxygenation because the anatomical reserve or dead space (oral and nasal cavities) is full.
- c. A nasal cannula is used for the client with chronic airflow limitation and for long-term oxygen use.
- d. Effective oxygen concentration can be delivered to nose breathers and mouth breathers with the use of a nasal cannula.

▲ **!** A client who is hypoxemic and has chronic hypercapnia requires low levels of oxygen delivery at 1 to 2 L/min because a low arterial oxygen level is the client's primary drive for breathing.

**2. Interventions**

- a. Place the nasal prongs in the nostrils, with the openings facing the client.
- b. Add humidification as prescribed when a flow rate higher than 2 L/min is prescribed.
- c. Check the water level and change the humidifier as needed.
- d. Assess the client for changes in respiratory rate or depth.

- e. Assess the nasal mucosa because high flow rates have a drying effect and increase mucosal irritation.
- f. Assess skin integrity because the oxygen tubing can irritate the skin.

**C. Simple face mask (Box 58-8 and Fig. 58-4)**

1. Description
  - a. A face mask is used to deliver oxygen concentrations of 40% to 60% for short-term oxygen therapy or to deliver oxygen in an emergency.
  - b. A minimal flow rate of 5 L/min is needed to prevent the rebreathing of exhaled air.
2. Interventions
  - a. Be sure that the mask fits securely over the nose and mouth because a poorly fitting mask reduces the fraction of inspired oxygen ( $F_{I_{O_2}}$ ) delivered.
  - b. Assess skin and provide skin care to the area covered by the mask because pressure and moisture under the mask may cause skin breakdown (remove mucus and saliva from the mask).

- c. Monitor the client closely for the risk of aspiration because the mask limits the client's ability to clear the mouth, especially if vomiting occurs.
- d. Provide emotional support to decrease anxiety in the client who feels claustrophobic.
- e. Consult with the physician regarding switching the client from a mask to a nasal cannula during eating.

**D. Partial rebreather mask (Box 58-9 and Fig. 58-5)**

1. Description
  - a. A partial rebreather mask consists of a mask with a reservoir bag that provides an oxygen concentration of 70% to 90% with flow rates of 6 to 15 L/min.
  - b. The client rebreathes one third of the exhaled tidal volume, which is high in oxygen, thus providing a high  $F_{I_{O_2}}$ .
2. Interventions
  - a. Make sure that the reservoir does not twist, kink, or become deflated.
  - b. Adjust the flow rate to keep the reservoir bag inflated two-thirds full during inspiration

**Box 58-8 Fraction of Inspired Oxygen Delivered via Simple Face Mask**

40% at 5 L/min

45% to 50% at 6 L/min

55% to 60% at 8 L/min

**Pyramid Point:** Flow rate must be set to at least 5 L/min to flush the mask of carbon dioxide.

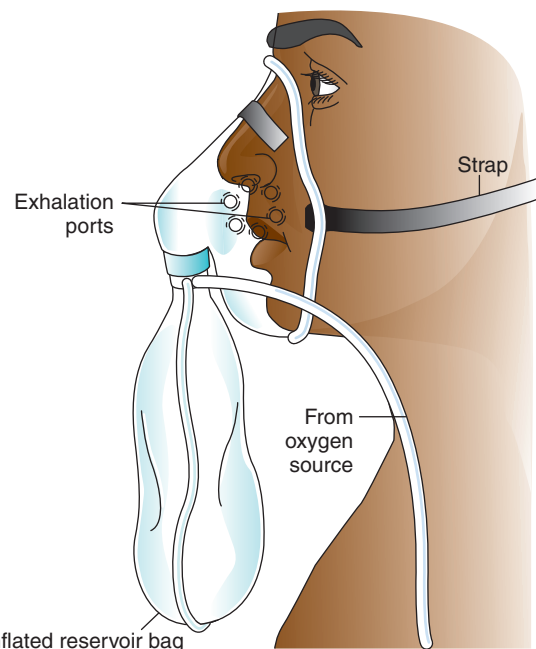

**Box 58-9 Fraction of Inspired Oxygen Delivered via Partial Rebreather Mask**

70% to 90%  $F_{I_{O_2}}$  delivered at 6 to 15 L/min

**Pyramid Point:** A flow rate high enough to maintain the bag two-thirds full during inspiration is needed.

**▲ FIGURE 58-4** A simple face mask used to deliver oxygen. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

**▲ FIGURE 58-5** A partial rebreather mask. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

because deflation results in decreased oxygen delivered and rebreathing of exhaled air.

### E. Nonrebreather mask (Fig. 58-6)

#### 1. Description

- Of the low-flow systems, a nonrebreather mask provides the highest concentration of oxygen and can deliver an  $F_{IO_2}$  higher than 90%, depending on the client's ventilatory pattern.
- A nonrebreather mask most frequently is used in the client with a deteriorating respiratory status who might require intubation.
- The nonrebreather mask has a one-way valve between the mask and the reservoir and two flaps over the exhalation ports.
- The valve allows the client to draw the entire quantity of oxygen from the reservoir bag.
- The flaps prevent room air from entering through the exhalation ports.
- During exhalation, air leaves through these exhalation ports while the one-way valve prevents exhaled air from reentering the reservoir bag.

2.  $F_{IO_2}$  delivered: 60% to 100%  $F_{IO_2}$  at a rate of flow that maintains the bag two-thirds full

#### 3. Interventions

- Remove mucus or saliva from the mask.

▲ **FIGURE 58-6** A nonrebreather mask. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

b. Assess the client closely.

c. Ensure that the valve and flaps are intact and functional during each breath.

d. Valves should open during expiration and close during inhalation.

e. Suffocation can occur if the reservoir bag kinks or if the oxygen source disconnects.

### F. Face tent

1. A face tent fits over the client's chin, with the top extending halfway across the face.

2. The oxygen concentration varies, but the face tent is useful instead of a tight-fitting mask for the client who has facial trauma or burns.

**G.** Aerosol mask: Used for the client who requires high humidity after extubation or upper airway surgery, or for the client who has thick secretions

### H. Tracheostomy collar and T-piece (Fig. 58-7)

1. The tracheostomy collar can be used to deliver high humidity and the desired oxygen to the client with a tracheostomy.

2. A special adapter, called the T-piece, can be used to deliver any desired  $F_{IO_2}$  to the client with a tracheostomy, laryngectomy, or endotracheal tube.

3. See Chapter 21 for information on endotracheal and tracheostomy tubes.

### I. Interventions for face tent, aerosol mask, tracheostomy collar, and T-piece

1. Change delivery system to a nasal cannula during mealtime if indicated for the client with a face mask or aerosol mask.

2. Assess that the aerosol mist escapes from the vents of the delivery system during inspiration and expiration.

3. Empty condensation from the tubing to prevent the client from being lavaged with water and to

▲ **FIGURE 58-7** A T-piece apparatus for attachment to an endotracheal tube or tracheostomy tube. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

promote an adequate oxygen flow rate; remove and clean the tubing at least every 4 hours.

4. Ensure that sufficient water is in the aerosol water container and change the container as needed.
5. Keep the exhalation port on the T-piece open and uncovered (if the port is occluded, the client can suffocate).
6. Position the T-piece so that it does not pull on the tracheostomy or endotracheal tube and cause erosion of the skin at the tracheostomy insertion site.
7. Make sure that the humidifier creates enough mist; a mist should be seen during inspiration and expiration.

#### J. Venturi mask (Fig. 58-8)

1. Description
  - a. High-flow oxygen delivery system
  - b. Operation of the Venturi mask is based on a mechanism that pulls in a specific proportional amount of room air for each liter of oxygen delivered.
  - c. An adapter is located between the bottom of the mask and the oxygen source; the adapter contains holes of different sizes that allow only specific amounts of air to mix with the oxygen.
  - d. The adapter allows selection of the amount of oxygen desired.
2.  $\text{FiO}_2$  delivered: 24% to 55%  $\text{FiO}_2$ , with flow rates of 4 to 10 L/min

**▲ FIGURE 58-8** A Venturi mask for precise oxygen delivery. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

#### 3. Interventions

- a. Monitor the client closely to ensure an accurate flow rate for a specific  $\text{FiO}_2$ .
- b. Keep the air entrainment port for the Venturi adapter open and uncovered to ensure adequate oxygen delivery.
- c. Ensure that the mask fits snugly and that the tubing is free of kinks, because the  $\text{FiO}_2$  is altered if kinking occurs or if the mask fits poorly.
- d. Assess the client for dry mucous membranes; humidity or aerosol can be added to the system.

### V. MECHANICAL VENTILATION

#### A. Types

1. Pressure-cycled ventilator: The ventilator pushes air into the lungs until a specific airway pressure is reached; it is used for short periods, as in the postanesthesia care unit.
2. Time-cycled ventilator: The ventilator pushes air into the lungs until a preset time has elapsed; it is used for the pediatric or neonatal client.
3. Volume-cycled ventilator
  - a. The ventilator pushes air into the lungs until a preset volume is delivered.
  - b. A constant tidal volume is delivered regardless of the changing compliance of the lungs and chest wall or the airway resistance in the client or ventilator.
4. Microprocessor ventilator
  - a. A computer or microprocessor is built into the ventilator to allow continuous monitoring of ventilatory functions, alarms, and client parameters.
  - b. This type of ventilator is more responsive to clients who have severe lung disease or require prolonged weaning.

#### B. Modes of ventilation (Box 58-10)

1. Controlled
  - a. The client receives a set tidal volume at a set rate.
  - b. Used for clients who cannot initiate respiratory effort.
  - c. Least used mode; if the client attempts to initiate a breath, the ventilator blocks the effort.
2. Assist-control
  - a. Most commonly used mode
  - b. Tidal volume and ventilatory rate are preset on the ventilator.

#### Box 58-10 Modes of Ventilation

Controlled  
Assist-control  
Synchronized intermittent mandatory ventilation

- c. The ventilator takes over the work of breathing for the client.
  - d. The ventilator is programmed to respond to the client's inspiratory effort if the client does initiate a breath.
  - e. The ventilator delivers the preset tidal volume when the client initiates a breath while allowing the client to control the rate of breathing.
  - f. If the client's spontaneous ventilatory rate increases, the ventilator continues to deliver a preset tidal volume with each breath, which may cause hyperventilation and respiratory alkalosis.
3. Synchronized intermittent mandatory ventilation (SIMV)
- a. Similar to assist-control ventilation in that the tidal volume and ventilatory rate are preset on the ventilator.
  - b. Allows the client to breath spontaneously at her or his own rate and tidal volume between the ventilator breaths
  - c. Can be used as a primary ventilatory mode or as a weaning mode.
  - d. When SIMV is used as a weaning mode, the number of SIMV breaths is decreased gradually, and the client gradually resumes spontaneous breathing.

**C. Ventilator controls and settings (Table 58-1)**

**D. Interventions**

**!** For a client receiving mechanical ventilation, always assess the client first and then assess the ventilator.

1. Assess vital signs, lung sounds, respiratory status, and breathing patterns (the client will never breathe at a rate lower than the rate set on the ventilator).
2. Monitor skin color, particularly in the lips and nail beds.
3. Monitor the chest for bilateral expansion.
4. Obtain pulse oximetry readings.
5. Monitor ABG results.
6. Assess the need for **suctioning** and observe the type, color, and amount of secretions.
7. Assess ventilator settings.
8. Assess the level of water in the humidifier and the temperature of the humidification system because extremes in temperature can damage the mucosa in the airway.
9. Ensure that the alarms are set.
10. If a cause for an alarm cannot be determined, ventilate the client manually with a resuscitation bag until the problem is corrected.
11. Empty the ventilator tubing when moisture collects.

**TABLE 58-1** Ventilator Controls and Settings and Descriptions

| Controls and Settings                           | Descriptions   |
|---|--|
| Tidal volume                                    | The volume of air that the client receives with each breath.   |
| Rate  | The number of ventilator breaths delivered per minute.   |
| Sighs   | The volumes of air that are 1.5 to 2 times the set tidal volume, delivered 6 to 10 times per hour; may be used to prevent atelectasis.   |
| Fraction of inspired oxygen (FiO <sub>2</sub> ) | The oxygen concentration delivered to the client; determined by the client's condition and ABG levels.   |
| Peak airway inspiratory pressure                | The pressure needed by the ventilator to deliver a set tidal volume at a given compliance. Monitoring peak airway inspiratory pressure reflects changes in compliance of the lungs and resistance in the ventilator or client.   |
| Continuous positive airway pressure             | The application of positive airway pressure throughout the entire respiratory cycle for spontaneously breathing clients.<br>Keeps the alveoli open during inspiration and prevents alveolar collapse; used primarily as a weaning modality.<br>No ventilator breaths are delivered, but the ventilator delivers oxygen and provides monitoring and an alarm system; the respiratory pattern is determined by the client's efforts. |
| Positive end-expiratory pressure (PEEP)         | Positive pressure is exerted during the expiratory phase of ventilation, which improves oxygenation by enhancing gas exchange and preventing atelectasis.<br>The need for PEEP indicates a severe gas exchange disturbance.<br>Higher amounts of PEEP (more than 15) increase the chance of complications, such as barotrauma tension pneumothorax.  |
| Pressure support                                | The application of positive pressure on inspiration that eases the workload of breathing.<br>May be used in combination with PEEP as a weaning method.<br>As the weaning process continues, the amount of pressure applied to inspiration is gradually decreased.  |

**Box 58-11 Causes of Ventilator Alarms****High-Pressure Alarm**

Increased secretions are in the airway.  
 Wheezing or bronchospasm causes decreased airway size.  
 The endotracheal tube is displaced.  
 The ventilator tube is obstructed because of water or a kink in the tubing.  
 Client coughs, gags, or bites on the oral endotracheal tube.  
 Client is anxious or fights the ventilator.

**Low-Pressure Alarm**

Disconnection or leak in the ventilator or in the client's airway cuff occurs.  
 The client stops spontaneous breathing.

12. Turn the client at least every 2 hours or get the client out of bed, as prescribed, to prevent complications of immobility.
13. Have resuscitation equipment available at the bedside.

 **E. Causes of alarms (Box 58-11)**

 **Never set ventilator alarm controls to the off position.**

**F. Complications**

1. Hypotension caused by the application of positive pressure, which increases intrathoracic pressure and inhibits blood return to the heart
2. Respiratory complications such as **pneumothorax** or subcutaneous **emphysema** as a result of positive pressure
3. Gastrointestinal alterations such as stress ulcers
4. Malnutrition if nutrition is not maintained
5. Infections
6. Muscular deconditioning
7. Ventilator dependence or inability to wean

 **G. Weaning: Process of going from ventilator dependence to spontaneous breathing**

1. SIMV
  - a. The client breathes between the preset breaths per minute rate of the ventilator.
  - b. The SIMV rate is decreased gradually until the client is breathing on his or her own without the use of the ventilator.
2. T-piece
  - a. The client is taken off the ventilator and the ventilator is replaced with a T-piece or continuous positive airway pressure, which delivers humidified oxygen.
  - b. The client is taken off the ventilator for short periods initially and allowed to breathe spontaneously.
  - c. Weaning progresses as the client is able to tolerate progressively longer periods off the ventilator.

3. Pressure support
  - a. Pressure support is a predetermined pressure set on the ventilator to assist the client in respiratory effort.
  - b. As weaning continues, the amount of pressure is decreased gradually.
  - c. With pressure support, pressure may be maintained while the preset breaths per minute of the ventilator gradually are decreased.

**VI. CHEST INJURIES****A. Rib fracture**

1. Description
  - a. Results from direct blunt chest trauma and causes a potential for intrathoracic injury, such as **pneumothorax** or pulmonary contusion
  - b. Pain with movement and chest splinting result in impaired ventilation and inadequate clearance of secretions.
2. Assessment
  - a. Pain at the injury site that increases with inspiration 
  - b. Tenderness at the site
  - c. Shallow respirations
  - d. Client splints chest 
  - e. Fractures noted on chest x-ray
3. Interventions
  - a. Note that the ribs usually unite spontaneously.
  - b. Place the client in a Fowler's position. 
  - c. Administer pain medication as prescribed to maintain adequate ventilatory status.
  - d. Monitor for increased respiratory distress. 
  - e. Instruct the client to self-splint with the hands and arms. 
  - f. Prepare the client for an intercostal nerve block as prescribed if the pain is severe.

**B. Flail chest**

1. Description
  - a. Occurs from blunt chest trauma associated with accidents, which may result in hemothorax and rib fractures.
  - b. The loose segment of the chest wall becomes paradoxical to the expansion and contraction of the rest of the chest wall. 
2. Assessment
  - a. Paradoxical respirations (inward movement of a segment of the thorax during inspiration with outward movement during expiration) 
  - b. Severe pain in the chest
  - c. Dyspnea
  - d. Cyanosis
  - e. Tachycardia
  - f. Hypotension
  - g. Tachypnea, shallow respirations
  - h. Diminished breath sounds
3. Interventions
  - a. Place the client in a Fowler's position. 

- b. Administer humidified oxygen as prescribed.
- c. Monitor for increased respiratory distress.
- d. Encourage coughing and deep breathing.
- e. Administer pain medication as prescribed.
- f. Maintain bed rest and limit activity to reduce oxygen demands.
- g. Prepare for intubation with **mechanical ventilation**, with positive end-expiratory pressure (PEEP) for severe flail chest associated with respiratory failure and shock.

### C. Pulmonary contusion

#### 1. Description

- a. Characterized by interstitial hemorrhage associated with intra-alveolar hemorrhage, resulting in decreased pulmonary compliance
- b. The major complication is acute respiratory distress syndrome.

#### 2. Assessment

- a. Dyspnea
- b. Hypoxemia
- c. Increased bronchial secretions
- d. Hemoptysis
- e. Restlessness
- f. Decreased breath sounds
- g. Crackles and wheezes

#### 3. Interventions

- a. Maintain a patent airway and adequate ventilation.
- b. Place the client in a Fowler's position.
- c. Administer oxygen as prescribed.
- d. Monitor for increased respiratory distress.
- e. Maintain bed rest and limit activity to reduce oxygen demands.
- f. Prepare for **mechanical ventilation** with PEEP if required.

### D. Pneumothorax (Fig. 58-9)

#### 1. Description

**▲ FIGURE 58-9** Pneumothorax. Air in the pleural space causes the lungs to collapse around the hilus and may push the mediastinal contents (heart and great vessels) toward the other lung. (From McCance, K., & Huether, S. [2010]. *Pathophysiology: The biologic basis for disease in adults and children* [6th ed.]. St. Louis: Mosby.)

- a. Accumulation of atmospheric air in the pleural space, which results in a rise in intrathoracic pressure and reduced vital capacity
- b. The loss of negative intrapleural pressure results in collapse of the lung.
- c. A spontaneous **pneumothorax** occurs with the rupture of a pulmonary bleb.
- d. An open **pneumothorax** occurs when an opening through the chest wall allows the entrance of positive atmospheric air pressure into the pleural space.
- e. A tension **pneumothorax** occurs from a blunt chest injury or from **mechanical ventilation** with PEEP when a buildup of positive pressure occurs in the pleural space.
- f. Diagnosis of **pneumothorax** is made by chest x-ray.

#### 2. Assessment (Box 58-12)

#### 3. Interventions

- a. Apply a dressing over an open chest wound.
- b. Administer oxygen as prescribed.
- c. Place the client in a Fowler's position.
- d. Prepare for chest tube placement, which will remain in place until the lung has expanded fully.
- e. Monitor the chest tube drainage system.
- f. Monitor for subcutaneous **emphysema**.
- g. See Chapter 21 for information on caring for a client with chest tubes.

**! Clients with a respiratory disorder should be positioned with the head of the bed elevated.**

## VII. ACUTE RESPIRATORY FAILURE

### A. Description

- 1. Occurs when insufficient oxygen is transported to the blood or inadequate carbon dioxide is removed from the lungs and the client's compensatory mechanisms fail

#### Box 58-12 Assessment Findings: Pneumothorax

Absent breath sounds on affected side  
 Cyanosis  
 Decreased chest expansion unilaterally  
 Dyspnea  
 Hypotension  
 Sharp chest pain  
 Subcutaneous emphysema as evidenced by crepitus on palpation  
 Sucking sound with open chest wound  
 Tachycardia  
 Tachypnea  
 Tracheal deviation to the unaffected side with tension pneumothorax

2. Causes include a mechanical abnormality of the lungs or chest wall, a defect in the respiratory control center in the brain, or an impairment in the function of the respiratory muscles.
3. In oxygenation failure, or hypoxemic respiratory failure, oxygen may reach the alveoli but cannot be absorbed or used properly, resulting in a  $P_{aO_2}$  lower than 60 mm Hg, arterial oxygen saturation ( $S_{aO_2}$ ) lower than 90%, or partial pressure of arterial carbon dioxide ( $P_{aCO_2}$ ) greater than 50 mm Hg occurring with acidemia.
4. Many clients experience both hypoxemic and hypercapnic respiratory failure and retained carbon dioxide in the alveoli displaces oxygen, contributing to the hypoxemia.
5. Manifestations of respiratory failure are related to the extent and rapidity of change in  $P_{aO_2}$  and  $P_{aCO_2}$ .

#### B. Assessment

1. Dyspnea
2. Headache
3. Restlessness
4. Confusion
5. Tachycardia
6. Hypertension
7. Dysrhythmias
8. Decreased level of consciousness
9. Alterations in respirations and breath sounds

#### C. Interventions

1. Identify and treat the cause of the respiratory failure
2. Administer oxygen to maintain the  $P_{aO_2}$  level higher than 60 to 70 mm Hg.
3. Place the client in a Fowler's position.
4. Encourage deep breathing.
5. Administer bronchodilators as prescribed.
6. Prepare the client for **mechanical ventilation** if supplemental oxygen cannot maintain acceptable  $P_{aO_2}$  and  $P_{aCO_2}$  levels.

### VIII. ACUTE RESPIRATORY DISTRESS SYNDROME

#### A. Description

1. A form of acute respiratory failure that occurs as a complication of some other condition; it is caused by a diffuse lung injury and leads to extravascular lung fluid.
2. The major site of injury is the alveolar capillary membrane.
3. The interstitial edema causes compression and obliteration of the terminal airways and leads to reduced lung volume and compliance.
4. The ABG levels identify respiratory acidosis and hypoxemia that do not respond to an increased percentage of oxygen.
5. The chest x-ray shows bilateral interstitial and alveolar infiltrates; interstitial edema may not be noted until there is a 30% increase in fluid content.

6. Causes include sepsis, fluid overload, shock, trauma, neurological injuries, burns, disseminated intravascular coagulation, drug ingestion, aspiration, and inhalation of toxic substances.

#### B. Assessment

1. Tachypnea
2. Dyspnea
3. Decreased breath sounds
4. Deteriorating ABG levels
5. Hypoxemia despite high concentrations of delivered oxygen
6. Decreased pulmonary compliance
7. Pulmonary infiltrates

#### C. Interventions

1. Identify and treat the cause of the acute respiratory distress syndrome.
2. Administer oxygen as prescribed.
3. Place the client in a Fowler's position.
4. Restrict fluid intake as prescribed.
5. Provide respiratory treatments as prescribed.
6. Administer diuretics, anticoagulants, or corticosteroids as prescribed.
7. Prepare the client for intubation and **mechanical ventilation** using PEEP.

### IX. ASTHMA (Fig. 58-10)

#### A. Description

1. Chronic inflammatory disorder of the airways that causes varying degrees of obstruction in the airways
2. **Asthma** is marked by airway inflammation and hyperresponsiveness to a variety of stimuli or triggers (Box 58-13).
3. **Asthma** causes recurrent episodes of wheezing, breathlessness, chest tightness, and coughing associated with airflow obstruction that may resolve spontaneously; it is often reversible with treatment.
4. **Asthma** severity is classified based on the clinical features before treatment (Box 58-14).
5. Status asthmaticus is a severe life-threatening **asthma** episode that is refractory to treatment and may result in **pneumothorax**, acute cor pulmonale, or respiratory arrest.
6. Refer to Chapter 38 for additional information on asthma.

#### B. Assessment

1. Restlessness
2. Wheezing or crackles
3. Absent or diminished lung sounds
4. Hyperresonance
5. Use of accessory muscles for breathing
6. Tachypnea with hyperventilation
7. Prolonged exhalation
8. Tachycardia
9. Pulsus paradoxus
10. Diaphoresis
11. Cyanosis

▲ **FIGURE 58-10** Pathophysiology in asthma. Stems with asterisks are primary processes. (From Lewis, S., Heitkemper, M., & Dirksen, S. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

12. Decreased oxygen saturation
13. Pulmonary function test results that demonstrate decreased air flow rates

#### C. Interventions

1. Monitor vital signs.
2. Monitor pulse oximetry.
3. Monitor peak flow.
4. During an acute **asthma** episode, provide interventions to assist with breathing (Box 58-15).

#### D. Client education

1. Instruct the client on the intermittent nature of symptoms and need for long-term management.
2. Instruct the client to identify possible triggers and measures to prevent episodes.
3. Instruct the client on the management of medication and proper administration.
4. Instruct the client on the correct use of a peak flowmeter.

### Box 58-13 Asthma Triggers

#### Environmental Factors

Animal dander  
Cockroaches  
Dust  
Exhaust fumes  
Fireplaces  
Molds  
Perfumes or other products with aerosol sprays  
Pollen  
Smoke, including cigarette or cigar smoke  
Sudden weather changes

#### Physiological Factors

Gastroesophageal reflux disease (GERD)  
Hormonal changes  
Sinusitis  
Stress  
Viral upper respiratory infection

#### Medications

Acetylsalicylic acid (Aspirin)  
β-Adrenergic blockers  
Nonsteroidal anti-inflammatory drugs

#### Occupational Exposure Factors

Metal salts  
Wood and vegetable dusts  
Industrial chemicals and plastics

#### Food Additives

Sulfites (bisulfites and metabisulfites)  
Beer, wine, dried fruit, shrimp, processed potatoes  
Monosodium glutamate

Modified from Lewis, S., Heitkemper, M., & Dirksen, S. (2007). *Medical-surgical nursing: Assessment and management of clinical problems* (7th ed.). St. Louis: Mosby.

5. Help the client develop an **asthma** action plan with the primary provider and teach the client what to do if an **asthma** episode occurs.

### X. CHRONIC OBSTRUCTIVE PULMONARY DISEASE

#### A. Description

1. Also known as chronic obstructive lung disease and chronic airflow limitation
2. **Chronic obstructive pulmonary** disease is a disease state characterized by airflow obstruction caused by **emphysema** or chronic bronchitis.
3. Progressive airflow limitation occurs, associated with an abnormal inflammatory response of the lungs that is not completely reversible.
4. **Chronic obstructive pulmonary disease** leads to pulmonary insufficiency, pulmonary hypertension, and cor pulmonale.

#### B. Assessment

1. Cough
2. Exertional dyspnea

**Box 58-14 Classification of Asthma Severity****Severe Persistent**

Symptoms are continuous.  
Physical activity requires limitations.  
Frequent exacerbations occur.  
Nocturnal symptoms occur frequently.

**Moderate Persistent**

Daily symptoms occur.  
Daily use of inhaled short-acting  $\beta$  agonist is needed.  
Exacerbations affect activity.  
Exacerbations occur at least twice weekly and may last for days.  
Nocturnal symptoms occur more frequently than once weekly.

**Mild Persistent**

Symptoms occur more frequently than twice weekly but less often than once daily.  
Exacerbations may affect activity.  
Exacerbations occur at least twice weekly and may last for days.  
Nocturnal symptoms occur more frequently than twice a month.

**Mild Intermittent**

Symptoms occur twice weekly or less.  
Client is asymptomatic between exacerbations.  
Exacerbations are brief (hours to days).  
Intensity of exacerbations varies.  
Nocturnal symptoms occur twice a month or less.

Modified from Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed.). St. Louis: Saunders.

**Box 58-15 Nursing Interventions During an Acute Asthma Episode**

Position the client in a high Fowler's position or sitting to aid in breathing.  
Administer oxygen as prescribed.  
Stay with the client to decrease anxiety.  
Administer bronchodilators as prescribed.  
Record the color, amount, and consistency of sputum, if any.  
Administer corticosteroids as prescribed.  
Auscultate lung sounds before, during, and after treatments.

3. Wheezing and crackles
4. Sputum production
5. Weight loss
6. Barrel chest (**emphysema**) (Fig. 58-11)
7. Use of accessory muscles for breathing
8. Prolonged expiration
9. Orthopnea
10. Cardiac dysrhythmias
11. Congestion and hyperinflation seen on chest x-ray (Fig. 58-12)
12. ABG levels that indicate respiratory acidosis and hypoxemia

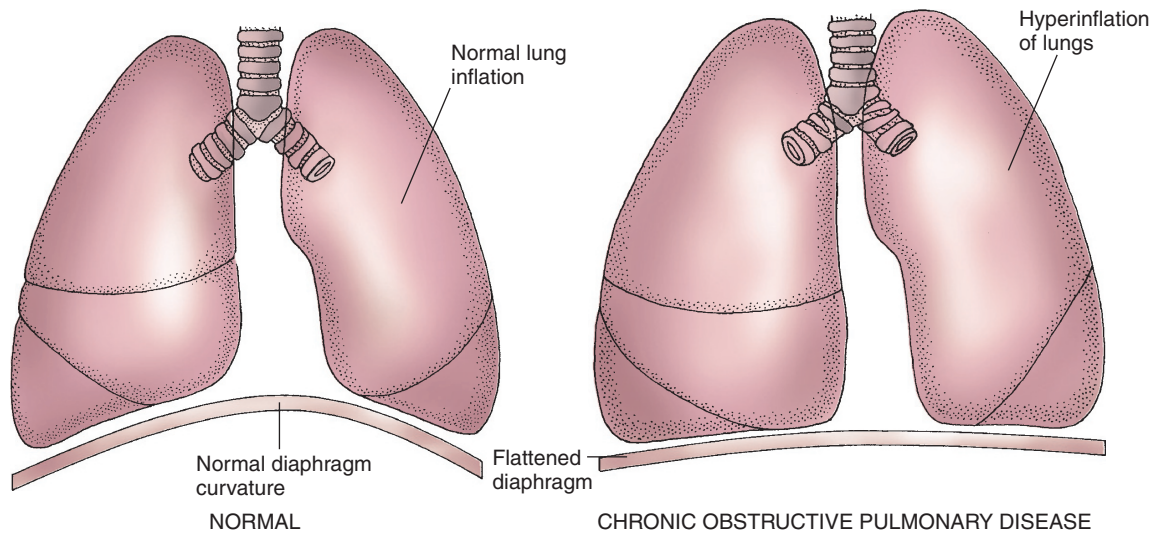

▲ **FIGURE 58-11** Typical barrel chest in a client with chronic obstructive pulmonary disease. (From Ignatavicius, D., & Workman, M. [2006]. *Medical-surgical nursing: Critical thinking for collaborative care* [5th ed.]. St. Louis: Saunders.)

13. Pulmonary function tests that demonstrate decreased vital capacity

**C. Interventions**

1. Monitor vital signs.
2. Administer a low concentration of oxygen (1 to 2 L/min) as prescribed; the stimulus to breathe is a low arterial  $P_{O_2}$  instead of an increased  $P_{CO_2}$ .
3. Monitor pulse oximetry.
4. Provide respiratory treatments and CPT.
5. Instruct the client in diaphragmatic or abdominal breathing techniques and pursed-lip breathing techniques.
6. Record the color, amount, and consistency of sputum.
7. Suction fluids from the client's lungs, if necessary, to clear the airway and prevent infection.
8. Monitor weight.
9. Encourage small frequent meals to maintain nutrition and prevent dyspnea.
10. Provide a high-calorie, high-protein diet with supplements.
11. Encourage fluid intake up to 3000 mL/day to keep secretions thin, unless contraindicated.
12. Place the client in a Fowler's position and leaning forward to aid in breathing (Fig. 58-13).
13. Allow activity as tolerated.
14. Administer bronchodilators as prescribed, and instruct the client in the use of oral and inhaled medications.
15. Administer corticosteroids as prescribed for exacerbations.
16. Administer mucolytics as prescribed to thin secretions.
17. Administer antibiotics for infection if prescribed.

▲ **FIGURE 58-12** Diaphragm shape and lung inflation in the normal client and in the client with chronic obstructive pulmonary disease. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

Sitting on the edge of a bed with the arms folded and placed on two or three pillows positioned over a nightstand.

Sitting in a chair with the feet spread shoulder-width apart and leaning forward with the elbows on the knees. Arms and hands are relaxed.

▲ **FIGURE 58-13** Orthopnea positions that clients with chronic obstructive pulmonary disease can assume to ease the work of breathing. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

- ▲ **D.** Client education (Box 58-16)
- ▲ **XI. SEVERE ACUTE RESPIRATORY SYNDROME (SARS)**
- A.** Respiratory illness caused by the coronavirus, called *SARS-associated coronavirus*
  - B.** The syndrome begins with a fever, an overall feeling of discomfort, body aches, and mild respiratory symptoms.
  - C.** After 2 to 7 days, the client may develop a dry cough and dyspnea.
  - D.** Infection is spread by close person-to-person contact by direct contact with infectious material (respiratory secretions or contact with persons or objects infected with infectious droplets).
  - E.** Prevention includes avoiding contact with those suspected of having SARS, avoiding travel to countries where an outbreak of SARS exists, avoiding close

### Box 58-16 Client Education: Chronic Obstructive Pulmonary Disease

Adhere to activity limitations, alternating rest periods with activity.

Avoid eating gas-producing foods, spicy foods, and extremely hot or cold foods.

Avoid exposure to individuals with infections and avoid crowds.

Avoid extremes in temperature.

Avoid fireplaces, pets, feather pillows, and other environmental allergens.

Avoid powerful odors.

Meet nutritional requirements.

Receive immunizations as recommended.

Recognize the signs and symptoms of respiratory infection and hypoxia.

Stop smoking.

Use medications and inhalers as prescribed.

Use oxygen therapy as prescribed.

Use pursed-lip and diaphragmatic or abdominal breathing.

When dusting, use a wet cloth.

contact with crowds in areas where SARS exists, and frequent hand washing if in an area where SARS exists.

## XII. PNEUMONIA

### A. Description

1. Infection of the pulmonary tissue, including the interstitial spaces, the alveoli, and the bronchioles.
2. The edema associated with inflammation stiffens the lung, decreases lung compliance and vital capacity, and causes hypoxemia.
3. Pneumonia can be community-acquired or hospital-acquired.
4. The chest x-ray film shows lobar or segmental consolidation, pulmonary infiltrates, or pleural effusions.
5. A sputum culture identifies the organism.
6. The white blood cell count and the erythrocyte sedimentation rate are elevated.

### B. Assessment

1. Chills
2. Elevated temperature
3. Pleuritic pain
4. Tachypnea
5. Rhonchi and wheezes
6. Use of accessory muscles for breathing
7. Mental status changes
8. Sputum production

### C. Interventions

1. Administer oxygen as prescribed.
2. Monitor respiratory status.
3. Monitor for labored respirations, cyanosis, and cold and clammy skin.
4. Encourage coughing and deep breathing and use of the incentive spirometer.
5. Place the client in a semi-Fowler's position to facilitate breathing and lung expansion.

6. Change the client's position frequently and ambulate as tolerated to mobilize secretions.

7. Provide CPT.

8. Perform nasotracheal **suctioning** if the client is unable to clear secretions.

9. Monitor pulse oximetry.

10. Monitor and record color, consistency, and amount of sputum.

11. Provide a high-calorie, high-protein diet with small frequent meals.

12. Encourage fluids, up to 3 L/day, to thin secretions unless contraindicated.

13. Provide a balance of rest and activity, increasing activity gradually.

14. Administer antibiotics as prescribed.

15. Administer antipyretics, bronchodilators, cough suppressants, mucolytic agents, and expectorants as prescribed.

16. Prevent the spread of infection by hand washing and the proper disposal of secretions.

### D. Client education

1. Instruct the client about the importance of rest, proper nutrition, and adequate fluid intake.
2. Avoid chilling and exposure to individuals with respiratory infections or viruses.
3. Instruct the client regarding medications and the use of inhalants as prescribed.
4. Instruct the client to notify the physician if chills, fever, dyspnea, hemoptysis, or increased fatigue occurs.
5. Instruct the client in the importance of receiving immunizations as recommended.

 Teach clients that using proper hand washing techniques, disposing respiratory secretions properly, and receiving vaccines (if one is available) will assist in preventing the spread of infection.

## XIII. INFLUENZA

### A. Description

1. Also known as the flu; highly contagious acute viral respiratory infection
2. May be caused by several viruses, usually known as types A, B, and C
3. Yearly vaccination is recommended to prevent the disease, especially for those older than 50 years of age, individuals with chronic illness or who are immunocompromised, those living in institutions, and health care personnel providing direct care to clients (the vaccination is contraindicated in the individual with egg allergies).
4. Additional prevention measures include avoiding those who developed influenza, frequent and proper hand washing, and cleaning and disinfecting surfaces that have become contaminated with secretions.

5. Avian influenza A (H5N1)
  - a. Affects birds; does not usually affect humans; however, human cases have been reported in some countries.
  - b. An H5N1 vaccine has been developed for use if a pandemic virus were to emerge.
  - c. Reported symptoms are similar to those associated with influenza types A, B, and C.
  - d. Prevention measures include thorough cooking of poultry products, avoiding contact with wild animals, frequent and proper hand washing and cleaning and disinfecting surfaces that have become contaminated with secretions.
6. Swine (H1N1) influenza
  - a. It is a new strain of flu that consists of genetic materials from swine, avian, and human influenza viruses.
  - b. Signs and symptoms are similar to those that present with seasonal flu; additionally vomiting and diarrhea commonly occur.
  - c. Prevention measures and treatment are the same as for the seasonal flu.
  - d. Refer to Chapter 48 for additional information on swine flu and Chapter 59 for information on H1N1 vaccines.

**B. Assessment**

1. Acute onset of fever and muscle aches
2. Headache
3. Fatigue, weakness, anorexia
4. Sore throat, cough, and rhinorrhea

**C. Interventions**

1. Encourage rest.
2. Encourage fluids to prevent pulmonary complications (unless contraindicated).
3. Monitor lung sounds.
4. Provide supportive therapy such as antipyretics or antitussives as indicated.
5. Administer antiviral medications as prescribed for current strain of influenza (see Chapter 59).

**XIV. LEGIONNAIRE'S DISEASE****A. Description**

1. Acute bacterial infection caused by *Legionella pneumophila*
2. Sources of the organism include contaminated cooling tower water and warm stagnant water supplies, including water vaporizers, water sonicators, whirlpool spas, and showers.
3. Person-to-person contact does not occur; the risk for infection is increased by the presence of other conditions.

**B. Assessment:** Influenza-like symptoms with a high fever, chills, muscle aches, and headache that may progress to dry cough, pleurisy, and sometimes diarrhea.

**C. Interventions:** Treatment is supportive and antibiotics may be prescribed.

**XV. PLEURAL EFFUSION****A. Description**

1. Pleural effusion is the collection of fluid in the pleural space.
2. Any condition that interferes with secretion or drainage of this fluid will lead to pleural effusion.

**B. Assessment**

1. Pleuritic pain that is sharp and increases with inspiration 
2. Progressive dyspnea with decreased movement of the chest wall on the affected side
3. Dry, nonproductive cough caused by bronchial irritation or mediastinal shift 
4. Tachycardia
5. Elevated temperature
6. Decreased breath sounds over affected area 
7. Chest x-ray film that shows pleural effusion and a mediastinal shift away from the fluid if the effusion is more than 250 mL 

**C. Interventions**

1. Identify and treat the underlying cause. 
2. Monitor breath sounds.
3. Place the client in a Fowler's position. 
4. Encourage coughing and deep breathing. 
5. Prepare the client for thoracentesis.
6. If pleural effusion is recurrent, prepare the client for pleurectomy or pleurodesis as prescribed.

**D. Pleurectomy**

1. Consists of surgically stripping the parietal pleura away from the visceral pleura
2. This produces an intense inflammatory reaction that promotes adhesion formation between the two layers during healing.

**E. Pleurodesis**

1. Involves the instillation of a sclerosing substance into the pleural space via a thoracotomy tube
2. The substance creates an inflammatory response that scleroses tissues together.

**XVI. EMPYEMA****A. Description**

1. Collection of pus within the pleural cavity
2. The fluid is thick, opaque, and foul-smelling.
3. The most common cause is pulmonary infection and lung abscess caused by thoracic surgery or chest trauma, in which bacteria are introduced directly into the pleural space.
4. Treatment focuses on treating the infection, emptying the empyema cavity, reexpanding the lung, and controlling the infection.

**B. Assessment**

1. Recent febrile illness or trauma
2. Chest pain
3. Cough
4. Dyspnea
5. Anorexia and weight loss
6. Malaise

7. Elevated temperature and chills
8. Night sweats
9. Pleural exudate on chest x-ray

### C. Interventions

1. Monitor breath sounds.
2. Place the client in a semi-Fowler's or high Fowler's position.
3. Encourage coughing and deep breathing.
4. Administer antibiotics as prescribed.
5. Instruct the client to splint the chest as necessary.
6. Assist with thoracentesis or chest tube insertion to promote drainage and lung expansion.
7. If marked pleural thickening occurs, prepare the client for decortication, if prescribed; this surgical procedure involves removal of the restrictive mass of fibrin and inflammatory cells.

## XVII. PLEURISY

### A. Description

1. Inflammation of the visceral and parietal membranes; may be caused by pulmonary infarction or pneumonia
2. The visceral and parietal membranes rub together during respiration and cause pain.
3. Pleurisy usually occurs on one side of the chest, usually in the lower lateral portions in the chest wall.

### B. Assessment

1. Knife-like pain aggravated on deep breathing and coughing
2. Dyspnea
3. Pleural friction rub heard on auscultation
4. Apprehension

### C. Interventions

1. Identify and treat the cause.
2. Monitor lung sounds.
3. Administer analgesics as prescribed.
4. Apply hot or cold applications as prescribed.
5. Encourage coughing and deep breathing.
6. Instruct the client to lie on the affected side to splint chest.

## XVIII. PULMONARY EMBOLISM

### A. Description

1. Occurs when a thrombus forms (most commonly in a deep vein), detaches, travels to the right side of the heart, and then lodges in a branch of the pulmonary artery
2. Clients prone to pulmonary embolism are those at risk for deep vein thrombosis, including those with prolonged immobilization, surgery, obesity, pregnancy, congestive heart failure, advanced age, or a history of thromboembolism.
3. Fat emboli can occur as a complication following fracture of a long bone and can cause pulmonary emboli.
4. Treatment is aimed at prevention through risk factor recognition and elimination.

### B. Assessment (Box 58-17)

### C. Interventions (see Priority Nursing Actions)

## XIX. LUNG CANCER AND LARYNGEAL CANCER (see Chapter 52)

## XX. CARBON MONOXIDE POISONING (see Chapter 50)

### Box 58-17 Assessment Findings: Pulmonary Embolism

Apprehension and restlessness  
 Blood-tinged sputum  
 Chest pain  
 Cough  
 Crackles and wheezes on auscultation  
 Cyanosis  
 Distended neck veins  
 Dyspnea accompanied by anginal and pleuritic pain, exacerbated by inspiration  
 Feeling of impending doom  
 Hypotension  
 Petechiae over the chest and axilla  
 Shallow respirations  
 Tachypnea and tachycardia

### PRIORITY NURSING ACTIONS!

#### Actions to Take If a Pulmonary Embolism is Suspected

1. Notify the Rapid Response Team.
2. Reassure the client and elevate the head of the bed.
3. Prepare to administer oxygen.
4. Obtain vital signs and check lung sounds.
5. Prepare to obtain an arterial blood gas.
6. Prepare for the administration of heparin therapy or other therapies.
7. Document the event, interventions taken, and the client's response to treatment.

Signs and symptoms of a pulmonary embolism include the sudden onset of dyspnea, apprehension and restlessness, a feeling of impending doom, cough, hemoptysis, tachypnea, crackles, petechiae over the chest and axillae, and a decreased arterial oxygen saturation. If suspected, the nurse immediately notifies the Rapid Response Team. The nurse stays with the client, reassures the client, and elevates the head of the bed. The nurse prepares to administer oxygen and obtains the vital signs and checks lung sounds. The nurse continues to monitor the client closely, prepares the client for tests prescribed to confirm the diagnosis, and prepares to obtain an arterial blood gas. When prescribed, the client is prepared for the administration of heparin therapy or other therapies such as embolectomy or placement of a vena cava filter if necessary. Finally, the nurse documents the event, interventions taken, and the client's response to treatment.

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 680). St. Louis: Saunders.

**XXI. HISTOPLASMOSIS****A. Description**

1. Pulmonary fungal infection caused by spores of *Histoplasma capsulatum*
2. Transmission occurs by the inhalation of spores, which commonly are found in contaminated soil.
3. Spores also are usually found in bird droppings.

**B. Assessment**

1. Similar to pneumonia
2. Positive skin test for histoplasmosis
3. Positive agglutination test
4. Splenomegaly, hepatomegaly

**C. Interventions**

1. Administer oxygen as prescribed.
2. Monitor breath sounds.
3. Administer antiemetics, antihistamines, antipyretics, and corticosteroids as prescribed.
4. Administer fungicidal medications as prescribed.
5. Encourage coughing and deep breathing.
6. Place the client in a semi-Fowler's position.
7. Monitor vital signs.
8. Monitor for nephrotoxicity from fungicidal medications.
9. Instruct the client to spray the floor with water before sweeping barn and chicken coops.

**XXII. SARCOIDOSIS****A. Description**

1. Presence of epithelioid cell tubercles in the lung
2. The cause is unknown, but a high titer of Epstein-Barr virus may be noted.
3. Viral incidence is highest in Blacks and young adults.

**B. Assessment**

1. Night sweats
2. Fever
3. Weight loss
4. Cough and dyspnea
5. Skin nodules
6. Polyarthritis
7. Kveim test: Sarcoid node antigen is injected intradermally and causes a local nodular lesion in about 1 month.

**C. Interventions**

1. Administer corticosteroids to control symptoms.
2. Monitor temperature.
3. Increase fluid intake.
4. Provide frequent periods of rest.
5. Encourage small, nutritious meals.

**XXIII. OCCUPATIONAL LUNG DISEASE****A. Description**

1. Caused by exposure to environmental or occupational fumes, dust, vapors, gases, bacterial or fungal antigens, and allergens; can result in acute reversible effects or chronic lung disease

2. Common disease classifications include occupational **asthma** pneumoconiosis (silicosis or coal miner's [black lung] disease), diffuse interstitial fibrosis (asbestosis, talcosis, berylliosis), or extrinsic allergic alveolitis (farmer's lung, bird fancier's lung, or machine operator's lung).

**B. Assessment: Manifestations depend on the type of disease and respiratory symptoms.****C. Interventions**

1. Prevention through the use of respiratory protective devices
2. Treatment is based on the symptoms experienced by the client.

**XXIV. TUBERCULOSIS****A. Description**

1. Highly communicable disease caused by **Mycobacterium tuberculosis**
2. **M. tuberculosis** is a nonmotile, nonsporulating, acid-fast rod that secretes niacin; when the bacillus reaches a susceptible site, it multiplies freely.
3. Because **M. tuberculosis** is an aerobic bacterium, it primarily affects the pulmonary system, especially the upper lobes, where the oxygen content is highest, but also can affect other areas of the body, such as the brain, intestines, peritoneum, kidney, joints, and liver.
4. An exudative response causes a nonspecific pneumonitis and the development of granulomas in the lung tissue.
5. **Tuberculosis** has an insidious onset, and many clients are not aware of symptoms until the disease is well advanced.
6. Improper or noncompliant use of treatment programs may cause the development of mutations in the tubercle bacilli, resulting in a **multidrug-resistant strain of tuberculosis** (MDR-TB).
7. The goal of treatment is to prevent transmission, control symptoms, and prevent progression of the disease.

**B. Risk factors (Box 58-18)****Box 58-18 Risk Factors for Tuberculosis**

Child younger than 5 years of age  
 Drinking unpasteurized milk if the cow is infected with bovine tuberculosis  
 Homeless individuals or those from a lower socioeconomic group, minority group, or refugee group  
 Individuals in constant, frequent contact with an untreated or undiagnosed individual  
 Individuals living in crowded areas, such as long-term care facilities, prisons, and mental health facilities  
 Older client  
 Individuals with malnutrition, infection, immune dysfunction or human immunodeficiency virus infection, or immunosuppressed as a result of medication therapy  
 Individual who abuses alcohol or is an intravenous drug user

### C. Transmission

1. Transmission of **tuberculosis** is via the airborne route by droplet infection.
2. When an infected individual coughs, laughs, sneezes, or sings, droplet nuclei containing **tuberculosis** bacteria enter the air and may be inhaled by others.
3. Identification of those in close contact with the infected individual is important so that they can be tested and treated as necessary.
4. When contacts have been identified, these persons are assessed with a tuberculin skin test and chest x-rays to determine infection with **tuberculosis**.
5. After the infected individual has received **tuberculosis** medication for 2 to 3 weeks, the risk of transmission is reduced greatly.

### D. Disease progression

1. Droplets enter the lungs, and the bacteria form a tubercle lesion.
2. The defense systems of the body encapsulate the tubercle, leaving a scar.
3. If encapsulation does not occur, bacteria may enter the lymph system, travel to the lymph nodes, and cause an inflammatory response termed granulomatous inflammation.
4. Primary lesions form; the primary lesions may become dormant but can be reactivated and become a secondary infection when reexposed to the bacterium.
5. In an active phase, **tuberculosis** can cause necrosis and cavitation in the lesions, leading to rupture, the spread of necrotic tissue, and damage to various parts of the body.

### E. Client history

1. Past exposure to **tuberculosis**
2. Client's country of origin and travel to foreign countries in which the incidence of **tuberculosis** is high
3. Recent history of influenza, pneumonia, febrile illness, cough, or foul-smelling sputum production
4. Previous tests for **tuberculosis**; results of the testing
5. Recent **bacille Calmette-Guérin vaccine** (a vaccine containing attenuated tubercle bacilli that may be given to persons in foreign countries or to persons traveling to foreign countries to produce increased resistance to **tuberculosis**).

 An individual who has received a bacille Calmette-Guérin vaccine will have a positive tuberculin skin test result and should be evaluated for tuberculosis with a chest x-ray.

### F. Clinical manifestations

1. May be asymptomatic in primary infection
2. Fatigue

3. Lethargy
4. Anorexia
5. Weight loss
6. Low-grade fever
7. Chills
8. Night sweats
9. Persistent cough and the production of mucoid and mucopurulent sputum, which is occasionally streaked with blood
10. Chest tightness and a dull, aching chest pain may accompany the cough.

### G. Chest assessment

1. A physical examination of the chest does not provide conclusive evidence of **tuberculosis**.
2. A chest x-ray is not definitive, but the presence of multinodular infiltrates with calcification in the upper lobes suggests **tuberculosis**.
3. If the disease is active, caseation and inflammation may be seen on the chest x-ray.
4. Advanced disease
  - a. Dullness with percussion over involved parenchymal areas, bronchial breath sounds, rhonchi, and crackles indicate advanced disease.
  - b. Partial obstruction of a bronchus caused by endobronchial disease or compression by lymph nodes may produce localized wheezing and dyspnea.

### H. QuantiFERON-TB Gold test

1. A blood analysis test by an enzyme-linked immunosorbent assay.
2. A sensitive and rapid test (results can be available in 24 hours) that assists in diagnosing the client.

### I. Sputum cultures

1. Sputum specimens are obtained for an acid-fast smear.
2. A sputum culture identifying **M. tuberculosis** confirms the diagnosis.
3. After medications are started, sputum samples are obtained again to determine the effectiveness of therapy.
4. Most clients have negative cultures after 3 months of treatment.

### J. Mantoux skin test

1. A positive Mantoux reaction does not mean that active disease is present but indicates previous exposure to **tuberculosis** or the presence of inactive (dormant) disease.
2. Once the test result is positive, it will be positive in any future tests.
3. Purified protein derivative containing 5 tuberculin units is administered intradermally in the forearm.
4. An area of induration measuring 10 mm or more in diameter, 48 to 72 hours after injection, indicates that the individual has been exposed to **tuberculosis**.

**Box 58-19 Client Education: Tuberculosis**

Provide the client and family with information about tuberculosis and allay concerns about the contagious aspect of the infection.

Instruct the client to follow the medication regimen exactly as prescribed and always to have a supply of the medication on hand.

Advise the client of the side effects of the medication and ways of minimizing them to ensure compliance.

Reassure the client that after 2 to 3 weeks of medication therapy, it is unlikely that the client will infect anyone.

Inform the client to resume activities gradually.

Instruct the client about the need for adequate nutrition and a well-balanced diet to promote healing and to prevent recurrence of the infection.

Instruct the client to increase intake of foods rich in iron, protein, and vitamin C.

Inform the client and family that respiratory isolation is not necessary because family members already have been exposed.

Instruct the client to cover the mouth and nose when coughing or sneezing and to put used tissues into plastic bags.

Instruct the client and family about thorough hand washing. Inform the client that a sputum culture is needed every 2 to 4 weeks once medication therapy is initiated.

Inform the client that when the results of three sputum cultures are negative, the client is no longer considered infectious and usually can return to former employment.

Advise the client to avoid excessive exposure to silicone or dust because these substances can cause further lung damage.

Instruct the client regarding the importance of compliance with treatment, follow-up care, and sputum cultures, as prescribed.

5. If the client needs to leave the room for a test or procedure, the client is required to wear a mask.
6. Respiratory isolation is discontinued when the client is no longer considered infectious.
7. After the infected individual has received **tuberculosis** medication for 2 to 3 weeks, the risk of transmission is reduced greatly.

L. Client education (Box 58-19)

M. Medications (see Chapter 59)

**MORE QUESTIONS ON THE CD!****Practice Questions**

- 652.** An emergency department nurse is assessing a client who has sustained a blunt injury to the chest wall. Which of these signs would indicate the presence of a pneumothorax in this client?
1. A low respiratory rate
  2. Diminished breath sounds
  3. The presence of a barrel chest
  4. A sucking sound at the site of injury
- 653.** A nurse is caring for a client hospitalized with acute exacerbation of chronic obstructive pulmonary disease. Which of the following would the nurse expect to note on assessment of this client?
1. Hypocapnia
  2. A hyperinflated chest noted on the chest x-ray
  3. Increased oxygen saturation with exercise
  4. A widened diaphragm noted on the chest x-ray
- 654.** A nurse instructs a client to use the pursed-lip method of breathing and the client asks the nurse about the purpose of this type of breathing. The nurse responds, knowing that the primary purpose of pursed-lip breathing is to:
1. Promote oxygen intake.
  2. Strengthen the diaphragm.
  3. Strengthen the intercostal muscles.
  4. Promote carbon dioxide elimination.
- 655.** The low-pressure alarm sounds on a ventilator. A nurse assesses the client and then attempts to determine the cause of the alarm. The nurse is unsuccessful in determining the cause of the alarm and takes what initial action?
1. Administers oxygen
  2. Checks the client's vital signs
  3. Ventilates the client manually
  4. Starts cardiopulmonary resuscitation
- 656.** A nurse is caring for a client after a bronchoscopy and biopsy. Which of the following signs, if noted in the client, should be reported immediately to the physician?

5. For individuals with human immunodeficiency virus infection or who are immunosuppressed, a reaction of 5 mm or more is considered positive.

6. Once an individual's skin test is positive, a chest x-ray is necessary to rule out active **tuberculosis** or to detect old healed lesions.

K. The hospitalized client

1. The client with active **tuberculosis** is placed in respiratory isolation precautions in a negative-pressure room; to maintain negative pressure, the door of the room must be tightly closed.
2. The room should have at least six exchanges of fresh air per hour and should be ventilated to the outside environment, if possible.

3. The nurse wears a particulate respirator (a special individually fitted mask) when caring for the client and a gown when the possibility of clothing contamination exists.
4. Thorough handwashing is required before and after caring for the client.

1. Dry cough
  2. Hematuria
  3. Bronchospasm
  4. Blood-streaked sputum
- 657.** A nurse is suctioning fluids from a client via a tracheostomy tube. When suctioning, the nurse must limit the suctioning time to a maximum of:
1. 1 minute
  2. 5 seconds
  3. 10 seconds
  4. 30 seconds
- 658.** A nurse is suctioning fluids from a client through an endotracheal tube. During the suctioning procedure, the nurse notes on the monitor that the heart rate is decreasing. Which of the following is the appropriate nursing intervention?
1. Continue to suction.
  2. Notify the physician immediately.
  3. Stop the procedure and reoxygenate the client.
  4. Ensure that the suction is limited to 15 seconds.
- 659.** A nurse is assessing the respiratory status of a client who has suffered a fractured rib. The nurse would expect to note which of the following?
1. Slow deep respirations
  2. Rapid deep respirations
  3. Paradoxical respirations
  4. Pain, especially with inspiration
- 660.** A client with a chest injury has suffered flail chest. A nurse assesses the client for which most distinctive sign of flail chest?
1. Cyanosis
  2. Hypotension
  3. Paradoxical chest movement
  4. Dyspnea, especially on exhalation
- 661.** A client has been admitted with chest trauma after a motor vehicle accident and has undergone subsequent intubation. A nurse checks the client when the high-pressure alarm on the ventilator sounds, and notes that the client has absence of breath sounds in the right upper lobe of the lung. The nurse immediately assesses for other signs of:
1. Right pneumothorax
  2. Pulmonary embolism
  3. Displaced endotracheal tube
  4. Acute respiratory distress syndrome
- 662.** A nurse is assessing a client with multiple trauma who is at risk for developing acute respiratory distress syndrome. The nurse assesses for which earliest sign of acute respiratory distress syndrome?
1. Bilateral wheezing
  2. Inspiratory crackles
  3. Intercostal retractions
  4. Increased respiratory rate
- 663.** A nurse is assessing a client with chronic airflow limitation and notes that the client has a "barrel chest." The nurse interprets that this client has which of the following forms of chronic airflow limitation?
1. Emphysema
  2. Bronchial asthma
  3. Chronic obstructive bronchitis
  4. Bronchial asthma and bronchitis
- 664.** A nurse has conducted discharge teaching with a client diagnosed with tuberculosis. The client has been taking medication for 1½ weeks. The nurse evaluates that the client has understood the information if the client makes which of the following statements?
1. "I need to continue drug therapy for 2 months."
  2. "I can't shop at the mall for the next 6 months."
  3. "I can return to work if a sputum culture comes back negative."
  4. "I should not be contagious after 2 to 3 weeks of medication therapy."
- 665.** A nurse is preparing to give a bed bath to an immobilized client with tuberculosis. The nurse should wear which of the following items when performing this care?
1. Surgical mask and gloves
  2. Particulate respirator, gown, and gloves
  3. Particulate respirator and protective eyewear
  4. Surgical mask, gown, and protective eyewear
- 666.** A client has experienced pulmonary embolism. A nurse assesses for which symptom, which is most commonly reported?
1. Hot, flushed feeling
  2. Sudden chills and fever
  3. Chest pain that occurs suddenly
  4. Dyspnea when deep breaths are taken
- 667.** A client who is human immunodeficiency virus-positive has had a Mantoux skin test. The nurse notes a 7-mm area of induration at the site of the skin test. The nurse interprets the results as:
1. Positive
  2. Negative
  3. Inconclusive
  4. Indicating the need for repeat testing
- 668.** A client with acquired immunodeficiency syndrome has histoplasmosis. A nurse assesses the client for which of the following signs and symptoms?

1. Dyspnea
  2. Headache
  3. Weight gain
  4. Hypothermia
- 669.** A nurse is giving discharge instructions to a client with pulmonary sarcoidosis. The nurse concludes that the client understands the information if the client reports which of the following early signs of exacerbation?
1. Fever
  2. Fatigue
  3. Weight loss
  4. Shortness of breath
- 670.** A nurse is taking the history of a client with silicosis. The nurse assesses whether the client wears which of the following items during periods of exposure to silica particles?
1. Mask
  2. Gown
  3. Gloves
  4. Eye protection
- 671.** An oxygen delivery system is prescribed for a client with chronic obstructive pulmonary disease to deliver a precise oxygen concentration. Which oxygen delivery system would the nurse anticipate to be prescribed?
1. Face tent
  2. Venturi mask
  3. Aerosol mask
  4. Tracheostomy collar
- 672.** A nurse is instructing a hospitalized client with a diagnosis of emphysema about measures that will enhance the effectiveness of breathing during dyspneic periods. Which of the following positions will the nurse instruct the client to assume?
1. Sitting up in bed
  2. Side-lying in bed
  3. Sitting in a recliner chair
  4. Sitting on the side of the bed and leaning on an overbed table
- 673.** A community health nurse is conducting an educational session with community members regarding tuberculosis. The nurse tells the group that one of the first symptoms associated with tuberculosis is:
1. Dyspnea
  2. Chest pain
  3. A bloody, productive cough
  4. A cough with the expectoration of mucoid sputum
- 674.** A nurse performs an admission assessment on a client with a diagnosis of tuberculosis. The nurse reviews the results of which diagnostic test that will confirm this diagnosis?
1. Chest x-ray
  2. Bronchoscopy
  3. Sputum culture
  4. Tuberculin skin test

### Alternate Item Format: Multiple Response

- 675.** The nurse is preparing a list of home care instructions for the client who has been hospitalized and treated for tuberculosis. Of the following instructions, which will the nurse include on the list? **Select all that apply.**
- 1. Activities should be resumed gradually.
  - 2. Avoid contact with other individuals, except family members, for at least 6 months.
  - 3. A sputum culture is needed every 2 to 4 weeks once medication therapy is initiated.
  - 4. Respiratory isolation is not necessary because family members already have been exposed.
  - 5. Cover the mouth and nose when coughing or sneezing and put used tissues in plastic bags.
  - 6. When one sputum culture is negative, the client is no longer considered infectious and usually can return to former employment.

## ANSWERS

### 652. 2

**Rationale:** This client has sustained a blunt or a closed chest injury. Basic symptoms of a closed pneumothorax are shortness of breath and chest pain. A larger pneumothorax may cause tachypnea, cyanosis, diminished breath sounds, and subcutaneous emphysema. Hyperresonance also may occur on the affected side. A sucking sound at the site of injury would be noted with an open chest injury.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *blunt* in the question. This will assist

in eliminating option 4, sucking chest wound injury. Knowing that in a respiratory injury increased respirations will occur will assist you in eliminating option 1. Option 3 can be eliminated because a barrel chest is a characteristic finding in a client with chronic obstructive pulmonary disease. Review the signs of pneumothorax if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Respiratory

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 699). St. Louis: Saunders.

### 653. 2

**Rationale:** Clinical manifestations of chronic obstructive pulmonary disease (COPD) include hypoxemia, hypercapnia, dyspnea on exertion and at rest, oxygen desaturation with exercise, and the use of accessory muscles of respiration. Chest x-rays reveal a hyperinflated chest and a flattened diaphragm if the disease is advanced.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 1 because in the client with COPD, hypercapnia would be noted. Next, eliminate option 3 because oxygen desaturation rather than saturation would occur. From the remaining options, reading carefully will assist in directing you to option 2. If you are unfamiliar with the manifestations associated with COPD, review this content.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Respiratory

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 623, 627). St. Louis: Saunders.

### 654. 4

**Rationale:** Pursed-lip breathing facilitates maximal expiration for clients with obstructive lung disease. This type of breathing allows better expiration by increasing airway pressure that keeps air passages open during exhalation. Options 1, 2, and 3 are not the purposes of this type of breathing.

**Test-Taking Strategy:** Visualize the use of this procedure to assist you in answering correctly. Knowledge regarding the respiratory conditions in which this type of breathing is helpful also will assist in directing you to option 4. Review the purpose of this breathing technique if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Respiratory

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 630–631). St. Louis: Saunders.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., pp. 960, 963). St. Louis: Mosby.

### 655. 3

**Rationale:** If at any time an alarm is sounding and the nurse cannot quickly ascertain the problem, the client is disconnected from the ventilator and manual resuscitation is used to support respirations until the problem can be corrected. No reason is given to begin cardiopulmonary resuscitation. Checking vital signs is not the initial action. Although oxygen is helpful, it will not provide ventilation to the client.

**Test-Taking Strategy:** Read the question carefully, and note that the subject relates to adequate ventilation of the client. Also note that the nurse is unsuccessful in determining the cause of the alarm. This will direct you to option 3. If you are unfamiliar with the management of ventilators and alarms, review this content.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Respiratory

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1643). St. Louis: Saunders.

### 656. 3

**Rationale:** If a biopsy was performed during a bronchoscopy, blood-streaked sputum is expected for several hours. Frank blood indicates hemorrhage. A dry cough may be expected. The client should be assessed for signs of complications, which would include cyanosis, dyspnea, stridor, bronchospasm, hemothysis, hypotension, tachycardia, and dysrhythmias. Hematuria is unrelated to this procedure.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 2 first because it is unrelated to the procedure. Next, eliminate option 1 because a dry cough may be expected. Noting that a biopsy has been performed will assist in eliminating option 4, because blood-streaked sputum would be expected. Note that option 3, the correct option, relates to the airway. If you had difficulty with this question, review post-procedure care following bronchoscopy with biopsy.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Respiratory

**Reference:** Chernecky, C., & Berger, B. (2008). *Laboratory tests and diagnostic procedures* (5th ed., p. 262). St. Louis: Saunders.

### 657. 3

**Rationale:** Hypoxemia can be caused by prolonged suctioning, which stimulates the pacemaker cells in the heart. A vagal response may occur, causing bradycardia. The nurse must preoxygenate the client before suctioning and limit the suctioning pass to 10 seconds.

**Test-Taking Strategy:** Use the process of elimination. Recall that during suctioning, the client's airway is blocked; therefore you should be able to eliminate options 1 and 4 easily. From the remaining options, eliminate option 2 because of the short time frame. Five seconds does not seem reasonable to achieve removal of secretions. Review the procedure for suctioning if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Respiratory

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 584). St. Louis: Saunders.

### 658. 3

**Rationale:** During suctioning, the nurse should monitor the client closely for side effects, including hypoxemia, cardiac irregularities such as a decrease in heart rate resulting from vagal stimulation, mucosal trauma, hypotension, and paroxysmal coughing. If side effects develop, especially cardiac irregularities, the procedure is stopped and the client is reoxygenated.

**Test-Taking Strategy:** Use the process of elimination, recalling that suctioning can cause cardiac irregularities. Noting the strategic words *heart rate is decreasing* should direct you to option 3. If you had difficulty with this question, review

the complications and interventions associated with suctioning procedures.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Respiratory

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1647, 1799). St. Louis: Saunders.

#### 659. 4

**Rationale:** Rib fractures are a common injury, especially in the older client, and result from a blunt injury or a fall. Typical signs and symptoms include pain and tenderness localized at the fracture site and exacerbated by inspiration and palpation, shallow respirations, splinting or guarding the chest protectively to minimize chest movement, and possible bruising at the fracture site. Paradoxical respirations are seen with flail chest.

**Test-Taking Strategy:** Use the process of elimination. Focusing on the anatomical location of the injury will direct you to option 4. Review the assessment findings in rib fractures if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Respiratory

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1658–1659). St. Louis: Saunders.

#### 660. 3

**Rationale:** Flail chest results from multiple rib fractures. This results in a “floating” section of ribs. Because this section is unattached to the rest of the bony rib cage, this segment results in paradoxical chest movement. This means that the force of inspiration pulls the fractured segment inward, while the rest of the chest expands. Similarly, during exhalation, the segment balloons outward while the rest of the chest moves inward. This is a characteristic sign of flail chest.

**Test-Taking Strategy:** Use the process of elimination, focusing on the strategic words *most distinctive*. Cyanosis and hypotension occur with many different disorders, so eliminate options 1 and 2 first. From the remaining options, choose paradoxical chest movement over dyspnea on exhalation by remembering that a flail chest has broken rib segments that move independently of the rest of the rib cage. Review the assessment findings in flail chest if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Respiratory

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1659–1660). St. Louis: Saunders.

#### 661. 1

**Rationale:** Pneumothorax is characterized by restlessness, tachycardia, dyspnea, pain with respiration, asymmetrical chest expansion, and diminished or absent breath sounds

on the affected side. Pneumothorax can cause increased airway pressure because of resistance to lung inflation. Acute respiratory distress syndrome and pulmonary embolism are not characterized by absent breath sounds. An endotracheal tube that is inserted too far can cause absent breath sounds, but the lack of breath sounds most likely would be on the left side because of the degree of curvature of the right and left main stem bronchi.

**Test-Taking Strategy:** Use the process of elimination. Focus on the symptoms presented in the question and note the relationship between *right* upper lobe and *right* pneumothorax in option 1. Review the manifestations associated with pneumothorax if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Respiratory

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 569, 698–699). St. Louis: Saunders.

#### 662. 4

**Rationale:** The earliest detectable sign of acute respiratory distress syndrome is an increased respiratory rate, which can begin from 1 to 96 hours after the initial insult to the body. This is followed by increasing dyspnea, air hunger, retraction of accessory muscles, and cyanosis. Breath sounds may be clear or consist of fine inspiratory crackles or diffuse coarse crackles.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic word *earliest*. Eliminate option 3 first because intercostal retraction is a later sign of respiratory distress. Of the remaining options, recall that adventitious breath sounds (options 1 and 2) would occur later than an increased respiratory rate. Review the early signs of acute respiratory distress syndrome if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Respiratory

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 687). St. Louis: Saunders.

#### 663. 1

**Rationale:** The client with emphysema has hyperinflation of the alveoli and flattening of the diaphragm. These lead to increased anteroposterior diameter, referred to as *barrel chest*. The client also has dyspnea with prolonged expiration and has hyperresonant lungs to percussion.

**Test-Taking Strategy:** Use the process of elimination. Recall that the barrel chest is a result of long-term hyperinflation of the lungs and air trapping. Knowing that a barrel chest occurs in emphysema will direct you to option 1. Review the characteristics of emphysema if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Respiratory

**Reference:** Copstead-Kirkhorn, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 553). St. Louis: Mosby.

**664. 4**

**Rationale:** The client is continued on medication therapy for 6 to 12 months, depending on the situation. The client generally is considered not to be contagious after 2 to 3 weeks of medication therapy. The client is instructed to wear a mask if there will be exposure to crowds until the medication is effective in preventing transmission. The client is allowed to return to work when the results of three sputum cultures are negative.

**Test-Taking Strategy:** Use the process of elimination. Knowing that the medication therapy lasts for at least 6 months helps you eliminate option 1 first. Knowing that three sputum cultures must be negative helps you to eliminate option 3 next. From the remaining options, recalling that the client is not contagious after 2 to 3 weeks of therapy will direct you to option 4. If you had difficulty with this question, review the infectious period of tuberculosis.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Respiratory

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 672–673). St. Louis: Saunders.

**665. 2**

**Rationale:** The nurse who is in contact with a client with tuberculosis should wear an individually fitted particulate respirator. The nurse also would wear gloves as per standard precautions. The nurse wears a gown when the possibility exists that the clothing could become contaminated, such as when giving a bed bath.

**Test-Taking Strategy:** Use the process of elimination. Knowing that the nurse should wear a particulate respirator eliminates options 1 and 4. Knowledge of basic standard precautions directs you to option 2 from the remaining options. Review precautions related to the care of a client with tuberculosis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Respiratory

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 670, 672). St. Louis: Saunders.

Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 185). St. Louis: Mosby.

**666. 3**

**Rationale:** The most common initial symptom in pulmonary embolism is chest pain that is sudden in onset. The next most commonly reported symptom is dyspnea, which is accompanied by an increased respiratory rate. Other typical symptoms of pulmonary embolism include apprehension and restlessness, tachycardia, cough, and cyanosis.

**Test-Taking Strategy:** Use the process of elimination. Because pulmonary embolism does not result from an infectious process or an allergic reaction, eliminate options 1 and 2 first. To select between options 3 and 4, look at them closely. Option 4 states dyspnea when deep breaths are taken. Although dyspnea commonly occurs with pulmonary embolism, dyspnea is not associated only with deep breathing. Therefore eliminate option 4. Review the signs of pulmonary embolism if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Respiratory

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 137). St. Louis: Mosby.

**667. 1**

**Rationale:** The client with human immunodeficiency virus (HIV) infection is considered to have positive results on Mantoux skin testing with an area larger than 5 mm of induration. The client without HIV is positive with an induration larger than 10 mm. The client with HIV is immunosuppressed, making a smaller area of induration positive for this type of client. It is possible for the client infected with HIV to have false-negative readings because of the immunosuppression factor. Options 2, 3, and 4 are incorrect interpretations.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 3 and 4 first because they are comparable or alike. From the remaining options, recalling that the client with HIV is immunosuppressed will assist in determining the interpretation of the area of induration. Review results of tuberculosis skin testing in an immunosuppressed client if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Adult Health—Respiratory

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 669). St. Louis: Saunders.

**668. 1**

**Rationale:** Histoplasmosis is an opportunistic fungal infection that can occur in the client with acquired immunodeficiency syndrome (AIDS). The infection begins as a respiratory infection and can progress to disseminated infection. Typical signs and symptoms include fever, dyspnea, cough, and weight loss. Enlargement of the client's lymph nodes, liver, and spleen may occur as well.

**Test-Taking Strategy:** Use the process of elimination. Recalling that histoplasmosis is an infectious process will help you eliminate option 4. Because the client has AIDS and another infection, weight gain is an unlikely symptom and can be eliminated next. Knowing that histoplasmosis begins as a respiratory infection helps you choose dyspnea over headache as the correct option. Review the signs of histoplasmosis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Respiratory

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 371). St. Louis: Saunders.

**669. 4**

**Rationale:** Dry cough and dyspnea are typical signs and symptoms of pulmonary sarcoidosis. Others include night sweats, fever, weight loss, and skin nodules.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *early*. Because sarcoidosis is a pulmonary problem, eliminate options 1 and 3 first. Select option 4 over option 2 because the shortness of breath (and impaired ventilation) appears first and would cause the fatigue as a secondary symptom. Review the early signs of exacerbation in sarcoidosis if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Respiratory

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 639). St. Louis: Saunders.

### 670. 1

**Rationale:** Silicosis results from chronic, excessive inhalation of particles of free crystalline silica dust. The client should wear a mask to limit inhalation of this substance, which can cause restrictive lung disease after years of exposure. Options 2, 3, and 4 are not necessary.

**Test-Taking Strategy:** Use the process of elimination. Recalling that exposure to silica dust causes the illness and that the dust is inhaled into the respiratory tract will direct you to option 1. If you had difficulty with this question, review the protective measures associated with silicosis.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Respiratory

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1625–1626). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 640). St. Louis: Saunders.

Potter, P., & Perry, A. (2009) *Fundamentals of nursing* (7th ed., pp. 662–663). St. Louis: Mosby.

### 671. 2

**Rationale:** The Venturi mask delivers the most accurate oxygen concentration. It is the best oxygen delivery system for the client with chronic airflow limitation because it delivers a precise oxygen concentration. The face tent, aerosol mask, and tracheostomy collar are also high-flow oxygen delivery systems but most often are used to administer high humidity.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *precise oxygen concentration*. Eliminate options 1, 3, and 4 because they are comparable or alike in that they are used to provide high humidity. Review the various types of oxygen delivery systems if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Respiratory

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 628). St. Louis: Saunders.

### 672. 4

**Rationale:** Positions that will assist the client with emphysema with breathing include sitting up and leaning on an overbed table, sitting up and resting the elbows on the knees, and standing and leaning against the wall.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 3 first because they are comparable or alike. Next, eliminate option 2 because this position will not enhance breathing. If you had difficulty with this question, review the positions that will decrease the work of breathing in a client with emphysema.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Respiratory

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 624). St. Louis: Saunders.

### 673. 4

**Rationale:** One of the first pulmonary symptoms of tuberculosis is a slight cough with the expectoration of mucoid sputum. Options 1, 2, and 3 are late symptoms and signify cavitation and extensive lung involvement.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *first* in the question. Next focusing on the diagnosis should direct you to option 4. If you are unfamiliar with the signs associated with tuberculosis, review this content.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Respiratory

**References:** Copstead-Kirkhorn, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., pp. 586–587). St. Louis: Mosby.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 143). St. Louis: Mosby.

### 674. 3

**Rationale:** Tuberculosis is definitively diagnosed through culture and isolation of *Mycobacterium tuberculosis*. A presumptive diagnosis is made based on a tuberculin skin test, a sputum smear that is positive for acid-fast bacteria, a chest x-ray, and histological evidence of granulomatous disease on biopsy.

**Test-Taking Strategy:** Note the strategic word *confirm* in the question. Confirmation is made by identifying *M. tuberculosis*. If you had difficulty with this question, review the diagnostic procedures related to tuberculosis.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Respiratory

### ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

**675. 1, 3, 4, 5**

**Rationale:** The nurse should provide the client and family with information about tuberculosis and allay concerns about the contagious aspect of the infection. Instruct the client to follow the medication regimen exactly as prescribed and always to have a supply of the medication on hand. Advise the client of the side effects of the medication and ways of minimizing them to ensure compliance. Reassure the client that after 2 to 3 weeks of medication therapy, it is unlikely that the client will infect anyone. Inform the client that activities should be resumed gradually and about the need for adequate nutrition and a well-balanced diet that is rich in iron, protein, and vitamin C to promote healing and prevent recurrence of infection. Inform the client and family that respiratory isolation is not necessary because family members already have been exposed. Instruct the client about thorough

hand washing and to cover the mouth and nose when coughing or sneezing and to put used tissues into plastic bags. Inform the client that a sputum culture is needed every 2 to 4 weeks once medication therapy is initiated. When the results of three sputum cultures are negative, the client is no longer considered infectious and can usually return to former employment.

**Test-Taking Strategy:** Knowledge regarding the pathophysiology, transmission, and treatment of tuberculosis is needed to answer this question. Read each option carefully to answer correctly. Review home care instructions for the client with tuberculosis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Respiratory

# Respiratory Medications

## I. USE OF AN INHALER

- A. Client instructions for use of a metered-dose inhaler (MDI; Figs. 59-1 and 59-2)
- B. If two different inhaled medications are prescribed and one of the medications contains a glucocorticoid (corticosteroid), administer the bronchodilator first and the corticosteroid second.

 If two different inhaled medications are prescribed, instruct the client to wait 5 minutes following administration of the first before inhaling the second.

## II. BRONCHODILATORS (Box 59-1)

-  A. Description
  - 1. Sympathomimetic bronchodilators relax the smooth muscle of the bronchi and dilate the airways of the respiratory tree, making air exchange and respiration easier for the client.
  - 2. Methylxanthine bronchodilators stimulate the central nervous system and respiration, dilate coronary and pulmonary vessels, cause diuresis, and relax smooth muscle.
  - 3. Bronchodilators are used to treat allergic rhinitis and sinusitis, acute bronchospasm, acute and chronic **asthma**, bronchitis, **chronic obstructive pulmonary disease**, **emphysema**, and other restrictive airway diseases.
  - 4. Bronchodilators are contraindicated in individuals with hypersensitivity, peptic ulcer disease, severe cardiac disease and cardiac dysrhythmias, hyperthyroidism, or uncontrolled seizure disorders.
  -  5. Bronchodilators should be used with caution in clients with hypertension, diabetes mellitus, or narrow-angle glaucoma.
  -  6. Theophylline increases the risk of digoxin toxicity and decreases the effects of lithium and phenytoin (Dilantin).
  -  7. If theophylline and a  $\beta_2$ -adrenergic agonist are administered together, cardiac dysrhythmias may result.
  -  8.  $\beta$ -Blockers, cimetidine (Tagamet), and erythromycin increase the effects of theophylline.

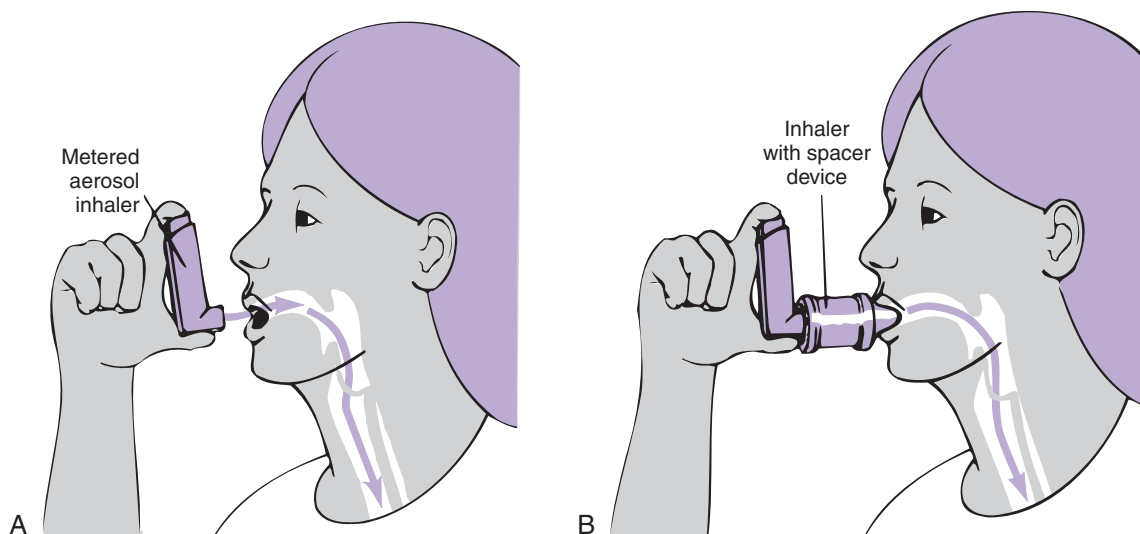

- 9. Barbiturates and carbamazepine (Tegretol) decrease the effects of theophylline. 

- B. Side effects 
  - 1. Palpitations and tachycardia 
  - 2. Dysrhythmias 
  - 3. Restlessness, nervousness, tremors
  - 4. Anorexia, nausea, and vomiting
  - 5. Headaches and dizziness
  - 6. Hyperglycemia 
  - 7. Decreased clotting time 
  - 8. Mouth dryness and throat irritation with inhalers 
  - 9. Tolerance and paradoxical bronchoconstriction with inhalers

- C. Interventions 
  - 1. Assess vital signs and lung sounds.
  - 2. Monitor for cardiac dysrhythmias.
  - 3. Assess for cough, wheezing, decreased breath sounds, and sputum production.
  - 4. Monitor for restlessness and confusion.
  - 5. Provide adequate hydration.
  - 6. Administer the medication at regular intervals around the clock to maintain a sustained therapeutic level.
  - 7. Administer oral medications with or after meals to decrease gastrointestinal irritation.
  - 8. Instruct the client not to crush enteric-coated or sustained-release tablets or capsules.
  - 9. Instruct the client to avoid caffeine-containing products such as coffee, tea, cola, and chocolate.
  - 10. Instruct the client in the side effects of bronchodilators.
  - 11. Instruct the client in how to monitor the pulse and to report any abnormalities to the physician.
  - 12. Instruct the client in how to use an inhaler or nebulizer and how to monitor the amount of medication remaining in an inhaler canister; how to use a spacer (a device that enhances the delivery of medication) is also taught (see Figs. 59-1 and 59-2)
  - 13. Instruct the client to avoid over-the-counter medications.
  - 14. Instruct the client to stop smoking and provide information regarding support resources.

▲ **FIGURE 59-1** Distribution of medication with and without a spacer. (From Kee, J., & Marshall, S. [2009]. *Clinical calculations: With applications to general and specialty areas* [6th ed.]. St. Louis: Saunders.)

▲ **FIGURE 59-2** Inhaled drugs commonly used in asthma treatment include  $\beta$ -adrenergic bronchodilators, cromolyn sodium, and aerosol glucocorticoids. **A**, The metered-dose inhaler should not be put in the mouth but held about two fingerwidths ( $1\frac{1}{2}$  inches) in front of the mouth. **B**, Alternatively, an inhaler with a spacer device can be used. Patients should breathe deeply once before activating the inhaler and then continue breathing in for about 5 seconds. Patients then should hold their breath for 10 to 15 seconds before breathing out slowly. If a second dose is needed, patients should wait 1 to 2 minutes before taking another dose. (From Clark, J., Queener, S., & Karb, V. [2000]. *Pharmacologic basis of nursing practice* [6th ed.]. St. Louis: Mosby.)

15. Instruct the client with diabetes mellitus to monitor blood glucose levels.
16. Instruct the client with **asthma** to wear a Medic-Alert bracelet.
17. Monitor for a therapeutic serum theophylline level of 10 to 20 mcg/mL.
18. Intravenously administered theophylline preparations should be administered slowly and always via an infusion pump.

⚠ **Theophylline toxicity is likely to occur when the serum level is higher than 20 mcg/mL. Early signs of toxicity include restlessness, nervousness, tremors, palpitations, and tachycardia.**

### III. ANTICHOLINERGICS (see Box 59-1)

- A.** Inhaled medications that improve lung function by blocking muscarinic receptors in the bronchi, which results in bronchodilation.
- B.** Effective for treating **chronic obstructive pulmonary disease**, allergy-induced **asthma**, and exercise-induced bronchospasm.
- C.** Side effects include dry mouth and irritation of the pharynx; sucking on sugarless candy will help to relieve symptoms.
- D.** Systemic anticholinergic effects rarely occur but can include increased intraocular pressure, blurred vision, tachycardia, cardiovascular events, urinary retention, and constipation.

**Box 59-1 Medications to Treat Restrictive Airway Disorders****Bronchodilators*****β*<sub>2</sub>-Adrenergic Agonists**

## Inhaled

Albuterol (Proventil HFA, AccuNeb, ProAir HFA, Ventolin HFA)  
 Arformoterol (Brovana)  
 Formoterol (Foradil Aerolizer, Perforomist)  
 Levalbuterol (Xopenex, Xopenex HFA)  
 Pirbuterol (Maxair Autohaler)  
 Salmeterol (Serevent Diskus)

## Oral

Albuterol (VoSpire)  
 Terbutaline (Brethine)

**Methylxanthines**

Theophylline, oral (Theo-24, Theochron, Uniphyll, Elixophyllin)

**Anticholinergics**

Ipratropium, inhaled (Atrovent, Atrovent HFA)  
 Ipratropium/albuterol, inhaled (Combivent)  
 Tiotropium, inhaled (Spiriva)

**Glucocorticoids (Corticosteroids)****Inhaled**

Beclomethasone dipropionate (Qvar)  
 Budesonide (Pulmicort Turbohaler, Pulmicort Respules)  
 Ciclesonide (Alvesco)  
 Flunisolide (AeroBid)  
 Fluticasone propionate (Flovent HFA, Flovent Diskus)  
 Mometasone furoate (Asmanex Twisthaler)  
 Triamcinolone acetonide (Azmacort)

**Oral**

Prednisone  
 Prednisolone

**Leukotriene Modifiers**

Montelukast, oral (Singulair)  
 Zafirlukast, oral (Accolate)  
 Zileuton, oral (Zyflo, Zyflo CR)

**Inhaled Nonsteroidal Antiallergy Agent**

Cromolyn sodium, inhaled (Intal)

**Monoclonal Antibody**

Omalizumab (Xolair)

Modified from Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 890). St. Louis: Saunders.

 The client with a peanut allergy should not take ipratropium (Atrovent HFA and Combivent) because the product contains soy lecithin, which is in the same plant family as peanuts.

**IV. GLUCOCORTICIDS (CORTICOSTEROIDS)**

(see Box 59-1)

- A. Glucocorticoids act as anti-inflammatory agents and reduce edema of the airways; they are used to treat **asthma** and other inflammatory respiratory conditions.
- B. See Chapter 55 for information on glucocorticoids.

**V. LEUKOTRIENE MODIFIERS** (see Box 59-1)

- A. Description
  1. Used in the prophylaxis and treatment of chronic bronchial **asthma** (not used for acute **asthma** episodes)
  2. Inhibit bronchoconstriction caused by specific antigens and reduce airway edema and smooth muscle constriction
  3. Contraindicated in clients with hypersensitivity and in breast-feeding mothers
  4. Should be used with caution in clients with impaired hepatic function
  5. Coadministration of inhaled glucocorticoids increases the risk of upper respiratory infection.
- B. Side effects
  1. Headache
  2. Nausea and vomiting
  3. Dyspepsia
  4. Diarrhea

5. Generalized pain, myalgia

6. Fever

7. Dizziness

**C. Interventions**

1. Monitor vital signs.
2. Assess lung sounds for rhonchi and wheezing.
3. Assess liver function laboratory values.
4. Monitor for cyanosis.
5. Instruct the client to take medication 1 hour before or 2 hours after meals.
6. Instruct the client to increase fluid intake.
7. Instruct the client not to discontinue the medication and to take as prescribed, even during symptom-free periods.

**VI. INHALED NONSTEROIDAL ANTIALLERGY AGENT** (see Box 59-1)**A. Description**

1. Antiasthmatic, antiallergic, and mast cell stabilizers inhibit mast cell release after exposure to antigens.
2. This medication is used to treat allergic rhinitis, bronchial **asthma**, and exercise-induced bronchospasm (see Box 59-1).
3. It is contraindicated in clients with known hypersensitivity.
4. Orally administered cromolyn sodium (Intal) is used with caution in clients with impaired hepatic or renal function.

**B. Side effects**

1. Cough or bronchospasm following inhalation
2. Nasal sting or sneezing following inhalation
3. Unpleasant taste in the mouth

**C. Interventions**

1. Monitor vital signs.
2. Monitor respirations and assess lung sounds for rhonchi or wheezing.
3. Administer oral capsules at least 30 minutes before meals.
4. Instruct the client not to discontinue the medication abruptly because a rebound asthmatic attack can occur.

 Instruct the client taking inhaled medications to drink a few sips of water before and after inhalation to prevent a cough and an unpleasant taste in the mouth.

**VII. MONOCLONAL ANTIBODY****A. Description**

1. Omalizumab (Xolair) is a recombinant DNA-derived humanized immunoglobulin G (IgG) murine monoclonal antibody that selectively binds to IgE to limit the release of mediators in the allergic response.
2. Used to treat allergy-related **asthma**; administered subcutaneously every 2 to 4 weeks
3. Dose is titrated based on the serum IgE level and body weight.
4. Contraindicated in those with hypersensitivity to the medication

**B. Side effects**

1. Injection site reactions
2. Viral infections
3. Upper respiratory infections
4. Sinusitis
5. Headache
6. Pharyngitis
7. Anaphylaxis
8. Malignancies

**C. Interventions**

1. Assess respiratory rate, rhythm, and depth and auscultate lung fields bilaterally.
2. Assess for allergies and/or allergic reaction symptoms such as rash or urticaria.
3. Instruct the client that respiratory improvement will not be immediate.
4. Instruct the client not to stop taking or decrease the currently prescribed **asthma** medications unless instructed.
5. Avoid live virus vaccines for the duration of treatment.
6. Have medications for the treatment of severe hypersensitivity reactions available during initial administration in case anaphylaxis occurs.

**VIII. ANTIHISTAMINES (Box 59-2)****A. Description**

1. Antihistamines are called histamine antagonists or H<sub>1</sub> blockers; these medications compete with histamine for receptor sites, thus preventing a histamine response.

**Box 59-2 Antihistamines**

Cetirizine (Zyrtec)  
 Chlorpheniramine (Chlor-Trimeton, others)  
 Desloratadine (Clarinox)  
 Dimenhydrinate (Dramamine)  
 Diphenhydramine (Benadryl)  
 Fexofenadine (Allegra)  
 Levocetirizine (Xyzal)  
 Loratadine (Claritin, Alavert)  
 Olopatadine (Patanase)

2. When the H<sub>1</sub> receptor is stimulated, the extravascular smooth muscles, including those lining the nasal cavity, are constricted.
3. Antihistamines decrease nasopharyngeal, gastrointestinal, and bronchial secretions by blocking the H<sub>1</sub> receptor.
4. Antihistamines are used for the common cold, rhinitis, nausea and vomiting, motion sickness, urticaria, and as a sleep aid.
5. Can cause central nervous system (CNS) depression if taken with alcohol, opioids, hypnotics, or barbiturates
6. Should be used with caution in clients with **chronic obstructive pulmonary disease** because of their drying effect
7. Diphenhydramine (Benadryl) has an anticholinergic effect and should be avoided in clients with narrow-angle glaucoma.

**B. Side effects**

1. Drowsiness and fatigue
2. Dizziness
3. Urinary retention
4. Blurred vision
5. Wheezing
6. Constipation
7. Dry mouth
8. Gastrointestinal irritation
9. Hypotension
10. Hearing disturbances
11. Photosensitivity
12. Nervousness and irritability
13. Confusion
14. Nightmares

**C. Interventions**

1. Monitor vital signs.
2. Monitor for signs of urinary dysfunction.
3. Administer with food or milk.
4. Avoid subcutaneous injection, and administer by intramuscular injection in a large muscle if the intramuscular route is prescribed.
5. Instruct the client to avoid hazardous activities, alcohol, and other CNS depressants.
6. Instruct the client taking the medication for motion sickness to take it 30 minutes before the event and then before meals and at bedtime during the event as prescribed.

**Box 59-3 Nasal Decongestants****Nonglucocorticoids**

Naphazoline (Privine)  
 Oxymetazoline (Afrin 12-Hour, others)  
 Phenylephrine hydrochloride (Neo-Synephrine, others)  
 Pseudoephedrine hydrochloride (Sudafed)  
 Tetrahydrozoline (Tyzine)  
 Xylometazoline (Natu-Vent, Otrivin)

**Glucocorticoids**

Beclomethasone (Beconase AQ)  
 Budesonide (Rhinocort Aqua)  
 Ciclesonide (Omnaris)  
 Flunisolide (Nasarel)  
 Fluticasone propionate (Flonase)  
 Fluticasone furoate (Veramyst)  
 Mometasone (Nasonex)  
 Triamcinolone (Nasacort AQ)

- Instruct the client to suck on hard candy or ice chips for dry mouth.

**IX. NASAL DECONGESTANTS** (Box 59-3)**A. Description**

- Nasal decongestants include adrenergic, anticholinergic, and corticosteroid medications.
- These medications shrink nasal mucosal membranes and reduce fluid secretion.
- Are used for allergic rhinitis, hay fever, and acute coryza (profuse nasal discharge).
- Contraindicated or used with extreme caution in clients with hypertension, cardiac disease, hyperthyroidism, or diabetes mellitus

**B. Side effects**

- Frequent use of decongestants, especially nasal sprays or drops, can result in tolerance and rebound nasal congestion (vasodilation) caused by irritation of the nasal mucosa.
- Nervousness
- Restlessness, insomnia
- Hypertension
- Hyperglycemia

 **Nasal decongestants can cause tolerance and rebound nasal congestion (vasodilation) caused by irritation of the nasal mucosa. Therefore, the client needs to be informed that these medications should not be used for longer than 48 hours.**

**C. Interventions**

- Assess the client for existing medical disorders.
- Monitor for cardiac dysrhythmias.
- Monitor blood glucose levels.
- Instruct the client to avoid consuming caffeine in large amounts because it can increase restlessness and palpitations.
- Instruct the client in the importance of limiting the use of nasal sprays and drops.

**Box 59-4 Expectorants and Mucolytic Agents****Expectorants**

Guaifenesin (Humibid,  
Mucinex)

**Mucolytic**

Acetylcysteine (Mucomyst)

**Box 59-5 Antitussives****Opioids**

Codeine phosphate, codeine sulfate  
 Hydrocodone

**Nonopioids**

Benzonatate (Tessalon)  
 Dextromethorphan  
 Diphenhydramine hydrochloride (Benadryl)

**X. EXPECTORANTS AND MUCOLYTIC AGENTS**  
(Box 59-4)**A. Description**

- Expectorants loosen bronchial secretions so that they can be eliminated with coughing; they are used for a dry unproductive cough and to stimulate bronchial secretions.
- Mucolytic agents thin mucous secretions to help make the cough more productive.
- Mucolytic agents with dextromethorphan should not be used by clients with **chronic obstructive pulmonary disease** because they suppress the cough.
- Acetylcysteine (Mucomyst) can increase airway resistance and should not be used in clients with **asthma**.

**B. Side effects**

- Gastrointestinal irritation
- Rash
- Oropharyngeal irritation

**C. Interventions**

- Instruct the client to take the medication with a full glass of water to loosen mucus.
- Instruct the client to maintain an adequate fluid intake.
- Encourage the client to cough and deep breathe.
- Acetylcysteine (Mucomyst), administered by nebulization, should not be mixed with another medication.
- If acetylcysteine is administered with a bronchodilator, the bronchodilator should be administered 5 minutes before the acetylcysteine.
- Monitor for side effects of acetylcysteine such as nausea and vomiting, stomatitis, and runny nose.

**XI. ANTITUSSIVES** (Box 59-5)

- A. Description:** Act on the cough control center in the medulla to suppress the cough reflex; used for a cough that is nonproductive and irritating

**Box 59-6 Opioid Antagonists**

Alvimopan (Entereg)  
 Methylnaltrexone (Relistor)  
 Nalmefene (Revex)  
 Naloxone (Narcan)  
 Naltrexone (ReVia, Depade)

**B. Side effects**

1. Dizziness, drowsiness, sedation
2. Gastrointestinal irritation, nausea
3. Dry mouth
4. Constipation
5. Respiratory depression

**C. Interventions**

1. Instruct the client that if the cough lasts longer than 1 week and a fever or rash occurs to notify the physician.
2. Encourage the client to take adequate fluids with the medication.
3. Encourage the client to sleep with the head of the bed elevated.
4. Instruct the client to avoid hazardous activities.
5. Note that drug dependency can occur.
6. Avoid administration to the client with a head injury or a postoperative cranial surgery client.
7. Avoid administration to the client using opioids, sedative-hypnotics, barbiturates, or antidepressants because CNS depression can occur.
8. Instruct the client to avoid the use of alcohol.

**XII. OPIOID ANTAGONISTS (Box 59-6)****A. Description**

1. An opioid antagonist reverses respiratory depression in opioid overdose.
2. Avoid its use for non-opioid respiratory depression.

**B. Side effects**

1. CNS depression
2. Nausea, vomiting
3. Tremors
4. Sweating
5. Increased blood pressure
6. Tachycardia

**C. Interventions**

1. Assess vital signs, especially respirations.
2. For intravenous administration, the dose is titrated every 2 to 5 minutes as prescribed.
3. Have oxygen and resuscitative equipment available during administration.

**XIII. TUBERCULOSIS MEDICATIONS (Box 59-7)****A. Description**

1. **Tuberculosis** medications offer the most effective method for treating the disease and preventing transmission.

**Box 59-7 First-Line and Second-Line Medications for Tuberculosis****First-Line Agents**

Isoniazid (INH, Nydrazid)  
 Rifampin (Rifadin)  
 Ethambutol (Myambutol)  
 Pyrazinamide  
 Rifabutin (Mycobutin)  
 Rifapentine (Priftin)

**Second-Line Agents**

Amikacin (Amikin)  
 Capreomycin sulfate (Capastat Sulfate)  
 Cycloserine (Seromycin)  
 Ethionamide (Trecator)  
 Kanamycin (Kantrex)  
 Levofloxacin (Levaquin)  
 Moxifloxacin (Avelox)  
 p-Aminosalicylic acid (Paser)  
 Streptomycin

2. Treatment of identified lesions depends on whether the individual has active disease or has only been exposed to the disease.
3. Treatment is difficult because the bacterium has a waxy substance on the capsule that makes penetration and destruction difficult.
4. The use of a multidrug regimen destroys organisms as quickly as possible and minimizes the emergence of drug-resistant organisms.
5. Active **tuberculosis** is treated with a combination of medications to which the organism is susceptible.
6. Individuals with active **tuberculosis** are treated for 6 to 9 months; however, clients with human immunodeficiency virus (HIV) infection are treated for a longer period of time.
7. After the infected individual has received medication for 2 to 3 weeks, the risk of transmission is greatly reduced.
8. Most clients have negative sputum cultures after 3 months of compliance with medication therapy.
9. Individuals who have been exposed to active **tuberculosis** are treated with preventive isoniazid (INH) for 9 to 12 months.

**B. First-line or second-line medications**

1. First-line medications provide the most effective antituberculosis activity.
2. Second-line medications are used in combination with first-line medications but are more toxic.
3. Current infecting organisms are proving resistant to standard first-line medications; the resistant organisms develop because individuals with the disease fail to complete the course of treatment, so surviving bacteria adapt to the medication and become resistant.

4. Multidrug therapies are instituted because of the resistant organisms.

**C. Multidrug-resistant strain of tuberculosis (MDR-TB)**

1. Resistance occurs when a client receiving two medications (first-line and second-line medications) discontinues one of the medications.
2. The client briefly experiences some response from the single medication but then large numbers of resistant organisms begin to grow.
3. The client, infectious again, transmits the drug-resistant organism to other individuals.
4. As this event is repeated, an organism develops that is resistant to many of the first-line **tuberculosis** medications.

**XIV. FIRST-LINE MEDICATIONS FOR TUBERCULOSIS** (see Box 59-7)

**A. Isoniazid (INH)**

1. Description

- a. Isoniazid is bactericidal.
- b. It inhibits the synthesis of mycolic acids and acts to kill actively growing organisms in the extracellular environment.
- c. It inhibits the growth of dormant organisms in the macrophages and caseating granulomas.
- d. It is active only during cell division and is used in combination with other antitubercular medications.

2. Contraindications and cautions

- a. Isoniazid is contraindicated in clients with hypersensitivity or with acute liver disease.
- b. Use with caution in clients with chronic liver disease, alcoholism, or renal impairment.
- c. Use with caution in clients taking nicotinic acid (niacin).
- d. Use with caution in clients taking hepatotoxic medications because the risk for hepatotoxicity increases.
- e. Alcohol increases the risk of hepatotoxicity.
- f. Isoniazid may increase the risk of toxicity of carbamazepine (Tegretol) and phenytoin (Dilantin).
- g. Isoniazid may decrease ketoconazole (Nizoral) concentrations.

3. Side effects

- a. Hypersensitivity reactions
- b. Peripheral neuritis
- c. Neurotoxicity
- d. Hepatotoxicity; increased liver function test levels
- e. Pyridoxine (vitamin B<sub>6</sub>) deficiency
- f. Irritation at injection site with intramuscular administration
- g. Nausea and vomiting
- h. Dry mouth
- i. Dizziness
- j. Hyperglycemia
- k. Vision changes
- l. Hepatitis

4. Interventions

- a. Assess for hypersensitivity.
- b. Assess for hepatic dysfunction.
- c. Assess for sensitivity to nicotinic acid.
- d. Monitor liver function test results.
- e. Monitor for signs of hepatitis, such as anorexia, nausea, vomiting, weakness, fatigue, dark urine, or jaundice; if these symptoms occur, withhold the medication and notify the physician.
- f. Monitor for tingling, numbness, or burning of the extremities.
- g. Assess mental status.
- h. Monitor for visual changes, and notify the physician if they occur.
- i. Assess for dizziness and initiate safety precautions.
- j. Monitor complete blood count (CBC) and blood glucose levels.
- k. Administer isoniazid 1 hour before or 2 hours after a meal because food may delay absorption.
- l. Administer isoniazid at least 1 hour before antacids, especially those antacids that contain aluminum.
- m. Administer pyridoxine as prescribed to reduce the risk of neurotoxicity.

**!** Many tuberculosis medications can cause toxic effects such as hepatotoxicity, nephrotoxicity, neurotoxicity, optic neuritis, or ototoxicity. Teach the client about the signs of toxicity and inform the client that the physician needs to be notified if any signs arise.

5. Client education

- a. Instruct the client not to skip doses and to take the medication for the full length of the prescribed therapy.
- b. Instruct the client not to take any other medication without consulting the physician.
- c. Advise the client of the importance of follow-up physician visits, vision testing, and laboratory tests.
- d. Instruct the client to avoid alcohol.
- e. Advise the client to take medication on an empty stomach with 8 oz of water 1 hour before or 2 hours after meals and to avoid taking antacids with the medication.
- f. Instruct the client to avoid tyramine-containing foods because they may cause a reaction such as red and itching skin, a pounding heartbeat, lightheadedness, a hot or clammy feeling, or a headache; if this does occur, the client should notify the physician.
- g. Instruct the client in the signs of neurotoxicity, hepatitis, and hepatotoxicity.
- h. Instruct the client to notify the physician if signs of neurotoxicity, hepatitis and hepatotoxicity, or visual changes occur.

- B. Rifampin (Rifadin)**
1. Description
    - a. Rifampin inhibits bacterial RNA synthesis.
    - b. It binds to DNA-dependent RNA polymerase and blocks RNA transcription.
    - c. It is used with at least one other antitubercular medication.
  2. Contraindications and cautions
    - a. Rifampin is contraindicated in clients with hypersensitivity.
    - b. It should be used with caution in clients with hepatic dysfunction or alcoholism.
    - c. Use of alcohol or hepatotoxic medications may increase the risk of hepatotoxicity.
    - d. Rifampin decreases the effects of several medications, including oral anticoagulants, oral hypoglycemics, chloramphenicol (Chloromycetin), digoxin (Lanoxin), disopyramide phosphate (Norpace), mexiletine (Mexitil), quinidine polygalacturonate, tocainide hydrochloride, fluconazole (Diflucan), methadone hydrochloride (Dolophine), phenytoin (Dilantin), and verapamil hydrochloride (Calan).
  3. Side effects
    - a. Hypersensitivity reaction, including fever, chills, shivering, headache, muscle and bone pain, and dyspnea
    - b. Heartburn, nausea, vomiting, diarrhea
    - c. Red-orange-colored body secretions
    - d. Vision changes
    - e. Hepatotoxicity and hepatitis
    - f. Increased uric acid levels
    - g. Blood dyscrasias
    - h. Colitis
  4. Interventions
    - a. Assess for hypersensitivity.
    - b. Evaluate CBC, uric acid, and liver function test results.
    - c. Assess for signs of hepatitis; if they occur, withhold the medication and notify the physician.
    - d. Monitor stools for signs of colitis.
    - e. Monitor mental status.
    - f. Assess for visual changes.
  5. Client education
    - a. Instruct the client not to skip doses and to take medication for the full length of the prescribed therapy.
    - b. Instruct the client not to take any other medication without consulting the physician.
    - c. Advise the client of the importance of follow-up physician visits and laboratory tests.
    - d. Instruct the client to avoid alcohol.
    - e. Advise the client to take medication on an empty stomach with 8 oz of water 1 hour before or 2 hours after meals and to avoid taking antacids with the medication.
  - f. Instruct the client that urine, feces, sweat, and tears will be red-orange and that soft contact lens can become permanently discolored.
  - g. Instruct the client to notify the physician if jaundice (yellow eyes or skin) develops or if weakness, fatigue, nausea, vomiting, sore throat, fever, or unusual bleeding occurs.
- C. Ethambutol (Myambutol)**
1. Description
    - a. Ethambutol is bacteriostatic.
    - b. It interferes with cell metabolism and multiplication by inhibiting one or more metabolites in susceptible organisms.
    - c. It inhibits bacterial RNA synthesis and is active only during cell division.
    - d. Ethambutol is slow-acting and must be used with other bactericidal agents.
  2. Contraindications and cautions
    - a. Ethambutol is contraindicated in clients with hypersensitivity or optic neuritis and in children younger than 13 years.
    - b. Use with caution in clients with renal dysfunction, gout, ocular defects, diabetic retinopathy, cataracts, or ocular inflammatory conditions.
    - c. Use with caution in clients taking neurotoxic medications because the risk for neurotoxicity increases.
  3. Side effects
    - a. Hypersensitivity reactions
    - b. Anorexia, nausea, vomiting
    - c. Dizziness
    - d. Malaise
    - e. Mental confusion
    - f. Joint pain
    - g. Dermatitis
    - h. Optic neuritis
    - i. Peripheral neuritis
    - j. Thrombocytopenia
    - k. Increased uric acid levels
    - l. Anaphylactoid reaction
  4. Interventions
    - a. Assess the client for hypersensitivity.
    - b. Evaluate results of CBC, uric acid, and renal and liver function tests.
    - c. Obtain baseline visual acuity and color discrimination, especially to green.
    - d. Monitor for visual changes such as altered color perception and decreased visual acuity; if changes occur, withhold the medication and notify the physician.
    - e. Administer once every 24 hours and administer with food to decrease gastrointestinal upset.
    - f. Monitor uric acid concentration and assess for painful or swollen joints or signs of gout.
    - g. Monitor intake and output and for adequate renal function.
    - h. Assess mental status.

- i. Monitor for dizziness and initiate safety precautions.
  - j. Assess for peripheral neuritis (numbness, tingling or burning of the extremities); if it occurs, notify the physician.
5. Client education
- a. Inform the client that he or she can prevent nausea related to the medication by taking the daily dose at bedtime or by taking the prescribed anti-nausea medications.
  - b. Instruct the client not to skip doses and to take the medication for the full length of the prescribed therapy.
  - c. Instruct the client not to take any other medication without consulting the physician.
  - d. Advise the client of the importance of follow-up physician visits, vision testing, and laboratory tests.
  - e. Instruct the client to notify the physician immediately if any visual problems occur or a rash, swelling and pain in the joints, or numbness, tingling, or burning in the hands or feet occurs.
- D. Pyrazinamide**
1. Description
- a. The exact mechanism of action of pyrazinamide is unknown.
  - b. Pyrazinamide may be bacteriostatic or bactericidal, depending on its concentration at the infection site and susceptibility of infecting organism.
  - c. It is used with at least one other antitubercular medication after failure or ineffectiveness of the primary medication(s).
2. Contraindications and cautions
- a. Pyrazinamide is contraindicated in clients with hypersensitivity.
  - b. Use pyrazinamide with caution in clients with diabetes mellitus, renal impairment, or gout, and in children.
  - c. Pyrazinamide may decrease the effects of allopurinol (Zyloprim), colchicine, probenecid (Benemid), and sulfapyrazone (Anturane).
  - d. Cross-sensitivity is possible with isoniazid (INH), ethionamide (Trecator), or nicotinic acid.
3. Side effects
- a. Increases liver function tests and uric acid levels
  - b. Arthralgia, myalgia
  - c. Photosensitivity
  - d. Hepatotoxicity
  - e. Thrombocytopenia
4. Interventions
- a. Assess for hypersensitivity.
  - b. Evaluate CBC, liver function test results, and uric acid levels.
  - c. Observe for hepatotoxic effects; if they occur, withhold the medication and notify the physician.
- d. Assess for painful or swollen joints.
  - e. Evaluate blood glucose level because diabetes mellitus may be difficult to control while client is taking the medication.
5. Client education
- a. Instruct the client to take the medication with food to reduce gastrointestinal distress.
  - b. Instruct the client to avoid sunlight or ultraviolet light until photosensitivity is determined.
  - c. Instruct the client to notify the physician if any side effects occur.
  - d. Instruct the client not to skip doses and to take the medication for the full length of the prescribed therapy.
  - e. Instruct the client not to take any other medication without consulting the physician.
  - f. Advise the client of the importance of follow-up physician visits and laboratory tests.
- E. Rifabutin (Mycobutin)**
1. Description
- a. Inhibits mycobacterial DNA-dependent RNA polymerase and suppresses protein synthesis
  - b. Used to prevent disseminated *Mycobacterium avium* complex (MAC) disease in clients with advanced HIV infection
  - c. Used to treat active MAC disease and **tuberculosis** in clients with HIV infection
2. Cautions
- a. Can affect blood levels of some medications, including oral contraceptives and some medications used to treat HIV infection
  - b. A nonhormonal method of birth control should be used instead of an oral contraceptive.
3. Side effects
- a. Rash
  - b. GI disturbances
  - c. Neutropenia
  - d. Red-orange-colored body secretions
  - e. Uveitis
  - f. Myositis
  - g. Arthralgia
  - h. Hepatitis
  - i. Chest pain with dyspnea
  - j. Flu-like syndrome
4. Interventions
- a. Assess medication history of the client.
  - b. Observe for hepatotoxic effects; if they occur, withhold the medication and notify the physician.
  - c. Assess for painful or swollen joints.
  - d. Assess for ocular pain or blurred vision.
5. Client education
- a. Instruct the client that the medication can be taken without regard to food.
  - b. Instruct the client to notify the physician if any side effects occur.

- c. Instruct the client not to skip doses and to take the medication for the full length of the prescribed therapy.
- d. Instruct the client not to take any other medication without consulting the physician.
- e. Advise the client of the importance of follow-up physician visits and laboratory tests.

#### F. Rifapentine (Priftin)

1. Description: Used only for pulmonary **tuberculosis**
2. Cautions: Can affect blood levels of some medications, including oral contraceptives and warfarin (Coumadin), and some medications used to treat HIV infection
3. Side effects
  - a. Red-orange-colored body secretions
  - b. Hepatotoxicity
4. Interventions
  - a. Assess medication history of the client.
  - b. Obtain baseline liver function studies and assess throughout therapy.
  - c. Observe for hepatotoxic effects; if they occur, withhold the medication and notify the physician.
5. Client education
  - a. Instruct the client that the medication can be taken without regard to food.
  - b. Instruct the client to avoid sunlight or ultraviolet light until photosensitivity is determined.
  - c. Instruct the client to notify the physician if any side effects occur
  - d. Instruct the client not to skip doses and to take the medication for the full length of the prescribed therapy.
  - e. Instruct the client not to take any other medication without consulting the physician.
  - f. Advise the client of the importance of follow-up physician visits and laboratory tests.

 Some tuberculosis medications can cause red-orange colored body secretions. Inform the client that this is not a harmful effect but that the secretions can stain and permanently discolor items.

### XV. SECOND-LINE MEDICATIONS FOR TUBERCULOSIS (see Box 59-7)

#### A. Capreomycin sulfate (Capastat Sulfate)

1. Description
  - a. Mechanism of action for capreomycin is unknown.
  - b. Used to treat MDR-TB when significant resistance to other medications is expected
  - c. Capreomycin must be given intramuscularly.
2. Contraindications and cautions
  - a. The risk of nephrotoxicity, ototoxicity, and neuromuscular blockade is increased with the use of aminoglycosides or loop diuretics.

- b. Use capreomycin with caution in clients with renal insufficiency, acoustic nerve impairment, hepatic disorder, myasthenia gravis, or parkinsonism.
- c. Do not administer to clients receiving streptomycin.

#### 3. Side effects

- a. Nephrotoxicity
- b. Ototoxicity
- c. Neuromuscular blockade

#### 4. Interventions

- a. Perform baseline audiometric testing.
- b. Assess renal, hepatic, and electrolyte levels before administration.
- c. Monitor intake and output.
- d. Reconstituted medication may be stored for 48 hours at room temperature.
- e. Administer intramuscularly deep into a large muscle mass.
- f. Rotate injection sites.
- g. Observe injection site for redness, excessive bleeding, and inflammation.

#### 5. Client education

- a. Instruct the client not to perform tasks that require mental alertness.
- b. Instruct the client to report any hearing loss, balance disturbances, respiratory difficulty, weakness, or signs of hypersensitivity reactions.

#### B. Antibiotics

##### 1. Description

- a. Aminoglycoside antibiotics (kanamycin [Kantrex]; amikacin [Amikin]) or fluoroquinolones (levofloxacin [Levaquin]; moxifloxacin [Avelox]) are given with at least one other antitubercular medication.
- b. These medications are bactericidal because of receptor-binding action interfering with protein synthesis in susceptible microorganisms.
- c. Gastrointestinal disturbances are the most common side effect.
- d. Fluoroquinolones are not recommended for use in children.

##### 2. Contraindications and cautions

- a. Contraindicated in clients with hypersensitivity, neuromuscular disorders, or eighth cranial nerve damage
- b. Used with caution in the older client, in neonates because of renal insufficiency and immaturity, and in young infants because it may cause CNS depression.
- c. The risk of toxicity increases if taken with other aminoglycosides or nephrotoxicity- or ototoxicity-producing medications.

##### 3. Side effects

- a. Hypersensitivity
- b. Pain and irritation at the injection site

- c. Nephrotoxicity is indicated by increased blood urea nitrogen and serum creatinine levels.
- d. Ototoxicity is indicated by tinnitus, dizziness, ringing or roaring in the ears, and reduced hearing.
- e. Neurotoxicity is indicated by headache, dizziness, lethargy, tremors, and visual disturbances.
- f. Superinfections

#### 4. Interventions

- a. Assess for hypersensitivity.
- b. Monitor for ototoxic, neurotoxic, and nephrotoxic reactions.
- c. Monitor liver and renal function test results.
- d. Obtain baseline audiometric test and repeat every 1 to 2 months because the medication impairs the eighth cranial nerve.
- e. Assess acuteness of hearing.
- f. Monitor for visual changes.
- g. Assess hydration status and maintain adequate hydration during therapy.
- h. Monitor intake and output.
- i. Assess urinalysis.
- j. Monitor for superinfection.

#### 5. Client education

- a. Instruct the client not to skip doses and to take the medication for the full length of the prescribed therapy.
- b. Instruct the client not to take any other medication without consulting the physician.
- c. Advise the client of the importance of follow-up physician visits and laboratory tests.
- d. Instruct the client to notify the physician if hearing loss, changes in vision, or urinary problems occur.

### C. Ethionamide (Trecator)

#### 1. Description

- a. Mechanism of action of ethionamide is unknown.
- b. Ethionamide is used to treat MDR-TB when significant resistance to other medications is expected.

#### 2. Contraindications and cautions

- a. Ethionamide is contraindicated in clients with hypersensitivity.
- b. Use ethionamide with caution in clients with diabetes mellitus or renal dysfunction.

#### 3. Side effects

- a. Anorexia, nausea, vomiting
- b. Metallic taste in the mouth
- c. Orthostatic hypotension
- d. Jaundice
- e. Mental changes
- f. Peripheral neuritis
- g. Rash

#### 4. Interventions

- a. Assess liver and renal function test results.

- b. Monitor glucose levels in the client with diabetes mellitus.
- c. Administer pyridoxine as prescribed to reduce the risk of neurotoxicity.

#### 5. Client education

- a. Instruct the client to take medication with food or meals to minimize gastrointestinal irritation.
- b. Instruct the client to change positions slowly.
- c. Instruct the client to report signs of a rash, which can progress to exfoliative dermatitis if the medication is not discontinued.
- d. Instruct the client to avoid alcohol.
- e. Instruct the client to report signs of jaundice and other side effects of the medication if they occur.

### D. Aminosalicyclic acid (Paser)

#### 1. Description

- a. Aminosalicyclic acid inhibits folic acid metabolism in mycobacteria.
- b. It is used to treat MDR-TB when significant resistance to other medications is expected.

#### 2. Contraindications and cautions

- a. Contraindicated with hypersensitivity to aminosalicylates, salicylates, or compounds containing the para-aminophenol group.
- b. Aminobenzoates block the absorption of aminosalicylate sodium.

#### 3. Side effects

- a. Hypersensitivity
- b. Bitter taste in the mouth
- c. Gastrointestinal tract irritation
- d. Exfoliative dermatitis
- e. Blood dyscrasias
- f. Crystalluria
- g. Changes in thyroid function

#### 4. Interventions

- a. Assess for hypersensitivity.
- b. Offer clear water to rinse the mouth and chewing gum or hard candy to alleviate the bitter taste.
- c. Encourage fluid intake to prevent crystalluria.
- d. Monitor intake and output.

#### 5. Client education

- a. Instruct the client to discard the medication and obtain a new supply if a purplish-brown discoloration occurs.
- b. Instruct the client to take the medication with food.
- c. Inform the client that urine may turn red on contact with hypochlorite bleach if bleach was used to clean a toilet.
- d. Instruct the client not to take aspirin or over-the-counter medications without the physician's approval.
- e. Instruct the client to report signs of a blood dyscrasia, such as sore throat or mouth, malaise, fatigue, bruising, or bleeding.

**E. Cycloserine (Seromycin)**

1. Description
  - a. Cycloserine interferes with cell wall biosynthesis.
  - b. It is used to treat MDR-TB when significant resistance to other medications is expected.
2. Contraindications and cautions
  - a. Use of alcohol or ethionamide increases the risk of seizures.
  - b. Use cycloserine with caution in clients with epilepsy, depression, severe anxiety, psychosis, or renal insufficiency, or the client who uses alcohol.
3. Side effects
  - a. Hypersensitivity
  - b. CNS reactions
  - c. Neurotoxicity
  - d. Seizures
  - e. Congestive heart failure
  - f. Headache
  - g. Vertigo
  - h. Altered level of consciousness
  - i. Irritability, nervousness, anxiety
  - j. Confusion
  - k. Mood changes, depression, thoughts of suicide
4. Interventions
  - a. Monitor level of consciousness.
  - b. Monitor for changes in mental status and thought processes.
  - c. Monitor renal and hepatic function tests.
  - d. Monitor serum drug level to avoid the risk of neurotoxicity; the peak concentration, measured 2 hours after dosing, should be 25 to 35 mcg/mL.
5. Client education
  - a. Instruct the client to take the medication after meals to prevent gastrointestinal upset.
  - b. Instruct the client to avoid alcohol.
  - c. Instruct the client to report signs of a rash or signs of CNS toxicity.
  - d. Instruct the client to avoid driving or performing tasks that require alertness until the reaction to the medication has been determined.
  - e. Advise the client of the need for monitoring serum drug levels weekly, as prescribed.

**F. Streptomycin**

1. Description
  - a. Streptomycin is an aminoglycoside antibiotic used with at least one other antitubercular medication.
  - b. It is bactericidal because of receptor-binding action that interferes with protein synthesis in susceptible organisms.
2. Contraindications and cautions
  - a. Streptomycin is contraindicated in clients with hypersensitivity, myasthenia gravis, parkinsonism, or eighth cranial nerve damage.

**Box 59-8 Side Effects of Streptomycin****Nephrotoxicity**

Changes in urine output  
Decreased appetite  
Increased thirst  
Nausea, vomiting

**Neurotoxicity**

Muscle numbness  
Seizures  
Tingling  
Twitching

**Vestibular Ototoxicity**

Clumsiness  
Dizziness  
Unsteadiness

**Auditory Ototoxicity**

A full feeling in the ears  
Ringing in the ears  
Loss of hearing

- b. Use streptomycin with caution in the older client, in neonates because of renal insufficiency and immaturity, and in young infants because the medication may cause CNS depression.
- c. The risk of toxicity increases when streptomycin is taken with other aminoglycosides or nephrotoxicity- or ototoxicity-producing medications.
3. Side effects (Box 59-8)
  - a. Hypersensitivity
  - b. Visual changes
  - c. Increased liver and renal function studies
  - d. Peripheral neuritis, such as burning of the face or mouth
4. Interventions
  - a. Assess for hypersensitivity.
  - b. Monitor liver and renal function test results.
  - c. Monitor for ototoxic, neurotoxic, and nephrotoxic reactions.
  - d. Perform baseline audiometric testing and repeat every 1 to 2 months because the medication impairs the eighth cranial nerve.
  - e. Assess hearing acuity.
  - f. Monitor for visual changes.
  - g. Assess hydration status and maintain adequate hydration during therapy.
  - h. Monitor intake and output.
  - i. Assess urinalysis results.
  - j. Monitor for signs of peripheral neuritis.
5. Client education
  - a. Instruct the client not to skip doses and to take medication for the full length of the prescribed therapy.
  - b. Instruct the client not to take any other medication without consulting the physician.
  - c. Advise the client of the importance of follow-up physician visits and laboratory tests.
  - d. Instruct the client to notify the physician if hearing loss, changes in vision, or urinary problems occur.

**XVI. INFLUENZA MEDICATIONS****A. Vaccines (Box 59-9)**

**Box 59-9 Influenza Vaccines****Inactivated (Intramuscular Administration)**

Afluria  
Fluarix  
FluLaval  
Fluvirin  
Fluzone

**Live, Attenuated (Nasal Administration)**

FluMist

## 1. Description

- a. Because the strain of influenza virus is different every year, annual vaccination is recommended (usually in October or November).
- b. Vaccine is available as inactivated influenza vaccine administered intramuscularly or as a live attenuated influenza vaccine, which is administered nasally.
- c. Future influenza vaccines will contain both seasonal and H1N1 vaccines in the same preparation.

 Seasonal flu and the H1N1 (swine) flu vaccines are recommended for all individuals unless a contraindication to receiving them exists.

## 2. Swine flu and the H1N1 vaccine

- a. Refer to Chapter 48 for additional information on the swine flu and its vaccine.
- b. The nasal spray (live) vaccine is approved only for healthy people ages 2 through 49.
- c. The nasal spray vaccine is not approved for pregnant women.
- d. The flu shots (inactivated vaccine) depending on the manufacturer, are approved for children as young as 6 months of age and are safe for pregnant women.
- e. The nasal spray contains a live flu virus that has been weakened to the point that it can't cause the flu; its advantage is that it may elicit a stronger immune response than the shot in children who have never had the flu or a flu vaccine before.
- f. The disadvantage of the nasal spray is that it may not be quite as protective as the flu shot for older people who have had the flu or flu vaccines before.
- g. All individuals should receive a H1N1 vaccine; high priority individuals include: pregnant woman, household contacts and caregivers of children younger than 6 months of age; people ages 6 months to 24 years; health care workers and emergency medical personnel; and adults aged 25 through 64 with a chronic medical condition, such as **asthma**, or a weakened immune system, which increases risk of flu complications.

## 3. Contraindications and cautions

- a. Contraindications of the inactivated vaccine include hypersensitivity, chicken egg allergy, active infection, Guillain-Barré syndrome, active febrile illness, and children younger than 6 months.
- b. Contraindications of the live attenuated vaccine include age younger than 2 years or adults 50 years or older, pregnant women, children or adolescents on long-term aspirin therapy, and those with severe nasal congestion or long-term conditions such as **asthma**, diabetes mellitus, anemia or blood disorders, or heart, kidney, or lung disease.

## 4. Side effects

- a. Side effects of the inactivated vaccine include localized pain and swelling at the injection site, general body aches and pains, malaise, fever.
- b. Side effects of the attenuated vaccine include runny nose or nasal congestion, cough, headache, and sore throat.

## 5. Interventions

- a. The intramuscular route is recommended for the inactivated vaccine; adults and older children should be vaccinated in the deltoid muscle.
- b. Monitor for side effects of the vaccine.
- c. Monitor for hypersensitivity reactions in clients receiving vaccination for the first time.

## 6. Client education

- a. Instruct the client about the importance of an annual vaccination.
- b. Instruct the client that the inactivated vaccine contains noninfectious killed viruses and cannot cause influenza.
- c. Instruct the client that any respiratory disease unrelated to influenza can occur after the vaccination.
- d. Instruct the client who has received the attenuated vaccine that the virus may be shed in secretion up to 2 days after vaccination.
- e. Instruct the client that development of antibodies in adults takes approximately 2 weeks.

7. Visit the Centers for Disease Control and Prevention for updates at [www.cdc.gov/flu](http://www.cdc.gov/flu).**B. Antiviral medications (Box 59-10)**

## 1. Description

- a. Antiviral medication use during outbreaks of influenza depends on the current strain of influenza.
- b. Diagnosis of influenza should include rapid diagnostic tests because symptoms of infection from other pathogens may cause symptoms similar to those of influenza infection.
- c. Influenza antivirals may also be administered as prophylaxis against infection but should not replace vaccination.

**Box 59-10 Antiviral Influenza Medications**

Amantadine (Symmetrel)  
 Oseltamivir (Tamiflu)  
 Rimantadine (Flumadine)  
 Zanamivir (Relenza)

**TABLE 59-1** Side Effects of Antiviral Influenza Medications

| Antiviral Medication    | Side Effects  |
|-------------------------|---|
| Amantadine (Symmetrel)  | Drowsiness, anxiety, psychosis, depression, hallucinations, tremors, confusion, insomnia, orthostatic hypotension, heart failure, blurred vision, constipation, dry mouth, urinary frequency and retention, leukopenia, photosensitivity, dermatitis                      |
| Oseltamivir (Tamiflu)   | Insomnia, diarrhea, abdominal pain, cough   |
| Rimantadine (Flumadine) | Depression, hallucinations, tremors, seizures, insomnia, poor concentration, asthenia, gait abnormalities, anxiety, confusion, pallor, palpitations, hypotension, edema, tinnitus, eye pain, constipation, dry mouth, anorexia, abdominal pain, diarrhea, dyspepsia, rash |
| Zanamivir (Relenza)     | Ear, nose, throat infections, diarrhea, nasal symptoms, cough, sinusitis, bronchitis  |

2. Contraindication and cautions: Antiviral medications are contraindicated in hypersensitive clients.
3. Side effects
  - a. Common side effects include headache, dizziness, fatigue, nausea and vomiting.
  - b. Some side effects depend on the medication (Table 59-1)
4. Interventions
  - a. Administer within 2 days of onset of symptoms and continue for the entire prescription.
  - b. Monitor for side effects of specific medications.
5. Client education
  - a. Teach the client that the medication may not prevent the transmission of influenza to others.
  - b. Adjust activities if dizziness or fatigue occur.
  - c. Instruct the client about management of side effects of various medications.
  - d. Instruct the client to take medication exactly as prescribed and for the duration of prescription.

**XVII. PNEUMOCOCCAL CONJUGATE VACCINE**

- A.** Pneumococcal conjugate vaccine (PCV, Prevnar) is used for the prevention of invasive pneumococcal disease in infants and children

- B.** Pneumococcal polysaccharide vaccine (Pneumovax 23) is used for adults and high-risk children older than 2 years.
- C.** Side effects may include erythema, swelling, pain, and tenderness at the injection site, fever, irritability, drowsiness, and reduced appetite.
- D.** See Chapter 48 for additional information about vaccines for pneumonia.

**MORE QUESTIONS ON THE CD!****Practice Questions**

- 676.** A client has a prescription to take guaifenesin (Mucinex). The nurse determines that the client understands the proper administration of this medication if the client states that he or she will:
1. Take an extra dose if fever develops.
  2. Take the medication with meals only.
  3. Take the tablet with a full glass of water.
  4. Decrease the amount of daily fluid intake.
- 677.** A nurse is preparing to administer a dose of naloxone hydrochloride (Narcan) intravenously to a client with an intravenous opioid overdose. Which supportive medical equipment would the nurse plan to have at the client's bedside if needed?
1. Nasogastric tube
  2. Paracentesis tray
  3. Resuscitation equipment
  4. Central line insertion tray
- 678.** A nurse teaches a client about the effects of diphenhydramine (Benadryl), which has been prescribed as a cough suppressant. The nurse determines that the client needs further instructions if the client states that he or she will:
1. Take the medication on an empty stomach.
  2. Avoid using alcohol while taking this medication.
  3. Use sugarless gum, candy, or oral rinses to decrease dry mouth.
  4. Avoid activities requiring mental alertness while taking this medication.
- 679.** A cromolyn sodium (Intal) inhaler is prescribed for a client with allergic asthma. A nurse provides instructions regarding the side effects of this medication. The nurse tells that client that which undesirable effect is associated with this medication?
1. Insomnia
  2. Constipation
  3. Hypotension
  4. Bronchospasm

- 680.** Terbutaline (Brethine) is prescribed for a client with bronchitis. A nurse understands that this

medication should be used with caution if which of the following medical conditions is present in the client?

1. Osteoarthritis
  2. Hypothyroidism
  3. Diabetes mellitus
  4. Polycystic disease
- 681.** Zafirlukast (Accolate) is prescribed for a client with bronchial asthma. Which laboratory test does the nurse expect to be prescribed before the administration of this medication?
1. Platelet count
  2. Neutrophil count
  3. Liver function tests
  4. Complete blood count
- 682.** A client has been taking isoniazid (INH) for 1½ months. The client complains to a nurse about numbness, paresthesias, and tingling in the extremities. The nurse interprets that the client is experiencing:
1. Hypercalcemia
  2. Peripheral neuritis
  3. Small blood vessel spasm
  4. Impaired peripheral circulation
- 683.** A client is to begin a 6-month course of therapy with isoniazid (INH). A nurse plans to teach the client to:
1. Use alcohol in small amounts only.
  2. Report yellow eyes or skin immediately.
  3. Increase intake of Swiss or aged cheeses.
  4. Avoid vitamin supplements during therapy.
- 684.** A client has been started on long-term therapy with rifampin (Rifadin). A nurse teaches the client that the medication:
1. Should always be taken with food or antacids
  2. Should be double-dosed if one dose is forgotten
  3. Causes orange discoloration of sweat, tears, urine, and feces
  4. May be discontinued independently if symptoms are gone in 3 months
- 685.** A nurse has given a client taking ethambutol (Myambutol) information about the medication. The nurse determines that the client understands the instructions if the client states to report immediately:
1. Impaired sense of hearing
  2. Gastrointestinal side effects
  3. Orange-red discoloration of body secretions
  4. Difficulty in discriminating the color red from green
- 686.** A client with tuberculosis is being started on anti-tuberculosis therapy with isoniazid (INH). Before giving the client the first dose, a nurse ensures that which of the following baseline studies has been completed?
1. Electrolyte levels
  2. Liver enzyme levels
  3. Serum creatinine level
  4. Coagulation times
- 687.** A nurse has an order to give a client salmeterol (Serevent Diskus), two puffs, and beclomethasone dipropionate (Qvar), two puffs, by metered-dose inhaler. The nurse administers the medication by giving the:
1. Beclomethasone first and then the salmeterol
  2. Salmeterol first and then the beclomethasone
  3. Alternating a single puff of each, beginning with the salmeterol
  4. Alternating a single puff of each, beginning with the beclomethasone
- 688.** The nurse is caring for a client with a diagnosis of influenza who first began to experience symptoms yesterday. Antiviral therapy is prescribed and the nurse provides instructions to the client about the therapy. Which statement by the client indicates an understanding of the instructions?
1. "I must take the medication exactly as prescribed."
  2. "Once I start the medication, I will no longer be contagious."
  3. "I will not get any colds or infections while taking this medication."
  4. "This medication has minimal side effects and I can return to normal activities."
- 689.** A client has begun therapy with theophylline (Theo-24). A nurse plans to teach the client to limit the intake of which of the following while taking this medication?
1. Coffee, cola, and chocolate
  2. Oysters, lobster, and shrimp
  3. Melons, oranges, and pineapple
  4. Cottage cheese, cream cheese, and dairy creamers
- 690.** The nurse has just administered the first dose of omalizumab (Xolair) to a client. Which statement by the client would alert the nurse that the client may be experiencing a life threatening adverse reaction?
1. "I have a severe headache."
  2. "My feet are quite swollen."
  3. "I am nauseated and may vomit."
  4. "My lips and tongue are swollen."

### Alternate Item Format: Multiple Response

**691.** Rifabutin (Mycobutin) is prescribed for a client with active *Mycobacterium avium* complex (MAC) disease and tuberculosis. For which of the following side effects of the medication should the nurse monitor? **Select all that apply.**

- 1. Signs of hepatitis
- 2. Flu-like syndrome
- 3. Low neutrophil count
- 4. Vitamin B<sub>6</sub> deficiency
- 5. Ocular pain or blurred vision
- 6. Tingling and numbness of the fingers

## ANSWERS

### 676. 3

**Rationale:** Guaifenesin (Mucinex) is an expectorant and should be taken with a full glass of water to decrease the viscosity of secretions. Extra doses should not be taken. The client should contact the physician if the cough lasts longer than 1 week or is accompanied by fever, rash, sore throat, or persistent headache. Fluids are needed to decrease the viscosity of secretions. The medication does not have to be taken with meals.

**Test-Taking Strategy:** Use the process of elimination. Begin to answer this question by eliminating option 1 first recalling that *extra doses* of medication should not be taken. Next eliminate option 2 because of the close-ended word *only*. From the remaining options, knowing that increased fluids helps liquefy secretions for more effective coughing directs you to option 3 as correct. If you had difficulty with this question, review this medication.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Pharmacology

**References:** Edmunds, M. (2010). *Introduction to clinical pharmacology* (6th ed., p. 154). St. Louis: Mosby.

Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 599). St. Louis: Saunders.

### 677. 3

**Rationale:** The nurse administering naloxone for suspected opioid overdose should have resuscitation equipment readily available to support naloxone therapy if it is needed. Other adjuncts that may be needed include oxygen, mechanical ventilator, and vasopressors.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *intravenous opioid overdose*. Recalling the effects of these medications will direct you to option 3. Option 3 is also the umbrella response. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Critical Care

**References:** Gahart, B., & Nazareno, A. (2010). *Intravenous medications* (26th ed., p. 956). St. Louis: Mosby.

Skidmore-Roth, L. (2010). *Mosby's nursing drug reference* (23rd ed., p. 759). St. Louis: Mosby.

### 678. 1

**Rationale:** Diphenhydramine (Benadryl) has several uses, including antihistamine, antitussive, antidyskinetic, and sedative-hypnotic. Instructions for use include taking with food or milk to decrease gastrointestinal upset and using oral rinses or sugarless gum or hard candy to minimize dry mouth. Because the medication causes drowsiness, the client should avoid use of alcohol or central nervous system depressants, operating a car, or engaging in other activities requiring mental awareness during use.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *needs further instructions*. These words indicate a negative event query and ask you to select an option that is incorrect. Knowing that the medication has a sedative effect helps you eliminate options 2 and 4 first. Recalling that the medication causes a dry mouth helps you choose option 1 as the answer to the question, according to the way the question is stated. If you had difficulty with this question, review client education related to this medication.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**References:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 356). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 827). St. Louis: Saunders.

### 679. 4

**Rationale:** Cromolyn sodium (Intal) is an inhaled nonsteroidal antiallergy agent and a mast cell stabilizer. Undesirable side effects associated with inhalation therapy of cromolyn sodium are bronchospasm, cough, nasal congestion, throat irritation, and wheezing. Clients receiving this medication orally may experience pruritus, nausea, diarrhea, and myalgia.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *undesirable effect*. This should assist in directing you to option 4. In addition, use the ABCs—airway, breathing, and circulation—to select the correct option. Option 4 addresses the airway. Review the undesirable effects of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 282). St. Louis: Saunders.

**680. 3**

**Rationale:** Terbutaline (Brethine) is a bronchodilator and is contraindicated in clients with hypersensitivity to sympathomimetics. It should be used with caution in clients with impaired cardiac function, diabetes mellitus, hypertension, hyperthyroidism, or a history of seizures. The medication may increase blood glucose levels.

**Test-Taking Strategy:** Knowledge regarding the contraindications and cautions associated with the use of this medication is needed to answer this question. Remember that terbutaline is used with caution in the client with diabetes mellitus. Review the contraindications and cautions associated with this medication if you are unfamiliar with them.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 1090). St. Louis: Saunders.

**681. 3**

**Rationale:** Zafirlukast (Accolate) is a leukotriene receptor antagonist used in the prophylaxis and long-term treatment of bronchial asthma. Zafirlukast is used with caution in clients with impaired hepatic function. Liver function laboratory tests should be performed to obtain a baseline, and the levels should be monitored during administration of the medication.

**Test-Taking Strategy:** Use the process of elimination, eliminating options 2 and 4 first because a complete blood count would include a neutrophil count. From the remaining options, you would need to know that this medication would affect hepatic function. If you had difficulty with this question, review this medication.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 1199). St. Louis: Saunders.

**682. 2**

**Rationale:** Isoniazid (INH) is an antitubercular medication. A common side effect of isoniazid is peripheral neuritis, manifested by numbness, tingling, and paresthesias in the extremities. This can be minimized with pyridoxine (vitamin B<sub>6</sub>) intake. Options 1, 3, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Options 3 and 4 would not cause the symptoms presented in the question but instead would cause pallor and coolness. From the remaining options, you should know that peripheral neuritis is a side effect of the medication or that these signs and symptoms do not correlate with hypercalcemia. Review the side effects associated with isoniazid if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**References:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 620). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 1049–1050). St. Louis: Saunders.

**683. 2**

**Rationale:** Isoniazid (INH) is hepatotoxic, and therefore the client is taught to report signs and symptoms of hepatitis immediately, which include yellow skin and sclera. For the same reason, alcohol should be avoided during therapy. The client should avoid intake of Swiss cheese, fish such as tuna, and foods containing tyramine because they may cause a reaction characterized by redness and itching of the skin, flushing, sweating, tachycardia, headache, or lightheadedness. The client can avoid developing peripheral neuritis by increasing the intake of pyridoxine (vitamin B<sub>6</sub>) during the course of isoniazid therapy.

**Test-Taking Strategy:** Use the process of elimination. Because alcohol intake is prohibited with the use of many medications, eliminate option 1 first. Because the client receiving this medication typically is given supplements of vitamin B<sub>6</sub>, option 4 is incorrect and is eliminated next. Recalling that the medication is hepatotoxic will direct you to option 2. If you had difficulty with this question, review this medication.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 1050). St. Louis: Saunders.

**684. 3**

**Rationale:** Rifampin should be taken exactly as directed. Doses should not be doubled or skipped. The client should not stop therapy until directed to do so by a physician. The medication should be administered on an empty stomach unless it causes gastrointestinal upset, and then it may be taken with food. Antacids, if prescribed, should be taken at least 1 hour before the medication. Rifampin causes orange-red discoloration of body secretions and will stain soft contact lenses permanently.

**Test-Taking Strategy:** Use the process of elimination. Options 2 and 4 are inaccurate in general and are eliminated first. Eliminate option 1 next because of the close-ended word *always*. If you had difficulty with this question, review the side effects associated with this medication.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 997). St. Louis: Saunders.

**685. 4**

**Rationale:** Ethambutol causes optic neuritis, which decreases visual acuity and the ability to discriminate between the colors red and green. This poses a potential safety hazard when a client is driving a motor vehicle. The client is taught to report this symptom immediately. The client also is taught to take the medication with food if gastrointestinal upset occurs. Impaired hearing results from antitubercular therapy with streptomycin. Orange-red discoloration of secretions occurs with rifampin (Rifadin).

**Test-Taking Strategy:** Use the process of elimination. Option 2 is the least likely symptom to report; instead, it should be managed by taking the medication with food. To select among the other options, you must know that this medication causes optic neuritis, resulting in difficulty with red-green discrimination. If this question was difficult, review antitubercular medications because the incorrect options for this question are typical side effects of other antitubercular medications.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Pharmacology

**References:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 441). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 1051). St. Louis: Saunders.

### 686. 2

**Rationale:** Isoniazid (INH) therapy can cause an elevation of hepatic enzyme levels and hepatitis. Therefore, liver enzyme levels are monitored when therapy is initiated and during the first 3 months of therapy. They may be monitored longer in the client who is older than 50 or abuses alcohol. The laboratory tests in options 1, 3, and 4 are not necessary.

**Test-Taking Strategy:** Use the process of elimination. Recalling that this medication can be toxic to the liver will direct you to the correct option. Review the adverse effects of the various antituberculosis medications if this is an area that is unfamiliar to you.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**References:** Edmunds, M. (2010). *Introduction to clinical pharmacology* (6th ed., p. 174). St. Louis: Mosby.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 1050). St. Louis: Saunders.

### 687. 2

**Rationale:** Salmeterol (Serevent Diskus) is an adrenergic type of bronchodilator and beclomethasone dipropionate is a glucocorticoid. Bronchodilators are always administered before glucocorticoids when both are to be given on the same time schedule. This allows for widening of the air passages by the bronchodilator, which then makes the glucocorticoid more effective.

**Test-Taking Strategy:** To answer this question correctly, you must know two different things. First, you must know that a bronchodilator is always given before a glucocorticoid. This would allow you to eliminate options 3 and 4 because you would not alternate the medications. To select between options 1 and 2, you must know that salmeterol is a bronchodilator, whereas beclomethasone is a glucocorticoid. Review these medications if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 607). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 895). St. Louis: Saunders.

### 688. 1

**Rationale:** Antiviral medications for influenza must be taken exactly as prescribed. These medications do not prevent the spread of influenza and clients are usually contagious for up to 2 days after the initiation of antiviral medications. Secondary bacterial infections may occur despite antiviral treatment. Side effects occur with these medications and may necessitate change in activities, especially when driving or operating machinery if dizziness occurs.

**Test-Taking Strategy:** Use process of elimination and note the strategic words *indicates an understanding*. Using general medication guidelines will direct you to option 1. Review these medications if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Pharmacology

**Reference:** Edmunds, M. (2010). *Introduction to clinical pharmacology* (6th ed., pp. 189–190). St. Louis: Mosby.

### 689. 1

**Rationale:** Theophylline (Theo-24) is a methylxanthine bronchodilator. The nurse teaches the client to limit the intake of xanthine-containing foods while taking this medication. These foods include coffee, cola, and chocolate.

**Test-Taking Strategy:** Use the process of elimination. Recall that theophylline is a xanthine bronchodilator and that intake of excessive amounts of foods naturally high in xanthines should be curtailed. Also recalling that these medications cause cardiac and central nervous system stimulation will direct you to option 1. Review the foods naturally high in xanthines if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**References:** Edmunds, M. (2010). *Introduction to clinical pharmacology* (6th ed., p. 148). St. Louis: Mosby.

Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 1102). St. Louis: Saunders.

### 690. 4

**Rationale:** Omalizumab is an anti-inflammatory used for long-term control of asthma. Anaphylactic reactions can occur with the administration of omalizumab. The nurse administering the medication should monitor for adverse reactions of the medication. Swelling of the lips and tongue are an indication of an adverse reaction. The client statements in options 1, 2, and 3 are not indicative of an adverse reaction.

**Test-Taking Strategy:** Use the process of elimination. Recall that anaphylactic reactions can occur with the administration of omalizumab. Knowing the signs of a reaction will direct you to the correct option. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 895). St. Louis: Saunders.

### ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

**691. 1, 2, 3, 5**

**Rationale:** Rifabutin (Mycobutin) may be prescribed for a client with active *Mycobacterium avium* complex (MAC) disease and tuberculosis. It inhibits mycobacterial DNA-dependent RNA polymerase and suppresses protein synthesis. Side effects include rash, gastrointestinal disturbances, neutropenia (low neutrophil count), red-orange-colored body secretions, uveitis (blurred vision and eye pain), myositis, arthralgia, hepatitis, chest pain with dyspnea, and flu-like

syndrome. Vitamin B<sub>6</sub> deficiency and numbness and tingling in the extremities is associated with the use of isoniazid (INH). Ethambutol (Myambutol) also causes peripheral neuritis.

**Test-Taking Strategy:** Focus on the name of the medication to assist in answering the question and use the process of elimination. Recalling that vitamin B<sub>6</sub> deficiency and numbness and tingling in the extremities is associated with the use of isoniazid will assist in answering. Review the side effects associated with rifabutin if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 1045, 1050). St. Louis: Saunders.

# UNIT XIII

## The Adult Client With a Cardiovascular Disorder

### PYRAMID TERMS

**afterload** The force against which the heart has to pump (peripheral resistance) to eject blood from the left ventricle. Factors and conditions that would impede blood flow increase left ventricular afterload.

**arterial pressure** The pressure of the blood against the arterial walls. Pressure can be measured indirectly by sphygmomanometer or directly by arterial catheter. Readings are expressed as systolic over diastolic. Arterial pressure increases when the cardiac output, peripheral resistance, or blood volume increases.

**automaticity** The ability of cardiac cells to initiate an impulse spontaneously and repetitively without external neurohormonal control. The pacemaker cells have the highest rate of automaticity of all cardiac cells.

**baroreceptors** Specialized nerve endings (also called pressoreceptors) located in the walls of the aortic arch and carotid sinuses. They are affected by changes in the arterial blood pressure (BP). Increases in arterial pressure stimulate baroreceptors and the heart rate and arterial pressure decrease. Decreases in arterial pressure lead to a lessened stimulation of the baroreceptors, vasoconstriction occurs, and the heart rate increases.

**blood pressure (BP)** The force exerted by the blood against the walls of the blood vessels. If the blood pressure falls too low, blood flow to the tissues, heart, brain, and other organs becomes inadequate. If the blood pressure becomes too high, the risk of vessel rupture and damage increases.

**capillary pressure or hydrostatic pressure** The pressure exerted by the blood against the capillary wall. Normal capillary pressure is 25 to 30 mm Hg at the arterial end of the capillaries, and 10 to 15 mm Hg at the venous end.

**cardiac output** The total volume of blood pumped through the heart in 1 minute. The normal cardiac output is 4 to 7

L/min. Cardiac output equals stroke volume multiplied by heart rate. Cardiac output can be calculated via the thermodilution method when the client has a pulmonary artery catheter (Swan-Ganz catheter).

**chemoreceptors** Nerve endings located in the aortic arch and carotid bodies that are stimulated by hypoxemia and that subsequently transmit impulses to the central nervous system.

**conductivity** The ability of the heart muscle fibers to propagate electrical impulses along and across cell membranes.

**contractility** The inherent ability of the myocardium to alter contractile force and velocity. Sympathetic stimulation increases myocardial contractility, so stroke volume increases. Conditions that decrease myocardial contractility reduce stroke volume.

**diastole** The phase of the cardiac cycle in which the heart relaxes between contractions. Diastole represents the period of time when the two ventricles are dilated by the blood flowing into them.

**diastolic pressure** The force of the blood exerted against the artery walls when the heart relaxes or fills.

**excitability** The ability of cardiac muscle cells to depolarize in response to a stimulus. Excitability is influenced by hormones, electrolytes, nutrition, oxygen supply, medication, infections, and nerve characteristics.

**mean arterial pressure (MAP)** An approximation of the average pressure in the systemic circulation throughout the cardiac cycle; used in hemodynamic monitoring. Mean arterial pressure must be at least 60 mm Hg for adequate organ perfusion.

**paradoxical blood pressure** An exaggerated decrease in systolic pressure by more than 10 mm Hg during the inspiratory phase of the respiratory cycle. Normal value is 3 to 10 mm Hg.

**postural (orthostatic) hypotension** A blood pressure decrease of more than 10 to 15 mm Hg of the systolic pressure or a decrease of more than 10 mm Hg of the diastolic pressure and a 10% to 20% increase in heart rate. Postural hypotension occurs when the client's blood pressure is not maintained adequately when moving from a lying to a sitting or standing position.

**preload** The volume of blood stretching the left ventricle at the end of diastole. Preload is determined by the total circulating blood volume and is increased by an increase in venous return to the heart.

**pulmonary capillary wedge pressure (PCWP)** The measurement obtained during momentary balloon inflation of a pulmonary artery catheter; it is reflective of left ventricular end-diastolic pressure. The PCWP normally ranges between 6 and 12 mm Hg. Decreased PCWP indicates hypovolemia, whereas increased PCWP indicates hypervolemia, left ventricular failure, or mitral regurgitation.

**pulse pressure** The difference between the systolic and diastolic pressure. Normal pulse pressure is 30 to 40 mm Hg.

**refractoriness** A property of excitable tissue. Refractoriness prevents uncontrolled rapid cardiac contractions and helps preserve the heart rhythm.

**stretch receptors** Nerve endings located in the vena cava and the right atrium that respond to pressure changes affecting circulatory blood volume. When the blood pressure decreases because of hypovolemia, a sympathetic response occurs, causing an increased heart rate and blood vessel constriction. When the blood pressure increases because of hypervolemia, an opposite effect occurs.

**stroke volume** The amount of blood ejected from the left ventricle with each contraction. The normal stroke volume is 70 to 130 mL/heartbeat. The stroke volume can be affected by preload, afterload, contractility, and the Frank-Starling law.

**systole** The phase of contraction of the heart, especially of the ventricles, during which blood is forced into the aorta and pulmonary artery.

**systolic pressure** The maximum pressure of blood exerted against the artery walls when the heart contracts.

**venous pressure** The force exerted by the blood against the vein walls. Normal venous pressures are highest in the extremities (5 to 14 cm H<sub>2</sub>O in the arm), and lowest closest to the heart (6 to 8 cm H<sub>2</sub>O in the inferior vena cava).

## PYRAMID TO SUCCESS

Pyramid Points focus on assessment data related to cardiovascular risks, health screening and promotion, complications of the various cardiovascular disorders, emergency implementation measures, and client education. Focus on the assessment findings in angina, myocardial infarction, congestive heart failure and pulmonary edema, pericarditis, aneurysms, hypertension,

and arterial and venous disorders. You must be able to identify the most common dysrhythmias and determine the appropriate interventions for these dysrhythmias, including the use of a pacemaker. Focus also on the care of the client following diagnostic treatments and surgical procedures. Note appropriate and therapeutic client positions, particularly with arterial and venous disorders of the extremities. Focus on treatments and medications prescribed for the various cardiovascular disorders and client teaching related to prescribed treatment plans. Be familiar with the components related to cardiac rehabilitation.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Consulting with members of the health care team
- Establishing priorities
- Initiating cardiovascular consultations and referrals
- Maintaining asepsis
- Maintaining standard and other precautions
- Obtaining informed consent related to treatments and procedures
- Upholding client rights

### Health Promotion and Maintenance

- Discussing alterations in lifestyle
- Implementing cardiovascular assessment techniques
- Mobilizing appropriate community resources
- Promoting cardiac rehabilitation
- Providing health screening and health promotion programs
- Preventing cardiovascular disease
- Teaching related to diet therapy, exercise, and medications

### Psychosocial Integrity

- Assisting the client to accept lifestyle changes
- Considering religious, spiritual, and cultural influences on health
- Discussing grief and loss and end-of-life issues
- Discussing situational role changes
- Discussing unexpected body image changes
- Identifying coping mechanisms
- Identifying fear, anxiety, and denial
- Identifying support systems

### Physiological Integrity

- Administering intravenous medications
- Assisting with basic care measures
- Discussing activity limitations and promoting rest and sleep

Monitoring hemodynamics

Monitoring for complications related to cardiovascular disorders

Monitoring for therapeutic effects of medications

Monitoring of cardiac enzyme and troponin levels and other laboratory values related to the cardiovascular system

Providing interventions required in emergencies

Providing nonpharmacological and pharmacological comfort interventions

Responding to medical emergencies

# Cardiovascular Disorders

## I. ANATOMY AND PHYSIOLOGY

### A. Heart and heart wall layers

1. The heart is located in the left side of the mediastinum.
2. The heart consists of three layers.
  - a. The epicardium is the outermost layer of the heart.
  - b. The myocardium is the middle layer and is the actual contracting muscle of the heart.
  - c. The endocardium is the innermost layer and lines the inner chambers and heart valves.

### B. Pericardial sac

1. Encases and protects the heart from trauma and infection
2. Has two layers
  - a. The parietal pericardium is the tough, fibrous outer membrane that attaches anteriorly to the lower half of the sternum, posteriorly to the thoracic vertebrae, and inferiorly to the diaphragm.
  - b. The visceral pericardium is the thin, inner layer that closely adheres to the heart.
3. The pericardial space is between the parietal and visceral layers; it holds 5 to 20 mL of pericardial fluid, lubricates the pericardial surfaces, and cushions the heart.

### C. There are four heart chambers

1. The right atrium receives deoxygenated blood from the body via the superior and inferior vena cava.
2. The right ventricle receives blood from the right atrium and pumps it to the lungs via the pulmonary artery.
3. The left atrium receives oxygenated blood from the lungs via four pulmonary veins.
4. The left ventricle is the largest and most muscular chamber; it receives oxygenated blood from the lungs via the left atrium and pumps blood into the systemic circulation via the aorta.

### D. There are four valves in the heart.

1. There are two atrioventricular valves, the tricuspid and the mitral, which lie between the atria and ventricles.

- a. The tricuspid valve is located on the right side of the heart.
- b. The bicuspid (mitral) valve is located on the left side of the heart.
- c. The atrioventricular valves close at the beginning of ventricular contraction and prevent blood from flowing back into the atria from the ventricles; these valves open when the ventricle relaxes.

### 2. There are two semilunar valves, the pulmonic and the aortic.

- a. The pulmonic semilunar valve lies between the right ventricle and the pulmonary artery.
- b. The aortic semilunar valve lies between the left ventricle and the aorta.
- c. The semilunar valves prevent blood from flowing back into the ventricles during relaxation; they open during ventricular contraction and close when the ventricles begin to relax.

### E. Sinoatrial (SA) node

1. The main pacemaker that initiates each heartbeat
2. It is located at the junction of the superior vena cava and the right atrium.
3. The sinoatrial node generates electrical impulses at 60 to 100 times per minute and is controlled by the sympathetic and parasympathetic nervous systems.

### F. Atrioventricular (AV) node

1. Located in the lower aspect of the atrial septum
2. Receives electrical impulses from the sinoatrial node
3. If the sinoatrial node fails, the atrioventricular node can initiate and sustain a heart rate of 40 to 60 beats/min.

### G. The bundle of His

1. A continuation of the AV node; located at the interventricular septum
2. It branches into the right bundle branch, which extends down the right side of the interventricular septum, and the left bundle branch, which extends into the left ventricle.
3. The right and left bundle branches terminate into Purkinje fibers.

**H. Purkinje fibers**

1. Purkinje fibers are a diffuse network of conducting strands located beneath the ventricular endocardium.
2. These fibers spread the wave of depolarization through the ventricles.
3. Purkinje fibers can act as the pacemaker with a rate between 20 and 40 beats/min when higher pacemakers (such as the sinoatrial nerve) fail.

**I. Coronary arteries (Fig. 60-1)**

1. The right coronary artery supplies the right atrium and ventricle, the inferior portion of the left ventricle, the posterior septal wall, and the sinoatrial and atrioventricular nodes.
2. The left main coronary artery consists of two major branches, the left anterior descending and the circumflex arteries.
3. The left anterior descending artery supplies blood to the anterior wall of the left ventricle, the anterior ventricular septum, and the apex of the left ventricle.
4. The circumflex artery supplies blood to the left atrium and the lateral and posterior surfaces of the left ventricle.

**!** The coronary arteries supply the capillaries of the myocardium with blood. If blockage occurs in these arteries, the client is at risk for myocardial infarction.

**J. Heart sounds**

1. The first heart sound ( $S_1$ ) is heard as the atrioventricular valves close and is heard loudest at the apex of the heart.
2. The second heart sound ( $S_2$ ) is heard when the semilunar valves close and is heard loudest at the base of the heart.

**▲ FIGURE 60-1** Coronary arterial system. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

3. A third heart sound ( $S_3$ ) may be heard if ventricular wall compliance is decreased and structures in the ventricular wall vibrate; this can occur in conditions such as congestive heart failure or valvular regurgitation. However, a third heart sound may be normal in individuals younger than 30 years.
4. A fourth heart sound ( $S_4$ ) may be heard on atrial **systole** if resistance to ventricular filling is present; this is an abnormal finding, and the causes include cardiac hypertrophy, disease, or injury to the ventricular wall.

**K. Heart rate**

1. The faster the heart rate, the less time the heart has for filling, and the **cardiac output** decreases.
2. An increase in heart rate increases oxygen consumption.
3. The normal sinus heart rate is 60 to 100 beats/min.
4. Sinus tachycardia is a rate more than 100 beats/min.
5. Sinus bradycardia is a rate less than 60 beats/min.

**L. Autonomic nervous system**

1. Stimulation of sympathetic nerve fibers releases the neurotransmitter norepinephrine, producing an increased heart rate, increased conduction speed through the atrioventricular node, increased atrial and ventricular **contractility**, and peripheral vasoconstriction. Stimulation occurs when a decrease in pressure is detected.
2. Stimulation of the parasympathetic nerve fibers releases the neurotransmitter acetylcholine, which decreases the heart rate and lessens atrial and ventricular **contractility** and **conductivity**. Stimulation occurs when an increase in pressure is detected.

**M. Blood pressure (BP) control**

1. **Baroreceptors**, also called *pressoreceptors*, are located in the walls of the aortic arch and carotid sinuses.
2. **Baroreceptors** are specialized nerve endings affected by changes in the arterial **BP**.
3. Increases in **arterial pressure** stimulate **baroreceptors**, and the heart rate and **arterial pressure** decrease.
4. Decreases in **arterial pressure** reduce stimulation of the **baroreceptors** and vasoconstriction occurs, as does an increase in heart rate.
5. **Stretch receptors**, located in the vena cava and the right atrium, respond to pressure changes that affect circulatory blood volume.
6. When the **BP** decreases as a result of hypovolemia, a sympathetic response occurs, causing an increased heart rate and blood vessel constriction; when the **BP** increases as a result of hypervolemia, an opposite effect occurs.
7. Antidiuretic hormone (vasopressin) influences **BP** indirectly by regulating vascular volume.
8. Increases in blood volume result in decreased antidiuretic hormone release, increasing

diuresis, decreasing blood volume, and thus decreasing **BP**.

9. Decreases in blood volume result in increased antidiuretic hormone release; this promotes an increase in blood volume and therefore **BP**.
10. Renin, a potent vasoconstrictor, causes the **BP** to increase.
11. Renin converts angiotensinogen to angiotensin I; angiotensin I is then converted to angiotensin II in the lungs.
12. Angiotensin II stimulates the release of aldosterone, which promotes water and sodium retention by the kidneys; this action increases blood volume and **BP**.

#### N. The vascular system

1. Arteries are vessels through which the blood passes away from the heart to various parts of the body; they convey highly oxygenated blood from the left side of heart to the tissues.
2. Arterioles control the blood flow into the capillaries.
3. Capillaries allow the exchange of fluid and nutrients between the blood and the interstitial spaces.
4. Venules receive blood from the capillary bed and move blood into the veins.
5. Veins transport deoxygenated blood from the tissues back to the right heart and then to the lungs for oxygenation.
6. Valves help return blood to the heart against the force of gravity.
7. The lymphatics drain the tissues and return the tissue fluid to the blood.

## II. DIAGNOSTIC TESTS AND PROCEDURES

#### A. Cardiac enzymes

1. CK-MB (creatine kinase, myocardial muscle)
  - a. An elevation in value indicates myocardial damage.
  - b. An elevation occurs within hours and peaks at 18 hours following an acute ischemic attack.
  - c. Normal value is 0% to 5% of total; total CK is 26 to 174 units/L.
2. Lactate dehydrogenase (LDH)
  - a. Elevations in LDH levels occur 24 hours following myocardial infarction and peak in 48 to 72 hours.
  - b. Normally, LDH1 is lower than LDH2; when the serum concentration of LDH1 is higher than LDH2, the pattern is indicated as “flipped,” signifying myocardial necrosis.
  - c. The normal value of LDH in conventional units is 140 to 280 international units/L.
3. Troponin
  - a. Troponin is composed of three proteins—troponin C, cardiac troponin I, and cardiac troponin T.

- b. Troponin I especially has a high affinity for myocardial injury; it rises within 3 hours and persists for up to 7 to 10 days.
- c. Normal values are low, with troponin I being lower than 0.6 ng/mL and troponin T normally ranging from 0 to 0.2 ng/mL; thus, any rise can indicate myocardial cell damage.

#### 4. Myoglobin

- a. Myoglobin is an oxygen-binding protein found in cardiac and skeletal muscle.
- b. The level rises within 2 hours after cell death, with a rapid decline in the level after 7 hours.

#### B. Complete blood count

1. The red blood cell count decreases in rheumatic heart disease and infective endocarditis and increases in conditions characterized by inadequate tissue oxygenation.
2. The white blood cell count increases in infectious and inflammatory diseases of the heart and after myocardial infarction (MI) because large numbers of white blood cells are needed to dispose of the necrotic tissue resulting from the infarction.
3. An elevated hematocrit level can result from vascular volume depletion.
4. Decreases in hemoglobin and hematocrit levels can indicate anemia.

#### C. Blood coagulation factors: An increase in coagulation factors can occur during and after MI, which places the client at greater risk for thrombophlebitis and extension of clots in the coronary arteries.

#### D. Serum lipids

1. The lipid profile measures serum cholesterol, triglyceride, and lipoprotein levels.
2. The lipid profile is used to assess the risk of developing coronary artery disease.
3. The desirable range for serum cholesterol is lower than 200 mg/dL, with low-density lipoprotein cholesterol lower than 130 mg/dL and high-density lipoprotein cholesterol at 30 to 70 mg/dL.
4. Lipoprotein-*a* or *Lp(a)*, a modified form of LDL, increases atherosclerotic plaques and increases clots; value should be less than 30 mg/dL.

#### E. Homocysteine: elevated levels may increase the risk of cardiovascular disease; level should be less than 14 mmol/dL.

#### F. Highly sensitive C-reactive protein (hsCRP): Detects an inflammatory process such as that associated with the development of atherothrombosis; a level less than 1 mg/dL is considered low risk and a level over 3 mg/dL places the client at high risk for heart disease.

#### G. Microalbuminuria: A small amount of protein in the urine has been a marker for endothelial dysfunction in cardiovascular disease.

**H. Electrolytes****1. Potassium**

- a. Hypokalemia causes increased cardiac electrical instability, ventricular dysrhythmias, and increased risk of digoxin toxicity.
- b. In hypokalemia, the electrocardiogram shows flattening and inversion of the T wave, the appearance of a U wave, and ST depression.
- c. Hyperkalemia causes asystole and ventricular dysrhythmias.
- d. In hyperkalemia, the electrocardiogram may show tall peaked T waves, widened QRS complexes, prolonged PR intervals, or flat P waves.

**2. Sodium**

- a. The serum sodium level decreases with the use of diuretics.
- b. The serum sodium level decreases in heart failure, indicating water excess.

**I. Calcium**

1. Hypocalcemia can cause ventricular dysrhythmias, prolonged ST and QT intervals, and cardiac arrest.
2. Hypercalcemia can cause a shortened ST segment and widened T wave, atrioventricular block, tachycardia or bradycardia, digitalis hypersensitivity, and cardiac arrest.

**J. Phosphorus level:** Phosphorus levels should be interpreted with calcium levels because the kidneys retain or excrete one electrolyte in an inverse relationship to the other.

**K. Magnesium**

1. A low magnesium level can cause ventricular tachycardia and fibrillation.
2. Electrocardiographic changes that may be observed with hypomagnesemia include tall T waves and depressed ST segments.
3. A high magnesium level can cause muscle weakness, hypotension, and bradycardia.
4. Electrocardiographic changes that may be observed with hypermagnesemia include a prolonged PR interval and widened QRS complex.

 **Electrolyte and mineral imbalances can cause cardiac electrical instability that can result in life-threatening dysrhythmias.**

**L. Blood urea nitrogen:** The blood urea nitrogen level is elevated in heart disorders that adversely affect renal circulation, such as heart failure and cardiogenic shock.

**M. Blood glucose:** An acute cardiac episode can elevate the blood glucose level.

**N. B-type natriuretic peptide (BNP)**

1. BNP is released in response to atrial and ventricular stretch; it serves as a marker for congestive heart failure (CHF).

2. BNP levels should be lower than 100 pg/mL; the higher the level, the more severe the CHF.

**O. Chest x-ray****1. Description**

- a. Radiography of the chest is done to determine the size, silhouette, and position of the heart.
- b. Specific pathological changes are difficult to determine on x-rays, but anatomical changes can be seen.

**2. Interventions**

- a. Prepare the client for radiography, explaining the purpose and procedure.
- b. Remove jewelry.
- c. Ensure that the client is not pregnant.

**P. Electrocardiography (Box 60-1)**

1. **Description:** This common noninvasive diagnostic test records the electrical activity of the heart and is useful for detecting cardiac dysrhythmias, location and extent of MI, and cardiac hypertrophy and for evaluation of the effectiveness of cardiac medications.

**2. Interventions**

- a. Determine the client's ability to lie still; advise the client to lie still, breathe normally, and refrain from talking during the test.
- b. Reassure the client that an electrical shock will not occur.
- c. Document any cardiac medications the client is taking.

**Q. Holter monitoring****1. Description**

- a. In this noninvasive test, the client wears a Holter monitor and an electrocardiographic tracing is recorded continuously over a period of 24 hours or more while the client performs his or her activities of daily living.
- b. The Holter monitor identifies dysrhythmias if they occur and evaluates the effectiveness of antidysrhythmics or pacemaker therapy.

**2. Interventions**

- a. Instruct the client to resume normal daily activities and to maintain a diary documenting activities and any symptoms that may develop for correlation with the electrocardiographic tracing.
- b. Instruct the client to avoid tub baths or showers because they will interfere with the electrocardiographic recorder device.

**R. Echocardiography****1. Description**

- a. This noninvasive procedure is based on the principles of ultrasound and evaluates structural and functional changes in the heart.
- b. Heart chamber size is measured, ejection fraction is calculated, and flow gradient across the valves is determined.

**Box 60-1 Basics of Electrocardiography**

An electrocardiogram (ECG) reflects the electrical activity of cardiac cells and records electrical activity at a speed of 25 mm/sec.

An electrocardiographic strip consists of horizontal lines representing seconds and vertical lines representing voltage.

Each small square represents 0.04 second.

Each large square represents 0.20 second.

The P wave represents atrial depolarization.

The PR interval represents the time it takes an impulse to travel from the atria through the atrioventricular node, bundle of His, and bundle branches to the Purkinje fibers.

Normal PR interval duration ranges from 0.12 to 0.2 second.

The PR interval is measured from the beginning of the P wave to the end of the PR segment.

The QRS complex represents ventricular depolarization.

Normal QRS complex duration ranges from 0.04 to 0.1 second.

The Q wave appears as the first negative deflection in the QRS complex and reflects initial ventricular septal depolarization.

The R wave is the first positive deflection in the QRS complex.

The S wave appears as the second negative deflection in the QRS complex.

The J point marks the end of the QRS complex and the beginning of the ST segment.

The QRS duration is measured from the end of the PR segment to the J point.

The ST segment represents early ventricular repolarization. The T wave represents ventricular repolarization and ventricular diastole.

The U wave may follow the T wave.

A prominent U wave may indicate an electrolyte abnormality, such as hypokalemia.

The QT interval represents ventricular refractory time or the total time required for ventricular depolarization and repolarization.

The QT interval is measured from the beginning of the QRS complex to the end of the T wave.

The QT interval normally lasts 0.32 to 0.4 second but varies with the client's heart rate, age, and gender.

- c. Transesophageal echocardiography may be performed in which the echocardiogram is done through the esophagus; this is an invasive exam and requires pre- and postprocedure preparation and care similar to endoscopy procedures.
2. Interventions: Determine the client's ability to lie still, and advise the client to lie still, breathe normally, and refrain from talking during the test.
- S.** Exercise electrocardiography testing (stress test)
  1. Description
    - a. This noninvasive test studies the heart during activity and detects and evaluates coronary artery disease.
    - b. Treadmill testing is the most commonly used mode of stress testing.
    - c. Stress testing may be used with myocardial radionuclide testing (perfusion imaging), at which point the procedure becomes invasive because a radionuclide must be injected.
    - d. If the client is unable to tolerate exercise, an intravenous (IV) infusion of dipyridamole (Persantine), dobutamine hydrochloride, or adenosine (Adenocard) is given to dilate the coronary arteries and simulate the effect of exercise.
    - e. An informed consent is required if a radionuclide is injected.
  2. Preprocedure interventions
    - a. Obtain an informed consent if required.
    - b. Provide adequate rest the night before the procedure.
  3. Postprocedure interventions: Instruct the client to avoid taking a hot bath or shower for at least 1 to 2 hours.
- T.** Digital subtraction angiography
  1. Description
    - a. This test combines x-ray techniques and a computerized subtraction technique with fluoroscopy for visualization of the cardiovascular system.
    - b. A contrast medium (dye) is injected.
  2. Preprocedure interventions
    - a. Assess for allergies to seafood, iodine, or radiopaque dyes. If allergic, the client may be premedicated with antihistamines and corticosteroids to prevent a reaction.
    - b. Obtain informed consent.
- c. Instruct the client to eat a light meal 1 to 2 hours before the procedure.
- d. Instruct the client to avoid smoking, alcohol, and caffeine before the procedure.
- e. Instruct the client to ask the physician about taking prescribed medication on the day of the procedure; theophylline products are usually withheld 12 hours before the test and calcium channel blockers and  $\beta$ -blockers are usually held for 24 hours.
- f. Instruct the client to wear nonconstrictive, comfortable clothing and supportive rubber-soled shoes for the exercise stress test.
- g. Instruct the client to notify the physician if any chest pain, dizziness, or shortness of breath occurs during the procedure.

3. Postprocedure interventions
  - a. Monitor vital signs.
  - b. Assess injection site for bleeding or discomfort.

#### U. Myocardial nuclear perfusion imaging (MNPI)

1. Description
  - a. Nuclear cardiology is the use of radionuclide techniques and scanning for cardiovascular assessment.
  - b. The most common tests include technetium pyrophosphate scanning, thallium imaging, and multigated cardiac blood pool imaging; can evaluate cardiac motion and calculate the ejection fraction.
2. Preprocedure interventions
  - a. Obtain informed consent.
  - b. Inform the client that a small amount of radioisotope will be injected and that the radiation exposure and risks are minimal.
3. Postprocedure interventions
  - a. Assess vital signs.
  - b. Assess injection site for bleeding or discomfort.
  - c. Inform the client that fatigue is possible.

#### V. Magnetic resonance imaging (MRI)

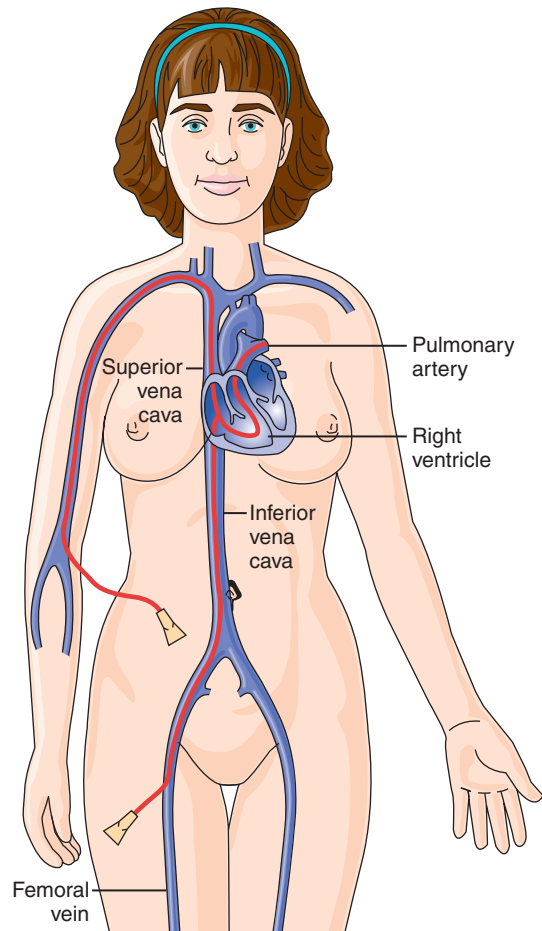

1. Description
  - a. This is a noninvasive diagnostic test that produces an image of the heart or great vessels through interaction of magnetic fields, radio waves, and atomic nuclei.
  - b. It provides information on chamber size and thickness, valve and ventricular function, and blood flow through the great vessels and coronary arteries.
2. Preprocedure interventions
  - a. Evaluate the client for the presence of a pacemaker or other implanted items that present a contraindication to the test.
  - b. Ensure that the client has removed all metallic objects such as a watch, other jewelry, clothing with metal fasteners, and metal hair fasteners.
  - c. Inform the client that she or he may experience claustrophobia while in the scanner.

**W.** Electrophysiologic studies: An invasive procedure in which a programmed electrical stimulation of the heart is induced to cause dysrhythmias and conduction defects; assists in finding an accurate diagnosis and aids in determining treatment.

**X.** Electronic-beam computer tomography scan (EBCT): determines whether calcifications are present in the arteries; coronary artery calcium (CAC) score is provided (a score higher than 400 requires intensive preventive treatment).

#### Y. Cardiac catheterization (Fig. 60-2)

1. Description
  - a. An invasive test involving insertion of a catheter into the heart and surrounding vessels

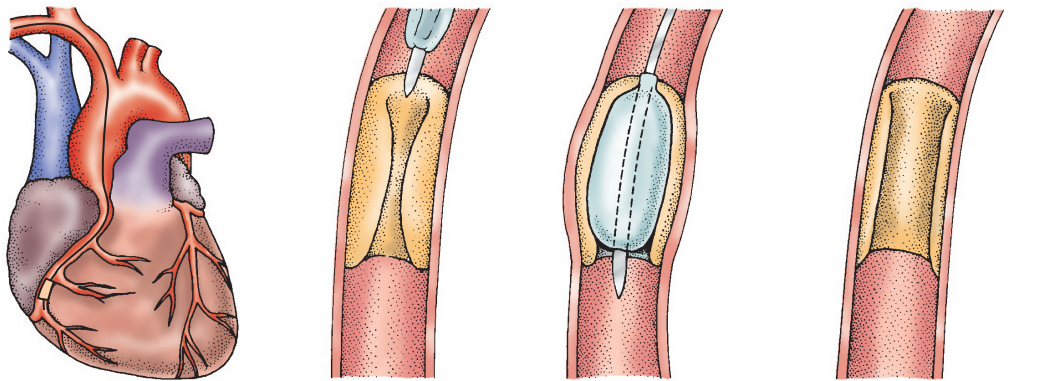

**▲ FIGURE 60-2** Right-sided heart catheterization. The catheter is inserted into the femoral vein and advanced into the inferior vena cava (or, if into an antecubital or basilic vein, through the superior vena cava), right atrium, and right ventricle and into the pulmonary artery. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

b. Obtains information about the structure and performance of the heart chambers and valves and the coronary circulation

#### 2. Preprocedure interventions

- a. Obtain informed consent.
- b. Assess for allergies to seafood, iodine, or radiopaque dyes; if allergic, the client may be premedicated with antihistamines and corticosteroids to prevent a reaction.
- c. Withhold solid food for 6 to 8 hours and liquids for 4 hours as prescribed to prevent vomiting and aspiration during the procedure.
- d. Document the client's height and weight because these data will be needed to determine the amount of dye to be administered.
- e. Document baseline vital signs and note the quality and presence of peripheral pulses for postprocedure comparison.
- f. Inform the client that a local anesthetic will be administered before catheter insertion.

1. The balloon-tipped catheter is positioned in the artery.
2. The uninflated balloon is centered in the obstruction.
3. The balloon is inflated, which flattens plaque against the artery wall.
4. The balloon is removed, and the artery is left unoccluded.

**▲ FIGURE 60-3** Percutaneous transluminal coronary angioplasty. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

- g. Inform the client that he or she may feel fatigued because of the need to lie still and quiet on a hard table for up to 2 hours.
- h. Inform the client that he or she may feel a fluttery feeling as the catheter passes through the heart, a flushed, warm feeling when the dye is injected, a desire to cough, and palpitations caused by heart irritability.
- i. Prepare the insertion site by shaving and cleaning with an antiseptic solution if prescribed.
- j. Administer preprocedure medications such as sedatives if prescribed.
- k. Insert an IV line if prescribed.
- e. Monitor the pressure dressing for bleeding or hematoma formation.
- f. Apply a sandbag or compression device (if prescribed) to the insertion site to provide additional pressure if required.
- g. Monitor for bleeding; if bleeding occurs, apply manual pressure immediately and notify the physician.
- h. Monitor for hematoma; if a hematoma develops, notify the physician.
- i. Keep extremity extended for 4 to 6 hours, as prescribed, keeping the leg straight to prevent arterial occlusion.
- j. Maintain strict bed rest for 6 to 12 hours, as prescribed; however, the client may turn from side to side. Do not elevate the head of the bed more than 15 degrees.
- k. If the antecubital vessel was used, immobilize the arm with an armboard.
- l. Encourage fluid intake, if not contraindicated, to promote renal excretion of the dye and to replace fluid loss caused by the osmotic diuretic effect of the dye.
- m. Monitor for nausea, vomiting, rash, or other signs of hypersensitivity to the dye.

**▲** If a client taking metformin (Glucophage) is scheduled to undergo a procedure requiring the administration of iodine dye, the metformin is withheld 48 hours prior because of the risk of lactic acidosis. The medication is not resumed until directed to do so by the physician (usually 48 hours after the procedure or after renal function studies are done and the results are evaluated).

### 3. Postprocedure interventions

- a. Monitor vital signs and cardiac rhythm for dysrhythmias at least every 30 minutes for 2 hours initially.
- b. Assess for chest pain and, if dysrhythmias or chest pain occurs, notify the physician.
- c. Monitor peripheral pulses and the color, warmth, and sensation of the extremity distal to the insertion site at least every 30 minutes for 2 hours initially.
- d. Notify the physician if the client complains of numbness and tingling, if the extremity becomes cool, pale, or cyanotic, or if loss of the peripheral pulses occurs.

## III. THERAPEUTIC MANAGEMENT

### A. Percutaneous transluminal coronary angioplasty (PTCA)

#### 1. Description (Fig. 60-3)

- a. An invasive, nonsurgical technique in which one or more arteries is (are) dilated with a balloon catheter to open the vessel lumen and improve arterial blood flow
- b. PTCA may be used for clients with an evolving myocardial infarction (MI), alone or in combination with medications to achieve reperfusion.

- c. The client can experience reocclusion after the procedure; thus, the procedure may need to be repeated.
  - d. Complications can include arterial dissection or rupture, embolization of plaque fragments, spasm, and acute MI.
  - e. Firm commitment is needed on the client's part to stop smoking, adhere to diet restrictions, lose weight, alter his or her exercise pattern, and stop any behaviors that lead to progression of artery occlusion.
2. Preprocedure interventions
    - a. Maintain NPO status after midnight.
    - b. Obtain informed consent, allergy assessment to iodine, and hold metformin (as for cardiac catheterization).
    - c. Prepare the groin area with antiseptic soap and shave per institutional procedure and as prescribed.
    - d. Assess baseline vital signs and peripheral pulses.
    - e. Instruct the client that chest pain may occur during balloon inflation and to report it if it does occur.
  3. Postprocedure interventions
    - a. Monitor vital signs closely.
    - b. Assess distal pulses in both extremities.
    - c. Maintain bed rest as prescribed, keeping the limb straight for 6 to 8 hours.
    - d. Administer anticoagulants such as intravenous heparin and antiplatelet agents as prescribed to prevent thrombus formation.
    - e. Intravenous nitroglycerin may be prescribed to prevent coronary artery vasospasm.
    - f. Encourage fluids, if not contraindicated, to enhance renal excretion of dye.
    - g. Instruct the client in the administration of nitrates, calcium channel blockers, antiplatelet agents, and anticoagulants as prescribed.
    - h. Instruct the client to take acetylsalicylic acid (aspirin) daily permanently if prescribed.
    - i. Assist the client with planning lifestyle modifications.
- B. Laser-assisted angioplasty**
1. Description
    - a. A laser probe is advanced through a cannula similar to that used for PTCA.
    - b. Laser-assisted angioplasty is used also for clients with small occlusions in the distal superficial femoral, proximal popliteal, and common iliac arteries, and in coronary arteries.
    - c. Heat from the laser vaporizes the plaque to open the occluded artery.
  2. Preprocedure and postprocedure interventions
    - a. Care is similar to that for PTCA.
    - b. Monitor for complications of coronary dissection, acute occlusion, perforation, embolism, and MI.
- C. Coronary artery stents**
1. Description
    - a. Coronary artery stents are used in conjunction with PTCA to provide a supportive scaffold to eliminate the risk of acute coronary vessel closure and to improve long-term patency of the vessel.
    - b. A balloon catheter bearing the stent is inserted into the coronary artery and positioned at the site of occlusion; balloon inflation deploys the stent.
    - c. When placed in the coronary artery, the stent reopens the blocked artery.
  2. Preprocedure and postprocedure interventions
    - a. Care is similar to that for PTCA.
    - b. Acute thrombosis is a major concern following the procedure; the client is placed on antiplatelet therapy such as clopidogrel (Plavix) and acetylsalicylic acid (aspirin) for several months following the procedure.
    - c. Monitor for complications of the procedure such as stent migration or occlusion, coronary artery dissection, and bleeding resulting from anticoagulation.
- D. Atherectomy**
1. Description
    - a. Atherectomy removes plaque from a coronary artery by the use of a cutting chamber on the inserted catheter or a rotating blade that pulverizes the plaque.
    - b. Atherectomy is also used to improve blood flow to ischemic limbs in individuals with peripheral arterial disease.
  2. Preprocedure and postprocedure interventions
    - a. Care is similar to that for PTCA.
    - b. Monitor for complications of perforation, embolus, and reocclusion.
- E. Transmyocardial revascularization**
1. May be used for clients with widespread atherosclerosis involving vessels that are too small and numerous for replacement or balloon catheterization; performed through a small chest incision
  2. Transmyocardial revascularization uses a high-powered laser that creates 20 to 24 channels through the ventricular muscle of the left ventricle; blood enters these small channels, providing the affected region of the heart with oxygenated blood.
  3. The opening on the surface of the heart heals; however, the main channels remain and perfuse the myocardium.
- F. Arterial revascularization**
1. Description
    - a. Performed to increase arterial blood flow to the affected limb
    - b. Inflow procedures involve bypassing the arterial occlusion above the superficial femoral arteries

- c. Outflow procedures involve bypassing the arterial occlusions at or below the superficial femoral arteries.
  - d. Graft material is sutured above and below the occlusion to facilitate blood flow around the occlusion.
2. Preoperative interventions
    - a. Assess baseline vital signs and peripheral pulses.
    - b. Insert an IV line and urinary catheter as prescribed.
    - c. Maintain a central venous catheter and/or arterial line if inserted.
  3. Postoperative interventions
    - a. Assess vital signs.
    - b. Monitor the **BP** and notify the physician if changes occur.
    - c. Monitor for hypotension, which may indicate hypovolemia.
    - d. Monitor for hypertension, which may place stress on the graft and cause clot formation.
    - e. Maintain bed rest for 24 hours as prescribed.
    - f. Instruct the client to keep the affected extremity straight, limit movement, and avoid bending the knee and hip.
    - g. Monitor for warmth, redness, and edema, which often are expected outcomes because of increased blood flow.
    - h. Monitor for graft occlusion, which often occurs within the first 24 hours.
    - i. Assess peripheral pulses and for adverse changes in color and temperature of the extremity.
    - j. Encourage coughing, deep breathing, and the use of incentive spirometry.
    - k. Maintain NPO status, with progression to clear liquids as prescribed.
- l. Use strict aseptic technique when in contact with the incision.
  - m. Assess the incision for drainage, warmth, or swelling.
  - n. Monitor for excessive bleeding (a small amount of bloody drainage is expected).
  - o. Monitor the area over the graft for hardness, tenderness, and warmth, which may indicate infection; if this occurs, notify the physician immediately.
  - p. Instruct the client about proper foot care and measures to prevent ulcer formation.
  - q. Instruct the client to take medications as prescribed.
  - r. Instruct the client in how to care for incision.
  - s. Assist the client in modifying lifestyle to prevent further plaque formation.

**!** Following arterial revascularization, monitor for a sharp increase in pain because pain is frequently the first indicator of postoperative graft occlusion. If signs of graft occlusion occur, notify the physician immediately.

#### G. Coronary artery bypass grafting (Fig. 60-4)

##### 1. Description

- a. The occluded coronary arteries are bypassed with the client's own venous or arterial blood vessels.
- b. The saphenous vein, internal mammary artery, or other arteries may be used to bypass lesions in the coronary arteries.
- c. Coronary artery bypass grafting is performed when the client does not respond to medical management of coronary artery disease or when vessels are severely occluded.

**▲ FIGURE 60-4** Two methods of coronary artery bypass grafting. The procedure used depends on the nature of the coronary disease, the condition of the vessels available for grafting, and the client's health status. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

2. Preoperative interventions
  - a. Familiarize the client and family with the cardiac surgical critical care unit.
  - b. Inform the client to expect a sternal incision, possible arm or leg incision(s), one or two chest tubes, a Foley catheter, and several IV fluid catheters.
  - c. Inform the client that an endotracheal tube will be in place and that he or she will be unable to speak.
  - d. Advise the client that he or she will be on mechanical ventilation and to breathe with the ventilator and not fight it.
  - e. Instruct the client to inform the nurse of any postoperative pain because pain medication will be available.
  - f. Instruct the client in how to splint the chest incision, cough and deep-breathe, use the incentive spirometer, and perform arm and leg exercises.
  - g. Encourage the client and family to discuss anxieties and fears related to surgery.
  - h. Note that prescribed medications may be discontinued preoperatively (usually, diuretics 2 to 3 days before surgery, digoxin 12 hours before surgery, and aspirin and anticoagulants 1 week before surgery).
  - i. Administer medications as prescribed, which may include potassium chloride, antihypertensives, antidysrhythmics, and antibiotics.
3. Cardiac surgical unit postoperative interventions
  - a. Maintain mechanical ventilation for 6 to 24 hours as prescribed.
  - b. Monitor heart rate and rhythm, pulmonary artery and **arterial pressures**, urinary output, and neurological status.
  - c. Maintain mediastinal and pleural chest tubes to the water seal drainage system with prescribed suction and report drainage exceeding 100 to 150 mL/hr.
  - d. Epicardial pacing wires should be covered by sterile caps or connected to a temporary pacemaker generator; all equipment in use must be properly grounded to prevent microshock.
  - e. Assess fluid and electrolyte balance.
  - f. Restrict fluids, as prescribed, to 1500 to 2000 mL because the client usually has edema.
  - g. Monitor for hypotension, which can cause collapse of a vein graft; determine the cause and provide intervention.
  - h. Monitor for hypertension because increased pressure promotes leakage from the suture line and may cause bleeding.
  - i. Monitor the temperature and initiate rewarming procedures using warm or thermal blankets if the temperature drops below 96.8° F; rewarm the client no faster than 1.8° F/hr to prevent shivering, and discontinue rewarming procedures when the temperature approaches 98.6° F.
  - j. Administer potassium intravenously as prescribed to maintain the potassium level between 4 and 5 mEq/L to prevent dysrhythmias.
  - k. Monitor for signs of cardiac tamponade, which will include sudden cessation of previously heavy mediastinal drainage, jugular vein distention with clear lung sounds, equalization of right atrial pressure and pulmonary artery wedge pressure, and pulsus paradoxus.
  - l. Monitor pain, differentiating sternotomy pain from anginal pain, which would indicate graft failure.
4. Transfer of the client from the cardiac surgical unit 
  - a. Monitor vital signs, level of consciousness, and peripheral perfusion.
  - b. Monitor for dysrhythmias.
  - c. Auscultate lungs and assess respiratory status.
  - d. Encourage the client to splint the incision, cough, deep-breathe, and use the incentive spirometer to raise secretions and prevent atelectasis.
  - e. Monitor temperature and white blood cell count, which, if elevated after 3 to 4 days, indicate infection.
  - f. Provide adequate fluids and hydration as prescribed to liquefy secretions.
  - g. Assess suture line and chest tube insertion sites for redness, purulent discharge, and signs of infection.
  - h. Assess sternal suture line for instability, which may indicate an infection.
  - i. Guide the client to gradually resume activity.
  - j. Assess the client for tachycardia, **postural (orthostatic) hypotension**, and fatigue before, during, and after activity.
  - k. Discontinue activities if the **BP** drops more than 10 to 20 mm Hg or if the pulse increases more than 10 beats/min.
  - l. Monitor episodes of pain closely.
  - m. See Box 60-2 for home care instructions.
- H. Heart transplantation
  1. A donor heart from an individual with a comparable body weight and ABO compatibility is transplanted into a recipient within less than 6 hours of procurement.
  2. The surgeon removes the diseased heart, leaving the posterior portion of the atria to serve as an anchor for the new heart.
  3. Because a remnant of the client's atria remains, two unrelated P waves are noted on the electrocardiogram.

4. The transplanted heart is denervated and unresponsive to vagal stimulation; because the heart is denervated, clients do not experience angina.
5. Symptoms of heart rejection include hypotension, dysrhythmias, weakness, fatigue, and dizziness.
6. Endomyocardial biopsies are performed at regular scheduled intervals and whenever rejection is suspected.
7. The client requires lifetime immunosuppressive therapy.
8. Strict aseptic technique and vigilant hand washing must be maintained when caring for the post-transplantation client because of increased risk for infection from immunosuppression.
9. The heart rate approximates 100 beats/min and responds slowly to exercise or stress with regard to increases in heart rate, **contractility**, and **cardiac output**.

#### IV. CARDIAC DYSRHYTHMIAS

##### A. Normal sinus rhythm (Fig. 60-5)

#### Box 60-2 Home Care Instructions Following Cardiac Surgery

Progressive return to activities at home  
 Limiting of pushing or pulling activities for 6 weeks following discharge  
 Maintenance of incisional care and recording signs of redness, swelling, or drainage  
 Sternotomy incision heals in about 6 to 8 weeks  
 Avoidance of crossing legs; wearing elastic hose as prescribed until edema subsides, and elevating the surgical limb (if used to obtain the graft) when sitting in a chair  
 Use of prescribed medications  
 Dietary measures, including the avoidance of saturated fats and cholesterol and the use of salt  
 Resumption of sexual intercourse on the advice of the physician after exercise tolerance is assessed (if client can walk one block or climb two flights of stairs without symptoms, he or she can resume sexual activity safely)

1. Rhythm originates from the sinoatrial node.
2. Description
  - a. Atrial and ventricular rhythms are regular.
  - b. Atrial and ventricular rates are 60 to 100 beats/min (Fig. 60-6 and Box 60-3).
  - c. PR interval and QRS width are within normal limits.
- B. Sinus bradycardia
  1. Description
    - a. Atrial and ventricular rhythms are regular.
    - b. Atrial and ventricular rates are less than 60 beats/min.
    - c. PR interval and QRS width are within normal limits.
    - d. Treatment may be necessary if the client is symptomatic (signs of decreased **cardiac output**).
    - e. Note that a low heart rate may be normal for some individuals.
  2. Interventions
    - a. Attempt to determine the cause of sinus bradycardia; if a medication is suspected of causing the bradycardia, withhold the medication and notify the physician.
    - b. Administer oxygen as prescribed.
    - c. Administer atropine sulfate as prescribed to increase the heart rate to 60 beats/min.
    - d. Be prepared to apply a noninvasive (transcutaneous) pacemaker initially as prescribed if the atropine sulfate does not increase the heart rate sufficiently.
    - e. Avoid additional doses of atropine sulfate because this will induce tachycardia.
    - f. Monitor for hypotension and administer fluids intravenously as prescribed.
    - g. Depending on the cause of the bradycardia, the client may need a permanent pacemaker.
- C. Sinus tachycardia
  1. Description
    - a. Atrial and ventricular rates are 100 to 180 beats/min.

▲ **FIGURE 60-5** Normal sinus rhythm. Both atrial and ventricular rhythms are essentially regular (a slight variation in rhythm is normal). Atrial and ventricular rates are both 83 beats/min. There is one P wave before each QRS complex, and all the P waves are of a consistent morphology, or shape. The PR interval measures 0.18 second and is constant; the QRS complex measures 0.06 second and is constant. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

**▲ FIGURE 60-6** Each segment between the dark lines (above the monitor strip) represents 3 seconds when the monitor is set at a speed of 25 mm/sec. To estimate the ventricular rate, count the QRS complexes in a 6-second strip and then multiply that number by 10 to estimate the heart rate for 1 minute. In this example, there are 9 QRS complexes in 6 seconds. Therefore the heart rate can be estimated as 90 beats/min. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

### Box 60-3 Determination of Heart Rate Using 6-Second Strip Method

The method can be used to determine heart rate for regular and irregular rhythms.

To determine atrial rate, count the number of P waves in 6 seconds and multiply by 10 to obtain a full minute rate.

To determine ventricular rate, count the number of R waves or QRS complexes in 6 seconds and multiply by 10 to obtain a full minute rate.

For accuracy, timing should begin on the P wave or the QRS complex and end exactly at 30 large blocks later.

**▲ FIGURE 60-7** Atrial dysrhythmias—atrial fibrillation. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

- b. Atrial and ventricular rhythms are regular.
- c. PR interval and QRS width are within normal limits.

#### 2. Interventions

- a. Identify the cause of the tachycardia.
- b. Decrease the heart rate to normal by treating the underlying cause.

### D. Atrial fibrillation (Fig. 60-7)

#### 1. Description

- a. Multiple rapid impulses from many foci depolarize in the atria in a totally disorganized manner at a rate of 350 to 600 times/min.
- b. The atria quiver, which can lead to the formation of thrombi.
- c. No definitive P wave can be observed, only fibrillatory waves before each QRS.

#### 2. Interventions

- a. Administer oxygen.
- b. Administer anticoagulants as prescribed because of the risk of emboli.

- c. Administer cardiac medications as prescribed to control the ventricular rhythm and assist in the maintenance of **cardiac output**.

- d. Prepare the client for cardioversion as prescribed.

- e. Instruct the client in the use of medications as prescribed to control the dysrhythmia.

### E. Premature ventricular contractions (PVCs; Fig. 60-8 and Box 60-4)

#### 1. Description

- a. Early ventricular complexes result from increased irritability of the ventricles.
- b. PVCs frequently occur in repetitive patterns such as bigeminy, trigeminy, and quadrigeminy.
- c. The QRS complexes may be unifocal or multifocal.

#### 2. Interventions

- a. Notify the physician if PVCs occur.
- b. Identify the cause and treat based on the cause.

▲ **FIGURE 60-8** Ventricular dysrhythmias—normal sinus rhythm with multifocal premature ventricular complexes (PVCs; one negative and the other positive). (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

### Box 60-4 Premature Ventricular Contractions

**Bigeminy:** Premature ventricular contraction (PVC) every other heartbeat

**Trigeminy:** PVC every third heartbeat

**Quadrigeminy:** PVC every fourth heartbeat

**Couplet or pair:** Two sequential PVCs

**Unifocal:** Uniform upward or downward deflection, arising from the same ectopic focus

**Multifocal:** Different shapes, with the impulse generation from different sites

**R-on-T phenomenon:** PVC falls on the T wave of the preceding beat; may precipitate ventricular fibrillation

▲ **FIGURE 60-9** Ventricular dysrhythmias—sustained ventricular tachycardia at a rate of 166 beats/min. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

- c. Evaluate oxygen saturation to assess for hypoxemia, which can cause PVCs.
- d. Administer oxygen as prescribed.
- e. Evaluate electrolytes, particularly the potassium level, because hypokalemia can cause PVCs.
- f. Lidocaine (Xylocaine) may be prescribed.

▲ **For the client experiencing PVCs, notify the physician if the client complains of chest pain or if the PVCs increase in frequency, are multifocal, occur on the T wave (R on T), or occur in runs of ventricular tachycardia.**

### F. Ventricular tachycardia (VT; Fig. 60-9)

#### 1. Description

- a. Ventricular tachycardia occurs because of a repetitive firing of an irritable ventricular ectopic focus at a rate of 140 to 250 beats/min or more.
- b. Ventricular tachycardia may present as a paroxysm of three self-limiting beats or more or may be a sustained rhythm.
- c. Ventricular tachycardia can lead to cardiac arrest.

2. Stable client with sustained VT (with pulse and no signs or symptoms of decreased **cardiac output**)

**▲ FIGURE 60-10** Ventricular dysrhythmias—coarse ventricular fibrillation. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

- a. Administer oxygen as prescribed.
- b. Administer antidysrhythmics as prescribed.
3. Unstable client with VT (with pulse and signs and symptoms of decreased **cardiac output**)
  - a. Administer oxygen and antidysrhythmic therapy as prescribed.
  - b. Prepare for synchronized cardioversion if the client is unstable.
  - c. Attempt cough cardiopulmonary resuscitation (CPR) by asking the client to cough hard every 1 to 3 seconds.
4. Pulseless client with ventricular tachycardia: defibrillation and CPR

#### G. Ventricular fibrillation (VF; Fig. 60-10)

1. Description
  - a. Impulses from many irritable foci in the ventricles fire in a totally disorganized manner.
  - b. VF is a chaotic rapid rhythm in which the ventricles quiver and there is no **cardiac output**.
  - c. VF is fatal if not successfully terminated within 3 to 5 minutes.
  - d. Client lacks a pulse, **BP**, respirations, and heart sounds.
2. Interventions
  - a. Defibrillate the client immediately, up to 3 times consecutively at 200, 300, and 360 joules (J).
  - b. Initiate CPR.
  - c. Administer oxygen as prescribed.
  - d. Administer antidysrhythmic therapy as prescribed.

### V. MANAGEMENT OF DYSRHYTHMIAS

#### A. Vagal maneuvers

1. Description: Vagal maneuvers induce vagal stimulation of the cardiac conduction system and are used to terminate supraventricular tachydysrhythmias.
2. Carotid sinus massage
  - a. The physician instructs the client to turn the head away from the side to be massaged.

- b. The physician massages over one carotid artery for a few seconds to determine whether a change in cardiac rhythm occurs.
- c. The client should be on a cardiac monitor; an electrocardiographic rhythm strip before, during, and after the procedure should be documented on the chart.
- d. Have a defibrillator and resuscitative equipment available.
- e. Monitor vital signs, cardiac rhythm, and level of consciousness following the procedure.
3. Valsalva maneuver
  - a. The physician instructs the client to bear down or induces a gag reflex in the client to stimulate a vagal response
  - b. Monitor the heart rate, rhythm, and **BP**.
  - c. Observe the cardiac monitor for a change in rhythm.
  - d. Record an electrocardiographic rhythm strip before, during, and after the procedure.
  - e. Provide an emesis basin if the gag reflex is stimulated, and initiate precautions to prevent aspiration.
  - f. Have a defibrillator and resuscitative equipment available.

#### B. Cardioversion

##### 1. Description

- a. Cardioversion is synchronized countershock to convert an undesirable rhythm to a stable rhythm.
- b. Cardioversion can be an elective procedure performed by the physician for stable tachydysrhythmias resistant to medical therapies or an emergent procedure for hemodynamically unstable ventricular or supraventricular tachydysrhythmias.
- c. A lower amount of energy is used than with defibrillation.
- d. The defibrillator is synchronized to the client's R wave to avoid discharging the shock during the vulnerable period (T wave).

- e. If the defibrillator were not synchronized, it could discharge on the T wave and cause VF.
2. Preprocedure interventions
    - a. Obtain an informed consent if an elective procedure.
    - b. Administer sedation as prescribed.
    - c. If an elective procedure, hold digoxin (Lanoxin) 48 hours preprocedure as prescribed to prevent postcardioversion ventricular irritability.
    - d. If an elective procedure for atrial fibrillation or atrial flutter, the client should receive anticoagulant therapy for 4 to 6 weeks preprocedure.
  3. During the procedure
    - a. Ensure that the skin is clean and dry in the area where the electrode paddles will be placed.
    - b. Stop the oxygen during the procedure to avoid the hazard of fire.
    - c. Be sure that no one is touching the bed or the client when delivering the countershock.
  4. Postprocedure interventions
    - a. Priority assessment includes ability of the client to maintain the airway and breathing.
    - b. Resume oxygen administration as prescribed.
    - c. Assess vital signs.
    - d. Assess level of consciousness.
    - e. Monitor cardiac rhythm.
    - f. Monitor for indications of successful response, such as conversion to sinus rhythm, strong peripheral pulses, an adequate BP, and adequate urine output.
    - g. Assess the skin on the chest for evidence of burns from the edges of the paddles.

### C. Defibrillation

1. Defibrillation is an asynchronous countershock used to terminate pulseless ventricular tachycardia (VT) or VF.
2. Three rapid consecutive shocks are delivered, with the first at an energy of 200 J.
3. If unsuccessful, the shock is repeated at 200 to 300 J.
4. The third and subsequent shocks will be 360 J.

 Before defibrillating a client be sure that the oxygen is shut off to avoid the hazard of fire and be sure that no one is touching the bed or the client.

### D. Use of paddle electrodes

1. Apply conductive pads.
2. One paddle is placed at the third intercostal space to the right of the sternum; the other is placed at the fifth intercostal space on the left midaxillary line.
3. Apply firm pressure of at least 25 lb to each of the paddles.
4. Be sure that no one is touching the bed or the client when delivering the countershock.

### E. Automatic external defibrillator

1. An automatic external defibrillator is used by laypersons and emergency medical technicians for prehospital cardiac arrest.
2. Place the client on a firm dry surface.
3. Stop CPR.
4. Ensure that no one is touching the client to avoid motion artifact during rhythm analysis.
5. Place the electrode patches in the correct position on the client's chest.
6. Press the analyzer button to identify the rhythm, which may take 30 seconds; the machine will advise whether a shock is necessary.
7. Shocks are recommended for pulseless VT or VF only.
8. If shock is recommended, the shock initially is delivered at an energy of 200 J.
9. If unsuccessful, the shock is repeated at 200 to 300 J.
10. The third and subsequent shock will be 360 J.
11. If unsuccessful, CPR is continued for 1 minute and then another series of three shocks is delivered, each at 360 J.

### F. Implantable cardioverter-defibrillator (ICD)

#### 1. Description

- a. An ICD monitors cardiac rhythm and detects and terminates episodes of VT and VF.
- b. The ICD senses VT or VF and delivers 25 to 30 J up to four times, if necessary.
- c. An ICD is used in clients with episodes of spontaneous sustained VT or VF unrelated to an MI or in clients whose medication therapy has been unsuccessful in controlling life-threatening dysrhythmias.
- d. Transvenous electrode leads are placed in the right atrium and ventricle in contact with the endocardium; leads are used for sensing, pacing, and delivery of cardioversion or defibrillation.
- e. The generator is most commonly implanted in the left pectoral region.

#### 2. Client education

- a. Instruct the client in the basic functions of the ICD.
- b. Know the rate cutoff of the ICD and the number of consecutive shocks that it will deliver.
- c. Wear loose-fitting clothing over the ICD generator site.
- d. Avoid contact sports to prevent trauma to the ICD generator and lead wires.
- e. Report any fever, redness, swelling, or drainage from the insertion site.
- f. Report symptoms of fainting, nausea, weakness, blackouts, and rapid pulse rates to the physician.
- g. During shock discharge, the client may feel faint or short of breath.

- h. Instruct the client to sit or lie down if he or she feels a shock and to notify the physician.
- i. Advise the client to maintain a log of the date, time, and activity preceding the shock, the symptoms preceding the shock, and postshock sensations.
- j. Instruct the client and family in how to access emergency medical system.
- k. Encourage the family to learn CPR.
- l. Instruct the client to avoid electromagnetic fields directly over the ICD because they can inactivate the device.
- m. Instruct the client to move away from the magnetic field immediately if beeping tones are heard, and to notify the physician.
- n. Keep an ICD identification card in the wallet and obtain and wear a Medic-Alert bracelet.
- o. Inform all health care providers that an ICD has been inserted; certain diagnostic tests, such as an MRI, and procedures using diathermy or electrocautery interfere with ICD function.
- p. Advise the client of restrictions on activities such as driving and operating dangerous equipment.

## VI. PACEMAKERS

- A. Description: Temporary or permanent device that provides electrical stimulation and maintains the heart rate when the client's intrinsic pacemaker fails to provide a perfusing rhythm
- B. Settings
  1. A synchronous (demand) pacemaker senses the client's rhythm and paces only if the client's intrinsic rate falls below the set pacemaker rate for stimulating depolarization.

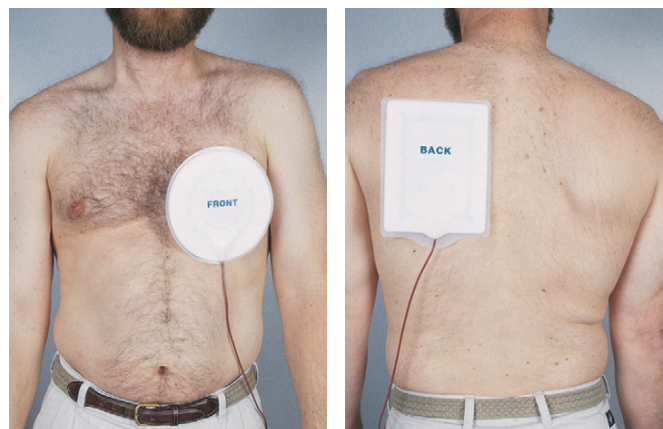

2. An asynchronous (fixed rate) pacemaker paces at a preset rate regardless of the client's intrinsic rhythm and is used when the client is asystolic or profoundly bradycardic.
3. Overdrive pacing suppresses the underlying rhythm in tachydysrhythmias so that the sinus node will regain control of the heart.

### C. Spikes

1. When a pacing stimulus is delivered to the heart, a spike (straight vertical line) is seen on the monitor or electrocardiogram strip.
2. Spikes precede the chamber being paced; a spike preceding a P wave indicates that the atrium is paced and a spike preceding the QRS indicates that the ventricle is being paced.
3. An atrial spike followed by a P wave indicates atrial depolarization and a ventricular spike followed by a QRS complex represents ventricular depolarization; this is referred to as *capture*.
4. If the electrode is in the atrium, the spike is before the P wave; if the electrode is in the ventricle, the spike is before the QRS complex.

### D. Temporary pacemakers

1. Noninvasive transcutaneous pacing
  - a. Noninvasive transcutaneous pacing is used as a temporary emergency measure in the profoundly bradycardic or asystolic client until invasive pacing can be initiated.
  - b. Large electrode pads are placed on the client's chest and back and connected to an external pulse generator.
  - c. Wash the skin with soap and water before applying electrodes.
  - d. It is not necessary to shave the hair or apply alcohol or tinctures to the skin.
  - e. Place the posterior electrode between the spine and left scapula behind the heart, avoiding placement over bone (Fig. 60-11).

▲ **FIGURE 60-11** Equipment and electrode placement for transcutaneous external pacing. (From Ignatavicius, D., & Workman, M. [2006]. *Medical-surgical nursing: Critical thinking for collaborative care* [5th ed.]. St. Louis: Saunders. Courtesy of ZOLL Medical Corporation, Chelmsford, MA.)

- f. Place the anterior electrode between V2 and V5 positions over the heart (see Fig. 60-11).
  - g. Do not place the anterior electrode over female breast tissue; rather, displace breast tissue and place under the breast.
  - h. Do not take the pulse or **BP** on the left side; the results will not be accurate because of the muscle twitching and electrical current.
  - i. Ensure that electrodes are in good contact with the skin.
  - j. Set pacing rate as prescribed; establish stimulation threshold to ensure capture.
  - k. If loss of capture occurs, assess the skin contact of the electrodes and increase the current until capture is regained.
  - l. Evaluate the client for discomfort from cutaneous and muscle stimulation; administer analgesics as needed.
2. Invasive transvenous pacing
    - a. Pacing lead wire is placed through the antecubital, femoral, jugular, or subclavian vein into the right atrium or right ventricle; so that it is in direct contact with the endocardium.
    - b. Monitor cardiac rhythm continuously.
    - c. Monitor vital signs.
    - d. Monitor the pacemaker insertion site.
    - e. Restrict client movement to prevent lead wire displacement.
  3. Invasive epicardial pacing—applied by using a transthoracic approach; the lead wires are threaded loosely on the epicardial surface of the heart after cardiac surgery
  4. Reducing the risk of microshock
    - a. Use only inspected and approved equipment.
    - b. Insulate the exposed portion of wires with plastic or rubber material (fingers of rubber gloves) when wires are not attached to the pulse generator; cover with nonconductive tape.
    - c. Ground all electrical equipment using a three-pronged plug.
    - d. Wear gloves when handling exposed wires.
    - e. Keep dressings dry.
- E. Permanent pacemakers**
1. Pulse generator is internal and surgically implanted in a subcutaneous pocket below the clavicle.
  2. The leads are passed transvenously via the cephalic or subclavian vein to the endocardium on the right side of the heart; postoperatively, limitation of arm movement on the operative side is required to prevent lead wire dislodgement.
  3. Permanent pacemakers may be single-chambered, in which the lead wire is placed in the chamber to be paced, or dual-chambered, with lead wires placed in both the right atrium and ventricle.
  4. Biventricular pacing of the ventricles allows for synchronized depolarization and is used for moderate to severe heart failure to improve **cardiac output**.
  5. A permanent pacemaker is programmed when inserted and can be reprogrammed if necessary by noninvasive transmission from an external programmer to the implanted generator.
  6. Pacemakers may be powered by a lithium battery with an average life span of 10 years, nuclear-powered with a life span of 20 years or longer, or designed to be recharged externally.
  7. Pacemaker function can be checked in the physician's office or clinic by a pacemaker interrogator or programmer or from home using a special telephone transmitter device.
  8. The client may be provided with a device placed over the pacemaker battery generator with an attachment to the telephone; the heart rate then can be transmitted to the clinic.
  9. Provide client teaching (Box 60-5).

### Box 60-5 Pacemakers: Client Education

Instruct the client about the pacemaker, including the programmed rate.

Instruct the client in the signs of battery failure and when to notify the physician.

Instruct the client to report any fever, redness, swelling, or drainage from the insertion site.

Report signs of dizziness, weakness or fatigue, swelling of the ankles or legs, chest pain, or shortness of breath.

Keep a pacemaker identification card in the wallet and obtain and wear a Medic-Alert bracelet.

Instruct the client in how to take the pulse, to take the pulse daily, and to maintain a diary of pulse rates.

Wear loose-fitting clothing over the pulse generator site.

Avoid contact sports.

Inform all health care providers that a pacemaker has been inserted.

Instruct the client to inform airport security that he or she has a pacemaker because the pacemaker may set off the security detector.

Instruct the client that most electrical appliances can be used without any interference with the functioning of the pacemaker; however, advise the client not to operate electrical appliances directly over the pacemaker site.

Avoid transmitter towers and antitheft devices in stores.

Instruct the client that if any unusual feelings occur when near any electrical devices to move 5 to 10 feet away and check the pulse.

Instruct the client about the methods of monitoring the function of the device.

Emphasize the importance of follow-up with the physician.

Use cell phones on the side opposite the pacemaker.

## VII. CORONARY ARTERY DISEASE

### A. Description

1. Coronary artery disease is a narrowing or obstruction of one or more coronary arteries as a result of atherosclerosis, which is an accumulation of lipid-containing plaque in the arteries (Fig. 60-12).
2. The disease causes decreased perfusion of myocardial tissue and inadequate myocardial oxygen supply leading to hypertension, angina, dysrhythmias, MI, heart failure, and death.
3. Collateral circulation, more than one artery supplying a muscle with blood, is normally present in the coronary arteries, especially in older persons.
4. The development of collateral circulation takes time and develops when chronic ischemia occurs to meet the metabolic demands; therefore an occlusion of a coronary artery in a

younger individual is more likely to be lethal than in an older individual.

5. Symptoms occur when the coronary artery is occluded to the point that inadequate blood supply to the muscle occurs, causing ischemia.
6. Coronary artery narrowing is significant if the lumen diameter of the left main artery is reduced at least 50%, or if any major branch is reduced at least 75%.
7. The goal of treatment is to alter the atherosclerotic progression.

### B. Assessment

1. Possibly normal findings during asymptomatic periods
2. Chest pain
3. Palpitations
4. Dyspnea
5. Syncope
6. Cough or hemoptysis
7. Excessive fatigue

▲ **FIGURE 60-12** Cross section of an atherosclerotic coronary artery. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

**C. Diagnostic studies**

1. Electrocardiography
  - a. When blood flow is reduced and ischemia occurs, ST-segment depression, T-wave inversion, or both is noted; the ST segment returns to normal when the blood flow returns.
  - b. With infarction, cell injury results in ST segment elevation, followed by T wave inversion and an abnormal Q wave.
2. Cardiac catheterization
  - a. Cardiac catheterization provides the most definitive source for diagnosis.
  - b. Cardiac catheterization shows the presence of atherosclerotic lesions.
3. Blood lipid levels
  - a. Blood lipid levels may be elevated.
  - b. Cholesterol-lowering medications may be prescribed to reduce the development of atherosclerotic plaques.

**D. Interventions**

1. Instruct the client regarding the purpose of diagnostic medical and surgical procedures and preprocedure and postprocedure expectations.
2. Assist the client to identify risk factors that can be modified.
3. Assist the client to set goals to promote lifestyle changes to reduce the impact of risk factors.
4. Assist the client to identify barriers to compliance with the therapeutic plan and to identify methods to overcome barriers.
5. Instruct the client regarding a low-calorie, low-sodium, low-cholesterol, and low-fat diet, with an increase in dietary fiber.
6. Stress to the client that dietary changes are not temporary and must be maintained for life; instruct the client regarding prescribed medications.
7. Provide community resources to the client regarding exercise, smoking cessation, and stress reduction as appropriate.

**E. Surgical procedures**

1. PTCA to compress the plaque against the walls of the artery and dilate the vessel
2. Laser angioplasty to vaporize the plaque
3. Atherectomy to remove the plaque from the artery
4. Vascular stent to prevent the artery from closing and to prevent restenosis
5. Coronary artery bypass grafting to improve blood flow to the myocardial tissue at risk for ischemia or infarction because of the occluded artery

**F. Medications**

1. Nitrates to dilate the coronary arteries and decrease **preload** and **afterload**
2. Calcium channel blockers to dilate coronary arteries and reduce vasospasm

3. Cholesterol-lowering medications to reduce the development of atherosclerotic plaques
4.  $\beta$ -Blockers to reduce the **BP** in individuals who are hypertensive

**VIII. ANGINA****A. Description**

1. Angina is chest pain resulting from myocardial ischemia caused by inadequate myocardial blood and oxygen supply.
2. Angina is caused by an imbalance between oxygen supply and demand.
3. Causes include obstruction of coronary blood flow resulting from atherosclerosis, coronary artery spasm, or conditions increasing myocardial oxygen consumption.

 The goal of treatment for angina is to provide relief of the acute attack, correct the imbalance between myocardial oxygen supply and demand, and prevent the progression of the disease and further attacks to reduce the risk of MI.

**B. Patterns of angina**

1. Stable angina
  - a. Also called *exertional angina*
  - b. Occurs with activities that involve exertion or emotional stress; relieved with rest or nitroglycerin
  - c. Usually has a stable pattern of onset, duration, severity, and relieving factors
2. Unstable angina
  - a. Also called *preinfarction angina*
  - b. Occurs with an unpredictable degree of exertion or emotion and increases in occurrence, duration, and severity over time
  - c. Pain may not be relieved with nitroglycerin.
3. Variant angina
  - a. Also called *Prinzmetal's* or *vasospastic angina*
  - b. Results from coronary artery spasm
  - c. May occur at rest
  - d. Attacks may be associated with ST segment elevation noted on the electrocardiogram (ECG).
4. Intractable angina is a chronic, incapacitating angina unresponsive to interventions.
5. Preinfarction angina
  - a. Associated with acute coronary insufficiency
  - b. Lasts longer than 15 minutes
  - c. Symptom of worsening cardiac ischemia
  - d. Occurs after an MI, when residual ischemia may cause episodes of angina

**C. Assessment**

1. Pain
  - a. Pain can develop slowly or quickly.
  - b. Pain usually is described as mild or moderate.

- c. Substernal, crushing, squeezing pain may occur.
  - d. Pain may radiate to the shoulders, arms, jaw, neck, or back.
  - e. Pain intensity is unaffected by inspiration and expiration.
  - f. Pain usually lasts less than 5 minutes; however, pain can last up to 15 to 20 minutes.
  - g. Pain is relieved by nitroglycerin or rest.
2. Dyspnea
  3. Pallor
  4. Sweating
  5. Palpitations and tachycardia
  6. Dizziness and faintness
  7. Hypertension
  8. Digestive disturbances

#### D. Diagnostic studies

1. Electrocardiography: Readings are normal during rest, with ST depression, or T-wave inversion during an episode of pain.
2. Stress testing: Chest pain or changes in the electrocardiogram or vital signs during testing may indicate ischemia.
3. Cardiac enzyme and troponin levels: Findings are normal in angina.
4. Cardiac catheterization: Catheterization provides a definitive diagnosis by providing information about the patency of the coronary arteries.

#### E. Interventions

1. Immediate management
  - a. Assess pain; institute pain relief measures.
  - b. Administer oxygen at 3 L/min by nasal cannula as prescribed.
  - c. Assess vital signs and provide continuous cardiac monitoring and nitroglycerin as prescribed to dilate the coronary arteries, reduce the oxygen requirements of the myocardium, and relieve the chest pain.
  - d. Ensure bed rest is maintained, place the client in semi-Fowler's position, and stay with the client.
  - e. Obtain a 12-lead ECG.
  - f. Establish an IV access route.
2. Following the acute episode
  - a. Instruct the client regarding the purpose of diagnostic medical and surgical procedures and the preprocedure and postprocedure expectations.
  - b. Assist the client to identify angina-precipitating events.
  - c. Instruct the client to stop activity and rest if chest pain occurs and to take nitroglycerin as prescribed.
  - d. Instruct the client to seek medical attention if pain persists.
  - e. Instruct the client regarding prescribed medications.

- f. Provide diet instructions to the client, stressing that dietary changes are not temporary and must be maintained for life.
- g. Assist the client to identify risk factors that can be modified.
- h. Assist the client to set goals that will promote changes in lifestyle to reduce the impact of risk factors.
- i. Assist the client to identify barriers to compliance with the therapeutic plan and to identify methods to overcome barriers.
- j. Provide community resources to the client regarding exercise, smoking cessation, and stress reduction.

**F. Surgical procedures:** See Section VII, Coronary Artery Disease.

#### **G. Medications**

1. See Section VII, Coronary Artery Disease.
2. Antiplatelet therapy may be prescribed; it inhibits platelet aggregation and reduces the risk of developing an acute MI.

## **IX. MYOCARDIAL INFARCTION**

### **A. Description**

1. Myocardial infarction occurs when myocardial tissue is abruptly and severely deprived of oxygen.
2. Ischemia can lead to necrosis of myocardial tissue if blood flow is not restored.
3. Infarction does not occur instantly but evolves over several hours.
4. Obvious physical changes do not occur in the heart until 6 hours after the infarction, when the infarcted area appears blue and swollen.
5. After 48 hours, the infarct turns gray, with yellow streaks developing as neutrophils invade the tissue.
6. By 8 to 10 days after infarction, granulation tissue forms.
7. Over 2 to 3 months, the necrotic area develops into a scar; scar tissue permanently changes the size and shape of the entire left ventricle.
8. Not all clients experience the classic symptoms of an MI.
9. Women may experience atypical discomfort, shortness of breath, or fatigue and often present with NSTEMI (non-ST elevation myocardial infarction) or T-wave inversion.
10. An older client may experience shortness of breath, pulmonary edema, dizziness, altered mental status, or a dysrhythmia.

### **B. Location of MI (see Fig. 60-1)**

1. Obstruction of the left anterior descending artery results in anterior wall or septal MI, or both.

2. Obstruction of the circumflex artery results in posterior wall MI or lateral wall MI.
3. Obstruction of the right coronary artery results in inferior wall MI.

### C. Risk factors

1. Atherosclerosis
2. Coronary artery disease
3. Elevated cholesterol levels
4. Smoking
5. Hypertension
6. Obesity
7. Physical inactivity
8. Impaired glucose tolerance
9. Stress

### D. Diagnostic studies

1. Troponin level
  - a. Level rises within 3 hours.
  - b. Level remains elevated for up to 7 to 10 days.
2. Total creatine kinase level
  - a. Level rises within 6 hours after the onset of chest pain.
  - b. Level peaks within 18 hours after damage and death of cardiac tissue.
3. CK-MB isoenzyme
  - a. Peak elevation occurs 18 hours after the onset of chest pain.
  - b. Level returns to normal 48 to 72 hours later.
4. Myoglobin: Level rises within 2 hours after cell death, with a rapid decline in the level after 7 hours.
5. LDH level
  - a. Level rises 24 hours after MI.
  - b. Level peaks between 48 and 72 hours and falls to normal in 7 to 14 days.
  - c. Serum level of LDH1 isoenzyme rises higher than serum level of LDH2.
6. White blood cell count: An elevated white blood cell count of 10,000 to 20,000 /mm<sup>3</sup> appears on the second day following the MI and lasts up to 1 week.
7. Electrocardiogram
  - a. Electrocardiogram shows either ST elevation MI (STEMI), T wave inversion, or non-ST elevation MI (NSTEMI); an abnormal Q wave may also present.
  - b. Hours to days after the MI, ST and T wave changes will return to normal but the Q wave changes usually remain permanently.
8. Diagnostic tests following the acute stage
  - a. Exercise tolerance test or stress test may be prescribed to assess for electrocardiographic changes and ischemia and to evaluate for medical therapy or identify clients who may need invasive therapy.

## Box 60-6 Complications of Myocardial Infarction

### Dysrhythmias

Heart failure

Pulmonary edema

Cardiogenic shock

Thrombophlebitis

Pericarditis

Mitral valve insufficiency

Postinfarction angina

Ventricular rupture

Dressler's syndrome (a combination of pericarditis, pericardial effusion, and pleural effusion, which can occur several weeks to months following a myocardial infarction)

- b. Thallium scans may be prescribed to assess for ischemia or necrotic muscle tissue.
- c. Multigated cardiac blood pool imaging scans may be used to evaluate left ventricular function.
- d. Cardiac catheterization is performed to determine the extent and location of obstructions of the coronary arteries.

### E. Assessment

1. Pain
  - a. Client may experience crushing substernal pain.
  - b. Pain may radiate to the jaw, back, and left arm.
  - c. Pain may occur without cause, primarily early in the morning.
  - d. Pain is unrelieved by rest or nitroglycerin and is relieved only by opioids.
  - e. Pain lasts 30 minutes or longer.
2. Nausea and vomiting
3. Diaphoresis
4. Dyspnea
5. Dysrhythmias
6. Feelings of fear and anxiety
7. Pallor, cyanosis, coolness of extremities

### F. Complications of MI (Box 60-6)

### G. Interventions, acute stage

Pain relief increases oxygen supply to the myocardium; administer morphine as a priority in managing pain in the client having an MI.

1. Obtain a description of the chest discomfort.
2. Administer oxygen by nasal cannula as prescribed and institute pain relief measures (morphine, nitroglycerin as prescribed).
3. Assess vital signs and cardiovascular status and maintain cardiac monitoring.

4. Ensure bedrest and place the client in a semi-Fowler's position to enhance comfort and tissue oxygenation; stay with the client.
5. Establish an IV access route.
6. Obtain a 12-lead ECG.
7. Administer antidysrhythmics as prescribed.
8. Administer thrombolytic therapy, which may be prescribed within the first 6 hours of the coronary event.
9. Monitor for signs of bleeding if the client is receiving thrombolytic therapy.
10. Monitor laboratory values as prescribed.
11. Administer  $\beta$ -blockers as prescribed to slow the heart rate and increase myocardial perfusion while reducing the force of myocardial contraction.
12. Monitor for complications related to the MI.
13. Monitor for cardiac dysrhythmias because tachycardia and PVCs frequently occur in the first few hours after MI.
14. Assess distal peripheral pulses and skin temperature because poor **cardiac output** may be identified by cool diaphoretic skin and diminished or absent pulses.
15. Monitor intake and output.
16. Assess respiratory rate and breath sounds for signs of heart failure, as indicated by the presence of crackles or wheezes or dependent edema.
17. Monitor the **BP** closely after the administration of medications; if the **BP** is lower than 100 mm Hg systolic or 25 mm Hg lower than the previous reading, lower the head of the bed and notify the physician.
18. Provide reassurance to the client and family.

- H.** Interventions following the acute episode
1. Maintain bed rest for the first 24 to 36 hours as prescribed.
  2. Allow the client to stand to void or use a bedside commode if prescribed.
  3. Provide range-of-motion exercises to prevent thrombus formation and maintain muscle strength.
  4. Progress to dangling legs at the side of the bed or out of bed to the chair for 30 minutes three times a day as prescribed.
  5. Progress to ambulation in the client's room and to the bathroom and then in the hallway three times a day.
  6. Monitor for complications.
  7. Encourage the client to verbalize feelings regarding the MI.
- I.** Cardiac rehabilitation: Process of actively assisting the client with cardiac disease to achieve and maintain a vital and productive life within the limitations of the heart disease.

## X. HEART FAILURE

- A.** Description
1. Heart failure is the inability of the heart to maintain adequate **cardiac output** to meet the metabolic needs of the body because of impaired pumping ability.
  2. Diminished **cardiac output** results in inadequate peripheral tissue perfusion.
  3. Congestion of the lungs and periphery may occur; the client can develop acute pulmonary edema.
- B.** Classification
1. Acute heart failure occurs suddenly.
  2. Chronic heart failure develops over time; however, a client with chronic heart failure can develop an acute episode.
- C.** Types of heart failure
1. Right ventricular failure, left ventricular failure
    - a. Because the two ventricles of the heart represent two separate pumping systems, it is possible for one to fail alone for a short period.
    - b. Most heart failure begins with left ventricular failure and progresses to failure of both ventricles.
    - c. Acute pulmonary edema, a medical emergency, results from left ventricular failure.
    - d. If pulmonary edema is not treated, death will occur from suffocation because the client literally drowns in his or her own fluids.
  2. Forward failure, backward failure
    - a. In forward failure, an inadequate output of the affected ventricle causes decreased perfusion to vital organs.
    - b. In backward failure, blood backs up behind the affected ventricle, causing increased pressure in the atrium behind the affected ventricle.
  3. Low output, high output
    - a. In low-output failure, not enough **cardiac output** is available to meet the demands of the body.
    - b. High-output failure occurs when a condition causes the heart to work harder to meet the demands of the body.
  4. Systolic failure, diastolic failure
    - a. Systolic failure leads to problems with contraction and ejection of blood.
    - b. Diastolic failure leads to problems with the heart relaxing and filling with blood.
- D.** Compensatory mechanisms
1. Compensatory mechanisms act to restore **cardiac output** to near-normal levels.
  2. Initially, these mechanisms increase **cardiac output**; however, they eventually have a damaging effect on pump action.

**TABLE 60-1** Clinical Manifestations of Right-Sided and Left-Sided Heart Failure

| Right-Sided Heart Failure   | Left-Sided Heart Failure                            |
|---|---|
| Dependent edema (legs and sacrum)   | Signs of pulmonary congestion                       |
| Jugular venous distention   | Dyspnea   |
| Abdominal distention  | Tachypnea   |
| Hepatomegaly  | Crackles in the lungs                               |
| Splenomegaly  | Dry, hacking cough                                  |
| Anorexia and nausea   | Paroxysmal nocturnal dyspnea                        |
| Weight gain   | Increased blood pressure (from fluid volume excess) |
| Nocturnal diuresis  | or decreased BP (from pump failure)                 |
| Swelling of the fingers and hands   |   |
| Increased BP (from fluid volume excess) or decreased BP (from pump failure) |   |

BP, Blood pressure.

3. Compensatory mechanisms contribute to an increase in myocardial oxygen consumption; when this occurs, myocardial reserve is exhausted and clinical manifestations of heart failure develop.
4. Compensatory mechanisms include increased heart rate, improved **stroke volume**, arterial vasoconstriction, sodium and water retention, and myocardial hypertrophy.

#### E. Assessment (Table 60-1)

1. Right- and left-sided heart failure

 Signs of left ventricular failure are evident in the pulmonary system. Signs of right ventricular failure are evident in the systemic circulation.

2. Acute pulmonary edema
  - a. Severe dyspnea and orthopnea
  - b. Pallor
  - c. Tachycardia
  - d. Expectoration of large amounts of blood-tinged, frothy sputum
  - e. Wheezing and crackles on auscultation
  - f. Bubbling respirations
  - g. Acute anxiety, apprehension, restlessness
  - h. Profuse sweating
  - i. Cold, clammy skin
  - j. Cyanosis
  - k. Nasal flaring
  - l. Use of accessory breathing muscles
  - m. Tachypnea
  - n. Hypocapnia, evidenced by muscle cramps, weakness, dizziness, and paresthesias

#### F. Immediate management of acute episode (see Priority Nursing Actions)

### PRIORITY NURSING ACTIONS!

#### Actions to Take If a Client Develops Pulmonary Edema

1. Place the client in a high Fowler's position.
2. Administer oxygen.
3. Assess the client quickly, including assessing lung sounds.
4. Ensure an intravenous access device is in place.
5. Prepare for the administration of a diuretic and morphine sulfate.
6. Insert a Foley catheter as prescribed.
7. Prepare for intubation and ventilator support, if required.
8. Document the event, actions taken, and the client's response.

Pulmonary edema is a life-threatening event that can result from severe heart failure. In pulmonary edema, the left ventricle fails to eject sufficient blood, and pressure increases in the lungs because of the accumulated blood. The client is immediately placed in a high Fowler's position, with the legs in a dependent position, to reduce pulmonary congestion and relieve edema. Oxygen is always prescribed, usually in high concentrations by mask or cannula to improve gas exchange and pulmonary function; the goal is to keep the oxygen saturation above 90%. The client is then assessed quickly, including checking the lung sounds. Next it is important to ensure that an IV access device is in place for the administration of a diuretic and morphine sulfate. Furosemide, a rapid-acting diuretic, will eliminate accumulated fluid. Morphine sulfate reduces venous return (preload), decreases anxiety, and also reduces the work of breathing. A Foley catheter is inserted to measure output accurately. The nurse then prepares for intubation and ventilator support, if required. The nurse stays with the client and provides reassurance. Vital signs are monitored and a cardiac monitor is used to monitor the heart rate and for dysrhythmias. The lung sounds are monitored for crackles, decreased breath sounds, and for a response to treatment. A weight measurement will also determine a response to treatment. Other interventions may include the administration of digoxin to increase ventricular contractility and improve cardiac output, bronchodilators for severe bronchospasm or bronchoconstriction, medications to facilitate myocardial contractility and enhance stroke volume, and vasodilators to reduce afterload, increase the capacity of the systemic venous bed, and decrease venous return to the heart. The nurse finally documents the event, actions taken, and the client's response.

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 775). St. Louis: Saunders.

#### G. Following the acute episode

1. Encourage the client to verbalize feelings about the lifestyle changes required as a result of the heart failure.

2. Assist the client to identify precipitating risk factors of heart failure and methods of eliminating these risk factors.
3. Instruct the client in the prescribed medication regimen, which may include digoxin, a diuretic, angiotensin-converting enzyme (ACE) inhibitors, low-dose  $\beta$ -blockers, and vasodilators.
4. Advise the client to notify the physician if side effects occur from the medications.
5. Advise the client to avoid over-the-counter medications.
6. Instruct the client to contact the physician if he or she is unable to take medications because of illness.
7. Instruct the client to avoid large amounts of caffeine, found in coffee, tea, cocoa, chocolate, and some carbonated beverages.
8. Instruct the client about the prescribed low-sodium, low-fat, and low-cholesterol diet.
9. Provide the client with a list of potassium-rich foods because diuretics can cause hypokalemia (except for potassium-sparing diuretics).
10. Instruct the client regarding fluid restriction, if prescribed, advising the client to spread the fluid out during the day and to suck on hard candy to reduce thirst.
11. Instruct the client to balance periods of activity and rest.
12. Advise the client to avoid isometric activities, which increase pressure in the heart.
13. Instruct the client to monitor daily weight.
14. Instruct the client to report signs of fluid retention such as edema or weight gain.

## XI. CARDIOGENIC SHOCK

### A. Description

1. Cardiogenic shock is failure of the heart to pump adequately, thereby reducing **cardiac output** and compromising tissue perfusion.
2. Necrosis of more than 40% of the left ventricle occurs, usually as a result of occlusion of major coronary vessels.
3. The goal of treatment is to maintain tissue oxygenation and perfusion and improve the pumping ability of the heart.

### B. Assessment

1. Hypotension: **BP** lower than 90 mm Hg systolic or 30 mm Hg lower than the client's baseline
2. Urine output lower than 30 mL/hr
3. Cold, clammy skin
4. Poor peripheral pulses
5. Tachycardia
6. Pulmonary congestion
7. Tachypnea
8. Disorientation, restlessness, and confusion
9. Continuing chest discomfort

### C. Interventions

1. Administer morphine sulfate intravenously as prescribed to decrease pulmonary congestion and relieve pain.
2. Administer oxygen as prescribed.
3. Prepare for intubation and mechanical ventilation.
4. Administer diuretics and nitrates as prescribed while monitoring the **BP** constantly.
5. Administer vasopressors and positive inotropics as prescribed to maintain organ perfusion.
6. Prepare the client for insertion of an intra-aortic balloon pump, if prescribed, to improve coronary artery perfusion and improve **cardiac output**.
7. Prepare the client for immediate reperfusion procedures such as PTCA or coronary artery bypass graft.
8. Monitor arterial blood gas levels and prepare to treat imbalances.
9. Monitor urinary output.
10. Assist with the insertion of a pulmonary artery (Swan-Ganz) catheter to assess degree of heart failure; readings obtained from the catheter correlating to cardiogenic shock include an increased **pulmonary capillary wedge pressure (PCWP)** and a decreased **cardiac output** (Fig. 60-13).
11. Monitor distal pulses and maintain the transducer at the level of the right atrium if the client has a Swan-Ganz catheter.

### D. Hemodynamic monitoring (see Fig. 60-13)

1. Central **venous pressure** (CVP)
  - a. The CVP is the pressure within the superior vena cava; it reflects the pressure under which blood is returned to the superior vena cava and right atrium.
  - b. The CVP is measured with a central venous line in the superior vena cava.
  - c. Normal CVP pressure is about 3 to 8 mm Hg.
  - d. An elevated CVP indicates an increase in blood volume as a result of sodium and water retention, excessive IV fluids, alterations in fluid balance, or renal failure.
  - e. A decreased CVP indicates a decrease in circulating blood volume and may be a result of fluid imbalances, hemorrhage, or severe vasodilation, with pooling of blood in the extremities that limits venous return.
2. Measuring CVP
  - a. The right atrium is located at the midaxillary line at the fourth intercostal space; the zero point on the transducer needs to be at the level of the right atrium.
  - b. The client needs to be supine, with the head of the bed at 45 degrees.
  - c. The client needs to be relaxed; note that activity that increases intrathoracic pressure,

▲ **FIGURE 60-13** Cardiac pressure waveforms can be visualized on the monitor. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

- such as coughing or straining, will cause false increases in the readings.
  - d. If the client is on a ventilator, the reading should be taken at the point of end-expiration.
  - e. To maintain patency of the line, a constant small amount of fluid is delivered under pressure.
3. Pulmonary artery pressures
    - a. A pulmonary artery catheter is used to measure right atrial and indirect left atrial pressures or pulmonary artery wedge pressure (PAWP), which is also known as pulmonary artery occlusive pressure (PAOP).
    - b. Pulmonary artery wedge pressure (PAWP) normally ranges between 4 and 12 mm Hg; elevations may indicate left ventricular failure, hypervolemia, mitral regurgitation, or intracardiac shunt whereas decreases may indicate hypovolemia or **afterload** reduction.
    - c. Normal right atrial (RA) pressure ranges from 1 to 8 mm Hg; increases occur with right ventricular failure, whereas decreases may indicate hypovolemia.
    - d. Normal pulmonary artery pressure (PAP) ranges from 15 to 26 mm Hg systolic/5 to 15 mm Hg diastolic.
  4. **Mean arterial pressure (MAP)**
    - a. An approximation of the average pressure in the systemic circulation throughout the cardiac cycle; used in hemodynamic monitoring.
    - b. **MAP** must be at least 60 mm Hg for adequate organ perfusion.

5. **Pulmonary capillary wedge pressure (PCWP)**
  - a. The measurement obtained during momentary balloon inflation of a pulmonary artery catheter; it is reflective of left ventricular end-diastolic pressure.
  - b. The **PCWP** normally ranges between 6 and 12 mm Hg; decreased **PCWP** indicates hypovolemia, whereas increased **PCWP** indicates hypervolemia, left ventricular failure, or mitral regurgitation.

## XII. INFLAMMATORY DISEASES OF THE HEART

### A. Pericarditis

1. Description
  - a. Pericarditis is an acute or chronic inflammation of the pericardium.
  - b. Chronic pericarditis, a chronic inflammatory thickening of the pericardium, constricts the heart, causing compression.
  - c. The pericardial sac becomes inflamed.
  - d. Pericarditis can result in loss of pericardial elasticity or an accumulation of fluid within the sac.
  - e. Heart failure or cardiac tamponade may result.
2. Assessment
  - a. Precordial pain in the anterior chest that radiates to the left side of the neck, shoulder, or back
  - b. Pain is grating and is aggravated by breathing (particularly inspiration), coughing, and swallowing
  - c. Pain is worse when in the supine position and may be relieved by leaning forward.

- d. Pericardial friction rub (scratchy, high-pitched sound) is heard on auscultation and is produced by the rubbing of the inflamed pericardial layers.
- e. Fever and chills
- f. Fatigue and malaise
- g. Elevated white blood cell count
- h. Electrocardiographic changes with acute pericarditis; ST segment elevation with the onset of inflammation; atrial fibrillation is common.
- i. Signs of right ventricular failure in clients with chronic constrictive pericarditis

### 3. Interventions

- a. Assess the nature of the pain.
- b. Position the client in a high Fowler's position, or upright and leaning forward.
- c. Administer analgesics, nonsteroidal anti-inflammatory drugs, or corticosteroids for pain as prescribed.
- d. Auscultate for a pericardial friction rub.
- e. Check results of blood culture to identify causative organism.
- f. Administer antibiotics for bacterial infection as prescribed.
- g. Administer diuretics and digoxin as prescribed to the client with chronic constrictive pericarditis; surgical incision of the pericardium (pericardiectomy) may be necessary.
- h. Monitor for signs of cardiac tamponade, including pulsus paradoxus, jugular vein distention with clear lung sounds, muffled heart sounds, narrowed **pulse pressure**, tachycardia, and decreased **cardiac output**.
- i. Notify the physician if signs of cardiac tamponade occur.

## B. Myocarditis

1. Description: Acute or chronic inflammation of the myocardium as a result of pericarditis, systemic infection, or allergic response
2. Assessment
  - a. Fever
  - b. Pericardial friction rub
  - c. Gallop rhythm
  - d. Murmur that sounds like fluid passing an obstruction
  - e. Pulsus alternans
  - f. Signs of heart failure
  - g. Fatigue
  - h. Dyspnea
  - i. Tachycardia
  - j. Chest pain
3. Interventions
  - a. Assist the client to a position of comfort, such as sitting up and leaning forward.
  - b. Administer analgesics, salicylates, and nonsteroidal anti-inflammatory drugs as prescribed to reduce fever and pain.

- c. Administer oxygen as prescribed.
- d. Provide adequate rest periods.
- e. Limit activities to avoid overexertion and decrease the workload of the heart.
- f. Administer digoxin as prescribed, and monitor for signs of digoxin toxicity.
- g. Administer antidysrhythmics as prescribed.
- h. Administer antibiotics as prescribed to treat the causative organism.
- i. Monitor for complications, which can include thrombus, heart failure, and cardiomyopathy.

## C. Endocarditis

### 1. Description

- a. Endocarditis is an inflammation of the inner lining of the heart and valves.
- b. Occurs primarily in clients who are IV drug abusers, have had valve replacements, or have mitral valve prolapse or other structural defects
- c. Ports of entry for the infecting organism include the oral cavity (especially if the client has had a dental procedure in the previous 3 to 6 months), cutaneous invasion, infections, invasive procedures, or surgery.

### 2. Assessment

- a. Fever
- b. Anorexia
- c. Weight loss
- d. Fatigue
- e. Cardiac murmurs
- f. Heart failure
- g. Embolic complications from vegetation fragments traveling through the circulation
- h. Petechiae
- i. Splinter hemorrhages in the nail beds
- j. Osler's nodes (reddish tender lesions) on the pads of the fingers, hands, and toes
- k. Janeway lesions (nontender hemorrhagic lesions) on the fingers, toes, nose, or earlobes
- l. Splenomegaly
- m. Clubbing of the fingers

### 3. Interventions

- a. Provide adequate rest balanced with activity to prevent thrombus formation.
- b. Maintain antiembolism stockings.
- c. Monitor cardiovascular status.
- d. Monitor for signs of heart failure.
- e. Monitor for signs of emboli.
- f. Monitor for splenic emboli, as evidenced by sudden abdominal pain radiating to the left shoulder and the presence of rebound abdominal tenderness on palpation.
- g. Monitor for renal emboli, as evidenced by flank pain radiating to the groin, hematuria, and pyuria.
- h. Monitor for confusion, aphasia, or dysphasia, which may indicate central nervous system emboli.

- i. Monitor for pulmonary emboli as evidenced by pleuritic chest pain, dyspnea, and cough.
- j. Assess skin, mucous membranes, and conjunctiva for petechiae.
- k. Assess nail beds for splinter hemorrhages.
- l. Assess for Osler's nodes on the pads of the fingers, hands, and toes.
- m. Assess for Janeway lesions on the fingers, toes, nose, or earlobes.
- n. Assess for clubbing of the fingers.
- o. Evaluate blood culture results.
- p. Administer antibiotics intravenously as prescribed.
- q. Plan and arrange for discharge, providing resources required for the continued administration of IV antibiotics.

#### 4. Client education (Box 60-7)

### XIII. CARDIAC TAMPONADE

#### A. Description

1. A pericardial effusion occurs when the space between the parietal and visceral layers of the pericardium fills with fluid.
2. Pericardial effusion places the client at risk for cardiac tamponade, an accumulation of fluid in the pericardial cavity.
3. Tamponade restricts ventricular filling, and cardiac output drops.

 **Acute cardiac tamponade can occur when small volumes (20 to 50 mL) of fluid accumulate rapidly in the pericardium.**

#### Box 60-7 Home Care Instructions for the Client With Infective Endocarditis

Teach the client to maintain aseptic technique during setup and administration of intravenous antibiotics. Instruct the client to administer intravenous antibiotics at scheduled times to maintain the blood level. Instruct the client to monitor intravenous catheter sites for signs of infection and report this immediately to the physician. Instruct the client to record the temperature daily for up to 6 weeks and report fever. Encourage oral hygiene at least twice a day with a soft toothbrush and rinse well with water after brushing. Client should avoid use of oral irrigation devices and flossing to avoid bacteremia. Teach the client to cleanse any skin lacerations thoroughly and apply an antibiotic ointment as prescribed. Client should inform all health care providers of history of endocarditis and request prophylactic antibiotics prior to every invasive procedure, including dentistry. Teach the client to observe for signs and symptoms of embolic phenomena and heart failure.

#### B. Assessment

1. Pulsus paradoxus
2. Increased CVP
3. Jugular venous distention with clear lungs
4. Distant, muffled heart sounds
5. Decreased **cardiac output**

#### C. Interventions

1. The client needs to be placed in a critical care unit for hemodynamic monitoring.
2. Administer fluids intravenously as prescribed to manage decreased **cardiac output**.
3. Prepare the client for chest x-ray or echocardiography.
4. Prepare the client for pericardiocentesis to withdraw pericardial fluid if prescribed.
5. Monitor for recurrence of tamponade following pericardiocentesis.
6. If the client experiences recurrent tamponade or recurrent effusions or develops adhesions from chronic pericarditis, a portion (pericardial window) or all of the pericardium (pericardiectomy) may be removed to allow adequate ventricular filling and contraction.

### XIV. VALVULAR HEART DISEASE

#### A. Description

1. Valvular heart disease occurs when the heart valves cannot fully open (stenosis) or close completely (insufficiency or regurgitation).
2. Valvular heart disease prevents efficient blood flow through the heart.

#### B. Types

1. Mitral stenosis: Valvular tissue thickens and narrows the valve opening, preventing blood from flowing from the left atrium to the left ventricle.
2. Mitral insufficiency, regurgitation: Valve is incompetent, preventing complete valve closure during **systole**.
3. Mitral valve prolapse: Valve leaflets protrude into the left atrium during **systole**.
4. Aortic stenosis: Valvular tissue thickens and narrows the valve opening, preventing blood from flowing from the left ventricle into the aorta.
5. Aortic insufficiency: Valve is incompetent, preventing complete valve closure during **diastole**.

#### C. Repair procedures

1. Balloon valvuloplasty
  - a. Balloon valvuloplasty is an invasive nonsurgical procedure.
  - b. A balloon catheter is passed from the femoral vein through the atrial septum to the mitral valve or through the femoral artery to the aortic valve.
  - c. The balloon is inflated to enlarge the orifice.
  - d. Institute precautions for arterial puncture if appropriate.
  - e. Monitor for bleeding from the catheter insertion site.

- f. Monitor for signs of systemic emboli.
  - g. Monitor for signs of a regurgitant valve by monitoring cardiac rhythm, heart sounds, and **cardiac output**.
2. Mitral annuloplasty: Tightening and suturing the malfunctioning valve annulus to eliminate or greatly reduce regurgitation
  3. Commissurotomy, valvotomy
    - a. The procedure is accomplished with cardiopulmonary bypass during open heart surgery.
    - b. The valve is visualized, thrombi are removed from the atria, fused leaflets are incised, and calcium is debrided from the leaflets, thus widening the orifice.
- D. Valve replacement procedures**
1. Mechanical prosthetic valves: These prosthetic valves are durable.

 **Thromboembolism is a problem following the valve replacement with a mechanical prosthetic valve, and lifetime anticoagulant therapy is required.**

2. Bioprosthetic valves
  - a. Biological grafts are xenografts (valves from other species)—porcine valves (pig), bovine valves (cow), or homografts (human cadavers).
  - b. The risk of clot formation is small; therefore long-term anticoagulation may not be indicated.
3. Preoperative interventions: Consult with the physician regarding discontinuing anticoagulants 72 hours before surgery.
4. Postoperative interventions
  - a. Monitor closely for signs of bleeding.
  - b. Monitor **cardiac output** and for signs of heart failure.
  - c. Administer digoxin as prescribed to maintain **cardiac output** and prevent atrial fibrillation.
  - d. Provide client teaching (Box 60-8).

**E. Mitral stenosis**

1. Assessment
  - a. Asymptomatic initially
  - b. Symptoms occur when the orifice is reduced by 50%.
  - c. Dyspnea
  - d. Orthopnea
  - e. Paroxysmal nocturnal dyspnea
  - f. Dry cough
  - g. Rumbling apical diastolic murmur
  - h. Right ventricular failure
  - i. Hepatomegaly
  - j. Neck vein distention
  - k. Pitting peripheral edema
  - l. Hemoptysis and pulmonary edema as pulmonary hypertension and congestion progress
  - m. Development of atrial fibrillation, indicating that the client may decompensate (notify physician immediately)

**2. Interventions**

- a. Administer prescribed treatment for heart failure.
- b. Administer oxygen as prescribed.
- c. Provide a low-sodium diet.
- d. Administer diuretics and digoxin as prescribed.
- e. Administer antibiotics as prescribed if infective endocarditis is present.
- f. Administer antidysrhythmics and anticoagulants for atrial fibrillation as prescribed.
- g. Prepare the client for commissurotomy or valve replacement as indicated.

**F. Mitral valve prolapse**

**1. Assessment**

- a. Fatigue
- b. Atypical chest pain
- c. Palpitations
- d. Dizziness and syncope
- e. Tachycardia
- f. Systolic click

**2. Interventions**

- a. Administer  $\beta$ -blockers for chest pain and antidysrhythmics as prescribed.
- b. Administer prophylactic antibiotics as prescribed prior to invasive procedures.

**G. Mitral insufficiency**

**1. Assessment**

- a. Dyspnea
- b. Orthopnea

**Box 60-8 Client Instructions Following Valve Replacement**

Adequate rest is important, and fatigue is usual. Anticoagulant therapy is necessary if a mechanical prosthetic valve has been inserted. Instruct the client concerning hazards related to anticoagulant therapy and to notify the physician if bleeding or excessive bruising occurs. Instruct the client concerning the importance of good oral hygiene to reduce the risk of infective endocarditis. Brush teeth twice daily with a soft toothbrush, followed by oral rinses. Avoid irrigation devices, electric toothbrushes, and flossing because these activities can cause the gums to bleed, allowing bacteria to enter the mucous membranes and bloodstream. Monitor incision and report any drainage or redness. Avoid any dental procedures for 6 months. Heavy lifting (more than 10 lb) is to be avoided, and exercise caution when in an automobile to prevent injury to the sternal incision. If a prosthetic valve was inserted, a soft, audible, clicking sound may be heard. Instruct the client concerning the importance of prophylactic antibiotics before any invasive procedure and the importance of informing all health care professionals of the valvular disease history. Obtain and wear a Medic-Alert bracelet.

- c. Fatigue
  - d. Dizziness
  - e. Palpitations
  - f. Signs of right ventricular failure
  - g. Atrial fibrillation
  - h. Neck vein distention
  - i. Pitting peripheral edema
  - j. High-pitched systolic murmur
2. Interventions: Refer to interventions for mitral stenosis.
- H. Aortic stenosis**
1. Assessment
    - a. Dyspnea on exertion
    - b. Angina
    - c. Syncope on exertion
    - d. Fatigue
    - e. Orthopnea
    - f. Paroxysmal nocturnal dyspnea
    - g. Harsh systolic crescendo-decrescendo murmur
  2. Interventions
    - a. Refer to interventions for mitral stenosis.
    - b. Prepare the client for valve replacement as indicated.
- I. Aortic insufficiency**
1. Assessment
    - a. Dyspnea
    - b. Orthopnea
    - c. Paroxysmal nocturnal dyspnea
    - d. Fatigue
    - e. Angina
    - f. Tachycardia
    - g. Blowing decrescendo diastolic murmur
  2. Interventions
    - a. Refer to interventions for mitral stenosis.
    - b. Prepare the client for valve replacement as indicated.
- J. Tricuspid stenosis**
1. Assessment
    - a. Easily fatigued
    - b. Effort intolerance
    - c. Complaints of fluttering sensations in the neck (obstructed venous flow)
    - d. Cyanosis
    - e. Signs of right ventricular failure
    - f. Symptoms of decreased **cardiac output**
    - g. Ascites
    - h. Hepatomegaly
    - i. Peripheral edema
    - j. Rumbling diastolic murmur
    - k. Jugular vein distention with clear lung fields
  2. Interventions
    - a. Refer to interventions for mitral stenosis.
    - b. Prepare the client for valve replacement as indicated.
- K. Tricuspid insufficiency**
1. Assessment
    - a. Asymptomatic in mild situations
    - b. Signs of right ventricular failure
    - c. Ascites
    - d. Hepatomegaly
    - e. Pleural effusion
    - f. Peripheral edema
    - g. Systolic murmur heard at the left sternal border, fourth intercostal space
  2. Interventions
    - a. Refer to interventions for mitral stenosis.
    - b. Prepare the client for valve replacement as indicated.
- L. Pulmonary stenosis**
1. Assessment
    - a. Asymptomatic in a mild condition
    - b. Dyspnea
    - c. Fatigue
    - d. Syncope
    - e. Signs of right ventricular failure
    - f. Ascites
    - g. Hepatomegaly
    - h. Peripheral edema
    - i. Systolic thrill heard at left sternal border
  2. Interventions
    - a. Refer to interventions for mitral stenosis.
    - b. Prepare the client for pulmonary valve commissurotomy as indicated.
- M. Pulmonary insufficiency**
1. Assessment
    - a. Asymptomatic in mild condition
    - b. Dyspnea
    - c. Fatigue
    - d. Syncope
    - e. Signs of right ventricular failure
    - f. Ascites
    - g. Hepatomegaly
    - h. Peripheral edema
    - i. Systolic thrill heard at the left sternal border
  2. Interventions
    - a. Refer to interventions for mitral stenosis.
    - b. Prepare the client for valve replacement as indicated.

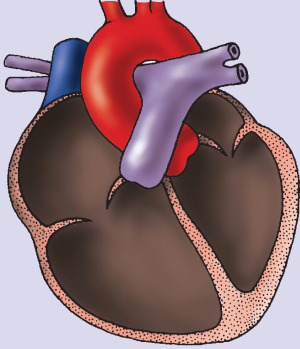

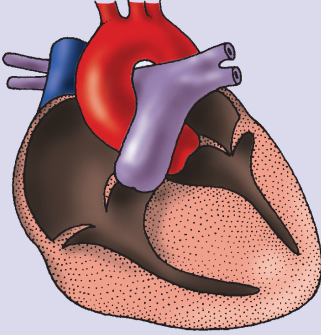

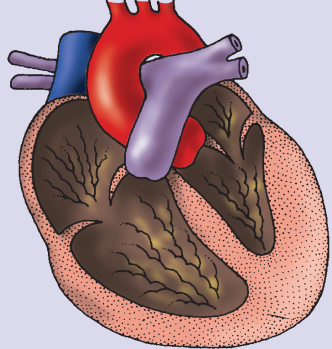

## XV. CARDIOMYOPATHY

- A. Description**
1. Cardiomyopathy is a subacute or chronic disorder of the heart muscle.
  2. Treatment is palliative, not curative, and the client needs to deal with numerous lifestyle changes and a shortened life span.
- B. Types, signs and symptoms, and treatment (Table 60-2)** 

## XVI. VASCULAR DISORDERS

- A. Venous thrombosis**
1. Description
    - a. Thrombus can be associated with an inflammatory process.

**TABLE 60-2** Pathophysiology, Signs and Symptoms, and Treatment of Cardiomyopathies

| Dilated Cardiomyopathy   | Hypertrophic Cardiomyopathy   |  | Restrictive Cardiomyopathy  |
|--|---|--|---|
|  | Nonobstructed   | Obstructed   |   |
| <b>Pathophysiology</b>   |   |  |   |
| Fibrosis of myocardium and endocardium<br>Dilated chambers<br>Mural wall thrombi prevalent   | Hypertrophy of the walls<br>Hypertrophied septum<br>Relatively small chamber size   | Same as for nonobstructed except for obstruction of left ventricular outflow tract associated with the hypertrophied septum and mitral valve incompetence              | Mimics constrictive pericarditis<br>Fibrosed walls cannot expand or contract<br>Chambers narrowed; emboli common  |
|   |    |   |   |
| <b>Signs and Symptoms</b>  |   |  |   |
| Fatigue and weakness<br>Heart failure (left side)<br>Dysrhythmias or heart block<br>Systemic or pulmonary emboli<br>S <sub>3</sub> and S <sub>4</sub> gallops<br>Moderate to severe cardiomegaly | Dyspnea<br>Angina<br>Fatigue, syncope, palpitations<br>Mild cardiomegaly<br>S <sub>4</sub> gallop<br>Ventricular dysrhythmias<br>Sudden death common<br>Heart failure   | Same as for nonobstructed except with mitral regurgitation murmur<br>Atrial fibrillation   | Dyspnea and fatigue<br>Heart failure (right sided)<br>Mild to moderate cardiomegaly<br>S <sub>3</sub> and S <sub>4</sub> gallops<br>Heart block<br>Emboli |

| Symptomatic treatment of heart failure<br>Vasodilators<br>Control of dysrhythmias<br>Surgery: Heart transplant   | For both:<br>Symptomatic treatment<br>β-Blockers<br>Conversion of atrial fibrillation<br>Surgery: ventriculomyotomy or muscle resection with mitral valve replacement<br>Digoxin, nitrates, and other vasodilators contraindicated with the obstructed form | Supportive treatment of symptoms<br>Treatment of hypertension<br>Conversion from dysrhythmias<br>Exercise restrictions<br>Emergency treatment of acute pulmonary edema |   |

From Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed.). St. Louis: Saunders.

- b. When a thrombus develops, inflammation occurs, thickening the vein wall and leading to embolization.
2. Types
  - a. Thrombophlebitis: Thrombus associated with inflammation
  - b. Phlebothrombus: Thrombus without inflammation
  - c. Phlebitis: Vein inflammation associated with invasive procedures, such as IV lines
  - d. Deep vein thrombophlebitis: More serious than a superficial thrombophlebitis because of the risk for pulmonary embolism
3. Risks factors for thrombus formation
  - a. Venous stasis from varicose veins, heart failure, immobility
  - b. Hypercoaguability disorders
  - c. Injury to the venous wall from IV injections; administration of vessel irritants (chemotherapy, hypertonic solutions)

- d. Following surgery, particularly orthopedic and abdominal surgery
- e. Pregnancy
- f. Ulcerative colitis
- g. Use of oral contraceptives
- h. Certain malignancies
- i. Fractures or other injuries of the pelvis or lower extremities

## B. Phlebitis

1. Assessment
  - a. Red, warm area radiating up the vein and extremity
  - b. Pain and soreness
  - c. Swelling
2. Interventions
  - a. Apply warm moist soaks as prescribed to dilate the vein and promote circulation (assess temperature of soak before applying).
  - b. Assess for signs of complications such as tissue necrosis, infection, or pulmonary embolus.

## C. Deep vein thrombophlebitis

1. Assessment
  - a. Calf or groin tenderness or pain with or without swelling
  - b. Positive Homans' sign may be noted; however, false-positive results are common.
  - c. Warm skin that is tender to touch
2. Interventions
  - a. Provide bed rest as prescribed.
  - b. Elevate the affected extremity above the level of the heart as prescribed.
  - c. Avoid using the knee gatch or a pillow under the knees.
  - d. Do not massage the extremity.
  - e. Provide thigh-high or knee-high antiembolism stockings as prescribed to reduce venous stasis and assist in the venous return of blood to the heart.
  - f. Administer intermittent or continuous warm, moist compresses as prescribed.
  - g. Palpate the site gently, monitoring for warmth and edema.
  - h. Measure and record the circumferences of the thighs and calves.
  - i. Monitor for shortness of breath and chest pain, which can indicate pulmonary emboli.
  - j. Administer thrombolytic therapy (tissue plasminogen activator) if prescribed, which must be initiated within 5 days after the onset of symptoms.
  - k. Administer heparin therapy as prescribed to prevent enlargement of the existing clot and prevent the formation of new clots.
  - l. Monitor activated partial thromboplastin time during heparin therapy.
  - m. Administer warfarin (Coumadin) as prescribed following heparin therapy when the

### Box 60-9 Instructions for the Client With Deep Vein Thrombophlebitis

Instruct the client concerning the hazards of anticoagulation therapy.

Recognize the signs and symptoms of bleeding.

Avoid prolonged sitting or standing, constrictive clothing, or crossing legs when seated.

Elevate the legs for 10 to 20 minutes every few hours each day.

Plan a progressive walking program.

Inspect the legs for edema, and measure the circumference of the legs.

Wear antiembolism stockings as prescribed.

Avoid smoking.

Avoid any medications unless prescribed by the physician.

Instruct the client concerning the importance of follow-up physician visits and laboratory studies.

Obtain and wear a Medic-Alert bracelet.

symptoms of deep vein thrombophlebitis have resolved.

- n. Monitor prothrombin time and international normalized ratio during warfarin (Coumadin) therapy.
- o. Monitor for the hazards and side effects associated with anticoagulant therapy.
- p. Administer analgesics as prescribed to reduce pain.
- q. Administer diuretics as prescribed to reduce lower extremity edema.
- r. Provide client teaching (Box 60-9).

## D. Venous insufficiency

### 1. Description

- a. Venous insufficiency results from prolonged venous hypertension, which stretches the veins and damages the valves.
- b. The resultant edema and venous stasis cause venous stasis ulcers, swelling, and cellulitis.
- c. Treatment focuses on decreasing edema and promoting venous return from the affected extremity.
- d. Treatment for venous stasis ulcers focuses on healing the ulcer and preventing stasis and ulcer recurrence.

### 2. Assessment

- a. Stasis dermatitis or brown discoloration along the ankles, extending up to the calf
- b. Edema
- c. Ulcer formation: Edges are uneven, ulcer bed is pink, and granulation is present.

### 3. Interventions

 For venous insufficiency, leg elevation is usually prescribed to assist with the return of blood to the heart.

- a. Instruct the client to wear elastic or compression stockings during the day and evening as prescribed (instruct the client to put on elastic stockings on awakening, before getting out of bed).
  - b. Advise the client to put on a clean pair of elastic stockings each day; it will probably be necessary to wear the stockings for the remainder of life.
  - c. Instruct the client to avoid prolonged sitting or standing, constrictive clothing, or crossing legs when seated.
  - d. Instruct the client to elevate the legs for 10 to 20 minutes every few hours each day.
  - e. Instruct the client to elevate the legs above the level of the heart when in bed.
  - f. Instruct the client in the use of an intermittent sequential pneumatic compression system, if prescribed; instruct the client to apply the compression system twice daily for 1 hour in the morning and evening.
  - g. Advise the client with an open ulcer that the compression system is applied over a dressing.
4. Wound care
    - a. Provide care to the wound as prescribed by the physician.
    - b. Assess the client's ability to care for the wound, and initiate home care resources as necessary.
    - c. If an Unna boot (dressing constructed of gauze moistened with zinc oxide) is prescribed, the physician will change it weekly.
    - d. The wound is cleansed with normal saline before application of the Unna boot; povidone-iodine (Betadine) and hydrogen peroxide are not used because they destroy granulation tissue.
    - e. The Unna boot is covered with an elastic wrap that hardens to promote venous return and prevent stasis.
    - f. Monitor for signs of arterial occlusion from an Unna boot that may be too tight.
    - g. Keep tape off the client's skin.
    - h. Occlusive dressings such as polyethylene film or a hydrocolloid dressing may be used to cover the ulcer.
  5. Medications
    - a. Apply topical agents to wound as prescribed to debride the ulcer, eliminate necrotic tissue, and promote healing.
    - b. When applying topical agents, apply an oil-based agent such as petroleum jelly (Vaseline) on surrounding skin, because debriding agents can injure healthy tissue.
    - c. Administer antibiotics as prescribed if infection or cellulitis occurs.
- E. Varicose veins**
1. Description
    - a. Distended, protruding veins that appear darkened and tortuous are evident.
    - b. Vein walls weaken and dilate, and valves become incompetent.
  2. Assessment
    - a. Pain in the legs with dull aching after standing
    - b. A feeling of fullness in the legs
    - c. Ankle edema
  3. Trendelenburg's test
    - a. Place the client in a supine position with the legs elevated.
    - b. When the client sits up, if varicosities are present, veins fill from the proximal end; veins normally fill from the distal end.
  4. Interventions
    - a. Assist with Trendelenburg's test.
    - b. Emphasize the importance of antiembolism stockings as prescribed.
    - c. Instruct the client to elevate the legs as much as possible.
    - d. Instruct the client to avoid constrictive clothing and pressure on the legs.
    - e. Prepare the client for sclerotherapy or vein stripping as prescribed.
  5. Sclerotherapy
    - a. A solution is injected into the vein, followed by the application of a pressure dressing.
    - b. Incision and drainage of the trapped blood in the sclerosed vein is performed 14 to 21 days after the injection, followed by the application of a pressure dressing for 12 to 18 hours.
  6. Vein stripping
    - a. Varicose veins are removed if they are larger than 4 mm in diameter or if they are in clusters.
    - b. Preoperatively assist the physician with vein marking.
    - c. Evaluate pulses as a baseline for comparison postoperatively.
    - d. Maintain elastic (Ace) bandages on the client's legs postoperatively.
    - e. Monitor the groin and leg for bleeding through the elastic bandages.
    - f. Monitor the extremity for edema, warmth, color, and pulses.
    - g. Assess for paresthesias, which could include saphenous nerve damage.
    - h. Elevate the legs above the level of the heart postoperatively.
    - i. Encourage range-of-motion exercises of the legs.
    - j. Instruct the client to avoid leg dangling or chair sitting.
    - k. Instruct the client to elevate the legs when sitting.
    - l. Emphasize the importance of wearing elastic stockings after bandage removal.
  7. Laser therapy: A laser fiber is used to heat and close the main vessel contributing to the varicosity.

## XVII. ARTERIAL DISORDERS

### A. Peripheral arterial disease

#### 1. Description

- a. Chronic disorder in which partial or total arterial occlusion deprives the lower extremities of oxygen and nutrients
- b. Tissue damage occurs below the level of the arterial occlusion.
- c. Atherosclerosis is the most common cause of peripheral arterial disease.

#### 2. Assessment

- a. Intermittent claudication (pain in the muscles resulting from an inadequate blood supply)
- b. Rest pain, characterized by numbness, burning, or aching in the distal portion of the lower extremities, which awakens the client at night and is relieved by placing the extremity in a dependent position
- c. Lower back or buttock discomfort
- d. Loss of hair and dry scaly skin on the lower extremities
- e. Thickened toenails
- f. Cold and gray-blue color of skin in the lower extremities
- g. Elevational pallor and dependent rubor in the lower extremities
- h. Decreased or absent peripheral pulses
- i. Signs of arterial ulcer formation occurring on or between the toes or on the upper aspect of the foot that are characterized as painful
- j. **BP** measurements at the thigh, calf, and ankle are lower than the brachial pressure (normally, **BP** readings in the thigh and calf are higher than those in the upper extremities).

#### 3. Interventions

 Because swelling in the extremities prevents arterial blood flow, the client with peripheral arterial disease is instructed to elevate the feet at rest but to refrain from elevating them above the level of the heart because extreme elevation slows arterial blood flow to the feet. In severe cases of peripheral arterial disease, clients with edema may sleep with the affected limb hanging from the bed or they may sit upright (without leg elevation) in a chair for comfort.

- a. Assess pain.
- b. Monitor the extremities for color, motion and sensation, and pulses.
- c. Obtain **BP** measurements.
- d. Assess for signs of ulcer formation or signs of gangrene.
- e. Assist in developing an individualized exercise program, which is initiated gradually and slowly increased.
- f. Encourage prescribed exercise, which will improve arterial flow through the development of collateral circulation.

- g. Instruct the client to walk to the point of claudication, stop and rest, and then walk a little farther.
  - h. Instruct the client with peripheral arterial disease to avoid crossing the legs, which interferes with blood flow.
  - i. Instruct the client to avoid exposure to cold (causes vasoconstriction) to the extremities and to wear socks or insulated shoes for warmth at all times.
  - j. Instruct the client never to apply direct heat to the limb, such as with a heating pad or hot water, because the decreased sensitivity in the limb will cause burning.
  - k. Instruct the client to inspect the skin on the extremities daily and to report any signs of skin breakdown.
  - l. Instruct the client to avoid tobacco and caffeine because of their vasoconstrictive effects.
  - m. Instruct the client in the use of hemorheological and antiplatelet medications as prescribed.
  - n. Inform the client of the importance of taking all medications prescribed by the physician.
- #### 4. Procedures to improve arterial blood flow
- a. Percutaneous transluminal angioplasty, with or without intravascular stent
  - b. Laser-assisted angioplasty
  - c. Atherectomy
  - d. Bypass surgery: Inflow procedures bypass the occlusion above the superficial femoral arteries and include aortoiliac, aortofemoral, and axillofemoral bypasses; outflow procedures bypass the occlusion at or below the superficial femoral arteries and include femoropopliteal and femorotibial bypass (Fig. 60-14).

### B. Raynaud's disease

#### 1. Description

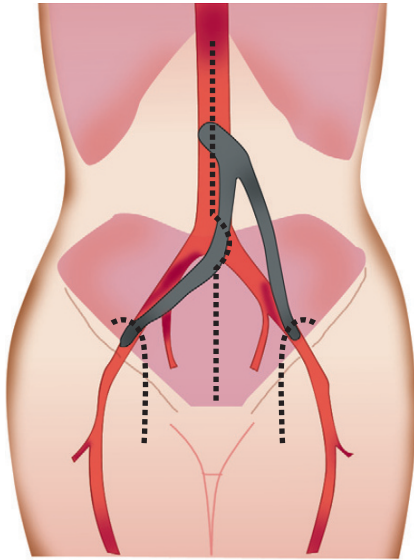

- a. Raynaud's disease is vasospasm of the arterioles and arteries of the upper and lower extremities.
- b. Vasospasm causes constriction of the cutaneous vessels.
- c. Attacks are intermittent and occur with exposure to cold or stress.
- d. Affects primarily fingers, toes, ears, and cheeks

#### 2. Assessment

- a. Blanching of the extremity, followed by cyanosis during vasoconstriction
- b. Reddened tissue when the vasospasm is relieved
- c. Numbness, tingling, swelling, and a cold temperature at the affected body part

#### 3. Interventions

- a. Monitor pulses.
- b. Administer vasodilators as prescribed.

**▲ FIGURE 60-14** In aortoiliac and aortofemoral bypass surgery, a midline incision into the abdominal cavity is required, with an additional incision in each groin. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

- c. Instruct the client regarding medication therapy.
- d. Assist the client to identify and avoid precipitating factors such as cold and stress.
- e. Instruct the client to avoid smoking.
- f. Instruct the client to wear warm clothing, socks, and gloves in cold weather.
- g. Advise the client to avoid injuries to fingers and hands.

**C. Buerger's disease (thromboangiitis obliterans)**

1. Description
  - a. Buerger's disease is an occlusive disease of the median and small arteries and veins.
  - b. The distal upper and lower limbs are affected most commonly.
2. Assessment
  - a. Intermittent claudication
  - b. Ischemic pain occurring in the digits while at rest
  - c. Aching pain that is more severe at night
  - d. Cool, numb, or tingling sensation
  - e. Diminished pulses in the distal extremities
  - f. Extremities that are cool and red in the dependent position
  - g. Development of ulcerations in the extremities
3. Interventions
  - a. Instruct the client to stop smoking.
  - b. Monitor pulses.
  - c. Instruct the client to avoid injury to the upper and lower extremities.
  - d. Administer vasodilators as prescribed.
  - e. Instruct the client regarding medication therapy.

**XVIII. AORTIC ANEURYSMS**

**A. Description**

1. An aortic aneurysm is an abnormal dilation of the arterial wall caused by localized weakness and stretching in the medial layer or wall of an artery.
2. The aneurysm can be located anywhere along the abdominal aorta.
3. The goal of treatment is to limit the progression of the disease by modifying risk factors, controlling the **BP** to prevent strain on the aneurysm, recognizing symptoms early, and preventing rupture.

**B. Types of aortic aneurysm**

1. Fusiform: Diffuse dilation that involves the entire circumference of the arterial segment
2. Saccular: Distinct localized outpouching of the artery wall
3. Dissecting: Created when blood separates the layers of the artery wall, forming a cavity between them
4. False (pseudoaneurysm)
  - a. Pseudoaneurysm occurs when the clot and connective tissue are outside the arterial wall.
  - b. Pseudoaneurysm occurs as a result of vessel injury or trauma to all three layers of the arterial wall.

**C. Assessment**

1. Thoracic aneurysm
  - a. Pain extending to neck, shoulders, lower back, or abdomen
  - b. Syncope
  - c. Dyspnea
  - d. Increased pulse
  - e. Cyanosis
  - f. Weakness
  - g. Hoarseness, difficulty swallowing because of pressure from the aneurysm
2. Abdominal aneurysm
  - a. Prominent, pulsating mass in abdomen, at or above the umbilicus
  - b. Systolic bruit over the aorta
  - c. Tenderness on deep palpation
  - d. Abdominal or lower back pain
3. Rupturing aneurysm
  - a. Severe abdominal or back pain
  - b. Lumbar pain radiating to the flank and groin
  - c. Hypotension
  - d. Increased pulse rate
  - e. Signs of shock
  - f. Hematoma at flank area
4. Diagnostic tests
  - a. Diagnostic tests are done to confirm the presence, size, and location of the aneurysm.
  - b. Tests includes abdominal ultrasound, computed tomography scan, and arteriography.
5. Interventions
  - a. Monitor vital signs.
  - b. Assess risk factors for the arterial disease process.

- c. Obtain information regarding back or abdominal pain.
  - d. Question the client regarding the sensation of pulsation in the abdomen.
  - e. Inspect the skin for the presence of vascular disease or breakdown.
  - f. Check peripheral circulation, including pulses, temperature, and color.
  - g. Observe for signs of rupture.
  - h. Note any tenderness over the abdomen.
  - i. Monitor for abdominal distention.
6. Nonsurgical interventions
- a. Modify risk factors.
  - b. Instruct the client regarding the procedure for monitoring **BP**.
  - c. Instruct the client on the importance of regular physician visits to follow the size of the aneurysm.
  - d. Instruct the client that if severe back or abdominal pain or fullness, soreness over the umbilicus, sudden development of discoloration in the extremities, or a persistent elevation of **BP** occurs to notify the physician immediately.

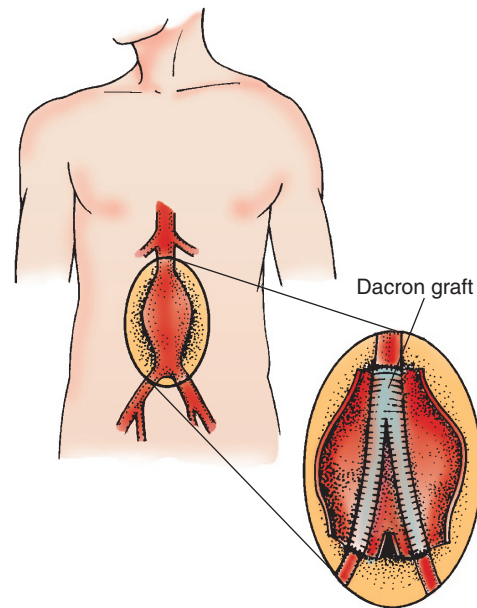

**!** Instruct the client with an aortic aneurysm to report immediately the occurrence of chest or back pain, shortness of breath, difficulty swallowing, or hoarseness.

**D.** Pharmacological interventions

1. Administer antihypertensives to maintain the **BP** within normal limits and to prevent strain on the aneurysm.
2. Instruct the client about the purpose of the medications.
3. Instruct the client about the side effects and schedule of the medication.

**E.** Abdominal aortic aneurysm resection

1. Description: Surgical resection or excision of the aneurysm; the excised section is replaced with a graft that is sewn end to end (Fig. 60-15).
2. Preoperative interventions
  - a. Assess all peripheral pulses as a baseline for postoperative comparison.
  - b. Instruct the client in coughing and deep-breathing exercises.
  - c. Administer bowel preparation as prescribed.
3. Postoperative interventions
  - a. Monitor vital signs.
  - b. Monitor peripheral pulses distal to the graft site.
  - c. Monitor for signs of graft occlusion, including changes in pulses, cool to cold extremities or flanks, severe pain, or abdominal distention.
  - d. Limit elevation of the head of the bed to 45 degrees to prevent flexion of the graft.

**▲ FIGURE 60-15** Surgical repair of an abdominal aortic aneurysm with a woven Dacron graft. (From Ignatavicius, D., & Workman, M. [2006]. *Medical-surgical nursing: Critical thinking for collaborative care* [5th ed.]. St. Louis: Saunders.)

- e. Monitor for hypovolemia and renal failure resulting from significant blood loss during surgery.
- f. Monitor urine output hourly, and notify the physician if it is lower than 30 to 50 mL/hr.
- g. Monitor serum creatinine and blood urea nitrogen levels daily.
- h. Monitor respiratory status and auscultate breath sounds to identify respiratory complications.
- i. Encourage turning, coughing and deep breathing, and splinting the incision.
- j. Ambulate as prescribed.
- k. Maintain nasogastric tube to low suction until bowel sounds return.
- l. Assess for bowel sounds and report their return to the physician
- m. Monitor for pain and administer medication as prescribed.
- n. Assess incision site for bleeding or signs of infection.
- o. Prepare the client for discharge by providing instructions regarding pain management, wound care, and activity restrictions.
- p. Instruct the client not to lift objects heavier than 15 to 20 lb for 6 to 12 weeks.
- q. Advise the client to avoid activities requiring pushing, pulling, or straining.
- r. Instruct the client not to drive a vehicle until approved by the physician.

**F.** Thoracic aneurysm repair

1. Description

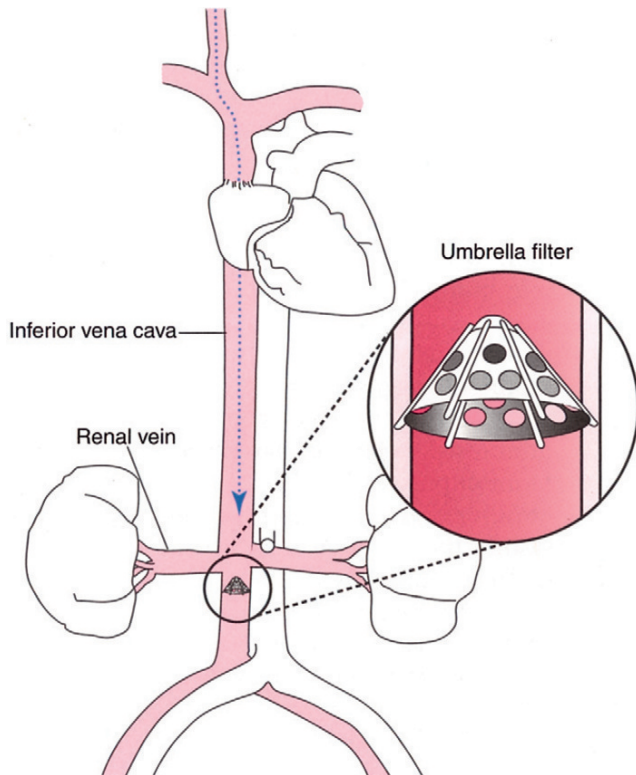

- a. A thoracotomy or median sternotomy approach is used to enter the thoracic cavity.
  - b. The aneurysm is exposed and excised, and a graft or prosthesis is sewn onto the aorta.
  - c. Total cardiopulmonary bypass is necessary for excision of aneurysms in the ascending aorta.
  - d. Partial cardiopulmonary bypass is used for clients with an aneurysm in the descending aorta.
2. Postoperative interventions
    - a. Monitor vital signs and neurological and renal status.
    - b. Monitor for signs of hemorrhage, such as a drop in **BP** and increased pulse rate and respirations, and report to the physician immediately.
    - c. Monitor chest tubes for an increase in chest drainage, which may indicate bleeding or separation at the graft site.
    - d. Assess sensation and motion of all extremities and notify the physician if deficits are noted, which can occur because of a lack of blood supply to the spinal cord during surgery.
    - e. Monitor respiratory status and auscultate breath sounds to identify respiratory complications.
    - f. Encourage turning, coughing, and deep breathing while splinting the incision.
    - g. Monitor cardiac status for dysrhythmias.
    - h. Monitor for pain and administer medication as prescribed.
    - i. Assess the incision site for bleeding or signs of infection.
    - j. Prepare the client for discharge by providing instructions regarding pain management, wound care, and activity restrictions.
    - k. Instruct the client not to lift objects heavier than 15 to 20 lb for 6 to 12 weeks.
    - l. Advise the client to avoid activities requiring pushing, pulling, or straining.
    - m. Instruct the client not to drive a vehicle until approved by the physician.
  2. Monitor affected extremity for color, temperature, and pulse.
  3. Assess sensory and motor function of the affected extremity.
  4. Monitor for signs and symptoms of new thrombi or emboli.
  5. Administer oxygen as prescribed.
  6. Monitor pulse oximetry.
  7. Monitor for complications caused by reperfusion of the artery, such as spasms and swelling of the skeletal muscles.
  8. Monitor for signs of swollen skeletal muscles such as edema, pain on passive movement, poor capillary refill, numbness, and muscle tenseness.
  9. Maintain bed rest initially, with the client in a semi-Fowler's position.
  10. Place a bed cradle on the bed.
  11. Check the incision site for bleeding or hematoma.
  12. Administer anticoagulants as prescribed.
  13. Monitor laboratory values related to anticoagulant therapy.
  14. Instruct the client to recognize the signs and symptoms of infection and edema.
  15. Instruct the client to avoid prolonged sitting or crossing the legs when sitting.
  16. Instruct the client to elevate the legs when sitting.
  17. Instruct the client to wear antiembolism stockings as prescribed and how to remove and reapply the stockings.
  18. Instruct the client to ambulate daily.
  19. Instruct the client about anticoagulant therapy and the hazards associated with anticoagulants.

### XIX. EMBOLECTOMY

- A. Description
  1. Embolectomy is removal of an embolus from an artery using a catheter.
  2. A patch graft may be required to close the artery.
- B. Preoperative interventions
  1. Obtain a baseline vascular assessment.
  2. Administer anticoagulants as prescribed.
  3. Administer thrombolytics as prescribed.
  4. Place a bed cradle on the bed.
  5. Avoid bumping or jarring the bed.
  6. Maintain the extremity in a slightly dependent position.
- C. Postoperative interventions
  1. Assess cardiac, respiratory, and neurological status.

### XX. VENA CAVAL FILTER AND LIGATION OF INFERIOR VENA CAVA

- A. Vena caval filter: Insertion of an intracaval filter (umbrella) that partially occludes the inferior vena cava and traps emboli to prevent pulmonary emboli (Fig. 60-16)
- B. Ligation: Suturing or placing clips on the inferior vena cava to prevent pulmonary emboli; done via abdominal laparotomy
- C. Preoperative interventions: If the client has been taking an anticoagulant, consult with the physician regarding discontinuation of the medication to prevent hemorrhage.
- D. Postoperative interventions
  1. Monitor vital signs.
  2. Assess cardiac, respiratory, neurological, and renal status.
  3. Administer oxygen as prescribed.
  4. Monitor pulse oximetry.
  5. Maintain a semi-Fowler's position.
  6. Avoid hip flexion.
  7. Provide activity as prescribed.

**▲ FIGURE 60-16** An inferior vena caval filter. (From Ignatavicius, D., & Workman, M. [2006]. *Medical-surgical nursing: Critical thinking for collaborative care* [5th ed.]. St. Louis: Saunders.)

8. Check the insertion site for bleeding or hematoma and signs or symptoms of infection.
9. Assess for peripheral edema.
10. Maintain antiembolism stockings as prescribed.
11. Monitor laboratory values related to anticoagulant therapy.
12. Instruct the client to recognize the signs and symptoms of infection and edema.
13. Instruct the client to avoid prolonged sitting or crossing the legs when sitting.
14. Instruct the client to elevate the legs when sitting.
15. Instruct the client to wear antiembolism stockings as prescribed and how to remove and reapply the stockings.
16. Instruct the client to ambulate daily.
17. Instruct the client about anticoagulant therapy and the hazards associated with anticoagulants.

## XXI. HYPERTENSION

### A. Description

1. For an adult (ages 18 and older), a normal **BP** is a systolic **BP** below 120 mm Hg and a diastolic below 80 mm Hg.
2. An individual classified with prehypertension has a systolic **BP** between 120 and 139 mm Hg or a **diastolic pressure** between 80 and 89 mm Hg.

**Table 60-3** Hypertension

| Organ Involvement     | Complications                      |
|-----------------------|------------------------------------|
| Eyes                  | Visual changes                     |
| Brain                 | Stroke                             |
| Cardiovascular system | Heart failure, hypertensive crisis |
| Kidneys               | Renal failure                      |

3. Stage 1 hypertension can be classified as a systolic **BP** between 140 and 159 mm Hg or a **diastolic pressure** between 90 and 99 mm Hg.
4. Stage 2 hypertension can be classified as a systolic **BP** equal to or greater than 160 mm Hg or a **diastolic pressure** equal to or greater than 100 mm Hg.
5. Hypertension is a major risk factor for coronary, cerebral, renal, and peripheral vascular disease.
6. The disease is initially asymptomatic.
7. The goals of treatment include reduction of the **BP** and preventing or lessening the extent of organ damage (Table 60-3).
8. Nonpharmacological approaches, such as lifestyle changes, may be prescribed initially; if the **BP** cannot be decreased after a reasonable time period (1 to 3 months), the client may require pharmacological treatment.

### B. Primary or essential hypertension

1. No known cause
2. Risk factors
  - a. Aging
  - b. Family history
  - c. Black race, with higher prevalence in males
  - d. Obesity
  - e. Smoking
  - f. Stress
  - g. Excessive alcohol
  - h. Hyperlipidemia
  - i. Increased intake of salt or caffeine

### C. Secondary hypertension

1. Treatment depends on the cause and the organs involved.
2. Secondary hypertension occurs as a result of other disorders or conditions.
3. Precipitating disorders or conditions
  - a. Cardiovascular disorders
  - b. Renal disorders
  - c. Endocrine system disorders
  - d. Pregnancy
  - e. Medications (e.g., estrogens, glucocorticoids, mineralocorticoids)

### D. Assessment

1. May be asymptomatic
2. Headache
3. Visual disturbances
4. Dizziness
5. Chest pain
6. Tinnitus

**Box 60-10 Client Education for Hypertension**

Describe the importance of compliance with the treatment plan.

Describe the disease process, explaining that symptoms usually do not develop until organs have suffered damage.

Initiate and assist the client in planning a regular exercise program, avoiding heavy weight-lifting and isometric exercises.

Emphasize the importance of beginning the exercise program gradually.

Encourage the client to express feelings about daily stress.

Assist the client to identify ways to reduce stress.

Teach relaxation techniques.

Instruct the client in how to incorporate relaxation techniques into the daily living pattern.

Instruct the client and family in the technique for monitoring blood pressure.

Instruct the client to maintain a diary of blood pressure readings.

Emphasize the importance of lifelong medication and the need for follow-up treatment.

Instruct the client and family about the dietary restrictions, which may include sodium, fat, calories, and cholesterol.

Instruct the client in how to shop for and prepare low-sodium meals.

Provide a list of products that contain sodium.

Instruct the client to read labels of products to determine sodium content, focusing on substances listed as sodium, NaCl, or MSG (monosodium glutamate).

Instruct the client to bake, roast, or boil foods, avoid salt in preparation of foods, and avoid using salt at the table.

Instruct the client that fresh foods are best to consume and to avoid canned foods.

Instruct the client about the actions, side effects, and scheduling of medications.

Advise the client that if uncomfortable side effects occur to contact the physician and not to stop the medication.

Instruct the client to avoid over-the-counter medications.

Stress the importance of follow-up care.

7. Flushed face

8. Epistaxis

 **E. Interventions**

1. Goals

- a. One treatment goal is to reduce the **BP**.
- b. Another treatment goal is to prevent or lessen the extent of organ damage.

2. Question the client regarding the signs and symptoms indicative of hypertension.

3. Obtain the **BP** two or more times on both arms, with the client supine and standing.

4. Compare the **BP** with prior documentation.

5. Determine family history of hypertension.

6. Identify current medication therapy.

7. Obtain weight.

8. Evaluate dietary patterns and sodium intake.

9. Assess for visual changes or retinal damage.

10. Assess for cardiovascular changes such as distended neck veins, increased heart rate, and dysrhythmias.

11. Evaluate chest x-ray for heart enlargement.

12. Assess the neurological system.

13. Evaluate renal function.

14. Evaluate results of diagnostic and laboratory studies.

**F. Nonpharmacological interventions**

1. Weight reduction, if necessary, or maintenance of ideal weight

2. Dietary sodium restriction to 2 g daily as prescribed

3. Moderate intake of alcohol and caffeine-containing products

4. Initiation of a regular exercise program

5. Avoidance of smoking

6. Relaxation techniques and biofeedback therapy

7. Elimination of unnecessary medications that may contribute to the hypertension

**G. Pharmacological interventions**

1. Medication therapy is individualized for each client and the selection of the medication is based on such factors as the client's age, culture, presence of coexisting conditions, severity of the hypertension, and client's preferences.

2. See Chapter 61 for medications to treat hypertension.

**H. See Box 60-10 for client education.**

**XXII. HYPERTENSIVE CRISIS**

**A. Description**

1. A hypertensive crisis is any clinical condition requiring immediate reduction in **BP**.

2. A hypertensive crisis is an acute and life-threatening condition.

3. The accelerated hypertension requires emergency treatment because target organ damage (brain, heart, kidneys, retina of the eye) can occur quickly.

4. Death can be caused by stroke, renal failure, or cardiac disease.

**B. Assessment**

1. An extremely high **BP**; usually the **diastolic pressure** is higher than 120 mm Hg

2. Headache

3. Drowsiness and confusion

4. Blurred vision

5. Changes in neurological status

6. Tachycardia and tachypnea

7. Dyspnea
8. Cyanosis
9. Seizures

**C. Interventions**

1. Maintain a patent airway.
2. Administer antihypertensive medications intravenously as prescribed.
3. Monitor vital signs, assessing the **BP** every 5 minutes.
4. Maintain bed rest, with the head of the bed elevated at 45 degrees.
5. Assess for hypotension during the administration of antihypertensives; place the client in a supine position if hypotension occurs.
6. Have emergency medications and resuscitation equipment readily available.
7. Monitor IV therapy, assessing for fluid overload.
8. Monitor intake and output.
9. Insert a Foley catheter as prescribed.
10. Monitor urinary output; if oliguria or anuria occurs, notify the physician.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 692.** A client is admitted to an emergency department with chest pain that is being ruled out for myocardial infarction. Vital signs are as follows: at 11 AM, pulse (P), 92 beats/min, respiratory rate (RR), 24 breaths/min, blood pressure (BP), 140/88 mm Hg; 11:15 AM, P, 96 beats/min, RR, 26 breaths/min, BP, 128/82 mm Hg; 11:30 AM, P, 104 beats/min, RR, 28 breaths/min, BP, 104/68 mm Hg; 11:45 AM, P, 118 beats/min, RR, 32 breaths/min, BP, 88/58 mm Hg. The nurse should alert the physician because these changes are most consistent with which of the following complications?
1. Cardiogenic shock
  2. Cardiac tamponade
  3. Pulmonary embolism
  4. Dissecting thoracic aortic aneurysm
- 693.** A client admitted to the hospital with chest pain and history of type 2 diabetes mellitus is scheduled for cardiac catheterization. Which of the following medications would need to be withheld for 48 hours before and after the procedure?
1. Regular insulin
  2. Glipizide (Glucotrol)
  3. Repaglinide (Prandin)
  4. Metformin (Glucophage)
- 694.** A client is in sinus bradycardia with a heart rate of 45 beats/min, complains of dizziness, and has a blood pressure of 82/60 mm Hg. Which of the following should the nurse anticipate will be prescribed?
1. Defibrillate the client.
  2. Administer digoxin (Lanoxin).
  3. Continue to monitor the client.
  4. Prepare for transcutaneous pacing.
- 695.** A nurse notes that a client with sinus rhythm has a premature ventricular contraction that falls on the T wave of the preceding beat. The client's rhythm suddenly changes to one with no P waves, no definable QRS complexes, and coarse wavy lines of varying amplitude. How would the nurse correctly interpret this rhythm?
1. Asystole
  2. Atrial fibrillation
  3. Ventricular fibrillation
  4. Ventricular tachycardia
- 696.** A client with myocardial infarction suddenly becomes tachycardic, shows signs of air hunger, and begins coughing frothy, pink-tinged sputum. Which of the following would the nurse anticipate when auscultating the client's breath sounds?
1. Stridor
  2. Crackles
  3. Scattered rhonchi
  4. Diminished breath sounds
- 697.** A client with myocardial infarction is developing cardiogenic shock. Because of the risk of myocardial ischemia, for which of the following should the nurse carefully assess the client?
1. Bradycardia
  2. Ventricular dysrhythmias
  3. Rising diastolic blood pressure
  4. Falling central venous pressure
- 698.** A client who had cardiac surgery 24 hours ago has a urine output averaging 20 mL/hr for 2 hours. The client received a single bolus of 500 mL of intravenous fluid. Urine output for the subsequent hour was 25 mL. Daily laboratory results indicate that the blood urea nitrogen level is 45 mg/dL and the serum creatinine level is 2.2 mg/dL. Based on these findings, the nurse would anticipate that the client is at risk for which of the following?
1. Hypovolemia
  2. Acute renal failure
  3. Glomerulonephritis
  4. Urinary tract infection
- 699.** The nurse is reviewing an electrocardiogram rhythm strip. The P waves and QRS complexes are regular. The PR interval is 0.16 second, and

QRS complexes measure 0.06 second. The overall heart rate is 64 beats/min. Which of the following would be a correct interpretation based on these characteristics?

1. Sinus bradycardia
2. Sick sinus syndrome
3. Normal sinus rhythm
4. First-degree heart block

**700.** A client is wearing a continuous cardiac monitor, which begins to sound its alarm. A nurse sees no electrocardiographic complexes on the screen. Which of the following should be the priority action of the nurse?

1. Call a code blue.
2. Call the physician.
3. Check the client status and lead placement.
4. Press the recorder button on the electrocardiogram console.

**701.** A nurse is watching the cardiac monitor and notices that the rhythm suddenly changes. There are no P waves, the QRS complexes are wide, and the ventricular rate is regular but more than 100 beats/min. The nurse determines that the client is experiencing which of the following dysrhythmias?

1. Sinus tachycardia
2. Ventricular fibrillation
3. Ventricular tachycardia
4. Premature ventricular contractions

**702.** A client has frequent bursts of ventricular tachycardia on the cardiac monitor. What should the nurse be most concerned about with this dysrhythmia?

1. It can develop into ventricular fibrillation at any time.
2. It is almost impossible to convert to a normal rhythm.
3. It is uncomfortable for the client, giving a sense of impending doom.
4. It produces a high cardiac output that quickly leads to cerebral and myocardial ischemia.

**703.** A client is having frequent premature ventricular contractions. A nurse would place priority on assessment of which of the following?

1. Sensation of palpitations
2. Causative factors, such as caffeine
3. Precipitating factors, such as infection
4. Blood pressure and oxygen saturation

**704.** A client has developed atrial fibrillation, with a ventricular rate of 150 beats/min. The nurse should assess the client for which associated signs or symptoms?

1. Flat neck veins
2. Nausea and vomiting
3. Hypotension and dizziness
4. Hypertension and headache

**705.** A nurse is watching the cardiac monitor, and a client's rhythm suddenly changes. There are no P waves; instead, there are fibrillatory waves before each QRS complex. How should the nurse correctly interpret the client's heart rhythm?

1. Atrial fibrillation
2. Sinus tachycardia
3. Ventricular fibrillation
4. Ventricular tachycardia

**706.** A nurse is preparing to defibrillate a client in ventricular fibrillation. After placing the paddles on the client's chest and before discharging them, which of the following should be done?

1. Ensure that the client has been intubated.
2. Set the defibrillator to the "synchronize" mode.
3. Administer lidocaine hydrochloride (Xylocaine).
4. Confirm that the rhythm is actually ventricular fibrillation.

**707.** A client in ventricular fibrillation is about to be defibrillated. A nurse knows that to convert this rhythm effectively, the machine should be set at which of the following energy levels (in joules, J) for the first delivery?

1. 50 J
2. 100 J
3. 200 J
4. 360 J

**708.** A nurse would evaluate that defibrillation of a client was most successful if which of the following observations was made?

1. Arousable, sinus rhythm, BP 116/72 mm Hg
2. Arousable, marked bradycardia, BP 86/54 mm Hg
3. Nonarousable, supraventricular tachycardia, BP 122/60 mm Hg
4. Nonarousable, sinus rhythm, BP 88/60 mm Hg

**709.** A nurse is evaluating a client's response to cardioversion. Which of the following observations would be of highest priority to the nurse?

1. Blood pressure
2. Status of airway
3. Oxygen flow rate
4. Level of consciousness

**710.** A nurse is caring for a client who has just had implantation of an automatic internal cardioverter-defibrillator. The nurse immediately would

assess which of the following items based on priority?

1. Anxiety level of the client and family
2. Presence of a Medic-Alert card for the client to carry
3. Knowledge of restrictions of postdischarge physical activity
4. Activation status of the device, heart rate cut-off, and number of shocks it is programmed to deliver

**711.** A client's electrocardiogram strip shows atrial and ventricular rates of 110 beats/min. The PR interval is 0.14 second, the QRS complex measures 0.08 second, and the PP and RR intervals are regular. How should the nurse correctly interpret this rhythm?

1. Sinus dysrhythmia
2. Sinus tachycardia
3. Sinus bradycardia
4. Normal sinus rhythm

**712.** A nurse is assessing the neurovascular status of a client who returned to the surgical nursing unit 4 hours ago after undergoing aortoiliac bypass graft. The affected leg is warm, and the nurse notes redness and edema. The pedal pulse is palpable and unchanged from admission. How would the nurse correctly interpret the client's neurovascular status?

1. The neurovascular status is normal because of increased blood flow through the leg.
2. The neurovascular status is moderately impaired, and the surgeon should be called.
3. The neurovascular status is slightly deteriorating and should be monitored for another hour.
4. The neurovascular status is adequate from an arterial approach, but venous complications are arising.

**713.** A nurse is evaluating the condition of a client after pericardiocentesis performed to treat cardiac tamponade. Which of the following observations would indicate that the procedure was unsuccessful?

1. Rising blood pressure
2. Clearly audible heart sounds
3. Client expressions of relief
4. Rising central venous pressure

**714.** A nurse is caring for a client who had a resection of an abdominal aortic aneurysm yesterday. The client has an intravenous infusion with a rate of 150 mL/hr, unchanged for the last 10 hours. The client's urine output for the last 3 hours was 90, 50, and 28 mL (28 mL most recent). The client's blood urea nitrogen level is 35 mg/dL and serum creatinine level is 1.8 mg/dL, measured this morning. Which of the following actions should the nurse take next?

1. Call the physician.
2. Check the urine specific gravity.
3. Check to see if the client had a sample for serum albumin level drawn.
4. Put the intravenous line on a pump so that the infusion rate is sure to stay stable.

**715.** A client with angina complains that the anginal pain is prolonged and severe and occurs at the same time each day, most often at rest in the absence of precipitating factors. How would the nurse best describe this type of anginal pain?

1. Stable angina
2. Variant angina
3. Unstable angina
4. Nonanginal pain

### Alternate Item Format: Multiple Response

**716.** A nurse in a medical unit is caring for a client with heart failure. The client suddenly develops extreme dyspnea, tachycardia, and lung crackles and the nurse suspects pulmonary edema. The nurse immediately asks another nurse to contact the physician and prepares to implement which priority interventions? **Select all that apply.**

- 1. Administering oxygen
- 2. Inserting a Foley catheter
- 3. Administering furosemide (Lasix)
- 4. Administering morphine sulfate intravenously
- 5. Transporting the client to the coronary care unit
- 6. Placing the client in a low Fowler's side-lying position

## ANSWERS

### 692. 1

**Rationale:** Cardiogenic shock occurs with severe damage (more than 40%) to the left ventricle. Classic signs include hypotension, a rapid pulse that becomes weaker, decreased urine output, and cool, clammy skin. Respiratory rate increases as the body develops metabolic acidosis from shock.

Cardiac tamponade is accompanied by distant, muffled heart sounds and prominent neck vessels. Pulmonary embolism presents suddenly with severe dyspnea accompanying the chest pain. Dissecting aortic aneurysms usually are accompanied by back pain.

**Test-Taking Strategy:** Use the process of elimination. Recalling that the early serious complications of myocardial infarction

include dysrhythmias, cardiogenic shock, and sudden death will direct you to option 1. No information in the question is associated with options 2, 3, or 4. Review the complications of myocardial infarction if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Critical Care

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 828, 830). St. Louis: Saunders.

#### 693. 4

**Rationale:** Metformin (Glucophage) needs to be withheld 48 hours before and after cardiac catheterization because of the injection of contrast medium during the procedure. If the contrast medium affects kidney function, with metformin in the system, the client would be at increased risk for lactic acidosis. The medications in options 1, 2, and 3 do not need to be withheld 48 hours before or after cardiac catheterization.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 2 and 3 first. Although these medications may be withheld on the morning of the procedure because of the client's NPO status, there is no indication for withholding the medication the day prior to and the day postprocedure. Regular insulin may be administered if elevated blood glucose levels from infused intravenous solutions occur on the day of the procedure. Review preprocedure and postprocedure interventions if you had difficulty with this question.

#### 694. 4

**Rationale:** Hypotension and dizziness are signs of decreased cardiac output. Transcutaneous pacing provides a temporary measure to increase the heart rate and thus perfusion in the symptomatic client. Digoxin will further decrease the client's heart rate. Defibrillation is used for treatment of pulseless ventricular tachycardia and ventricular fibrillation. Continuing to monitor the client delays necessary intervention.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 3 because the client is symptomatic and requires intervention. Option 2 is eliminated because digoxin will further decrease the client's heart rate. Defibrillation is used for treatment of pulseless ventricular tachycardia and ventricular fibrillation; therefore eliminate option 1. Review the indications for transcutaneous pacing if you had difficulty with this question.

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1474). St. Louis: Saunders.

#### 695. 3

**Rationale:** Ventricular fibrillation is characterized by irregular chaotic undulations of varying amplitudes. Ventricular fibrillation has no measurable rate and no visible P waves or QRS complexes and results from electrical chaos in the ventricles.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the characteristics of ventricular fibrillation. The lack of visible QRS complexes eliminates atrial fibrillation and ventricular tachycardia. Recalling that asystole is lack of any electrical activity of the heart will direct you to option 3. Review the characteristics of ventricular fibrillation if you had difficulty with this question.

#### 696. 2

**Rationale:** Pulmonary edema is characterized by extreme breathlessness, dyspnea, air hunger, and the production of frothy, pink-tinged sputum. Auscultation of the lungs reveals crackles. Rhonchi and diminished breath sounds are not associated with pulmonary edema. Stridor is a crowing sound associated with laryngospasm or edema of the upper airway.

**Test-Taking Strategy:** Use the process of elimination. Recalling that fluid produces sounds that are called *crackles* will assist you in eliminating options 1, 3, and 4. If you had difficulty with this question, review the manifestations found in pulmonary edema.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Cardiovascular

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 775). St. Louis: Saunders.

#### 697. 2

**Rationale:** Classic signs of cardiogenic shock as they relate to this question include low blood pressure and tachycardia. The central venous pressure would rise as the backward effects of the severe left ventricular failure became apparent. Dysrhythmias commonly occur as a result of decreased oxygenation and severe damage to greater than 40% of the myocardium.

**Test-Taking Strategy:** Use the process of elimination and focus on the strategic words *myocardial ischemia*. Recall that ischemia makes the myocardium irritable, producing dysrhythmias. Also, knowledge of the classic signs of shock helps eliminate the incorrect options. Review the clinical manifestations associated with cardiogenic shock if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Critical Care

**Reference:** Copstead, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., pp. 494–495). St. Louis: Mosby.

### 698. 2

**Rationale:** The client who undergoes cardiac surgery is at risk for renal injury from poor perfusion, hemolysis, low cardiac output, or vasopressor medication therapy. Renal insult is signaled by decreased urine output and increased blood urea nitrogen and creatinine levels. The client may need medications to increase renal perfusion and possibly could need peritoneal dialysis or hemodialysis. No data in the question indicate the presence of hypovolemia, urinary tract infection, or glomerulonephritis.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 3 and 4 first because no data indicate infection or inflammation. Noting that the urine output is inadequate will assist you in eliminating option 1. Review the complications associated with cardiac surgery if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Critical Care

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1426). St. Louis: Saunders.

### 699. 3

**Rationale:** Normal sinus rhythm is defined as a regular rhythm, with an overall rate of 60 to 100 beats/min. The PR and QRS measurements are normal, measuring 0.12 to 0.20 second and 0.04 to 0.10 second, respectively.

**Test-Taking Strategy:** A baseline knowledge of normal electrocardiographic measurements is needed to answer this question. Focusing on the data in the question and recalling the characteristics of normal sinus rhythm will direct you to option 3. Review this content if you are unfamiliar with it.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Cardiovascular

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 737). St. Louis: Saunders.

### 700. 3

**Rationale:** Sudden loss of electrocardiographic complexes indicates ventricular asystole or possibly electrode displacement. Accurate assessment of the client and equipment is necessary to determine the cause and identify the appropriate intervention. Options 1, 2, and 4 are unnecessary.

**Test-Taking Strategy:** Use the steps of the nursing process. Always assess the client directly before taking any action. Option 3 is the only option that addresses assessment. Review care of the client on a cardiac monitor if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Cardiovascular

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 749–750). St. Louis: Saunders.

Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 1192). St. Louis: Mosby.

### 701. 3

**Rationale:** Ventricular tachycardia is characterized by the absence of P waves, wide QRS complexes (longer than 0.12 second), and typically a rate between 140 and 180 impulses/min. The rhythm is regular.

**Test-Taking Strategy:** Focus on the data in the question. Eliminate option 1 first because there are no P waves. Premature ventricular contractions are isolated ectopic beats superimposed on an underlying rhythm, so option 4 is eliminated next. Recalling that there are no true QRS complexes with ventricular fibrillation will direct you to option 3 from the remaining options. Review the characteristics of ventricular tachycardia if you are unfamiliar with it.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Critical Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 748). St. Louis: Saunders.

### 702. 1

**Rationale:** Ventricular tachycardia is a life-threatening dysrhythmia that results from an irritable ectopic focus that takes over as the pacemaker for the heart. The low cardiac output that results can lead quickly to cerebral and myocardial ischemia. Clients frequently experience a feeling of impending doom. Ventricular tachycardia is treated with antidysrhythmic medications, cardioversion (client awake), or defibrillation (loss of consciousness). Ventricular tachycardia can deteriorate into ventricular fibrillation at any time.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *most concerned*. Option 2 is incorrect and is eliminated first. From the remaining options, focusing on the strategic words will direct you to option 1 because this option identifies the life-threatening condition. Review the concerns associated with ventricular tachycardia if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Cardiovascular

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 748). St. Louis: Saunders.

### 703. 4

**Rationale:** Premature ventricular contractions can cause hemodynamic compromise. The shortened ventricular filling time with the ectopic beat leads to decreased stroke volume and, if frequent enough, to decreased cardiac output. The client may be asymptomatic or may feel palpitations. Premature ventricular contractions can be caused by cardiac disorders, states of hypoxemia, or by any number of physiological

stressors, such as infection, illness, surgery, or trauma, and by intake of caffeine, nicotine, or alcohol.

**Test-Taking Strategy:** Note the strategic words *priority on assessment*. Use the ABCs—airway, breathing, and circulation—to direct you to option 4. Review the effects of premature ventricular contractions if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Cardiovascular

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1464–1465). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 747–748). St. Louis: Saunders.

### 704. 3

**Rationale:** The client with uncontrolled atrial fibrillation with a ventricular rate more than 100 beats/min is at risk for low cardiac output because of loss of atrial kick. The nurse assesses the client for palpitations, chest pain or discomfort, hypotension, pulse deficit, fatigue, weakness, dizziness, syncope, shortness of breath, and distended neck veins.

**Test-Taking Strategy:** Use the process of elimination. Flat neck veins are normal or indicate hypovolemia, so eliminate option 1. Nausea and vomiting (option 2) are associated with vagus nerve activity and do not correlate with a tachycardic state. From the remaining options, think of the consequences of falling cardiac output to direct you to option 3. Review the effects of atrial fibrillation if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Critical Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 745). St. Louis: Saunders.

### 705. 1

**Rationale:** Atrial fibrillation is characterized by a loss of P waves and fibrillatory waves before each QRS complex. The atria quiver, which can lead to thrombus formation.

**Test-Taking Strategy:** Focus on the data in the question. Noting the strategic words *there are no P waves* should direct you to option 1. Loss of P waves is characteristic of this dysrhythmia. Review the characteristics of atrial fibrillation if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Critical Care

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1457–1458). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 745). St. Louis: Saunders.

### 706. 4

**Rationale:** Until the defibrillator is attached and charged, the client is resuscitated by using cardiopulmonary resuscitation. Once the defibrillator has been attached, the electrocardiogram is checked to verify that the rhythm is ventricular fibrillation or pulseless ventricular tachycardia. Leads also are checked for any loose connections. A nitroglycerin patch, if present, is removed. The client does not have to be intubated to be defibrillated. Lidocaine may be given subsequently but is not required before defibrillation. The machine is not set to the synchronous mode because there is no underlying rhythm with which to synchronize.

**Test-Taking Strategy:** Use the process of elimination, focusing on the subject, ventricular fibrillation. Note that option 4 directly addresses this subject and also addresses assessment of the client. Review the procedure for defibrillation if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Critical Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 749). St. Louis: Saunders.

### 707. 3

**Rationale:** The client may be defibrillated up to three times in succession. The energy levels used are 200, 300, and 360 J for the first, second, and third attempts, respectively.

**Test-Taking Strategy:** Focus on the strategic words *first delivery*. As a general rule, though, remember that lower levels of energy are used for cardioversion. Higher levels are used in defibrillation. Review this procedure if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Critical Care

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1468). St. Louis: Saunders.

### 708. 1

**Rationale:** After defibrillation, the client requires continuous monitoring of electrocardiographic rhythm, hemodynamic status, and neurological status. Respiratory and metabolic acidosis develop during ventricular fibrillation because of lack of respiration and cardiac output. These can cause cerebral and cardiopulmonary complications. Arousable status, adequate blood pressure, and a sinus rhythm indicate successful response to defibrillation.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *most successful*. Eliminate options 3 and 4 first because of the word *nonarousable*. From the remaining options, select option 1 because a sinus rhythm is a more successful response compared with marked bradycardia. Review the expected effects of defibrillation if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Critical Care

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1471). St. Louis: Saunders.

### 709. 2

**Rationale:** Nursing responsibilities after cardioversion include maintenance first of a patent airway, and then oxygen administration, assessment of vital signs and level of consciousness, and dysrhythmia detection.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *highest priority*. Use the ABCs—airway, breathing, and circulation—to direct you to option 2. Review care of the client following cardioversion if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Critical Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 756). St. Louis: Saunders.

### 710. 4

**Rationale:** The nurse who is caring for the client after insertion of an automatic internal cardioverter-defibrillator needs to assess device settings, similar to after insertion of a permanent pacemaker. Specifically, the nurse needs to know whether the device is activated, the heart rate cutoff above which it will fire, and the number of shocks it is programmed to deliver. Options 1, 2, and 3 are also nursing interventions but are not the priority.

**Test-Taking Strategy:** Note the strategic word *priority*. Use Maslow's Hierarchy of Needs theory. Option 4 is the option that identifies the physiological need. Review care to the client following insertion of an automatic internal cardioverter-defibrillator if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Critical Care

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1472–1473). St. Louis: Saunders.

### 711. 2

**Rationale:** Sinus tachycardia has the characteristics of normal sinus rhythm, including a regular PP interval and normal-width PR and QRS intervals; however, the rate is the differentiating factor. In sinus tachycardia, the atrial and ventricular rates are greater than 100 beats/min.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 3 and 4 because they do not meet the rate criteria (ventricular rate is 110 beats/min). Eliminate option 1 because sinus dysrhythmia is an irregular rhythm, with changing PP and RR intervals. Review the characteristics of sinus tachycardia if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Critical Care

**Reference:** Copstead, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 477). St. Louis: Mosby.

### 712. 1

**Rationale:** An expected outcome of aortoiliac bypass graft surgery is warmth, redness, and edema in the surgical extremity because of increased blood flow. Therefore options 2, 3, and 4 are incorrect interpretations.

**Test-Taking Strategy:** Use the process of elimination. Option 2 can be eliminated because the pedal pulse is unchanged from admission. Venous complications from immobilization resulting from surgery would not be apparent within 4 hours, so eliminate option 4. From the remaining options, think about the effects of sudden reperfusion in an ischemic limb. There would be redness from new blood flow and edema from the sudden change in pressure in the blood vessels. Review the expected assessment findings following this surgical procedure if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Cardiovascular

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 808–809). St. Louis: Saunders.

### 713. 4

**Rationale:** Following pericardiocentesis, a rise in blood pressure and a fall in central venous pressure are expected. The client usually expresses immediate relief. Heart sounds are no longer muffled or distant.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *unsuccessful*. Successful therapy is measured by the disappearance of the original signs and symptoms of cardiac tamponade. Therefore look for the option that identifies a sign consistent with continued tamponade. Review signs of cardiac tamponade and the expected effects of pericardiocentesis if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Critical Care

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 786). St. Louis: Saunders.

Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed., pp. 714–715). St. Louis: Mosby.

### 714. 1

**Rationale:** Following abdominal aortic aneurysm resection or repair, the nurse monitors the client for signs of renal failure. Renal failure can occur because often much blood is lost during the surgery and, depending on the aneurysm location, the renal arteries may be hypoperfused for a short period during surgery. The nurse monitors hourly intake and output and notes the results of daily blood urea nitrogen and creatinine levels. Urine output lower than 30 to 50 mL/hr is reported to the physician.

**Test-Taking Strategy:** Focus on the information in the question and the abnormal assessment data. This question indicates elevations in blood urea nitrogen and creatinine levels and a significant drop in hourly urine output. These assessment findings should direct you to option 1. Review the

complications associated with this surgical procedure if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Critical Care

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1327–1328). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 811). St. Louis: Saunders.

### 715. 2

**Rationale:** Variant angina, or Prinzmetal's angina, is prolonged and severe and occurs at the same time each day, most often at rest. Stable angina is induced by exercise and relieved by rest or nitroglycerin tablets. Unstable angina occurs at lower and lower levels of activity or at rest, is less predictable, and is often a precursor of myocardial infarction.

**Test-Taking Strategy:** Use the process of elimination, focusing on the data in the question. Noting the strategic words *at rest* will direct you to option 2. If you had difficulty with this question, review the characteristics of the various types of angina.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Cardiovascular

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1485–1486). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 716. 1, 2, 3, 4

**Rationale:** Pulmonary edema is a life-threatening event that can result from severe heart failure. In pulmonary edema, the left ventricle fails to eject sufficient blood, and pressure increases in the lungs because of the accumulated blood. Oxygen is always prescribed, and the client is placed in a high Fowler's position to ease the work of breathing. Furosemide, a rapid-acting diuretic, will eliminate accumulated fluid. A Foley catheter is inserted to measure output accurately. Intravenously administered morphine sulfate reduces venous return (preload), decreases anxiety, and also reduces the work of breathing. Transporting the client to the coronary care unit is not a priority intervention. In fact, this may not be necessary at all if the client's response to treatment is successful.

**Test-Taking Strategy:** Note the strategic words *priority interventions* and focus on the client's diagnosis. Recall the pathophysiology associated with pulmonary edema and use the ABCs—airway, breathing, and circulation—to help determine priority interventions. Review priority interventions for the client with pulmonary edema if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Critical Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 775–776). St. Louis: Saunders.

# Cardiovascular Medications

## I. ANTICOAGULANTS (Box 61-1)

-  **A. Description (Box 61-2)**
1. Anticoagulants prevent the extension and formation of clots by inhibiting factors in the clotting cascade and decreasing blood coagulability.
  2. Anticoagulants are administered when there is evidence of or likelihood of clot formation—myocardial infarction, unstable angina, atrial fibrillation, deep vein thrombosis, pulmonary embolism, and the presence of mechanical heart valves.
  3. Anticoagulants are contraindicated with active bleeding (except for disseminated intravascular coagulation), bleeding disorders or blood dyscrasias, ulcers, liver and kidney disease, and hemorrhagic brain injuries.
-  **B. Side effects**
1. Hemorrhage
  2. Hematuria
  3. Epistaxis
  4. Ecchymosis
  5. Bleeding gums
  6. Thrombocytopenia
  7. Hypotension
-  **C. Heparin sodium**
1. Description
    - a. Heparin prevents thrombin from converting fibrinogen to fibrin.
    - b. Heparin prevents thromboembolism.
    - c. The therapeutic dose does not dissolve clots but prevents new thrombus formation.
  2. Blood levels
    - a. The normal activated partial thromboplastin time (aPTT) is 20 to 36 seconds in most laboratories but may be as high as 40 seconds.
    - b. To maintain a therapeutic level of anticoagulation when the client is receiving a continuous infusion of heparin, the aPTT should be 1.5 to 2.5 times the normal value.
    - c. Activated partial thromboplastin time therapy should be measured every 4 to 6 hours during initial continuous infusion therapy and then daily.
      - a. If the aPTT is too long, longer than 80 seconds, the dosage should be lowered.
      - b. If aPTT is too short, less than 60 seconds, the dosage should be increased.
-  **3. Interventions**
- a. Monitor aPTT.
  - b. Monitor platelet count.
  - c. Observe for bleeding gums, bruises, nosebleeds, hematuria, hematemesis, occult blood in the stool, and petechiae.
  - d. When administering heparin subcutaneously, inject into the abdomen with a  $\frac{5}{8}$ -inch needle (25 to 28 gauge) at a 90-degree angle and do not aspirate or rub the injection site.
  - e. Continuous infusions must be run on an infusion pump to ensure precise rate of delivery.
  - f. Instruct the client regarding measures to prevent bleeding.
  - g. The antidote to heparin is protamine sulfate.
-  **D. Enoxaparin (Lovenox)—low-molecular-weight heparin**
1. Description: Enoxaparin has the same mechanism of action and use as heparin but is not interchangeable; has a longer half-life than heparin.
  2. Interventions
    - a. Administer by subcutaneous injection only to the recumbent client in the anterolateral or posterolateral abdominal wall; do not expel the air bubble from the prefilled syringe or aspirate during injection.
    - b. Monitor the same laboratory values as for heparin and observe for bleeding.
    - c. The antidote to enoxaparin is protamine sulfate.
-  **E. Warfarin sodium (Coumadin)**
1. Description
    - a. Warfarin suppresses coagulation by acting as an antagonist of vitamin K by inhibiting four dependent clotting factors (X, IX, VII, and II).
    - b. Warfarin prolongs clotting time and is monitored by the prothrombin time (PT) and the international normalized ratio (INR).

**Box 61-1 Anticoagulants****Oral**

Warfarin sodium (Coumadin)

**Parenteral**

Argatroban (Acova)  
 Bivalirudin (Angiomax)  
 Dalteparin (Fragmin)  
 Desirudin (Iprivask)  
 Enoxaparin (Lovenox)  
 Fondaparinux (Arixtra)  
 Heparin sodium  
 Tinzaparin (Innohep)  
 Lepirudin (Refludan)

**Box 61-2 Substances to Avoid With Anticoagulants**

Allopurinol (Zyloprim)  
 Cimetidine (Tagamet)  
 Corticosteroids  
 Green leafy vegetables and foods high in vitamin K  
 Nonsteroidal anti-inflammatory drugs  
 Oral hypoglycemic agents  
 Phenytoin (Dilantin)  
 Salicylates  
 Sulfonamides  
 Ginkgo and ginseng (herbs)

c. It is used for long-term anticoagulation and is used mainly to prevent thromboembolic conditions such as thrombophlebitis, pulmonary embolism, and embolism formation caused by atrial fibrillation, thrombosis, myocardial infarction, or heart valve damage.

**2. Blood levels**

a. The normal PT is 9.6 to 11.8 seconds.  
 b. Warfarin sodium prolongs the PT; the therapeutic range is 1.5 to 2 times the control value.

**3. International normalized ratio (INR)**

a. The normal INR is 1.3 to 2.0.  
 b. The INR is determined by multiplying the observed PT ratio (the ratio of the client's PT to a control PT) by a correction factor specific to a particular thromboplastin preparation used in the testing.  
 c. The treatment goal is to raise the INR to an appropriate value.  
 d. An INR of 2 to 3 is appropriate for most clients, although for some clients the target INR is 3 to 4.5.  
 e. If the INR is below the recommended range, warfarin sodium should be increased.

**Box 61-3 Thrombolytic Medications**

Alteplase (Activase, tPA)  
 Reteplase (Retavase)  
 Streptokinase (Streptase)  
 Tenecteplase (TNKase)

f. If the INR is above the recommended range, warfarin sodium should be reduced.

**4. Interventions**

a. Monitor PT and INR.  
 b. Observe for bleeding gums, bruises, nosebleeds, hematuria, hematemesis, occult blood in the stool, and petechiae.  
 c. Instruct the client regarding measures to prevent bleeding.

**II. THROMBOLYTIC MEDICATIONS (Box 61-3)****A. Description**

1. Thrombolytic medications activate plasminogen; plasminogen generates plasmin (the enzyme that dissolves clots).
2. Thrombolytic medications are used early in the course of myocardial infarction (within 4 to 6 hours of the onset of the infarct) to restore blood flow, limit myocardial damage, preserve left ventricular function, and prevent death.
3. Thrombolytics are also used in arterial thrombosis, deep vein thrombosis, occluded shunts or catheters, and pulmonary emboli.

**B. Contraindications**

1. Active internal bleeding
2. History of hemorrhagic brain attack (stroke)
3. Intracranial problems, including trauma
4. Intracranial or intraspinal surgery within the previous 2 months
5. History of thoracic, pelvic, or abdominal surgery in the previous 10 days
6. History of hepatic or renal disease
7. Uncontrolled hypertension
8. Recently required, prolonged cardiopulmonary resuscitation
9. Known allergy to the specific product or any of its preservatives

**C. Side effects**

1. Bleeding
2. Dysrhythmias
3. Allergic reactions

**D. Interventions**

1. Determine aPTT, PT, fibrinogen level, hematocrit, and platelet count.
2. Monitor vital signs.
3. Assess pulses.
4. Monitor for bleeding.
5. Monitor all excretions for occult blood.

**Box 61-4 Antiplatelet Medications**

Abciximab (ReoPro)  
 Aspirin (acetylsalicylic acid, ASA)  
 Cilostazol (Pletal)  
 Clopidogrel (Plavix)  
 Dipyridamole (Persantine)  
 Dipyridamole; aspirin (Aggrenox)  
 Eptifibatide (Integrilin)  
 Ticlopidine (Ticlid)  
 Tirofiban (Aggrastat)

6. Monitor for neurological changes such as slurred speech, lethargy, confusion, and hemiparesis.
7. Monitor for hypotension and tachycardia.
8. Avoid injections if possible.
9. Apply direct pressure over a puncture site for 20 to 30 minutes.
10. Handle the client as little as possible when moving.
11. Instruct the client to use an electric razor for shaving and to brush teeth gently.
12. Withhold the medication if bleeding develops, and notify the physician.
13. Antidote
  - a. Aminocaproic acid (Amicar) is the antidote for streptokinase.
  - b. Used only in acute, life-threatening conditions

 **Bleeding is the primary concern for a client taking an anticoagulant, thrombolytic, or antiplatelet medication.**

**III. ANTIPLATELET MEDICATIONS** (Box 61-4)**A. Description**

1. Antiplatelet medications inhibit the aggregation of platelets in the clotting process, thereby prolonging the bleeding time.
2. Antiplatelet medications may be used with anticoagulants.
3. Used in the prophylaxis of long-term complications following myocardial infarction, coronary revascularization, stents, and brain attacks (stroke).
4. These medications are contraindicated in those with bleeding disorders and known sensitivity.

**B. Side effects**

1. Gastrointestinal bleeding
2. Bruising
3. Hematuria
4. Tarry stools

**C. Interventions**

1. Determine sensitivity before administration.
2. Monitor vital signs.
3. Instruct the client to take medication with food if gastrointestinal upset occurs.

**Box 61-5 Positive Inotropic/Cardiotonic Medications****Dopamine**

Used as a short-term rescue measure for clients with severe, acute cardiac failure  
 Increases myocardial contractility, thereby improving cardiac performance  
 Dilates renal blood vessels and increases renal blood flow and urine output

**Dobutamine**

Used for short-term management of heart failure  
 Increases myocardial contractility, thereby improving cardiac performance

**Inamrinone Lactate**

Used for short-term management of congestive heart failure in those who have not responded adequately to cardiac glycosides, diuretics, and vasodilators

**Milrinone (Primacor)**

Used for short-term management of congestive heart failure; may be given before heart transplantation

4. Monitor bleeding time.
5. Monitor for side effects related to bleeding.
6. Instruct the client in the use of the medication.
7. Instruct the client to monitor for side effects related to bleeding and in the measures to prevent bleeding.

**IV. POSITIVE INOTROPIC AND CARDIOTONIC MEDICATIONS** (Box 61-5)**A. Description**

1. These medications stimulate myocardial **contractility** and produce a positive inotropic effect.
2. These are used for short-term management of advanced heart failure; the increase in myocardial **contractility** improves cardiac, peripheral, and kidney function by increasing **cardiac output**, decreasing **preload**, improving blood flow to the periphery and kidneys, decreasing edema, and increasing fluid excretion. As a result, fluid retention in the lungs and extremities is decreased (Fig. 61-1).

**B. Side effects**

1. Dysrhythmias
2. Hypotension
3. Thrombocytopenia

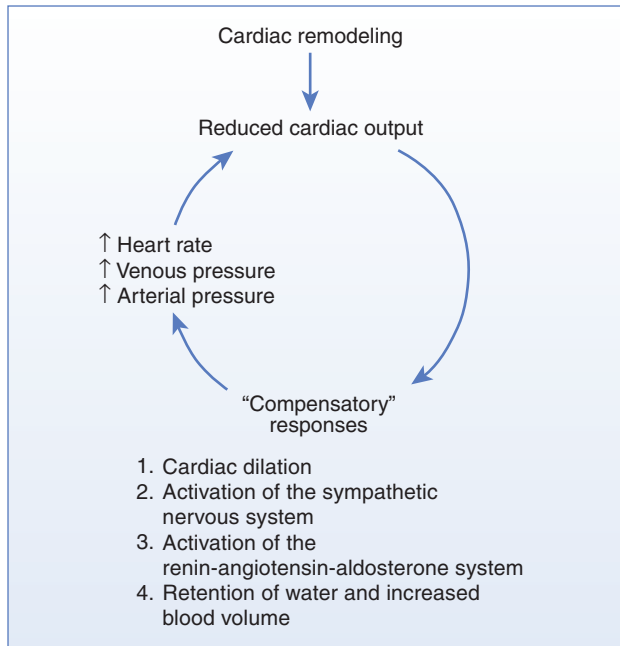

**C. Toxic and adverse reactions**

1. Hepatotoxicity manifested by elevated liver enzyme levels
2. Hypersensitivity manifested by wheezing, shortness of breath, pruritus, urticaria, clammy skin, and flushing

**D. Interventions**

1. Positive inotropic and cardiotonic medications are used for intravenous (IV) administration.

▲ **FIGURE 61-1** The vicious cycle of maladaptive compensatory responses to a failing heart. (From Lehne, R. [2010]. *Pharmacology for nursing care* [7th ed.]. St. Louis: Saunders.)

- Should not be diluted with dextrose-containing solutions (follow physician prescription and agency procedure).
  - For continuous IV infusion, administer with an infusion pump.
  - Stop the infusion if the client's **blood pressure (BP)** drops or dysrhythmias occur.
- Monitor the apical pulse and **BP**.
  - Monitor for hypersensitivity.
  - Assess lung sounds for wheezing and crackles.
  - Monitor for edema.
  - Monitor for relief of heart failure as noted by reduction in edema, lessening of dyspnea, orthopnea, and fatigue.
  - Monitor electrolyte and liver enzyme levels, platelet count, and renal function studies; the medications may decrease potassium and increase liver enzyme levels; continuous electrocardiographic monitoring is done during administration.

## V. CARDIAC GLYCOSIDES (Box 61-6)

### A. Description

- Cardiac glycosides inhibit the sodium-potassium pump, thus increasing intracellular calcium, which causes the heart muscle fibers to contract more efficiently.
- Cardiac glycosides produce a positive inotropic action, which increases the force of myocardial contractions.
- Cardiac glycosides produce a negative chronotropic action, which slows the heart rate.

### Box 61-6 Cardiac Glycoside

Digoxin (Lanoxicaps, Lanoxin)

- Cardiac glycosides produce a negative dromotropic action that slows conduction velocity through the atrioventricular (AV) node.
- The increase in myocardial **contractility** increases cardiac, peripheral, and kidney function by increasing **cardiac output**, decreasing **pre-load**, improving blood flow to the periphery and kidneys, decreasing edema, and increasing fluid excretion; as a result, fluid retention in the lungs and extremities is decreased.
- Cardiac glycosides are used for heart failure and cardiogenic shock, atrial tachycardia, atrial fibrillation, and atrial flutter.
- These medications are contraindicated in those with ventricular dysrhythmias and second- or third-degree heart block and should be used with caution in clients with renal disease, hypothyroidism, and hypokalemia.

### B. Side effects and toxic effects

- Anorexia, nausea, vomiting, diarrhea
- Headache
- Visual disturbances: Diplopia, blurred vision, yellow-green halos, photophobia
- Drowsiness
- Bradycardia
- Fatigue, weakness

▲ **Early signs of digoxin toxicity present as gastrointestinal manifestations (anorexia, nausea, vomiting, diarrhea); then, heart rate abnormalities and visual disturbances appear.**

### C. Interventions

- Monitor for toxicity as evidenced by anorexia, nausea, vomiting, visual disturbances, confusion, bradycardia, heart block, premature ventricular contractions, and tachydysrhythmias.
- Monitor serum digoxin level, electrolyte levels, and renal function test results.
- Therapeutic digoxin range is 0.5 to 2 ng/mL; levels above 2 ng/mL are toxic.
- An increased risk of toxicity exists in clients with hypercalcemia, hypokalemia, hypomagnesemia, or hypothyroidism.
- Monitor the potassium level; if hypokalemia occurs (potassium lower than 3.5 mEq/L), notify the physician.
- Instruct the client to avoid over-the-counter medications.
- Monitor the client taking a potassium-wasting diuretic or corticosteroids closely for hypokalemia

**Box 61-7 Classifications of Diuretics**

Loop diuretics  
 Osmotic diuretics  
 Potassium-sparing diuretics  
 Thiazide diuretics

**Box 61-8 Thiazide and Thiazide-like Diuretics**

Bendroflumethiazide  
 Benzthiazide  
 Chlorthiazide (Diuril)  
 Chlorthalidone (Hygroton, Thalitone)  
 Hydrochlorothiazide (HydroDIURIL)  
 Hydroflumethiazide (Saluron)  
 Indapamide (Lozol)  
 Methyclothiazide (Enduron)  
 Metolazone (Zaroxolyn)  
 Polythiazide  
 Quinethazone  
 Trichlormethiazide

because the hypokalemia can cause digoxin toxicity.

8. Note that older clients are more sensitive to digoxin toxicity.
9. Advise the client to eat foods high in potassium, such as fresh and dried fruits, fruit juices, vegetables, and potatoes.
10. Monitor the apical pulse.
11. If the apical pulse rate is lower than 60 beats/min, the medication should be held and the physician notified.
12. Teach the client how to measure the pulse.
13. Teach the client to notify physician if the pulse rate is lower than 60 or more than 100 beats/min.
14. Teach the client the signs and symptoms of toxicity.
15. Antidote: Digoxin immune Fab (Digibind) is used in extreme toxicity.

**VI. ANTIHYPERTENSIVE MEDICATIONS (Box 61-7)****A. Thiazide diuretics (Box 61-8)**

1. Description
  - a. Thiazide diuretics increase sodium and water excretion by inhibiting sodium reabsorption in the distal tubule of the kidney.
  - b. Used for hypertension and peripheral edema
  - c. Not effective for immediate diuresis
  - d. Used in clients with normal renal function (contraindicated in clients with renal failure)
  - e. Thiazide diuretics should be used with caution in the client taking lithium because lithium toxicity can occur and in the client

**Box 61-9 Loop Diuretics**

Bumetanide (Bumex)  
 Ethacrynic acid (Edecrin)  
 Furosemide (Lasix)  
 Torsemide (Demadex)

taking digoxin, corticosteroids, or hypoglycemic medications.

2. Side effects
  - a. Hypercalcemia, hyperglycemia, hyperuricemia
  - b. Hypokalemia, hyponatremia
  - c. Hypovolemia
  - d. Hypotension
  - e. Headaches
  - f. Nausea, vomiting
  - g. Constipation
  - h. Rashes
  - i. Photosensitivity
  - j. Blood dyscrasias
3. Interventions
  - a. Monitor vital signs.
  - b. Monitor weight.
  - c. Monitor urine output.
  - d. Monitor electrolytes, glucose, calcium, blood urea nitrogen (BUN), creatinine, and uric acid levels.
  - e. Check peripheral extremities for edema.
  - f. Instruct the client to take the medication in the morning to avoid nocturia and sleep interruption.
  - g. Instruct the client in how to record the **BP**.
  - h. Instruct the client to eat foods high in potassium.
    - i. Instruct the client in how to take potassium supplements if prescribed.
    - j. Instruct the client to take medication with food to avoid gastrointestinal upset.
    - k. Instruct the client to change positions slowly to prevent **orthostatic hypotension**.
      - l. Instruct the client to use sunscreen when in direct sunlight because of increased photosensitivity.
      - m. Instruct the client with diabetes mellitus to have the blood glucose level checked periodically.

**B. Loop diuretics (Box 61-9)**

1. Description
  - a. Loop diuretics inhibit sodium and chloride reabsorption from the loop of Henle and the distal tubule.
  - b. Loop diuretics have little effect on the blood glucose level; however, they cause depletion of water and electrolytes, increased uric acid levels, and the excretion of calcium.
  - c. Loop diuretics are more potent than thiazide diuretics, causing rapid diuresis, and thus decreasing vascular fluid volume, **cardiac output**, and **BP**.

- d. Used for hypertension, pulmonary edema, edema associated with heart failure, hypercalcemia, and renal disease
- e. Use loop diuretics with caution in the client taking digoxin or lithium and the client on aminoglycosides, anticoagulants, corticosteroids, or amphotericin B.

2. Side effects
  - a. Hypokalemia, hyponatremia, hypocalcemia, hypomagnesemia
  - b. Hypochloremia
  - c. Thrombocytopenia
  - d. Hyperuricemia
  - e. **Orthostatic hypotension**
  - f. Skin disturbances
  - g. Ototoxicity and deafness
  - h. Thiamine deficiency
  - i. Dehydration

3. Interventions
  - a. Monitor vital signs.
  - b. Monitor weight.
  - c. Monitor urine output.
  - d. Monitor electrolytes, calcium, magnesium, BUN, creatinine, and uric acid levels.
  - e. Check the peripheral extremities for edema.
  - f. Monitor for signs of digoxin or lithium toxicity if the client is on these medications.
  - g. Instruct the client to take the medication in the morning to avoid nocturia and sleep interruption.
  - h. Instruct the client in how to record the **BP**.
  - i. Instruct the client to eat foods high in potassium.
  - j. Instruct the client in how to take potassium supplements if prescribed.
  - k. Instruct the client to take medication with food to avoid gastrointestinal upset.
  - l. Instruct the client to change positions slowly to prevent **orthostatic hypotension**.
  - m. Administer IV furosemide (Lasix) slowly because hearing loss can occur if injected rapidly.

### C. Osmotic diuretics

1. See Chapter 67 for information regarding osmotic diuretics.
2. Box 61-10 lists osmotic diuretics.

### D. Potassium-sparing diuretics (Box 61-11)

1. Description
  - a. Potassium-sparing diuretics act on the distal tubule to promote sodium and water excretion and potassium retention.
  - b. Used for edema and hypertension, to increase urine output, and to treat fluid retention and overload associated with heart failure, ascites resulting from cirrhosis or nephrotic syndrome, and diuretic-induced hypokalemia.

### Box 61-10 Osmotic Diuretics

Glycerin (Osmoglyn)  
 Isosorbide (Ismotic)  
 Mannitol (Osmitol)  
 Urea (Ureaphil)

### Box 61-11 Potassium-Sparing Diuretics

Amiloride (Midamor)  
 Amiloride hydrochloride; hydrochlorothiazide (Moduretic)  
 Spironolactone (Aldactone)  
 Spironolactone; hydrochlorothiazide (Aldactazide)  
 Triamterene (Dyrenium)

- c. Potassium-sparing diuretics are contraindicated in severe kidney or hepatic disease and in severe hyperkalemia.
- d. Potassium-sparing diuretics should be used with caution in the client with diabetes mellitus, taking antihypertensives or lithium, or taking angiotensin-converting enzyme inhibitors or potassium supplements because hyperkalemia can result.

The primary concern with administering potassium-sparing diuretics is hyperkalemia.

### 2. Side effects

- a. Hyperkalemia
- b. Nausea, vomiting, diarrhea
- c. Rash
- d. Dizziness, weakness
- e. Headache
- f. Dry mouth
- g. Photosensitivity
- h. Anemia
- i. Thrombocytopenia

### 3. Interventions

- a. Monitor vital signs.
- b. Monitor urine output.
- c. Monitor for signs and symptoms of hyperkalemia such as nausea, diarrhea, abdominal cramps, tachycardia followed by bradycardia, tall peaked T waves on the electrocardiogram, and oliguria.
- d. Monitor for a potassium level greater than 5.1 mEq/L, which indicates hyperkalemia.
- e. Instruct the client to avoid foods high in potassium.
- f. Instruct the client to avoid exposure to direct sunlight.
- g. Instruct the client to monitor for signs of hyperkalemia.
- h. Instruct the client to avoid salt substitutes because they contain potassium.

**Box 61-12 Peripherally Acting  $\alpha$ -Adrenergic Blockers**

Doxazosin (Cardura)  
Prazosin (Minipress)  
Terazosin (Hytrin)

**Box 61-13 Centrally Acting Sympatholytics**

Clonidine (Catapres)  
Guanabenz (Wytensin)  
Guanfacine (Tenex)  
Methyldopa (Aldomet)

- i. Instruct the client to take with or after meals to decrease gastrointestinal irritation.

**VII. PERIPHERALLY ACTING  $\alpha$ -ADRENERGIC BLOCKERS** (Box 61-12)**A. Description**

1. These medications decrease sympathetic vasoconstriction by reducing the effects of norepinephrine at peripheral nerve endings, resulting in vasodilation and decreased **BP**.
2. These medications are used to maintain renal blood flow.
3. These medications are used to treat hypertension.

**B. Side effects**

1. **Orthostatic hypotension**
2. Reflex tachycardia
3. Sodium and water retention
4. Gastrointestinal disturbances
5. Nausea
6. Drowsiness
7. Nasal congestion
8. Edema
9. Weight gain

**C. Interventions**

1. Monitor vital signs.
2. Monitor for fluid retention and edema.
3. Instruct the client to change positions slowly to prevent **orthostatic hypotension**.
4. Instruct the client in how to monitor the **BP**.
5. Instruct the client to monitor for edema.
6. Instruct the client to decrease salt intake.
7. Instruct the client to avoid over-the-counter medications.

**VIII. CENTRALLY ACTING SYMPATHOLYTICS (ADRENERGIC BLOCKERS)** (Box 61-13)**A. Description**

1. Centrally acting sympatholytics stimulate alpha receptors in the central nervous system to inhibit vasoconstriction, thus reducing peripheral resistance.

**Box 61-14 Angiotensin-Converting Enzyme Inhibitors and Angiotensin Receptor Blockers****Angiotensin-Converting Enzyme Inhibitors**

Benazepril (Lotensin)  
Captopril (Capoten)  
Enalapril (Vasotec)  
Fosinopril (Monopril)  
Lisinopril (Prinivil, Zestril)  
Moexipril (Univasc)  
Perindopril (Aceon)  
Quinapril (Accupril)  
Ramipril (Altace)  
Trandolapril (Mavik)

**Angiotensin II Receptor Blockers**

Candesartan (Atacand)  
Eprosartan (Teveten)  
Irbesartan (Avapro)  
Losartan (Cozaar)  
Olmesartan (Benicar)  
Telmisartan (Micardis)  
Valsartan (Diovan)

2. Used to treat hypertension
3. Contraindicated in impaired liver function

**B. Side effects**

1. Sodium and water retention
2. Drowsiness, dizziness
3. Dry mouth
4. Bradycardia
5. Edema
6. Impotence
7. Hypotension
8. Depression

**C. Interventions**

1. Monitor vital signs.
2. Instruct the client not to discontinue medication because abrupt withdrawal can cause severe rebound hypertension.
3. Monitor liver function tests.

**IX. ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS AND ANGIOTENSIN II RECEPTOR BLOCKERS (ARBs)** (Box 61-14)**A. Description**

1. ACE inhibitors prevent peripheral vasoconstriction by blocking conversion of angiotensin I to angiotensin II (AII).
2. ARBs prevent peripheral vasoconstriction and secretion of aldosterone and block the binding of AII to type 1 AII receptors.
3. These medications are used to treat hypertension and heart failure; also, ACE inhibitors are administered for their cardioprotective effect after myocardial infarction.
4. Avoid use with potassium supplements and potassium-sparing diuretics.

**B. Side effects**

1. Nausea, vomiting, diarrhea
2. Persistent dry cough (ACE inhibitors only)
3. Hypotension
4. Hyperkalemia
5. Tachycardia
6. Headache
7. Dizziness, fatigue
8. Insomnia
9. Hypoglycemic reaction in the client with diabetes mellitus
10. Bruising, petechiae, bleeding
11. Diminished taste (ACE inhibitors)

**!** A persistent dry cough is a common complaint for those taking an ACE inhibitor. Instruct the client to contact the physician if this side effect occurs and persists.

**C. Interventions**

1. Monitor vital signs.
2. Monitor white blood cells, and protein, albumin, BUN, creatinine, and potassium levels.
3. Monitor for hypoglycemic reactions in the client with diabetes mellitus.
4. Instruct the client to take captopril (Capoten) 20 to 60 minutes before a meal.
5. Monitor for bruising, petechiae, or bleeding with captopril.
6. Instruct the client not to discontinue medications because rebound hypertension can occur.
7. Instruct the client not to take over-the-counter medications.
8. Instruct the client in how to take the **BP**.
9. Instruct the client that if dizziness or any other side effects occur and persist to notify the physician.
10. Inform the client that the taste of food may be diminished during the first month of therapy.
11. Instruct the client to report the side effect of angioedema (dermal, subcutaneous, or submucosal swelling) immediately to the health care provider.

**X. ANTIANGINAL MEDICATIONS (Box 61-15)****A. Nitrates (see Priority Nursing Actions)**

1. Description
  - a. Nitrates produce vasodilation.
  - b. Nitrates decrease **preload** and **afterload** and reduce myocardial oxygen consumption.
  - c. Contraindicated in the client with significant hypotension, increased intracranial pressure, or severe anemia
  - d. Should be used with caution with severe renal or hepatic disease
  - e. Avoid abrupt withdrawal of long-acting preparations to prevent the rebound effect of severe pain from myocardial ischemia.

**PRIORITY NURSING ACTIONS!****Actions to Take If a Client With Cardiac Disease Complains of Chest Pain**

1. Quickly assess the client, specifically characteristics of pain, heart rate and rhythm, and blood pressure (BP).
2. Administer a nitroglycerin tablet.
3. Stay with the client.
4. Reassess in 5 minutes.
5. Administer another nitroglycerin tablet if pain is not relieved and the BP is stable.
6. Reassess in 5 minutes.
7. Administer a third nitroglycerin tablet if pain is not relieved and the BP is stable.
8. Reassess in 5 minutes; contact the physician if the third nitroglycerin tablet does not relieve the pain.
9. Document the event, actions taken, and the client's response to treatment.

The usual guidelines for administering nitroglycerin tablets for chest pain include administering 1 tablet every 5 minutes PRN for chest pain, for a total dose of 3 tablets. If the client does not obtain relief after taking a third dose of nitroglycerin, the physician is notified. Before administering the first dose of nitroglycerin, the nurse quickly assesses the client, specifically the characteristics of the pain, the heart rate and rhythm, and BP. The nurse always stays with the client during the event to provide reassurance and to relieve anxiety. Additionally the nurse needs to be present if a life-threatening situation develops. The nurse assesses the client before administering each subsequent dose of nitroglycerin and pays particular attention to the BP because nitroglycerin causes hypotension. The nurse needs to lower the head of the bed and contact the physician before administering another nitroglycerin if hypotension occurs. Agency protocols for this type of event should also be followed. The nurse documents the event, actions taken, and the client's response to treatment.

Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 926). St. Louis: Saunders.

**Box 61-15 Antianginal Medications (Organic Nitrates)**

Amyl nitrate inhalant  
 Isosorbide dinitrate (Isordil, Isordil Titradose, Dilatrate-SR)  
 Isosorbide mononitrate (Imdur, Monoket, ISMO, Isotrate ER)  
 Nitroglycerin, sublingual (Nitrostat, NitroQuick, Nitrotab)  
 Nitroglycerin, translingual (Nitrolingual Pumpspray)  
 Nitroglycerin, transmucosal (Nitrogard)  
 Nitroglycerin, transdermal patches (Minitran, Nitro-Dur, Nitrodisc, Nitrek, Transderm-Nitro)  
 Nitroglycerin ointment (Nitro-Bid)  
 Intravenous nitroglycerin (Nitro-Bid IV, Tridil)

2. Side effects
  - a. Headache
  - b. **Orthostatic hypotension**
  - c. Dizziness, weakness
  - d. Faintness
  - e. Nausea, vomiting
  - f. Flushing or pallor
  - g. Confusion
  - h. Rash
  - i. Dry mouth
  - j. Reflex tachycardia
3. Sublingual medications
  - a. Monitor vital signs.
  - b. Offer sips of water before giving because dryness may inhibit medication absorption.
  - c. Instruct the client to place under the tongue and leave until fully dissolved.
  - d. Instruct the client not to swallow the medication.
  - e. Instruct the client to take one tablet for pain and repeat every 5 minutes, for a total of three doses.
  - f. Instruct the client to seek medical help immediately if pain is not relieved in 15 minutes, following the three doses.
  - g. Inform the client that a stinging or burning sensation may indicate that the tablet is fresh.
  - h. Instruct the client to store medication in a dark, tightly closed bottle.
  - i. Instruct the client to take acetaminophen (Tylenol) for a headache.
4. Translingual medications (spray)
  - a. Instruct the client to direct the spray against the oral mucosa.
  - b. Instruct the client to avoid inhaling the spray.
5. Sustained-released medications: Instruct the client to swallow and not to chew or crush the medication.
6. Transmucosal-buccal medications
  - a. Instruct the client to place the medication between the upper lip and gum or in the buccal area between the cheek and gum.
  - b. Inform the client that the medication will adhere to the oral mucosa and slowly dissolve.
7. Transdermal patch
  - a. Instruct the client to apply the patch to a hairless area, using a new patch and different site each day.
  - b. As prescribed, instruct the client to remove the patch after 12 to 14 hours, allowing 10 to 12 “patch-free” hours each day to prevent tolerance.
8. Topical ointments
  - a. Instruct the client to remove the ointment on the skin from the previous dose.
  - b. Instruct the client to squeeze a ribbon of ointment of the prescribed length onto the applicator paper.

### Box 61-16 $\beta$ -Adrenergic Blockers

#### Nonselective (Block $\beta_1$ and $\beta_2$ )

Carteolol (Cartrol Filmtabs)  
 Carvedilol (Coreg Tiltab)  
 Labetalol (Trandate)  
 Nadolol (Corgard)  
 Nebivolol (Bystolic)  
 Penbutolol (Levatol)  
 Pindolol (Visken)  
 Propranolol (Inderal)  
 Sotalol (Betapace)  
 Timolol (Blocadren)

#### Cardioselective (Block $\beta_1$ )

Acebutolol (Sectral)  
 Atenolol (Tenormin)  
 Betaxolol (Kerlone)  
 Bisoprolol (Zebeta)  
 Metoprolol (Lopressor, Toprol-XL)

- c. Instruct the client to spread the ointment over a 6 × 6-inch area, using the chest, back, abdomen, upper arm, or anterior thigh (avoiding hairy areas), and cover with a plastic wrap.
  - d. Instruct the client to rotate sites and to avoid touching the ointment when applying.
9. Patches and ointments
- a. Wear gloves when applying.
  - b. Do not apply on the chest in the area of defibrillator-cardioverter paddle placement because skin burns can result if the paddles need to be used.

**!** Instruct the client using nitroglycerin tablets to check the expiration date on the medication bottle because expiration may occur within 6 months of obtaining the medication. The tablets will not relieve the chest pain if they have expired.

## XI. $\beta$ -ADRENERGIC BLOCKERS (Box 61-16)

### A. Description

1.  $\beta$ -Adrenergic blockers inhibit response to  $\beta$ -adrenergic stimulation, thus decreasing **cardiac output**.
2.  $\beta$ -Adrenergic blockers block the release of catecholamines, epinephrine, and norepinephrine, thus decreasing the heart rate and **BP**.
3.  $\beta$ -Adrenergic blockers decrease the workload of the heart and decrease oxygen demands.
4. Used for angina, dysrhythmias, hypertension, migraine headaches, prevention of myocardial infarction, and glaucoma
5.  $\beta$ -Adrenergic blockers are contraindicated in the client with asthma, bradycardia, heart failure (with exceptions), severe renal or hepatic disease, hyperthyroidism, or brain attack (stroke); carvedilol,

metoprolol and bisoprolol have been approved for use in heart failure once the client has been stabilized with ACE inhibitor and diuretic therapy.

6.  $\beta$ -Adrenergic blockers should be used with caution in the client with diabetes mellitus because the medication may mask symptoms of hypoglycemia.
7.  $\beta$ -Adrenergic blockers should be used with caution in the client taking antihypertensive medications.

#### B. Side effects

1. Bradycardia
2. Bronchospasm
3. Hypotension
4. Weakness, fatigue
5. Nausea, vomiting
6. Dizziness
7. Hyperglycemia
8. Agranulocytosis
9. Behavioral or psychotic response
10. Depression
11. Nightmares

#### C. Interventions

1. Monitor vital signs.
2. Withhold the medication if the pulse or **BP** is not within the prescribed parameters.
3. Monitor for signs of heart failure or worsening heart failure.
4. Assess for respiratory distress and for signs of wheezing and dyspnea.
5. Instruct the client to report dizziness, light-headedness, or nasal congestion.
6. Instruct the client not to stop the medication because rebound hypertension, rebound tachycardia, or an anginal attack can occur.
7. Advise the client taking insulin that the  $\beta$ -adrenergic blocker can mask early signs of hypoglycemia, such as tachycardia and nervousness.
8. Instruct the client taking insulin to monitor the blood glucose level.
9. Instruct the client in how to take pulse and **BP**.
10. Instruct the client to change positions slowly to prevent **orthostatic hypotension**.
11. Instruct the client to avoid over-the-counter medications, especially cold medications and nasal decongestants.

### XII. CALCIUM CHANNEL BLOCKERS (Box 61-17)

#### A. Description

1. Calcium channel blockers decrease cardiac **contractility** (negative inotropic effect by relaxing smooth muscle) and the workload of the heart, thus decreasing the need for oxygen.
2. Calcium channel blockers promote vasodilation of the coronary and peripheral vessels.
3. Used for angina, dysrhythmias, or hypertension

### Box 61-17 Calcium Channel Blockers

Amlodipine (Norvasc)  
 Clevidipine (Cleviprex)  
 Diltiazem (Cardizem, Dilacor XR, others)  
 Felodipine (Plendil)  
 Isradipine (DynaCirc)  
 Nicardipine (Cardene)  
 Nifedipine (Adalat, Nifedical, Nifediac, Procardia)  
 Nimodipine (Nimotop)  
 Nisoldipine (Sular)  
 Verapamil (Calan, Isoptin SR, Covera-HS, Verelan)

4. Should be used with caution in the client with CHF, bradycardia, or atrioventricular block

#### B. Side effects

1. Bradycardia
2. Hypotension
3. Reflex tachycardia as a result of hypotension
4. Headache
5. Dizziness, light-headedness
6. Fatigue
7. Peripheral edema
8. Constipation
9. Flushing of the skin
10. Changes in liver and kidney function

#### C. Interventions

1. Monitor vital signs.
2. Monitor for signs of heart failure.
3. Monitor liver enzyme levels.
4. Monitor kidney function tests.
5. Instruct the client not to discontinue the medication.
6. Instruct the client in how to take the pulse.
7. Instruct the client to notify the physician if dizziness or fainting occurs.
8. Instruct the client not to crush or chew sustained-release tablets.

### XIII. PERIPHERAL VASODILATORS (Box 61-18)

#### A. Description

1. Peripheral vasodilators decrease peripheral resistance by exerting a direct action on the arteries or on the arteries and the veins.
2. Peripheral vasodilators increase blood flow to the extremities and are used in peripheral vascular disorders of venous and arterial vessels.
3. Peripheral vasodilators are most effective for disorders resulting from vasospasm (Raynaud's disease).
4. These medications may decrease some symptoms of cerebral vascular insufficiency.

#### B. Side effects

1. Light-headedness, dizziness
2. **Orthostatic hypotension**
3. Tachycardia
4. Palpitations

**Box 61-18 Peripheral Vasodilators** **$\alpha$ -Adrenergic Blockers**

Prazosin (Minipress)  
Terazosin (Hytrin)

**Calcium Channel Blockers**

Diltiazem (Cardizem, Dilacor XR, others)  
Nifedipine (Adalat, Nifedical, Nifediac, Procardia)  
Nimodipine (Nimotop)  
Verapamil (Calan, Isoptin SR, Covera-HS, Verelan)

**Hemorheological**

Pentoxifylline (Trental; increases microcirculation and tissue perfusion)

**Box 61-19 Direct-Acting Vasodilators**

Diazoxide (Hyperstat)  
Fenoldopam (Corlopam)  
Hydralazine (Apresoline)  
Minoxidil (Loniten)  
Nitroglycerin  
Sodium nitroprusside (Nitropress)

5. Flushing
6. Gastrointestinal distress

**C. Interventions**

1. Monitor vital signs, especially the **BP** and the heart rate.
2. Monitor for **orthostatic hypotension** and tachycardia.
3. Monitor for signs of inadequate blood flow to the extremities, such as pallor, feeling cold, and pain.
4. Instruct the client that it may take up to 3 months for a desired therapeutic response.
5. Advise the client not to smoke because smoking increases vasospasm.
6. Instruct the client to avoid aspirin or aspirin-like compounds unless approved by the physician.
7. Instruct the client to take the medication with meals if gastrointestinal disturbances occur.
8. Instruct the client to avoid alcohol because it may cause a hypotensive reaction.
9. Encourage the client to change positions slowly to avoid **orthostatic hypotension**.

#### **XIV. DIRECT-ACTING ARTERIOLAR VASODILATORS** (Box 61-19)

**A. Description**

1. Direct-acting vasodilators relax the smooth muscles of the blood vessels, mainly the arteries, causing vasodilation.
2. Direct-acting vasodilators promote an increase in blood flow to the brain and kidneys.

3. With vasodilation, the **BP** drops and sodium and water are retained, resulting in peripheral edema.
4. Diuretics may be given to decrease the edema.
5. Direct-acting vasodilators are used in the client with moderate to severe hypertension.
6. Direct-acting vasodilators are used during acute hypertensive emergencies.

**B. Side effects**

1. Hypotension
2. Reflex tachycardia caused by vasodilation and the drop in **BP**
3. Palpitations
4. Edema
5. Dizziness
6. Headaches
7. Nasal congestion
8. Gastrointestinal bleeding
9. Neurological symptoms
10. Confusion
11. Excess hair growth with minoxidil (Loniten)
12. With sodium nitroprusside, cyanide toxicity and thiocyanate toxicity can occur.

**C. Interventions**

1. Monitor vital signs, especially **BP**.
2. Sodium nitroprusside
  - a. Monitor cyanide and thiocyanate levels.
  - b. Protect from light because the medication decomposes.
  - c. When administering, solution must be covered by a dark bag provided by the manufacturer and is stable for 24 hours.
  - d. Discard if the medication is red, green, or blue.

 **Vasodilators cause orthostatic hypotension. Instruct the client about safety measures when taking these medications, such as the need to rise from a lying to a sitting or standing position slowly.**

**XV. MISCELLANEOUS VASODILATOR****A. Description**

1. Nesiritide (Natrecor)
  - a. Recombinant version of human B-type natriuretic peptide that vasodilates arteries and veins
  - b. Used for the treatment of decompensated heart failure
2. Side effects
  - a. Hypotension
  - b. Confusion
  - c. Dizziness
  - d. Dysrhythmias
3. Interventions
  - a. Administer by continuous intravenous infusion via pump
  - b. Monitor **BP**, cardiac rhythm, urine output, and body weight.
  - c. Monitor for signs of resolving heart failure.

## XVI. ANTIDYSRHYTHMIC MEDICATIONS

- A.** Description: Antidysrhythmic medications suppress dysrhythmias by inhibiting abnormal pathways of electrical conduction through the heart.
- B.** Class I antidysrhythmics are sodium channel blockers, class II are  $\beta$ -blockers, class III are potassium channel blockers (medications that delay repolarization), and class IV are calcium channel blockers.
- C.** Class IA antidysrhythmics
1. Disopyramide (Norpace)
  2. Procainamide (Procanbid)
  3. Quinidine sulfate
- D.** Class IB antidysrhythmics
1. Lidocaine (Xylocaine)
  2. Mexiletine hydrochloride (Mexitil)
  3. Phenytoin (Dilantin)
- E.** Class IC antidysrhythmics
1. Flecainide acetate (Tambocor)
  2. Propafenone hydrochloride (Rythmol)
  3. Other Class I medication: Moricizine (Ethmozine)
  4. Side effects: Class I antidysrhythmics
    - a. Hypotension
    - b. Heart failure
    - c. Worsened or new dysrhythmias
    - d. Nausea, vomiting, or diarrhea
- F.** Class II antidysrhythmics
1. Acebutolol (Sectral)
  2. Esmolol (Brevibloc)
  3. Propranolol (Inderal)
  4. Side effects: Class II antidysrhythmics
    - a. Dizziness
    - b. Fatigue
    - c. Hypotension
    - d. Bradycardia
    - e. Heart failure
    - f. Dysrhythmias
    - g. Heart block
    - h. Bronchospasms
    - i. Gastrointestinal distress
- G.** Class III antidysrhythmics
1. Amiodarone (Cordarone, Pacerone)
  2. Bretylium
  3. Dofetilide (Tikosyn)
  4. Ibutilide (Corvert)
  5. Sotalol (Betapace)
  6. Side effects: Class III antidysrhythmics
    - a. Hypotension
    - b. Bradycardia
    - c. Nausea, vomiting
    - d. Amiodarone hydrochloride may cause pulmonary fibrosis, photosensitivity, bluish skin discoloration, corneal deposits, peripheral neuropathy, tremor, poor coordination, abnormal gait, and hypothyroidism.
    - e. Bretylium may cause vertigo, syncope, and dizziness.

## Box 61-20 Adrenergic Agonists

Dobutamine  
Dopamine  
Epinephrine (Adrenalin)  
Isoproterenol (Isuprel)  
Norepinephrine (Levophed)

- H.** Class IV antidysrhythmics
1. Verapamil (Isoptin, Calan, Verelan)
  2. Diltiazem (Cardizem)
  3. Side effects: Class IV antidysrhythmics
    - a. Dizziness
    - b. Hypotension
    - c. Bradycardia
    - d. Edema
    - e. Constipation
- I.** Other antidysrhythmics
1. Adenosine (Adenocard)
  2. Digoxin (Lanoxin)
- J.** Interventions for antidysrhythmics
1. Monitor heart rate, respiratory rate, and **BP**.
  2. Monitor electrocardiogram.
  3. Provide continuous cardiac monitoring.
  4. Maintain therapeutic serum drug levels.
  5. Before administering lidocaine, always check the vial label to prevent administering a form that contains epinephrine or preservatives because these solutions are used for local anesthesia only.
  6. Do not administer antidysrhythmics with food because food may affect absorption.
  7. Mexiletine may be administered with food or antacids to reduce gastrointestinal distress.
  8. Always administer IV antidysrhythmics via an infusion pump.
  9. Monitor for signs of fluid retention such as weight gain, peripheral edema, or shortness of breath.
  10. Advise the client to limit fluid and salt intake to minimize fluid retention.
  11. Monitor respiratory, thyroid, and neurological functions.
  12. After administering bretylium, keep the client supine and monitor for hypotension.
  13. Instruct the client to change positions slowly to minimize **orthostatic hypotension**.
  14. Instruct the client taking amiodarone to use sunscreen and protective clothing to prevent photosensitivity reactions.
  15. Encourage the client to increase fiber intake to prevent constipation.

## XVII. ADRENERGIC AGONISTS (Box 61-20)

- A.** Dobutamine
1. Increases myocardial force and **cardiac output** through stimulation of beta receptors

- Used in clients with heart failure and for clients undergoing cardiopulmonary bypass surgery

-  **B. Dopamine**
- Increases **BP** and **cardiac output** through positive inotropic action and increases renal blood flow through its action on alpha and beta receptors
  - Used to treat mild renal failure caused by low **cardiac output**
- C. Epinephrine (Adrenalin)**
- Used for cardiac stimulation in cardiac arrest
  - Used for bronchodilation in asthma or allergic reactions
  - Produces mydriasis
  - Produces local vasoconstriction when combined with local anesthetics and prolongs anesthetic action by decreasing blood flow to the site
- D. Isoproterenol (Isuprel)**
- Stimulates beta receptors
  - Used for cardiac stimulation and bronchodilation
- E. Norepinephrine (Levophed)**
- Stimulates the heart in cardiac arrest
  - Vasoconstricts and increases the **BP** in hypotension and shock
-  **F. Side effects**
- Dysrhythmias
  - Tachycardia
  - Angina
  - Restlessness
  - Urgency or urinary incontinence
-  **G. Interventions**
- Monitor vital signs.
  - Monitor lung sounds.
  - Monitor urinary output.
  - Monitor electrocardiogram.
  - Administer the medication through a large vein.

## XVIII. ANTILIPEMIC MEDICATIONS

- A. Description**
- Antilipemic medications reduce serum levels of cholesterol, triglycerides, or low-density lipoprotein.
  - When cholesterol, triglyceride, and low-density lipoprotein levels are elevated, the client is at increased risk for coronary artery disease.
  - In many cases, diet alone will not lower blood lipid levels; therefore antilipemic medications will be prescribed.
- B. Bile sequestrants (Box 61-21)**
- Description
    - Bind with acids in the intestines, which prevents reabsorption of cholesterol
    - Should not be used as the only therapy in clients with elevated triglyceride levels because they may raise triglyceride levels.
  - Side effects
    - Constipation
    - Gastrointestinal disturbances: Heartburn, nausea, belching, bloating

### Box 61-21 Bile Acid Sequestrants

Cholestyramine (Questran)  
 Colesevelam (WelChol)  
 Colestipol (Colestid)

### Box 61-22 HMG-CoA Reductase Inhibitors

Atorvastatin (Lipitor)  
 Fluvastatin (Lescol)  
 Lovastatin (Mevacor)  
 Pravastatin (Pravachol)  
 Rosuvastatin (Crestor)  
 Simvastatin (Zocor)

- Interventions
  - Cholestyramine (Questran) comes in a gritty powder that must be mixed thoroughly in juice or water before administration.
  - Monitor the client for early signs of peptic ulcer such as nausea and abdominal discomfort followed by abdominal pain and distention.
  - Instruct the client that the medication must be taken with and followed by sufficient fluids.
- HMG-CoA reductase inhibitors (Box 61-22)
  - Description
    - Lovastatin (Mevacor) is highly protein-bound and should not be administered with anticoagulants.
    - Lovastatin should not be administered with gemfibrozil (Lopid).
    - Administer lovastatin with caution to the client taking immunosuppressive medications.
  - Side effects
    - Nausea
    - Diarrhea or constipation
    - Abdominal pain or cramps
    - Flatulence
    - Dizziness
    - Headache
    - Blurred vision
    - Rash
    - Pruritus
    - Elevated liver enzyme levels
    - Muscle cramps and fatigue
  - Interventions
    - Monitor serum liver enzyme levels.
    - Instruct the client to receive an annual eye examination because the medications can cause cataract formation.
    - If lovastatin is not effective in lowering the lipid level after 3 months, it should be discontinued.

**Box 61-23 Other Antilipemic Medications**

Ezetimibe (Zetia)  
 Ezetimibe; simvastatin (Vytorin)  
 Fenofibrate  
 Gemfibrozil (Lopid)  
 Nicotinic acid (Niacin)  
 Probucole

 **Instruct the client who is taking an antilipemic medication to report any unexplained muscular pain to the health care provider immediately.**

**D. Other antilipemic medications (Box 61-23)****1. Description**

- a. Gemfibrozil should not be taken with anti-coagulants because they compete for protein sites; if the client is taking an anticoagulant, the anticoagulant dose should be reduced during antilipemic therapy and the INR should be monitored closely.
- b. Do not administer gemfibrozil with HMG-CoA reductase inhibitors because it increases the risk for myositis, myalgias, and rhabdomyolysis.
- c. Fish oil supplements have been associated with a decreased risk for cardiovascular heart disease; plant stanol and sterol esters and cholestin have been associated with reducing cholesterol levels.

**2. Interventions**

- a. Monitor vital signs.
- b. Monitor liver enzyme levels.
- c. Monitor serum cholesterol and triglyceride levels.
- d. Instruct the client to restrict intake of fats, cholesterol, carbohydrates, and alcohol.
- e. Instruct the client to follow an exercise program.
- f. Instruct the client that it will take several weeks before the lipid level declines.
- g. Instruct the client to have an annual eye examination and to report any changes in vision.
- h. Instruct the client with diabetes mellitus who is taking gemfibrozil to monitor blood glucose levels regularly.
- i. Instruct the client to increase fluid intake.
- j. Note that nicotinic acid has numerous side effects, including gastrointestinal disturbances, flushing of the skin, elevated liver enzyme levels, hyperglycemia, and hyperuricemia.
- k. Instruct the client that aspirin or nonsteroidal anti-inflammatory drugs taken 30 minutes before may assist in reducing the side effect of cutaneous flushing from nicotinic acid.
- l. Instruct the client to take nicotinic acid with meals to reduce gastrointestinal discomfort.

**MORE QUESTIONS ON THE CD!****Practice Questions**

- 717.** A client with atrial fibrillation is receiving a continuous heparin infusion at 1000 units/hr. The nurse would determine that the client is receiving the therapeutic effect based on which of the following results?
1. Prothrombin time of 12.5 seconds
  2. Activated partial thromboplastin time of 60 seconds
  3. Activated partial thromboplastin time of 28 seconds
  4. Activated partial thromboplastin time longer than 120 seconds
- 718.** A nurse provides discharge instructions to a post-operative client who is taking warfarin sodium (Coumadin). Which statement, if made by the client, reflects the need for further teaching?
1. "I will take my pills every day at the same time."
  2. "I will avoid alcohol consumption."
  3. "I have already called my family to pick up a Medic-Alert bracelet."
  4. "I will take Ecotrin (enteric-coated aspirin) for my headaches because it is coated."
- 719.** A client who is receiving digoxin (Lanoxin) daily has a serum potassium level of 3 mEq/L and is complaining of anorexia. A physician prescribes a digoxin level to rule out digoxin toxicity. A nurse checks the results, knowing that which of the following is the therapeutic serum level (range) for digoxin?
1. 0.5 to 2 ng/mL
  2. 1.2 to 2.8 ng/mL
  3. 3 to 5 ng/mL
  4. 3.5 to 5.5 ng/mL
- 720.** A client is being treated with procainamide (Procanbid) for a cardiac dysrhythmia. Following intravenous administration of the medication, the client complains of dizziness. What intervention should the nurse take first?
1. Administer prescribed nitroglycerin tablets.
  2. Measure the heart rate on the rhythm strip.
  3. Obtain a 12-lead electrocardiogram immediately.
  4. Auscultate the client's apical pulse and obtain a blood pressure.
- 721.** A nurse is monitoring a client who is taking propranolol (Inderal). Which assessment data would indicate a potential serious complication associated with propranolol?
1. The development of complaints of insomnia
  2. The development of audible expiratory wheezes

3. A baseline blood pressure of 150/80 mm Hg followed by a blood pressure of 138/72 mm Hg after two doses of the medication
  4. A baseline resting heart rate of 88 beats/min followed by a resting heart rate of 72 beats/min after two doses of the medication
- 722.** A nurse is caring for a client receiving a heparin intravenous (IV) infusion. The nurse anticipates that which laboratory study will be prescribed to monitor the therapeutic effect of heparin?
1. Hematocrit
  2. Hemoglobin
  3. Prothrombin time
  4. Activated partial thromboplastin time
- 723.** A client is diagnosed with an acute myocardial infarction and is receiving tissue plasminogen activator, alteplase (Activase, tPA). Which of the following is a priority nursing intervention?
1. Monitor for renal failure.
  2. Monitor psychosocial status.
  3. Monitor for signs of bleeding.
  4. Have heparin sodium available.
- 724.** A nurse is planning to administer hydrochlorothiazide (HydroDIURIL) to a client. The nurse understands that which of the following are concerns related to the administration of this medication?
1. Hypouricemia, hyperkalemia
  2. Increased risk of osteoporosis
  3. Hypokalemia, hyperglycemia, sulfa allergy
  4. Hyperkalemia, hypoglycemia, penicillin allergy
- 725.** A home health care nurse is visiting a client with elevated triglyceride levels and a serum cholesterol level of 398 mg/dL. The client is taking cholestyramine (Questran). Which of the following statements, if made by the client, indicates the need for further education?
1. "Constipation and bloating might be a problem."
  2. "I'll continue to watch my diet and reduce my fats."
  3. "Walking a mile each day will help the whole process."
  4. "I'll continue my nicotinic acid from the health food store."
- 726.** A client is on nicotinic acid (niacin) for hyperlipidemia and the nurse provides instructions to the client about the medication. Which statement by the client would indicate an understanding of the instructions?
1. "It is not necessary to avoid the use of alcohol."
  2. "The medication should be taken with meals to decrease flushing."
  3. "Clay-colored stools are a common side effect and should not be of concern."
  4. "Ibuprofen (Motrin) taken 30 minutes before the nicotinic acid should decrease the flushing."
- 727.** A 66-year-old client complaining of not feeling well is seen in a clinic. The client is taking several medications for the control of heart disease and hypertension. These medications include atenolol (Tenormin), digoxin (Lanoxin), and chlorothiazide (Diuril). A tentative diagnosis of digoxin toxicity is made. Which of the following assessment data would support this diagnosis?
1. Dyspnea, edema, and palpitations
  2. Chest pain, hypotension, and paresthesia
  3. Double vision, loss of appetite, and nausea
  4. Constipation, dry mouth, and sleep disorder
- 728.** A client is being treated for acute congestive heart failure with intravenously administered bumetanide (Bumex). The vital signs are as follows: blood pressure, 100/60 mm Hg; pulse, 96 beats/min; and respirations, 24 breaths/min. After the initial dose, which of the following is the priority assessment?
1. Monitoring weight loss
  2. Monitoring urine output
  3. Monitoring blood pressure
  4. Monitoring potassium level
- 729.** Intravenous heparin therapy is prescribed for a client. While implementing this prescription, a nurse ensures that which of the following medications is available on the nursing unit?
1. Protamine sulfate
  2. Potassium chloride
  3. Aminocaproic acid (Amicar)
  4. Vitamin K (AquaMEPHYTON)
- 730.** A client is receiving thrombolytic therapy with a continuous infusion of streptokinase (Streptase). The client suddenly becomes extremely anxious and complains of itching. A nurse hears stridor and on examination of the client notes generalized urticaria and hypotension. Which of the following should be the priority action of the nurse?
1. Administer oxygen and protamine sulfate.
  2. Stop the infusion and call the physician.
  3. Cut the infusion rate in half and sit the client up in bed.
  4. Administer diphenhydramine (Benadryl) and continue the infusion.
- 731.** A client is admitted with pulmonary embolism and is to be treated with streptokinase (Streptase). A nurse would report which of the following assessments to the physician before initiating this therapy?

1. Adventitious breath sounds
2. Temperature of 99.4° F orally
3. Blood pressure of 198/110 mm Hg
4. Respiratory rate of 28 breaths/min

### Alternate Item Format: Multiple Response

**732.** The nurse is monitoring a client who is taking digoxin (Lanoxin) for adverse effects. Which

findings are characteristic of digoxin toxicity. **Select all that apply.**

- 1. Tremors
- 2. Diarrhea
- 3. Irritability
- 4. Blurred vision
- 5. Nausea and vomiting

## ANSWERS

### 717. 2

**Rationale:** Common laboratory ranges for activated partial thromboplastin time are 20 to 36 seconds. Because the activated partial thromboplastin time should be 1.5 to 2.5 times the normal value, the client's activated partial thromboplastin time would be considered therapeutic if it was 60 seconds.

**Test-Taking Strategy:** Use the process of elimination. Option 1 is eliminated because the prothrombin time assesses response to warfarin (Coumadin) therapy. Eliminate option 3 because at 28 seconds the client is receiving no therapeutic effect from the continuous heparin infusion. Eliminate option 4 because this value is beyond the therapeutic range and the client is at risk for bleeding. Review laboratory tests to monitor the effectiveness of heparin therapy if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Pharmacology

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., pp. 682–683). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 600). St. Louis: Saunders.

### 718. 4

**Rationale:** Ecotrin is an aspirin-containing product and should be avoided. Alcohol consumption should be avoided by a client taking warfarin sodium. Taking prescribed medication at the same time each day increases client compliance. The Medic-Alert bracelet provides health care personnel emergency information.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *need for further teaching*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Recalling that warfarin (Coumadin) is an anticoagulant and that Ecotrin is an aspirin-containing product will direct you to option 4. Review client teaching points related to warfarin if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**References:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 1197). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 606). St. Louis: Saunders.

### 719. 1

**Rationale:** Therapeutic levels for digoxin range from 0.5 to 2 ng/mL. Therefore options 2, 3, and 4 are incorrect.

**Test-Taking Strategy:** Knowledge of the therapeutic serum digoxin level will direct you to option 1. If you had difficulty with this question, learn the therapeutic level for digoxin.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 624). St. Louis: Saunders.

### 720. 4

**Rationale:** Signs of toxicity from procainamide include confusion, dizziness, drowsiness, decreased urination, nausea, vomiting, and tachydysrhythmias. If the client complains of dizziness, the nurse should assess the vital signs first. Although options 2 and 3 may be interventions, these would be done after the vital signs are taken. Nitroglycerin is a vasodilator and will lower the blood pressure.

**Test-Taking Strategy:** Use the steps of the nursing process to eliminate options 1 and 3. From the remaining options, remember always to assess the client first, not the monitoring devices. Therefore option 4 is correct. Review the signs of toxicity and the nursing interventions if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**References:** Gahart, B., & Nazareno, A. (2010). *2010 Intravenous medications* (26th ed., p. 1115). St. Louis: Mosby.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 551). St. Louis: Saunders.

### 721. 2

**Rationale:** Audible expiratory wheezes may indicate a serious adverse reaction, bronchospasm.  $\beta$ -Blockers may induce this reaction, particularly in clients with chronic obstructive pulmonary disease or asthma. Normal decreases in blood pressure and heart rate are expected. Insomnia is a frequent mild side effect and should be monitored.

**Test-Taking Strategy:** Use the process of elimination, eliminating options 3 and 4 because these are expected effects from

the medication. Note the strategic words *potential serious complication*. These strategic words will direct you to option 2. Review the adverse effects of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (pp. 955–957). St. Louis: Saunders.

#### 722. 4

**Rationale:** The prothrombin time will assess for the therapeutic effect of warfarin sodium (Coumadin), and the activated partial thromboplastin time (aPTT) will assess the therapeutic effect of heparin. Hematocrit and hemoglobin values assess red blood cell concentrations. Baseline assessment, including an aPTT value, should be completed, as well as ongoing daily aPTT values while the client is taking heparin. Heparin doses are determined based on the result of the aPTT.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 2 because they are comparable or alike and are unrelated to heparin therapy. From the remaining options, recall the relationship between the prothrombin time and warfarin and the aPTT and heparin. Review care of a client on heparin infusion if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Gahart, B., & Nazareno, A. (2010). *2010 Intravenous medications* (26th ed., p. 680). St. Louis: Mosby.

#### 723. 3

**Rationale:** Tissue plasminogen activator is a thrombolytic. Hemorrhage is a complication of any type of thrombolytic medication. The client is monitored for bleeding. Monitoring for renal failure and monitoring the client's psychosocial status are important but are not the most critical interventions. Heparin is given after thrombolytic therapy, but the question is not asking about follow-up medications.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *priority*. Remember, bleeding is a priority. Review care of the client on tissue plasminogen activator if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 42). St. Louis: Saunders.

#### 724. 3

**Rationale:** Thiazide diuretics such as hydrochlorothiazide are sulfa-based medications, and a client with a sulfa allergy is at risk for an allergic reaction. Also, clients are at risk for hypokalemia, hyperglycemia, hypercalcemia, hyperlipidemia, and hyperuricemia.

**Test-Taking Strategy:** Use the process of elimination. Recalling that thiazide diuretics carry a sulfa ring will direct you to option 3. Review the nursing considerations related to administering this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**References:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (pp. 558–559). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 453–454). St. Louis: Saunders.

#### 725. 4

**Rationale:** Nicotinic acid, even an over-the-counter form, should be avoided because it may lead to liver abnormalities. All lipid-lowering medications also can cause liver abnormalities, so a combination of nicotinic acid and cholestyramine resin is to be avoided. Constipation and bloating are the two most common side effects. Walking and the reduction of fats in the diet are therapeutic measures to reduce cholesterol and triglyceride levels.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *need for further education*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Remembering that over-the-counter medications should be avoided when a client is taking a prescription medication will direct you to option 4. Review client teaching points related to this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 577–578). St. Louis: Saunders.

#### 726. 4

**Rationale:** Flushing is a side effect of this medication. Aspirin or a nonsteroidal anti-inflammatory drug can be taken 30 minutes prior to taking the medication to decrease flushing. Alcohol consumption needs to be avoided because it will enhance this side effect. The medication should be taken with meals but this will decrease gastrointestinal upset; taking the medication with meals has no effect on the flushing. Clay-colored stools are a sign of hepatic dysfunction and should be immediately reported to the physician.

**Test-Taking Strategy:** Use the process of elimination. Option 1 can be eliminated because alcohol must be abstained from. Option 2 can be eliminated because taking the medication with meals helps decrease the gastrointestinal symptoms. The clay-colored stools in option 3 is a sign of hepatic dysfunction and should be immediately reported to the physician. Review the client teaching points related to this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 578). St. Louis: Saunders.

#### 727. 3

**Rationale:** Double vision, loss of appetite, and nausea are early signs of digoxin toxicity. Additional signs of digoxin toxicity

include bradycardia, difficulty reading, other visual alterations such as green and yellow vision or seeing spots or halos, confusion, vomiting, diarrhea, decreased libido, and impotence.

**Test-Taking Strategy:** Use the process of elimination. Recalling that gastrointestinal and visual disturbances occur with digoxin toxicity will direct you to option 3. If you had difficulty with this question, review the signs of digoxin toxicity.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 624). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 531–532). St. Louis: Saunders.

### 728. 3

**Rationale:** Hypotension is a common side effect associated with the use of this medication. Options 1, 2, and 4 also require assessment but are not the priority.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *priority*. Also, note that blood pressure is mentioned in the question and in option 3. Use of the ABCs—airway, breathing, and circulation—also will direct you to option 3. Review care of the client receiving this medication by the intravenous route if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**References:** Gahart, B., & Nazareno, A. (2010). *2010 Intravenous medications* (26th ed., p. 215). St. Louis: Mosby.

Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 150). St. Louis: Saunders.

### 729. 1

**Rationale:** The antidote to heparin is protamine sulfate; it should be readily available for use if excessive bleeding or hemorrhage should occur. Vitamin K is an antidote for warfarin sodium. Aminocaproic acid is the antidote for thrombolytic therapy. Potassium chloride is administered for a potassium deficit.

**Test-Taking Strategy:** Knowledge regarding the various antidotes is needed to answer this question. Remember the antidote to heparin is protamine sulfate. Learn these antidotes if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Pharmacology

**Reference:** Gahart, B., & Nazareno, A. (2010). *2010 Intravenous medications* (26th ed., p. 682). St. Louis: Mosby.

### 730. 2

**Rationale:** The client is experiencing an anaphylactic reaction to streptokinase, which is allergenic. The infusion should be stopped, the physician notified, and the client treated with epinephrine, antihistamines, and corticosteroids.

**Test-Taking Strategy:** Recall that an allergic reaction and possible anaphylaxis are risks associated with streptokinase therapy. Also, focusing on the signs and symptoms in the question will assist in answering the question. When a severe allergic reaction

occurs, the offending substance should be stopped, and lifesaving treatment should begin. Review the adverse effects of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**Reference:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 688). St. Louis: Saunders.

### 731. 3

**Rationale:** Thrombolytic therapy is contraindicated in a number of preexisting conditions in which there is a risk of uncontrolled bleeding, similar to the case in anticoagulant therapy. Thrombolytic therapy also is contraindicated in severe uncontrolled hypertension because of the risk of cerebral hemorrhage. Therefore the nurse would report the results of the blood pressure to the physician before initiating therapy.

**Test-Taking Strategy:** Use the process of elimination and focus on the client's diagnosis. Options 1, 2, and 4 may be present in the client with pulmonary embolism but are not necessarily signs that warrant reporting before this therapy is initiated. Review the contraindications associated with the administration of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 858–859). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 732. 2, 4, 5

**Rationale:** Digoxin (Lanoxin) is a cardiac glycoside. The risk of toxicity can occur with the use of this medication. Toxicity can lead to life-threatening events and the nurse needs to monitor the client closely for signs of toxicity. Early signs of toxicity include gastrointestinal manifestations such as anorexia, nausea, vomiting, and diarrhea. Subsequent manifestations include headache, visual disturbances such as diplopia, blurred vision, yellow-green halos, photophobia, drowsiness, fatigue, and weakness. Cardiac rhythm abnormalities can also occur. The nurse also monitors the digoxin level. Therapeutic levels for digoxin range from 0.5 to 2 ng/mL.

**Test-Taking Strategy:** Specific knowledge regarding the characteristics of digoxin toxicity is needed to answer this question. Recall that the early signs are gastrointestinal manifestations. Next, recall that visual disturbances occur. If you had difficulty with this question review the manifestations associated with digoxin toxicity.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 624). St. Louis: Saunders.

# UNIT XIV

## The Adult Client With a Renal System Disorder

### PYRAMID TERMS

**acute renal failure (ARF)** The sudden loss of kidney function caused by renal cell damage from ischemia or toxic substances. Acute renal failure occurs abruptly and can be reversible. Acute renal failure leads to hypoperfusion, cell death, and decompensation in renal function. The prognosis depends on the cause and condition of the client. Near-normal or normal kidney function may resume gradually.

**anuria** Urine output of less than 100 mL/day.

**arterial steal syndrome** A syndrome that can develop following the insertion of an arteriovenous fistula when too much blood is diverted to the vein and arterial perfusion to the hand is compromised.

**arteriovenous fistula** Surgical creation by anastomosis of an opening, or fistula, between a large artery and a large vein. The flow of arterial blood into the venous system causes the vein to become engorged (maturity). Maturity is necessary so that the engorged vein can be punctured using a large-bore needle. This also allows the blood to be returned quickly for effective dialysis.

**azotemia** The retention of nitrogenous waste products in the blood.

**chronic renal failure (CRF)** The progressive loss and ongoing deterioration in kidney function. It is characterized by a glomerular filtration rate of less than 60 mL/min for a period of 3 months or longer. Chronic renal failure is irreversible and results in uremia or end-stage renal disease. Chronic renal failure requires dialysis or kidney transplantation to maintain life.

**dialysis** A blood filtering procedure that is indicated when kidney function deteriorates and the accumulation of water and waste products interferes with life functions. Dialysis

is performed via the blood stream (hemodialysis) or through the peritoneal cavity (peritoneal dialysis).

**disequilibrium syndrome** A rapid change in the composition of the extracellular fluid that occurs during hemodialysis. Solutes are removed from the blood faster than from the cerebrospinal fluid and brain. Fluid is pulled into the brain, causing cerebral edema.

**nephrolithiasis** The formation of kidney stones. Kidney stones are formed in the renal parenchyma.

**oliguria** Urine output of less than 400 mL/day.

**renal failure** The loss of kidney function. The types of renal failure include acute renal failure and chronic renal failure. The signs and symptoms of renal failure are caused by the retention of wastes, the retention of fluids, and the inability of the kidneys to regulate electrolytes.

**urolithiasis** The formation of urinary stones or calculi. Urinary calculi are formed in the ureter.

### PYRAMID TO SUCCESS

Pyramid Points focus on acute renal failure and chronic renal failure, dialysis procedures such as hemodialysis and peritoneal dialysis, urinary diversions, and postoperative care following urinary or renal surgery. Focus on the major problems associated with renal failure and the rationale for the prescribed treatment modalities. Be familiar with the complications associated with hemodialysis and peritoneal dialysis, the specific assessment data related to complications, and the expected treatment. Focus on the care of a peritoneal catheter and hemodialysis access devices, the complications associated with these access devices, and the

appropriate nursing interventions if a complication is suspected. Review preoperative and postoperative care related to renal transplantation and the assessment data indicating rejection. Be familiar with urinary diversions, care to the client following prostatectomy, and treatment measures for the client with urinary or renal calculi.

Providing client instructions regarding the prevention of the recurrence of a urinary or renal disorder

### Psychosocial Integrity

Assisting the client to use appropriate coping mechanisms

Discussing body image disturbances

Discussing the loss of renal function

Identifying appropriate community resources

Identifying grief and loss and end-of-life issues

Identifying religious and spiritual influences on health

Identifying support systems

### Physiological Integrity

Ensuring elimination measures

Informing the client about diagnostic tests and laboratory results

Monitoring for fluid and electrolyte imbalances and acid-base disorders

Obtaining assessment data indicating rejection of renal transplant

Preventing complications arising as a result of dialysis

Providing adequate rest and sleep

Providing care related to dialysis access devices

Providing care related to hemodialysis and peritoneal dialysis

Providing care to the client following prostatectomy

Providing comfort interventions

Providing pharmacological therapy

Providing preoperative and postoperative care related to renal transplantation

Providing treatment measures for the client with urinary or renal calculi or the client with a urinary diversion

Teaching the client about the prescribed nutrition and fluid measures

## CLIENT NEEDS

### Safe and Effective Care Environment

Consulting with members of the health care team

Establishing priorities

Identifying the guidelines related to renal organ donation

Maintaining confidentiality related to the renal disorder

Maintaining asepsis related to wound care and dialysis access devices

Obtaining informed consent related to diagnostic and surgical procedures

Preventing injury related to complications of the disorder

Maintaining standard and other precautions related to care of the client

Upholding client rights

### Health Promotion and Maintenance

Discussing expected body image changes

Performing urinary and renal physical assessment techniques

Providing client instructions regarding care of a urinary diversion, dialysis access device, and dialysis procedures

Providing client instructions regarding postoperative management

Providing client instructions regarding prescribed treatments related to urinary or renal disorder

# Renal System

## I. ANATOMY AND PHYSIOLOGY

### A. Kidney anatomy

1. Each person has two kidneys; one is attached to the left abdominal wall at the level of the last thoracic and first three lumbar vertebrae and the other is on the right.
2. The kidneys are enclosed in the renal capsule.
3. The renal cortex is the outer layer of the renal capsule, which contains blood-filtering mechanisms (glomeruli).
4. The renal medulla is the inner region, which contains the renal pyramids and renal tubules.
5. Together the renal cortex, pyramids, and medulla constitute the parenchyma, or functional unit of the kidneys.
6. Nephrons
  - a. Located within the parenchyma
  - b. Composed of glomerulus and tubules
  - c. Selectively secretes and reabsorbs ions and filtrates, including fluid, wastes, electrolytes, acids, and bases

 **The nephrons are the functional units of the kidney.**

### 7. Glomerulus

- a. Each nephron contains tufts of capillaries, which filter large plasma proteins and blood cells.
- b. Blood flows into the glomerular capillaries from the afferent arteriole and flows out of the glomerular capillaries into the efferent arteriole.

### 8. Bowman's capsule

- a. Thin double-walled capsule that surrounds the glomerulus
- b. Fluid and particles from the blood such as electrolytes, glucose, amino acids, and metabolic waste (glomerular filtrate) are filtered through the glomerular membrane into a fluid-filled space in Bowman's capsule (Bowman's space) and then enters the proximal convoluted tubule (PCT).

### 9. Tubules

- a. The tubules include the PCT, Henle's loop, and the distal convoluted tubule (DCT).

- b. The PCT receives filtrate from the glomerular capsule and reabsorbs water and electrolytes through active and passive transport.
- c. The descending loop of Henle passively reabsorbs water from the filtrate.
- d. The ascending loop of Henle passively reabsorbs sodium and chloride from the filtrate and helps maintain osmolality.
- e. The DCT actively and passively removes sodium and water.
- f. The filtered fluid is converted to urine in the tubules, and then the urine moves to the pelvis of the kidney.
- g. The urine flows from the pelvis of the kidneys through the ureters and empties into the bladder.

### B. Functions of kidneys

1. Maintain acid-base balance
2. Excrete end products of body metabolism
3. Control fluid and electrolyte balance
4. Excrete bacterial toxins, water-soluble drugs, and drug metabolites
5. Secrete renin to regulate the blood pressure and erythropoietin to stimulate the bone marrow to produce red blood cells. 
6. Synthesize vitamin D for calcium absorption and regulation of the parathyroid hormones.

### C. Urine production

1. As fluid flows through the tubules, water, electrolytes, and solutes are reabsorbed and other solutes such as creatinine, hydrogen ions, and potassium are secreted.
2. Water and solutes that are not reabsorbed become urine.
3. The process of selective reabsorption determines the amount of water and solutes to be secreted.

### D. Homeostasis of water

1. Antidiuretic hormone (ADH) is primarily responsible for the reabsorption of water by the kidneys. 
2. ADH is produced by the hypothalamus and secreted from the posterior lobe of the pituitary gland.
3. Secretion of ADH is stimulated by dehydration or high sodium intake and by a decrease in blood volume.

4. ADH makes the distal convoluted tubules and collecting duct permeable to water.
5. Water is drawn out of the tubules by osmosis and returns to the blood; concentrated urine remains in the tubule to be excreted.
6. When ADH is lacking, the client develops diabetes insipidus (DI).
7. Clients with DI produce large amounts of dilute urine; treatment is necessary because the client cannot drink sufficient water to survive.

#### E. Homeostasis of sodium

1. When the amount of sodium increases, extra water is retained to preserve osmotic pressure.
2. An increase in sodium and water produces an increase in blood volume and blood pressure (BP).
3. When the BP increases, glomerular filtration increases, and extra water and sodium are lost; blood volume is reduced, returning the BP to normal.
4. Reabsorption of sodium in the distal convoluted tubules is controlled by the renin-angiotensin system.
5. Renin, an enzyme, is released from the nephron when the BP or fluid concentration in the distal convoluted tubule is low.
6. Renin catalyzes the splitting of angiotensin I from angiotensinogen; angiotensin I converts to angiotensin II as blood flows through the lung.
7. Angiotensin II, a potent vasoconstrictor, stimulates the secretion of aldosterone.
8. Aldosterone stimulates the distal convoluted tubules to reabsorb sodium and secrete potassium.
9. The additional sodium increases water reabsorption and increases blood volume and BP, returning the BP to normal; the stimulus for the secretion of renin then is removed.

#### F. Homeostasis of potassium

1. Increases in the serum potassium level stimulate the secretion of aldosterone.
2. Aldosterone stimulates the distal convoluted tubules to secrete potassium; this action returns the serum potassium concentration to normal.

#### G. Homeostasis of acidity (pH)

1. Blood pH is controlled by maintaining the concentration of buffer systems.
2. Carbonic acid and sodium bicarbonate form the most important buffers for neutralizing acids in the plasma.
3. The concentration of carbonic acid is controlled by the respiratory system.
4. The concentration of sodium bicarbonate is controlled by the kidneys.
5. Normal arterial pH is 7.35 to 7.45, maintained by keeping the ratio of concentrations of sodium bicarbonate to carbon dioxide constant at 20:1.
6. Strong acids are neutralized by sodium bicarbonate to produce carbonic acid and the sodium

salts of the strong acid; this process quickly restores the ratio and thus blood pH.

7. The carbonic acid dissociates into carbon dioxide and water; because the concentration of carbon dioxide is maintained at a constant level by the respiratory system, the excess carbonic acid is rapidly excreted.
  8. Sodium combined with the strong acid is actively reabsorbed in the distal convoluted tubules in exchange for hydrogen or potassium ions. The strong acid is neutralized by ammonia and is excreted as ammonia or potassium salts.
- H. Adrenal glands** (see Chapter 54 for information about the adrenal glands)
1. One adrenal gland is on top of each kidney.
  2. The adrenal glands influence blood pressure and sodium and water retention.
- I. Bladder**
1. The bladder detrusor muscle, composed of smooth muscle, distends during bladder filling and contracts during bladder emptying.
  2. The ureterovesical sphincter prevents reflux of urine from the bladder to the ureter.
  3. The total bladder capacity is 1 L; normal adult urine output is 1500 mL/day.
- J. Prostate gland**
1. The prostate gland surrounds the male urethra.
  2. The prostate gland contains a duct that opens into the prostatic portion of the urethra and secretes the alkaline portion of seminal fluid, which protects passing sperm.
- K. Risk factors associated with renal disorders** (Box 62-1)

## II. DIAGNOSTIC TESTS

- A.** See Chapter 11 and Box 62-2 for information regarding normal values for renal function studies.

### Box 62-1 Risk Factors Associated With Renal Disorders

Chemical or environmental toxin exposure  
 Contact sports  
 Diabetes mellitus  
 Family history of renal disease  
 Frequent urinary tract infections  
 Heart failure  
 High-sodium diet  
 Hypertension  
 Medications  
 Trauma  
 Urolithiasis or nephrolithiasis

### Box 62-2 Normal Renal Function Values

Blood urea nitrogen level, 8 to 25 mg/dL  
 Serum creatinine level, 0.6 to 1.3 mg/dL  
 Serum uric acid level, 2.5 to 8.0 mg/dL

- B.** Determination of serum creatinine level
1. Description: A test that measures the amount of creatinine in the serum. Creatinine is an end product of protein and muscle metabolism.
  2. Analysis
    - a. Creatinine level reflects glomerular filtration rate.
    - b. Renal disease is the only pathological condition that increases the serum creatinine level.
    - c. Serum creatinine level increases only when at least 50% of renal function is lost.
- C.** Determination of blood urea nitrogen (BUN) level
1. Description: A serum test that measures the amount of nitrogenous urea, a byproduct of protein metabolism in the liver.
  2. Analysis
    - a. BUN levels indicate the extent of renal clearance of urea nitrogenous waste products.
    - b. An elevation does not always mean that renal disease is present.
    - c. Some factors that can elevate the BUN level include dehydration, poor renal perfusion, intake of a high-protein diet, infection, stress, corticosteroid use, gastrointestinal (GI) bleeding, and factors that cause muscle breakdown.
    - d. When the BUN and serum creatinine levels increase at the same rate, the ratio of the BUN to creatinine remains constant; elevated serum creatinine and BUN levels suggest renal dysfunction.
- D.** Urinalysis
1. Description: A urine test for evaluation of the renal system and renal disease
  2. Interventions
    - a. Wash perineal area and use a clean container for collection.
    - b. Obtain 10 to 15 mL of the first morning voiding if possible.
    - c. Refrigerated samples may alter the specific gravity.
    - d. If the client is menstruating, note this on the laboratory requisition form.
- E.** Specific gravity determination
1. Description: A urine test that measures the ability of the kidneys to concentrate urine
  2. Interventions
    - a. Specific gravity can be measured by a multiple-test dipstick method (most common method), refractometer (an instrument used in the laboratory setting), or urinometer (least accurate method).
    - b. Factors that interfere with an accurate reading include radiopaque contrast agents, glucose, and proteins.
    - c. Cold specimens may produce a false high reading.
    - d. Normal value is 1.016 to 1.022 (may vary depending on the laboratory).
- F.** Urine culture and sensitivity testing
1. Description: A urine test that identifies the presence of microorganisms (culture) and determines the specific antibiotics to treat the existing microorganism (sensitivity) appropriately
  2. Interventions
    - a. Clean the perineal area and urinary meatus with a bacteriostatic solution.
    - b. Collect the midstream sample in a sterile container.
    - c. Send the collected specimen to the laboratory immediately.
    - d. Identify any sources of potential contaminants during the collection of the specimen, such as the hands, skin, clothing, hair, or vaginal or rectal secretions.
    - e. Urine from the client who drank a very large amount of fluids may be too dilute to provide a positive culture.
- G.** Creatinine clearance test
1. Description
    - a. The creatinine clearance test evaluates how well the kidneys remove creatinine from the blood.
    - b. The test includes obtaining a blood sample and timed urine specimens.
    - c. Blood is drawn when the urine specimen collection is complete.
    - d. The urine specimen for the creatinine clearance is usually collected for 24 hours, but shorter periods such as 8 or 12 hours could be prescribed.
-  **The creatinine clearance test provides the best estimate of the glomerular filtration rate (GFR) and the normal GFR is 125 mL/min.**
2. Interventions
    - a. Encourage fluids before and during the test.
    - b. Instruct the client to avoid caffeinated beverages during testing.
    - c. Check with the physician regarding the administration of any prescribed medications during testing.
    - d. Instruct the client about the urine collection.
    - e. At the start time, ask the client to void (or empty the tubing and drainage bag if the client has a Foley catheter) and discard the first sample.

- f. Collect all urine for the prescribed time.
  - g. Keep the urine specimen on ice or refrigerated and check with the laboratory regarding adding a preservative to the specimen during collection.
  - h. At the end of the prescribed time, ask the client to empty the bladder (or empty the tubing and drainage bag if the client has a Foley catheter) and add that final urine to the collection container.
  - i. Send the labeled urine specimen to the laboratory in a biohazard bag along with the requisition.
  - j. Document specimen collection, time started and completed, and pertinent assessments.
- H. Uric acid test**
1. Description: A 24-hour urine collection sample is tested to diagnose gout and kidney disease.
  2. Interventions
    - a. Encourage fluid intake and a regular diet during testing.
    - b. Follow the same procedure for urine collection as with the creatinine clearance test.
- I. Vanillylmandelic acid (VMA) test**
1. Description
    - a. The test is a 24-hour urine collection to diagnose pheochromocytoma, a tumor of the adrenal gland.
    - b. The test determines catecholamine levels in the urine.
  2. Interventions
    - a. Check with the laboratory regarding medication restrictions.
    - b. Instruct the client to avoid foods such as caffeine, cocoa, vanilla, cheese, gelatin, licorice, and fruits for at least 2 days before and during urine collection and to check with the physician regarding the administration of any prescribed medications before or during testing.
    - c. Instruct the client to avoid stress; encourage adequate food and fluid intake during the test.
    - d. Follow the same procedure for urine collection as for the creatinine clearance test.
- J. KUB (kidneys, ureters, and bladder) radiography**
1. Description: An x-ray of the urinary system and adjacent structures to detect urinary calculi.
  2. Interventions: No specific preparation is necessary.
- K. Bladder ultrasonography (bladder scanning)**
1. Bladder ultrasonography is a noninvasive method for measuring the volume of urine in the bladder.
  2. Bladder ultrasonography may be performed for evaluating urinary frequency, inability to urinate, or amount of residual urine (the amount of urine remaining in the bladder after voiding).
- L. Computed tomography (CT) and magnetic resonance imaging (MRI)**
1. Description: These imaging methods provide cross-sectional views of the kidney and urinary tract.
  2. Interventions: See Chapter 66.
- M. Intravenous pyelography**
1. Description: An x-ray procedure in which an intravenous injection of a radiopaque dye is used to visualize and identify abnormalities in the renal system.
  2. Preprocedure interventions
    - a. Obtain an informed consent.
    - b. Assess the client for allergies to iodine, seafood, and radiopaque dyes.
    - c. Withhold food and fluids after midnight on the night before the test.
    - d. Administer laxatives if prescribed.
    - e. Inform the client about possible throat irritation, flushing of the face, warmth, or a salty or metallic taste during the test.
  3. Postprocedure interventions
    - a. Monitor vital signs.
    - b. Instruct the client to drink at least 1 L of fluid unless contraindicated.
    - c. Assess the venipuncture site for bleeding.
    - d. Monitor urinary output.
    - e. Monitor for signs of a possible allergic reaction to the dye used during the test and instruct the client to notify the physician if any signs of an allergic reaction occur.
- N. Renal angiography**
1. Description: An injection of a radiopaque dye through a catheter inserted into the femoral artery to examine the renal blood vessels and renal arterial supply
  2. Preprocedure interventions
    - a. Obtain an informed consent.
    - b. Assess the client for allergies to iodine, seafood, and radiopaque dyes.
    - c. Inform the client about a possible feeling of burning or heat along the vessel when the dye is injected.
    - d. Withhold food and fluids after midnight on the night before the test.
    - e. Instruct the client to void immediately before the procedure.
    - f. Administer enemas if prescribed.
    - g. Shave injection sites as prescribed.
    - h. Assess and mark the peripheral pulses.
  3. Postprocedure interventions
    - a. Assess vital signs and peripheral pulses frequently as prescribed
    - b. Maintain bed rest and apply a sandbag or other device that will provide pressure to prevent bleeding, if prescribed, at the insertion site for 4 to 8 hours.

- c. Instruct the client to maintain a supine position with the leg straight (the head of the bed should not be elevated greater than 20 degrees for 8 hours, or as prescribed).
- d. Assess the temperature, color, movement, and sensation (CMS) of the toes of the involved extremity with each vital sign check.
- e. Inspect the catheter insertion site for bleeding or swelling with each vital sign check.

 **The dye used in a renal angiography may be nephrotoxic; therefore encourage increased fluids unless contraindicated and monitor urinary output.**

#### O. Renal scanning

1. Description: An intravenous (IV) injection of a radioisotope for visual imaging of renal blood flow, glomerular filtration, tubular function, and excretion
2. Preprocedure interventions
  - a. Obtain an informed consent.
  - b. Assess for allergies.
  - c. Inform the client that the test requires no dietary or activity restrictions.
  - d. Assist with administering the radioisotope as necessary.
  - e. Instruct the client to remain motionless during the test.
  - f. Instruct the client that imaging may be repeated at various intervals before the test is complete.
3. Postprocedure interventions
  - a. Encourage fluid intake unless contraindicated.
  - b. Assess the client for signs of delayed allergic reaction such as itching and hives.
  - c. The radioisotope is eliminated in 24 hours; wear gloves for excretion precautions.
  - d. Follow standard precautions when caring for incontinent clients and double-bag client linens per agency policy.

#### P. Cystoscopy and biopsy of the bladder

1. Description: The bladder mucosa is examined for inflammation, calculi, or tumors by means of a cystoscope; a sample for biopsy may be obtained.
2. Preprocedure interventions
  - a. Obtain an informed consent.
  - b. If a biopsy is planned, withhold food and fluids after midnight the night before the test.
  - c. If a cystoscopy alone is planned, no special preparation is necessary, and the procedure may be performed in the physician's office; postprocedure interventions include increasing fluid intake.
3. Postprocedure interventions following biopsy
  - a. Monitor vital signs.
  - b. Increase fluid intake as prescribed.

- c. Monitor intake and output.
- d. Encourage deep-breathing exercises to relieve bladder spasms.
- e. Administer analgesics as prescribed.
- f. Administer sitz or tub baths for back and abdominal pain.
- g. Note that leg cramps are common because of the lithotomy position maintained during the procedure.
- h. Assess the urine for color and consistency.
- i. Inform the client that burning on urination, pink-tinged or tea-colored urine, and urinary frequency are common after cystoscopy and resolve in a few days.
- j. Monitor for bright red urine or clots, and notify the physician if this occurs.

#### Q. Renal biopsy

1. Description: Insertion of a needle into the kidney to obtain a sample of tissue for examination; usually done percutaneously
2. Preprocedure interventions
  - a. Assess vital signs.
  - b. Assess baseline coagulation studies; notify the physician if abnormal results are noted.
  - c. Obtain an informed consent.
  - d. Withhold food and fluids after midnight the night before the test.
3. Interventions during the procedure: Position the client prone with a pillow under the abdomen and shoulders.
4. Postprocedure interventions
  - a. Monitor vital signs, especially for hypotension and tachycardia, which could indicate bleeding.
  - b. Provide pressure to the biopsy site for 30 minutes.
  - c. Monitor the hemoglobin and hematocrit levels for decreases, which could indicate bleeding.
  - d. Place the client in the supine position and on bed rest for 8 hours as prescribed.
  - e. Check the biopsy site and under the client for bleeding.
  - f. Encourage fluid intake of 1500 to 2000 mL as prescribed.
  - g. Observe the urine for gross and microscopic bleeding.
  - h. Instruct the client to avoid heavy lifting and strenuous activity for 2 weeks.
  - i. Instruct the client to notify the physician if either a temperature greater than 100° F or hematuria occurs after the first 24 hours postprocedure.

### III. ACUTE RENAL FAILURE

#### A. Description

1. **Acute renal failure (ARF)** is the rapid loss of kidney function from renal cell damage.

**Box 62-3 Potentially Nephrotoxic Substances****Medications****Antibiotics—Anti-Infectives**

Amphotericin B  
 Colistimethate  
 Methicillin  
 Polymyxin B  
 Rifampin  
 Sulfonamides  
 Tetracycline hydrochloride  
 Vancomycin

**Aminoglycoside Antibiotics**

Gentamicin  
 Kanamycin  
 Neomycin  
 Netilmicin sulfate  
 Tobramycin

**Antineoplastics**

Cisplatin  
 Cyclophosphamide  
 Methotrexate

**Nonsteroidal Anti-Inflammatory Drugs (NSAIDs)**

Celecoxib  
 Flurbiprofen  
 Ibuprofen  
 Indomethacin  
 Ketorolac  
 Meclofenamate  
 Meloxicam  
 Nabumetone

Naproxen  
 Oxaprozin  
 Rofecoxib  
 Tolmetin

**Other Medications**

Acetaminophen  
 Captopril  
 Cyclosporine  
 Fluorinate anesthetics  
 D-Penicillamine  
 Phenazopyridine hydrochloride  
 Quinine

**Other Substances****Organic Solvents**

Carbon tetrachloride  
 Ethylene glycol

**Nonpharmacological Chemical Agents**

Radiographic contrast dye  
 Pesticides  
 Fungicides  
 Myoglobin (from breakdown of skeletal muscle)

**Heavy Metals and Ions**

Arsenic  
 Bismuth  
 Copper sulfate  
 Gold salts  
 Lead  
 Mercuric chloride

From Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1603). St. Louis: Saunders.

2. Occurs abruptly and can be reversible
  3. **ARF** leads to cell hypoperfusion, cell death, and decompensation of renal function.
  4. The prognosis depends on the cause and the condition of the client.
  5. Near-normal or normal kidney function may resume gradually.
- B. Causes**
1. Prerenal: Outside the kidney; caused by intravascular volume depletion, dehydration, decreased cardiac output, decreased peripheral vascular resistance, decreased renovascular blood flow, and prerenal infection or obstruction.
  2. Intrarenal: Within the parenchyma of the kidney; caused by tubular necrosis, prolonged pre renal ischemia, intrarenal infection or obstruction, and nephrotoxicity (Box 62-3).
  3. Postrenal: Between the kidney and urethral meatus, such as bladder neck obstruction, bladder cancer, calculi, and postrenal infection
- C. Phases of **ARF** and interventions (Box 62-4)**
1. Onset: Begins with precipitating event
  2. Oliguric phase
    - a. For some clients, **oliguria** does not occur and the urine output is normal; otherwise the duration of **oliguria** is 8 to 15 days; the longer the duration, the less chance of recovery.
    - b. Sudden decrease in urine output; urine output is less than 400 mL/day.
    - c. Signs of excess fluid volume: Hypertension, edema, pleural and pericardial effusions, dysrhythmias, congestive heart failure (CHF), and pulmonary edema
    - d. Signs of uremia: Anorexia, nausea, vomiting, and pruritus
    - e. Signs of metabolic acidosis: Kussmaul's respirations
    - f. Signs of neurological changes: Tingling of extremities, drowsiness progressing to disorientation, and then coma
    - g. Signs of pericarditis: Friction rub, chest pain with inspiration, and low-grade fever
    - h. Laboratory analysis (see Box 62-4)
    - i. Restrict fluid intake; if hypertension is present, daily fluid allowances may be 400 mL

### Box 62-4 Acute Renal Failure: Phases and Laboratory Findings

#### Onset

Begins with precipitating event

#### Oliguric Phase

Elevated blood urea nitrogen and serum creatinine levels  
Decreased urine specific gravity (prerenal causes) or normal (intrarenal causes)

Decreased glomerular filtration rate and creatinine clearance

Hyperkalemia

Normal or decreased serum sodium level

Hypervolemia

Hypocalcemia

Hyperphosphatemia

#### Diuretic Phase

Gradual decline in blood urea nitrogen and serum creatinine levels, but still elevated

Continued low creatinine clearance with improving glomerular filtration rate

Hypokalemia

Hyponatremia

Hypovolemia

#### Recovery Phase (Convalescent)

Increased glomerular filtration rate

Stabilization or continual decline in blood urea nitrogen and serum creatinine levels toward normal

Complete recovery—may take 1 to 2 years

to 1000 mL plus the measured urinary output.

j. Administer medications as prescribed, such as diuretics (furosemide [Lasix]), to increase renal blood flow and diuresis.

#### 3. Diuretic phase

a. Urine output rises slowly, followed by diuresis (4 to 5 L/day).

b. Excessive urine output indicates that damaged nephrons are recovering their ability to excrete wastes.

c. Dehydration, hypovolemia, hypotension, and tachycardia can occur.

d. Level of consciousness improves.

e. Laboratory analysis (see Box 62-4)

f. Administer IV fluids as prescribed, which may contain electrolytes to replace losses.

#### 4. Recovery phase (convalescent)

a. Recovery is a slow process; complete recovery may take 1 to 2 years.

b. Urine volume returns to normal.

c. Memory improves.

d. Strength increases.

e. The older adult is less likely than a younger adult to regain full kidney function.

f. Laboratory analysis (see Box 62-4)

g. **ARF** can progress to **chronic renal failure (CRF)**.

 The signs and symptoms of acute renal failure are primarily caused by the retention of nitrogenous wastes, the retention of fluids, and the inability of the kidneys to regulate electrolytes.

**D.** Assessment: Assess objective and subjective data noted in the phases of **ARF** (see Box 62-4). 

**E.** Other interventions

1. Monitor vital signs, especially for signs of hypertension, tachycardia, tachypnea, and an irregular heart rate.

2. Monitor urine and intake and output (hourly in **ARF**) and urine color and characteristics. 

3. Monitor daily weight (same scale, same clothes, same time of the day), noting that an increase of ½ to 1 lb/day indicates fluid retention. 

4. Monitor for changes in the BUN, serum creatinine, and serum electrolyte levels.

5. Monitor for acidosis (may be treated with sodium bicarbonate).

6. Monitor urinalysis for protein level, hematuria, casts, and specific gravity.

7. Monitor for altered level of consciousness caused by uremia.

8. Monitor for signs of infection because the client may not exhibit an elevated temperature or an increased white blood cell count. 

9. Monitor the lungs for wheezes and rhonchi and monitor for edema, which can indicate fluid overload. 

10. Administer a prescribed diet, which is usually a low- to moderate-protein (to decrease the workload on the kidneys) and high-carbohydrate diet. 

11. Restrict potassium and sodium intake as prescribed based on the electrolyte level.

12. Administer medications as prescribed; be alert to the mechanism for metabolism and excretion of all prescribed medications. 

13. Be alert to nephrotoxic medications, which may be prescribed (see Box 62-3).

14. Be alert to the health care provider's adjustment of medication dosages for **renal failure**.

15. Prepare the client for **dialysis** if prescribed; continuous renal replacement therapy may be used in **ARF** to treat fluid volume overload or rapidly developing **azotemia** and metabolic acidosis. 

16. Provide emotional support by allowing opportunities for the client to express concerns and fears and by encouraging family interactions.

17. Promote consistency in caregivers.

18. Also refer to the section in this chapter on special problems in **renal failure** and interventions.

**TABLE 62-1** Progression of Chronic Kidney Disease

| Stage of CKD   | Estimated GFR |
|--|---------------|
| At risk; normal kidney function (early kidney disease may or may not be present) | >90 mL/min    |
| Mild CKD   | 60-89 mL/min  |
| Moderate CKD   | 30-59 mL/min  |
| Severe CKD   | 15-29 mL/min  |
| ESKD   | <15 mL/min    |

CKD, chronic kidney disease; ESKD, end-stage kidney disease; GFR, glomerular filtration rate.

From Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1609). St. Louis: Saunders.

#### IV. CHRONIC RENAL FAILURE

##### A. Description

1. **CRF** is a slow, progressive, irreversible loss in kidney function, with a GFR less than or equal to 60 mL/min for 3 months or longer.
2. It occurs in stages and results in uremia or end-stage renal disease (Table 62-1).
3. Hypervolemia can occur because of the kidneys' inability to excrete sodium and water; hypovolemia can occur because of the kidneys' inability to conserve sodium and water.

 **Chronic renal failure affects all major body systems and requires dialysis or kidney transplantation to maintain life.**

##### B. Primary causes

1. May follow **ARF**
2. Diabetes mellitus and other metabolic disorders
3. Hypertension
4. Chronic urinary obstruction
5. Recurrent infections
6. Renal artery occlusion
7. Autoimmune disorders

##### C. Assessment

1. Assess body systems for the manifestations of **CRF** (Box 62-5).
2. Assess psychological changes, which could include emotional lability, withdrawal, depression, anxiety, suicidal behavior, denial, dependence-independence conflict, and changes in body image.

##### D. Interventions

1. Same as the interventions for **ARF**
2. Administer a prescribed diet, which is usually a moderate-protein (to decrease the workload on the kidneys) and high-carbohydrate, low-potassium, and low-phosphorus diet.
3. Provide oral care to prevent stomatitis and reduce discomfort from mouth sores.

4. Provide skin care to prevent pruritus.
5. Teach the client about fluid and dietary restrictions and the importance of daily weights.
6. Provide support to promote acceptance of the chronic illness and prepare the client for long-term **dialysis** and transplantation, or explain to the client about his or her choice to decline **dialysis** or transplantation.

##### E. Special problems in **renal failure** and interventions (Box 62-6)

1. Activity intolerance and insomnia
  - a. Fatigue results from anemia and the buildup of wastes from the diseased kidneys.
  - b. Provide adequate rest periods.
  - c. Teach the client to plan activities to avoid fatigue.
  - d. Administer mild central nervous system depressants as prescribed to promote rest.
2. Anemia
  - a. Anemia results from the decreased secretion of erythropoietin by damaged nephrons resulting in decreased production of red blood cells.
  - b. Monitor for decreased hemoglobin and hematocrit levels.
  - c. Administer epoetin alfa (Epogen, Procrit) or darbepoetin alfa (Aranesp), hematopoietics, as prescribed to promote maturity of the red blood cells.
  - d. Administer folic acid (vitamin B<sub>9</sub>) as prescribed.
  - e. Administer iron orally as prescribed, but not at the same time as phosphate binders.
  - f. Administer stool softeners as prescribed because of the constipating effects of iron.
  - g. Note that oral iron is not well absorbed by the gastrointestinal tract in **CRF** and causes nausea and vomiting; parenteral iron (iron sucrose [Venofer] or sodium ferric gluconate complex [Ferrlecit]) may be used if iron deficiencies persist despite folic acid or oral iron administration.
  - h. Administer blood transfusions if prescribed; blood transfusions are prescribed only when necessary (acute blood loss, symptomatic anemia) because they decrease the stimulus to produce red blood cells; note that certain clients' religious beliefs (e.g., Jehovah's Witness) may refuse blood and blood products.
  - i. Blood transfusions also cause the development of antibodies against human tissues, which can make matching for organ transplantation difficult.
3. Gastrointestinal bleeding
  - a. Urea is broken down by the intestinal bacteria to ammonia; ammonia irritates the gastrointestinal mucosa, causing ulceration and bleeding.

**Box 62-5 Key Features of Chronic Renal Failure****Neurological Manifestations**

Asterixis  
 Ataxia (alteration in gait)  
 Coma  
 Inability to concentrate or decreased attention span  
 Lethargy and daytime drowsiness  
 Myoclonus  
 Paresthesias  
 Seizures  
 Slurred speech  
 Tremors, twitching, or jerky movements

**Cardiovascular Manifestations**

Cardiac tamponade  
 Cardiomyopathy  
 Heart failure  
 Hypertension  
 Pericardial effusion  
 Pericardial friction rub  
 Peripheral edema  
 Uremic pericarditis

**Respiratory Manifestations**

Crackles  
 Deep sighing, yawning  
 Depressed cough reflex  
 Kussmaul's respirations  
 Pleural effusion  
 Pulmonary edema  
 Shortness of breath  
 Tachypnea  
 Uremic halitosis  
 Uremic pneumonia

**Hematological Manifestations**

Abnormal bleeding and bruising  
 Anemia

**Gastrointestinal Manifestations**

Anorexia

Changes in taste acuity and sensation  
 Constipation  
 Diarrhea  
 Metallic taste in the mouth  
 Nausea  
 Stomatitis  
 Uremic colitis (diarrhea)  
 Uremic fetor  
 Uremic gastritis (possible gastrointestinal bleeding)  
 Vomiting

**Urinary Manifestations**

Diluted, straw-colored appearance  
 Hematuria  
 Oliguria, anuria (later)  
 Polyuria, nocturia (early)  
 Proteinuria

**Integumentary Manifestations**

Decreased skin turgor  
 Dry skin  
 Ecchymosis  
 Pruritus  
 Purpura  
 Soft tissue calcifications  
 Uremic frost (late, pre-morbid)  
 Yellow-gray pallor

**Musculoskeletal Manifestations**

Bone pain  
 Muscle weakness and cramping  
 Pathological fractures  
 Renal osteodystrophy

**Reproductive Manifestations**

Decreased fertility  
 Decreased libido  
 Impotence  
 Infrequent or absent menses

From Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1613). St. Louis: Saunders.

**Box 62-6 Special Problems in Renal Failure**

|                                   |                       |
|-----------------------------------|-----------------------|
| Activity intolerance and insomnia | Hypovolemia           |
| Anemia                            | Infection             |
| Gastrointestinal bleeding         | Metabolic acidosis    |
| Hyperkalemia                      | Muscle cramps         |
| Hypermagnesemia                   | Neurological changes  |
| Hyperphosphatemia                 | Ocular irritation     |
| Hypertension                      | Potential for injury  |
| Hypovolemia                       | Pruritus              |
| Hypocalcemia                      | Psychosocial problems |

- b. Monitor for decreasing hemoglobin and hematocrit levels.
- c. Monitor stools for occult blood.
- d. Instruct the client to use a soft toothbrush.

- e. Avoid the administration of acetylsalicylic acid (aspirin) because it is excreted by the kidneys; if administered, aspirin toxicity can occur and prolong the bleeding time.
4. Hyperkalemia
    - a. Monitor vital signs for hypertension or hypotension and the apical heart rate; an irregular heart rate could indicate dysrhythmias.
    - b. Monitor the serum potassium level; an elevated serum potassium level can cause tall, peaked T waves, flat P waves, a widened QRS complex, and a prolonged PR interval; decreased cardiac output; heart blocks; fibrillation; or asystole (Fig. 62-1).
    - c. Provide a low-potassium diet, avoiding foods high in potassium (see Chapter 9 for a listing of foods that are high in potassium).

#### Serum Potassium Levels

- A. Normal (3.5-5.1 mEq/L)
- B. About 7.0 mEq/L
- C. 8.0-9.0 mEq/L
- D. >10.0 mEq/L

▲ **FIGURE 62-1** Cardiac rhythm changes with hyperkalemia. ECG, Electrocardiogram. (From Huszar, R. [2002]. *Basic dysrhythmias: Interpretation and management* [3rd ed.]. St. Louis: Mosby. Developed by Kathleen Ohman.)

- d. Administer electrolyte-binding and electrolyte-excreting medications such as oral or rectal sodium polystyrene sulfonate (Kayexalate) as prescribed to lower the serum potassium level.
- e. Administer prescribed medications: 50% dextrose and insulin may be prescribed to shift potassium into the cell; calcium gluconate IV may be prescribed to reduce myocardial irritability from hyperkalemia; and sodium bicarbonate IV may be prescribed to correct acidosis.
- f. Administer prescribed loop diuretics to excrete potassium.
- g. Avoid potassium-sparing medications such as spironolactone (Aldactone) and triamterene (Dyrenium) because these medications will increase the potassium level.
- h. Prepare the client for peritoneal **dialysis** or hemodialysis as prescribed.

▲ **Place the client with renal failure on continuous cardiac monitoring. The client can develop hyperkalemia resulting in the risk for dysrhythmias.**

- 5. **Hypermagnesemia**
  - a. Results from decreased renal excretion of magnesium.
  - b. Monitor for cardiac manifestations such as bradycardia, peripheral vasodilation, and hypotension.
  - c. Monitor central nervous system (CNS) manifestations of decreased nerve impulse transmission, such as drowsiness or lethargy.
  - d. Monitor neuromuscular manifestations, such as reduced or absent deep tendon reflexes or weak or absent voluntary skeletal muscle contractions.
  - e. Administer loop diuretics as prescribed, such as furosemide (Lasix).
  - f. Administer calcium as prescribed for resulting cardiac problems.
  - g. Avoid medications that contain magnesium, such as antacids, laxatives, or enemas.
  - h. During severe elevations, avoid foods that increase magnesium levels (see Chapter 9 for a listing of foods that are high in magnesium).
- 6. **Hyperphosphatemia**
  - a. As the phosphorus level rises, the calcium level drops; this leads to the stimulation of parathyroid hormone, causing bone demineralization.
  - b. Treatment is aimed at lowering the serum phosphorus level.
  - c. Administer phosphate binders such as calcium carbonate (TUMS), calcium acetate (PhosLo), or sevelamer (Renagel) as prescribed with meals to lower serum phosphate levels.
  - d. Avoid the use of aluminum hydroxide preparations to bind phosphates because they are associated with dementia and osteomalacia.
  - e. Administer stool softeners and laxatives as prescribed because phosphate binders are constipating.
  - f. Teach the client about the need to limit the intake of foods high in phosphorus (see Chapter 9 for a listing of foods that are high in phosphorus).
- 7. **Hypertension**
  - a. Caused by failure of the kidneys to maintain BP homeostasis
  - b. Monitor vital signs for elevated blood pressure.
  - c. Maintain fluid and sodium restrictions as prescribed.
  - d. Administer diuretics and antihypertensives as prescribed.
  - e. Administer propranolol (Inderal), a  $\beta$ -blocker, as prescribed; propranolol decreases renin release (renin causes vasoconstriction and subsequent hypertension).
- 8. **Hypervolemia**
  - a. Monitor vital signs for an elevated blood pressure.

- b. Monitor intake and output and daily weight for indications of fluid retention.
  - c. Monitor for periorbital, sacral, and peripheral edema.
  - d. Monitor the serum electrolyte levels.
  - e. Monitor for hypertension and notify the health care provider for sustained elevations.
  - f. Monitor for signs of CHF and pulmonary edema, such as restlessness, heightened anxiety, tachycardia, dyspnea, basilar lung crackles, and blood-tinged sputum; notify the physician immediately if signs occur.
  - g. Maintain fluid restriction.
  - h. Avoid the administration of large amounts of IV fluids.
  - i. Administer diuretics such as furosemide (Lasix) as prescribed.
  - j. Teach the client to maintain a low-sodium diet.
  - k. Teach the client to avoid antacids, cold remedies, or other products containing sodium bicarbonate.
9. Hypocalcemia
- a. Results from the high phosphorus level and the inability of the diseased kidney to activate vitamin D
  - b. The absence of vitamin D causes poor calcium absorption from the intestinal tract.
  - c. Monitor the serum calcium level.
  - d. Administer calcium supplements as prescribed.
  - e. Administer activated vitamin D as prescribed.
  - f. See Chapter 9 for a listing of foods that are high in calcium.
10. Hypovolemia
- a. Monitor the vital signs for hypotension and tachycardia.
  - b. Monitor for decreasing intake and output and a reduction in the daily weight.
  - c. Monitor for dehydration.
  - d. Monitor electrolyte levels.
  - e. Provide replacement therapy based on the serum electrolyte level values.
  - f. Provide sodium supplements as prescribed, based on the serum electrolyte level.
11. Infection
- a. The client is at risk for infection caused by a suppressed immune system, **dialysis** access site, and possible malnutrition.
  - b. Monitor for signs of infection.
  - c. Avoid urinary catheters when possible; if used, provide catheter care.
  - d. Provide strict asepsis during urinary catheter insertion and other invasive procedures.
  - e. Instruct the client to avoid fatigue, which decreases body resistance.
  - f. Instruct the client to avoid persons with infections.
  - g. Administer antibiotics as prescribed, monitoring for nephrotoxic effects.
12. Metabolic acidosis
- a. The kidneys are unable to excrete hydrogen ions or manufacture bicarbonate, resulting in acidosis.
  - b. Administer alkalizers such as sodium bicarbonate as prescribed.
  - c. Note that clients with **CRF** adjust to low bicarbonate levels and as a result do not become acutely ill.
13. Muscle cramps
- a. Occur from electrolyte imbalances and the effects of uremia on peripheral nerves
  - b. Monitor serum electrolyte levels.
  - c. Administer electrolyte replacements and medications to control muscle cramps as prescribed.
  - d. Administer heat and massage as prescribed.
14. Neurological changes
- a. The buildup of active particles and fluids causes changes in the brain cells and leads to confusion and impairment in decision-making ability.
  - b. Peripheral neuropathy results from the effects of uremia on peripheral nerves.
  - c. Monitor the level of consciousness and for confusion.
  - d. Monitor for restless leg syndrome, which is also common during **dialysis** treatments.
  - e. Teach the client to examine areas of decreased sensation for signs of injury.
15. Ocular irritation
- a. Calcium deposits in the conjunctivae cause burning and watering of the eyes.
  - b. Administer medications to control the calcium and phosphate levels as prescribed.
  - c. Administer lubricating eye drops.
  - d. Protect the client from injury.
  - e. Provide a safe and hazard-free environment.
  - f. Use side rails as needed.
16. Potential for injury
- a. The client is at risk for fractures caused by alterations in the absorption of calcium, excretion of phosphate, and vitamin D metabolism.
  - b. Provide for a safe environment.
  - c. Avoid injury; tissue breakdown causes increased serum potassium levels.
17. Pruritus
- a. To rid the body of excess wastes, urate crystals are excreted through the skin, causing pruritus.
  - b. The deposit of urate crystals (uremic frost) occurs in advanced stages of **renal failure**.
  - c. Monitor for skin breakdown, rash, and uremic frost.
  - d. Provide meticulous skin care and oral hygiene.
  - e. Avoid the use of soaps.
  - f. Administer antihistamines and antipruritics as prescribed to relieve itching.

- g. Teach the client to keep the nails trimmed to prevent local infection from scratching.
- 18. Psychosocial problems
  - a. Listen to the client's concerns to determine how the client is handling the situation.
  - b. Allow the client time to mourn the loss of kidney function.
  - c. With client permission, include the family members in discussions of the client's concerns.
  - d. Provide education about treatment options and support their decision.
  - e. Offer information about support groups.
  - f. Provide end-of-life care for the client with end-stage renal disease.

## V. UREMIC SYNDROME

### A. Description

1. Accumulation of nitrogenous waste products in the blood caused by the kidneys' inability to filter out these waste products
2. Uremic syndrome may occur as a result of **ARF** or **CRF**.

### B. Assessment

1. **Oliguria**
2. Presence of protein, red blood cells, and casts in the urine
3. Elevated levels of urea, uric acid, potassium, and magnesium in the urine
4. Hypotension or hypertension
5. Alterations in the level of consciousness
6. Electrolyte imbalances
7. Stomatitis
8. Nausea or vomiting
9. Diarrhea or constipation

### C. Interventions

1. Monitor vital signs for hypertension, tachycardia, and an irregular heart rate.
2. Monitor serum electrolyte levels.
3. Monitor intake and output and for **oliguria**.
4. Provide a limited but high-quality protein diet as prescribed.
5. Provide a limited sodium, nitrogen, potassium, and phosphate diet as prescribed.
6. Assist the client to cope with body image disturbances caused by uremic syndrome.

## VI. HEMODIALYSIS

### A. Description

1. Hemodialysis is the process of cleansing the client's blood.
2. It involves the diffusion of dissolved particles from one fluid compartment into another across a semipermeable membrane; the client's blood flows through one fluid compartment of a **dialysis** filter, and the dialysate is in another fluid compartment.

### B. Functions of hemodialysis

1. Cleanses the blood of accumulated waste products

2. Removes the byproducts of protein metabolism such as urea, creatinine, and uric acid from the blood
3. Removes excess body fluids
4. Maintains or restores the buffer system of the body
5. Corrects electrolyte levels in the body

### C. Principles of hemodialysis

1. The semipermeable membrane is made of a thin, porous cellophane.
2. The pore size of the membrane allows small particles to pass through, such as urea, creatinine, uric acid, and water molecules.
3. Proteins, bacteria, and some blood cells are too large to pass through the membrane.
4. The client's blood flows into the dialyzer; the movement of substances occurs from the blood to the dialysate by the principles of osmosis, diffusion, and ultrafiltration.
5. Diffusion is the movement of particles from an area of higher concentration to one of lower concentration.
6. Osmosis is the movement of fluids across a semipermeable membrane from an area of lower concentration of particles to an area of higher concentration of particles.
7. Ultrafiltration is the movement of fluid across a semipermeable membrane as a result of an artificially created pressure gradient.

### D. Dialysate bath

1. A dialysate bath is composed of water and major electrolytes.
2. The dialysate need not be sterile because bacteria and viruses are too large to pass through the pores of the semipermeable membrane; however, the dialysate must meet specific standards, and water is treated to ensure a safe water supply.

### E. Interventions

1. Monitor vital signs before, during, and after **dialysis**; the client's temperature may elevate because of slight warming of the blood from the **dialysis** machine (notify the physician about excessive temperature elevations because this could indicate sepsis; obtain samples for blood culture as prescribed for excessive temperature elevations).
2. Monitor laboratory values before, during, and after **dialysis**.
3. Assess the client for fluid overload before **dialysis** and fluid volume deficit following **dialysis**.
4. Weigh the client before and after **dialysis** to determine fluid loss.
5. Assess the patency of the blood access device before, during, and after **dialysis**.
6. Monitor for bleeding; heparin is added to the **dialysis** bath to prevent clots from forming in the dialyzer or the blood tubing.
7. Monitor for hypovolemia and shock during **dialysis**, which can occur from blood loss or excess fluid and electrolyte removal.

8. Provide adequate nutrition; the client may eat before or during **dialysis**.
9. Identify the client's reactions to the treatment and support coping mechanisms; encourage independence and involvement in care.

**!** Withhold antihypertensives and other medications that can affect the blood pressure or result in hypotension until after the hemodialysis treatment. Also withhold medications that could be removed by dialysis, such as water-soluble vitamins, certain antibiotics, and digoxin (Lanoxin).

## VII. ACCESS FOR HEMODIALYSIS

### A. Subclavian and femoral catheter

#### 1. Description

- a. A subclavian (subclavian vein) or femoral (femoral vein) catheter may be inserted for short-term or temporary use in **ARF**.
- b. The catheter is used until a fistula or graft matures or develops, which is typically 6 weeks, or may be required when the client's fistula or graft access has failed because of infection or clotting.

#### 2. Interventions

- a. Assess insertion site for hematoma, bleeding, catheter dislodgement, and infection.
- b. These catheters should only be used for **dialysis** treatments.
- c. Maintain an occlusive dressing over the catheter insertion site.

### 3. Subclavian vein catheter

- a. The catheter is usually filled with heparin and capped to maintain patency between **dialysis** treatments.
- b. The catheter should not be uncapped except for **dialysis** treatments.
- c. The catheter may be left in place for up to 6 weeks if no complications occur.

### 4. Femoral vein catheter

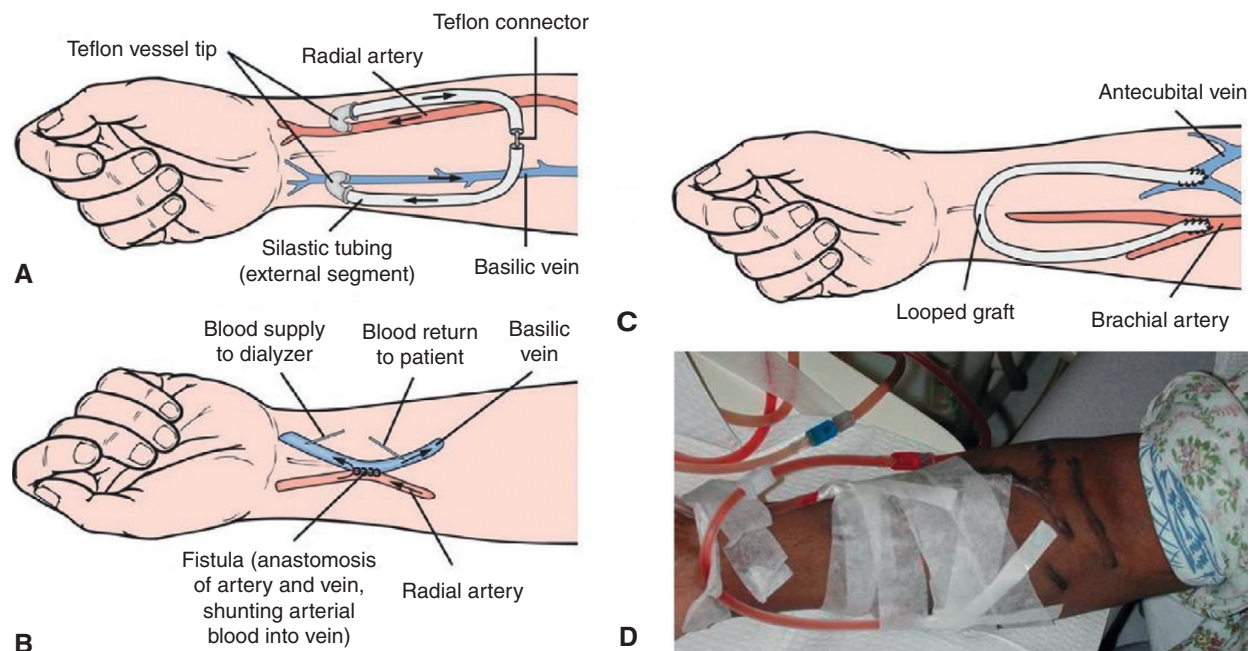

- a. Assess the extremity for circulation, temperature, and pulses.
- b. Prevent pulling or disconnecting of the catheter when giving care.
- c. Because the groin is not a clean site, meticulous perineal care is required.
- d. Use an IV infusion pump or controller with microdrip tubing if a heparin infusion through the catheter to maintain patency is prescribed.

**!** The client with a femoral vein catheter should not sit up more than 45 degrees or lean forward, because the catheter may kink and occlude.

### B. External arteriovenous shunt (Fig. 62-2)

#### 1. Description

- a. Two Silastic cannulas are surgically inserted into an artery and vein in the forearm or leg to form an external blood path.
- b. The cannulas are connected to form a U shape; blood flows from the client's artery through the shunt into the vein.

**▲ FIGURE 62-2** Vascular access for hemodialysis. **A**, External shunt. **B**, Internal arteriovenous fistula. **C**, Internal arteriovenous graft. **D**, A hemodialysis graft while connected to a hemodialysis machine. (From Lewis, S., Heitkemper, M., Dirksen, S., O'Brien, P., & Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

- c. A tube leading to the membrane compartment of the dialyzer is connected to the arterial cannula.
  - d. Blood fills the membrane compartment, passes through the dialyzer, and is returned back to the client through a tube connected to the venous cannula.
  - e. When **dialysis** is complete, the cannulas are clamped and reattached, reforming the U shape.
2. Advantages
    - a. The external arteriovenous shunt can be used immediately following its creation.
    - b. No venipuncture is necessary for **dialysis**.
  3. Disadvantages
    - a. Disconnection or dislodgment of the external shunt
    - b. Risk of hemorrhage, infection, or clotting
    - c. Potential for skin erosion around the catheter site
  4. Interventions
    - a. Avoid getting the shunt wet.
    - b. Wrap a dressing completely around the shunt and keep it dry and intact.
    - c. Keep cannula clamps at the client's bedside or attached to the arteriovenous dressing for use in case of accidental disconnection.
    - d. Teach the client that the shunt extremity should not be used for monitoring BP, drawing blood, placing IV lines, or administering injections.
    - e. Fold back the dressing to expose the shunt tubing and assess for signs of hemorrhage, infection, or clotting.
    - f. Monitor skin integrity around the insertion site.
    - g. Auscultate for a bruit and palpate for a thrill, although a bruit may not be heard with the shunt.
    - h. Notify the physician immediately if signs of clotting, hemorrhage, or infection occur.
  5. Signs of clotting
    - a. Fibrin-white flecks noted in the tubing
    - b. Separation of serum and cells
    - c. Thrill absent on palpation
    - d. Coolness of the tubing or extremity
    - e. Tingling sensation at site or in extremity
- C. Internal arteriovenous fistula** (see Fig. 62-2)
1. Description
    - a. A permanent access of choice for the client with **CRF** requiring **dialysis**
    - b. The fistula is created surgically by anastomosis of a large artery and large vein in the arm.
    - c. The flow of arterial blood into the venous system causes the vein to become engorged (matured or developed).
    - d. Maturity takes about 4 to 6 weeks, depending on the client's ability to do hand-flexing

exercises such as ball squeezing, which help the fistula mature.

- e. The fistula is required to be mature before it can be used because the engorged vein is punctured with a large-bore needle for the **dialysis** procedure.
  - f. Subclavian or femoral catheters, peritoneal **dialysis**, or an external arteriovenous shunt can be used for **dialysis** while the fistula is maturing or developing.
2. Advantages
    - a. Because the fistula is internal, the risk of clotting and bleeding is low.
    - b. The fistula can be used indefinitely.
    - c. Fistulas have a decreased incidence of infection because it is internal and is not exposed.
    - d. Once healing has occurred, no external dressing is required.
    - e. The fistula allows freedom of movement.
  3. Disadvantages
    - a. The fistula cannot be used immediately after insertion so planning ahead for an alternate access for **dialysis** is important.
    - b. Needle insertions through the skin and tissues to the fistula are required for **dialysis**.
    - c. Infiltration of the needles during **dialysis** can occur and cause hematomas.
    - d. An aneurysm can form in the fistula.
    - e. Congestive heart failure can occur from the increased blood flow in the venous system.
- !** Arterial steal syndrome can develop in a client with an internal arteriovenous fistula. In this complication, too much blood is diverted to the vein, and arterial perfusion to the hand is compromised.
- D. Internal arteriovenous graft** (see Fig. 62-2)
1. Description
    - a. The internal graft may be used for chronic **dialysis** clients who do not have adequate blood vessels for the creation of a fistula.
    - b. An artificial graft made of Gore-Tex or a bovine (cow) carotid artery is used to create an artificial vein for blood flow.
    - c. The procedure involves the anastomosis of an artery to a vein using an artificial graft.
    - d. The graft can be used 2 weeks after insertion.
    - e. Complications of the graft include clotting, aneurysms, and infection.
  2. Advantages
    - a. Because the graft is internal, the risk of clotting and bleeding is low.
    - b. The graft can be used indefinitely.
    - c. The graft has a decreased incidence of infection.
    - d. Once healing has occurred, no external dressing is required.
    - e. The graft allows freedom of movement.

3. Disadvantages
  - a. The graft cannot be used immediately after insertion.
  - b. Needle insertions through the skin and tissues to the graft are required for **dialysis**.
  - c. Infiltration of the needles during **dialysis** can occur and cause hematomas.
  - d. An aneurysm can form in the graft; additionally, grafts clot more frequently than **arteriovenous fistulas**.
  - e. **Arterial steal syndrome** can develop (too much blood is diverted to the vein, and arterial perfusion to the hand is compromised).
  - f. Congestive heart failure can occur from the increased blood flow in the venous system.

#### E. Interventions for an **arteriovenous fistula** and arteriovenous graft

1. Teach the client that the extremity should not be used for monitoring blood pressure, drawing blood, placing IV lines, or administering injections.
2. Teach the client with an **arteriovenous fistula** hand-flexing exercises such as ball squeezing (if prescribed) to promote graft maturity.
3. Note the temperature and capillary refill of the extremity.
4. Palpate pulses below the fistula or graft, and monitor for hand swelling as an indication of ischemia.
5. Monitor for clotting.
  - a. Complaints of tingling or discomfort in the extremity.
  - b. Inability to palpate a thrill or auscultate a bruit over the fistula or graft.
6. Monitor for **arterial steal syndrome**.
7. Monitor for infection.
8. Monitor lung and heart sounds for signs of CHF.
9. Notify the physician immediately if signs of clotting, infection, or **arterial steal syndrome** occur.

 To ensure patency, palpate for a thrill or auscultate for a bruit over the fistula or graft. Notify the physician if a thrill or bruit is absent.

### VIII. COMPLICATIONS OF HEMODIALYSIS (Box 62-7)

#### A. Air embolus

1. Description
  - a. Introduction of air into the circulatory system
  - b. Results in cardiopulmonary complications
2. Assessment
  - a. Dyspnea and tachypnea
  - b. Chest pain
  - c. Hypotension
  - d. Reduced oxygen saturation
  - e. Cyanosis
  - f. Anxiety
  - g. Changes in sensorium
3. Interventions (see Priority Nursing Actions box)

#### Box 62-7 Complications of Hemodialysis

|                         |             |
|-------------------------|-------------|
| Air embolus             | Hepatitis   |
| Disequilibrium syndrome | Hypotension |
| Electrolyte alterations | Sepsis      |
| Encephalopathy          | Shock       |
| Hemorrhage              |             |

#### PRIORITY NURSING ACTIONS!

##### Actions to Take If a Client Receiving Hemodialysis Develops an Air Embolism

1. Stop the hemodialysis.
2. Turn the client on the left side, with the head down (Trendelenburg's).
3. Notify the physician.
4. Administer oxygen.
5. Assess vital signs and pulse oximetry.
6. Document the event, actions taken, and the client's response.

Air embolism occurs when air enters the catheter system and is a complication of hemodialysis. The signs of air embolism include dyspnea, tachypnea, chest pain, hypotension, reduced oxygen saturation, cyanosis, anxiety, and changes in sensorium. Air embolism is a critical situation and if it is suspected, hemodialysis is stopped immediately and the client should be placed in a left side-lying position with the head lower than the feet. This position is used to try to prevent the air from traveling as a bolus to the lungs by trapping it in the right side of the heart. The physician is notified immediately and oxygen is administered. Vital signs are assessed including the pulse oximetry and other prescribed interventions are done. The event, actions taken, and the client's response are documented.

Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 850). St. Louis: Mosby.

#### B. Disequilibrium syndrome

1. Description
  - a. A rapid change in the composition of the extracellular fluid occurs during hemodialysis.
  - b. Solutes are removed from the blood faster than from the cerebrospinal fluid and brain; fluid is pulled into the brain, causing cerebral edema.
  - c. Occurs more frequently in a new client during the initial onset of hemodialysis.
2. Assessment
  - a. Nausea and vomiting
  - b. Headache
  - c. Hypertension
  - d. Restlessness and agitation
  - e. Muscle cramps
  - f. Confusion
  - g. Seizures

**▲ FIGURE 62-3** Manual peritoneal dialysis via an implanted abdominal catheter (Tenckhoff catheter). (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

### 3. Interventions

- Slow or stop the **dialysis**.
- Notify the physician if signs of **disequilibrium syndrome** occur.
- Reduce environmental stimuli.
- Prepare to administer intravenous hypertonic saline solution, albumin, or mannitol (Osmitrol) if prescribed.
- Prepare to dialyze the client for a shorter period of time at reduced flow rates to prevent its occurrence.

### C. **Dialysis** encephalopathy

- Description: An aluminum toxicity from dialysate water sources containing aluminum; also can occur from ingestion of aluminum-containing antacids (phosphate binders). This is not a common occurrence.
- Assessment
  - Progressive neurological impairment
  - Mental cloudiness
  - Speech disturbances
  - Dementia
  - Muscle incoordination
  - Bone pain
  - Seizures
- Interventions
  - Monitor for the signs of **dialysis** encephalopathy.
  - Notify the physician if signs of **dialysis** encephalopathy occur.
  - Administer aluminum-chelating agents as prescribed so that the aluminum is released and dialyzed from the body.

## IX. PERITONEAL DIALYSIS

### A. Description

- The peritoneum acts as the dialyzing membrane (semipermeable membrane) to achieve **dialysis** during kidney failure.

- Peritoneal **dialysis** (PD) works on the principles of osmosis, diffusion and ultrafiltration; PD occurs via the transfer of fluid and solute from the bloodstream through the peritoneum into the dialysate solution.
- The peritoneal membrane is large and porous, allowing solutes and fluid to move via osmosis from an area of higher concentration in the body to an area of lower concentration in the dialyzing fluid.
- The peritoneal cavity is rich in capillaries; therefore it provides a ready access to the blood supply.

### B. Contraindications to peritoneal **dialysis**

- Peritonitis
- Recent abdominal surgery
- Abdominal adhesions
- Other gastrointestinal problems such as diverticulosis

### C. Access for peritoneal **dialysis** (Fig. 62-3)

- A siliconized rubber catheter such as a Tenckhoff catheter is surgically inserted into the client's peritoneal cavity to allow infusion of **dialysis** fluid.
- The preferred insertion site is 3 to 5 cm below the umbilicus; this area is relatively avascular and has less fascial resistance.
- The catheter is tunneled under the skin, through the fat and muscle tissue to the peritoneum; it is stabilized with inflatable Dacron cuffs in the muscle and under the skin.
- Over a period of 1 to 2 weeks following insertion, fibroblasts and blood vessels grow around the cuffs, fixing the catheter in place and providing an extra barrier against dialysate leakage and bacterial invasion.
- If the client is scheduled for transplant surgery, the peritoneal **dialysis** catheter may either be

removed or left in place if the need for **dialysis** is suspected post-transplantation.

#### D. Dialysate solution

1. The solution is sterile.
2. All **dialysis** solutions are prescribed by the physician; the solution contains electrolytes and minerals and has a specific osmolarity, specific glucose concentration, and other medication additives as prescribed.
3. The higher the glucose concentration, the greater the hypertonicity and the amount of fluid removed during a peritoneal **dialysis** exchange.
4. Increasing the glucose concentration increases the concentration of active particles that cause osmosis, increases the rate of ultrafiltration, and increases the amount of fluid removed.
5. If hyperkalemia is not a problem, potassium may be added to each bag of dialysate solution.
6. Heparin is added to the dialysate solution to prevent clotting of the catheter.
7. Prophylactic antibiotics may be added to the dialysate solution to prevent peritonitis.
8. Insulin may be added to the dialysate solution for the client with diabetes mellitus.

#### E. Peritoneal **dialysis** infusion

1. Description
  - a. One infusion (fill), dwell, and drain is considered one exchange.
  - b. Fill: The infusion of 1 to 2 L of dialysate as prescribed is infused by gravity into the peritoneal space, which usually takes 10 to 20 minutes.
  - c. Dwell time: The amount of time that the dialysate solution remains in the peritoneal cavity is prescribed by the physician and can last 20 to 30 minutes to 8 or more hours, depending on the type of **dialysis** used.
  - d. Drain (outflow): Fluid drains out of body by gravity into the drainage bag.
2. Interventions before treatment
  - a. Monitor vital signs.
  - b. Obtain weight.
  - c. Have the client void, if possible.
  - d. Assess electrolyte and glucose levels.
3. Interventions during treatment
  - a. Monitor vital signs.
  - b. Monitor for respiratory distress, pain, or discomfort.
  - c. Monitor for signs of pulmonary edema.
  - d. Monitor for hypotension and hypertension.
  - e. Monitor for malaise, nausea, vomiting.
  - f. Assess the catheter site dressing for wetness or bleeding.
  - g. Monitor dwell time as prescribed by the physician.
  - h. Do not allow dwell time to extend beyond the physician's prescription because this increases the risk for hyperglycemia.

- i. Initiate outflow; turn the client from side to side if the outflow is slow to start.
- j. Monitor outflow, which should be a continuous stream after the clamp is opened.
- k. Monitor outflow for color and clarity.
- l. Monitor intake and output accurately; if outflow is less than inflow, the difference is equal to the amount absorbed or retained by the client during **dialysis** and should be counted as intake.
- m. An outflow greater than inflow should be reported to the physician as well as the appearance of frank blood or cloudiness in the outflow.

#### F. Types of peritoneal **dialysis**

1. Continuous ambulatory peritoneal **dialysis** (CAPD)
  - a. Closely resembles renal function because it is a continuous process
  - b. Does not require a machine for the procedure
  - c. Promotes client independence
  - d. The client performs self-**dialysis** 24 hours a day, 7 days a week.
  - e. Four **dialysis** cycles are usually administered in a 24-hour period, including an overnight 8-hour dwell time.
  - f. Dialysate, 1½ to 2 L, is instilled into the abdomen four times daily and allowed to dwell as prescribed.
  - g. After dwell, the bag is placed lower than the insertion site so that fluid drains by gravity flow.
  - h. After fluid is drained, the bag is changed, new dialysate is instilled into the abdomen, and the process continues.
  - i. Between exchanges, the catheter is clamped.
2. Automated peritoneal **dialysis** (Box 62-8)
  - a. Automated **dialysis** requires a peritoneal cycling machine.
  - b. Automated **dialysis** can be done as intermittent peritoneal **dialysis**, continuous cycling peritoneal **dialysis**, or nightly peritoneal **dialysis**.
  - c. The exchanges are automated instead of manual

#### X. COMPLICATIONS OF PERITONEAL DIALYSIS (Box 62-9)

 Infection is a concern with peritoneal dialysis; sites of infection are either the catheter insertion site or in the peritoneum causing peritonitis.

#### A. Peritonitis

1. Monitor for symptoms of peritonitis: Fever, cloudy outflow, rebound abdominal tenderness, abdominal pain, general malaise, nausea, and vomiting.

### Box 62-8 Types of Automated Peritoneal Dialysis

#### Continuous Cycling Peritoneal Dialysis

Dialysis requires a peritoneal cycling machine.

Dialysis usually consists of three cycles done at night and one cycle with an 8-hour dwell done in the morning.

The sterile catheter system is opened only for the on-and-off procedures, which reduces the risk of infection.

The client does not need to do exchanges during the day.

#### Intermittent Peritoneal Dialysis

Dialysis requires a peritoneal cycling machine.

Dialysis is not a continuous procedure.

Dialysis is performed for 10 to 14 hours, three or four times a week.

#### Nightly Peritoneal Dialysis

Dialysis requires a cycling machine.

Dialysis is performed 8 to 12 hours each night, with no daytime exchanges or dwells.

### Box 62-9 Complications of Peritoneal Dialysis

Abdominal pain

Bladder or bowel perforation

Insufficient outflow

Leakage around the catheter site

Peritonitis

2. Cloudy or opaque outflow is an early sign of peritonitis.
  3. If peritonitis is suspected, obtain a sample for culture and sensitivity of the outflow to determine the infective organism.
  4. Administer antibiotics as prescribed.
  5. Avoid infections by maintaining meticulous sterile technique when connecting and disconnecting PD solution bags and when caring for the catheter insertion site.
  6. Prevent the catheter insertion site dressing from becoming wet during care of the client or the **dialysis** procedure; change the dressing if wet or soiled.
  7. Follow institutional procedure for connecting and disconnecting PD solution bags, which may include scrubbing the connection sites with an antiseptic solution.
- B. Abdominal pain**
1. Peritoneal irritation during inflow commonly causes pain during the first few exchanges; the pain usually disappears after 1 to 2 weeks of **dialysis** treatments.
  2. Warm the dialysate before administration using a special dialysate warmer pad, because the cold temperature of the dialysate can cause discomfort.

- C. Abnormal outflow characteristics indicative of complications
  1. Bloody outflow after the first few exchanges indicates vascular complications (the outflow should be clear after the initial exchanges).
  2. Brown outflow indicates bowel perforation.
  3. Urine-colored outflow indicates bladder perforation.
  4. Cloudy outflow indicates peritonitis.
- D. Insufficient outflow
  1. The main cause of insufficient outflow is a full colon; encourage a high-fiber diet, because constipation can cause inflow and outflow problems. Administer stool softeners as prescribed.
  2. Insufficient outflow may also be caused by catheter migration out of the peritoneal area; if this occurs, an x-ray will be prescribed to evaluate catheter position.
  3. Maintain the drainage bag below the client's abdomen.
  4. Check for kinks in the tubing.
  5. Check for fibrin clots in the tubing and milk the tubing to dislodge the clot as prescribed.
  6. Change the client's outflow position by turning the client to a side-lying position or ambulating the client.
- E. Leakage around the catheter site
  1. Clear fluid that leaks from the catheter exit site will be noted.
  2. It takes 1 to 2 weeks following insertion of the catheter before fibroblasts and blood vessels grow into the catheter cuffs, which fix it in place and provide an extra barrier against dialysate leakage and bacterial invasion.
  3. Smaller amounts of dialysate need to be used; it may take up to 2 weeks for the client to tolerate a full 2-L exchange without leaking around the catheter site.

## XI. CONTINUOUS RENAL REPLACEMENT THERAPY

- A. Continuous renal replacement therapy (CRRT) provides continuous ultrafiltration of extracellular fluid and clearance of urinary toxins over a period of 8 to 24 hours; used primarily for clients in **ARF** or critically ill clients with **CRF** who cannot tolerate hemodialysis.
- B. Water, electrolytes, and other solutes are removed as the client's blood passes through a hemofilter.
- C. Because rapid shifts in fluids and electrolytes typically do not occur, hemofiltration is usually better tolerated by critically ill clients.
- D. There are five variations of CRRT (Box 62-10), some requiring a hemodialysis machine and others that rely on the client's blood pressure to power the system.
- E. If CRRT does not require a hemodialysis machine, the client's mean arterial blood pressure needs to be

maintained above 60 mm Hg and arterial and venous access sites are necessary.

## XII. KIDNEY TRANSPLANTATION (Fig. 62-4)

### A. Description

1. A human kidney from a compatible donor is implanted into a recipient.
2. Kidney transplantation is performed for irreversible kidney failure; specific criteria is established for eligibility for a transplant.
3. The recipient must take immunosuppressive medications for life.

### B. Living related donors

1. The most desirable source of kidneys for transplantation is living related donors who closely match the client.
2. Donors are screened for ABO blood group, tissue-specific antigen, human leukocyte antigen suitability, mixed lymphocyte culture index (histocompatibility); donors are also screened for the presence of any communicable diseases and undergo a complete medical evaluation as well as a nephrology consultation.

3. The donor must be in excellent health, with two properly functioning kidneys.
4. The emotional well-being of the donor is determined.
5. Complete understanding of the donation process and outcome by the donor is necessary.

### C. Cadaver donors

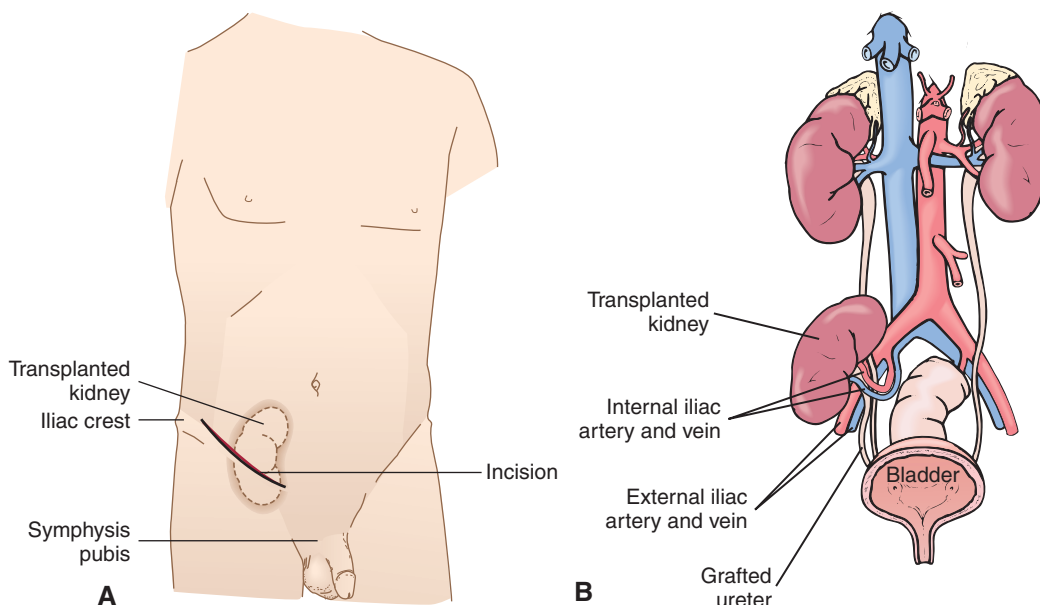

1. Cadaver donors must meet the institution's criteria of brain death.
2. Cadaver donors usually need to be younger than 70 years.
3. Cadaver donors must have normal renal function, although "marginal" donor organs have been used with the consent of the recipient.
4. No malignant disease outside the central nervous system can be present.
5. No generalized infection or communicable disease can be present.
6. No renal trauma can be present.
7. The potential donor must be negative for communicable diseases at the time of donation.
8. Once cerebral death has been established for a potential donor, restoration of intravascular volume, weaning from vasopressors, and establishing diuresis are crucial; management of the donor is determined by organ bank personnel.
9. Continuous ventilation, and normal blood pressure and heart rate are maintained until the kidneys and other organs are surgically removed.

### D. Cold ischemic time

1. Cold ischemic time is the time elapsed between the cessation of blood flow to the kidney and the time required for anastomosis of the kidney in the recipient.

### Box 62-10 Types of Continuous Renal Replacement Therapy

Continuous venovenous hemofiltration (CVVH)  
 Continuous arteriovenous hemofiltration (CAVH)  
 Continuous venovenous hemodialysis (CVVHD)  
 Continuous arteriovenous hemodialysis (CAVHD)  
 Slow continuous ultrafiltration (SCUF)

▲ **FIGURE 62-4** **A**, Surgical incision for renal transplantation. **B**, Surgical placement of transplanted kidney. (From Lewis, S., Heitkemper, M., Dirksen, S., O'Brien, P., & Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

2. The maximum transplantation time is up to 72 hours.

**E. Preoperative interventions**

1. Verify histocompatibility tests of donor, which will be done by organ bank personnel.
2. Administer immunosuppressive medications to the recipient for 2 days before the transplantation, as prescribed.
3. Maintain strict aseptic technique for the recipient.
4. Verify that hemodialysis of the recipient was completed 24 hours before transplantation.
5. Ensure that the recipient is free of any infections.
6. Assess renal function studies.
7. Encourage discussion of feelings of the donor and the recipient.
8. Provide psychological support to the live donor or cadaver donor family and the recipient.

**F. Postoperative interventions for the recipient**

1. Urine output usually begins immediately if the donor was a living donor; it may be delayed for a few days or more with a cadaver kidney.
2. Hemodialysis may be performed until adequate kidney function is established.
3. Monitor vital signs, central venous pressure (CVP), and pulse oximetry for signs of complications.
4. Monitor urine output hourly; immediately report a urine output less than 100 mL/hr.
5. Monitor IV fluids closely; for the first 12 to 24 hours, IV fluid replacement is based on hourly urine output.
6. Administer prescribed diuretics and osmotic agents.
7. Monitor daily weight to evaluate fluid status.
8. Monitor daily laboratory results to evaluate renal function, including hematocrit, BUN, and serum creatinine levels, and monitor urine for blood and specific gravity.
9. Position the client in a semi-Fowler's position to promote gas exchange, turning from the back to the nonoperative side.
10. Monitor Foley catheter patency; the Foley catheter remains in the bladder for 3 to 5 days to allow for anastomosis healing.
11. Note that urine is pink and bloody initially but gradually returns to normal within several days to weeks.
12. Notify the physician if gross hematuria and clots are noted in the urine.
13. Monitor the three-way bladder irrigation, if present, for clots; irrigate only if a physician's prescription is present.
14. Remove the Foley catheter as soon as possible to prevent infection.
15. Maintain aseptic technique and monitor for infection; infection is the primary cause of death in the first year post-transplant.

16. Maintain strict aseptic technique with wound care.
17. Monitor for bowel sounds and for the passage of flatus; initiate a specific diet and oral fluids as prescribed when flatus and bowel sounds return (usually, fluids, sodium, and potassium are restricted if the client is oliguric).
18. Maintain good oral hygiene, monitoring for stomatitis and bacterial and fungal infections.
19. Encourage coughing and deep-breathing exercises.
20. Administer medications as prescribed, which may include antifungal medications, antibiotics, immunosuppressive agents, and corticosteroids.
21. The client is usually ambulated after 24 hours.
22. Assess for organ rejection by monitoring of laboratory values closely.
23. Promote live donor and recipient relationship.
24. Monitor both the donor and recipient for depression.
25. Provide the recipient with instructions following the kidney transplantation (Box 62-11).
26. Assist the recipient to cope with the body image disturbances that occur from long-term use of immunosuppressants.
27. Advise the recipient of available support groups.

**G. Graft rejection**

1. Assessment (Box 62-12)
2. Hyperacute rejection
  - a. Hyperacute rejection occurs at the time of anastomosis of the organ.
  - b. Interventions: Removal of rejected kidney
3. Acute rejection
  - a. Most common type; occurs most frequently within 6 weeks postoperatively, but can occur any time post-transplant.
  - b. Interventions: Potentially reversible with increased immunosuppression and if treated early; administer high doses of corticosteroids, or monoclonal antibodies if corticosteroids are ineffective.

**Box 62-11 Client Instructions Following Kidney Transplantation**

Avoid prolonged periods of sitting.  
 Monitor intake and output.  
 Recognize the signs and symptoms of infection and rejection.  
 Use medications as prescribed, and maintain immunosuppressive therapy for life.  
 Avoid contact sports.  
 Avoid exposure to persons with infections.  
 Know the signs and symptoms that require the need to contact the physician.  
 Ensure follow-up care.

**Box 62-12 Clinical Signs of Renal Transplant (Graft) Rejection**

Temperature higher than 100° F (37.7° C)  
 Pain or tenderness over the grafted kidney  
 2- to 3-lb weight gain in 24 hours  
 Edema  
 Hypertension  
 Malaise  
 Elevated blood urea nitrogen and serum creatinine levels  
 Decreased creatinine clearance  
 Elevated white blood cell count  
 Rejection indicated by ultrasound or biopsy

4. Chronic rejection
  - a. Occurs slowly months to years after transplant and mimics **CRF**.
  - b. Interventions: Immunosuppressive medications and retransplantation if necessary.

 Except for identical twin donors and recipients, the major postoperative complication following renal transplant is graft rejection.

**XIII. CYSTITIS—URINARY TRACT INFECTION****A. Description**

1. Cystitis (urinary tract infection, UTI) is an inflammation of the bladder from an infection, obstruction of the urethra, or other irritants (Box 62-13).
2. The most common causative organisms are *Escherichia coli* and *Enterobacter*, *Pseudomonas*, and *Serratia* species.
3. Cystitis is more common in women because women have a shorter urethra than men and the urethra in the woman is located close to the rectum.
4. Sexually active and pregnant women are most vulnerable to cystitis.

**B. Assessment**

1. Frequency and urgency
2. Burning on urination
3. Voiding in small amounts
4. Inability to void
5. Incomplete emptying of the bladder
6. Lower abdominal discomfort or back discomfort
7. Cloudy, dark, foul-smelling urine
8. Hematuria
9. Bladder spasms
10. Malaise, chills, fever
11. Nausea and vomiting
12. WBC count greater than 100,000 cells/mm<sup>3</sup> on urinalysis
13. An elevated specific gravity and pH may be noted on urinalysis.

**Box 62-13 Causes of Cystitis**

Allergens or irritants, such as soaps, sprays, bubble bath, perfumed sanitary napkins  
 Bladder distention  
 Calculus  
 Hormonal changes, influencing alterations in vaginal flora  
 Indwelling urinary catheters  
 Invasive urinary tract procedures  
 Loss of bactericidal properties of prostatic secretions in the male  
 Microorganisms  
 Poor-fitting vaginal diaphragms  
 Sexual intercourse  
 Synthetic underwear and pantyhose  
 Urinary stasis  
 Use of spermicides  
 Wet bathing suits

 Altered mentation is a sign of a urinary tract infection in older adults; frequency and urgency may not be specific symptoms of UTI because of urinary elimination changes that occur with aging.

**C. Interventions**

1. Before administering prescribed antibiotics, obtain a urine specimen for culture and sensitivity, if prescribed, to identify bacterial growth. 
2. Encourage the client to increase fluids up to 3000 mL/day, especially if the client is taking a sulfonamide; sulfonamides can form crystals in concentrated urine. 
3. Administer prescribed medications, which may include analgesics, antiseptics, antispasmodics, antibiotics, and antimicrobials.
4. Maintain an acid urine pH (5.5); instruct the client about foods to consume to maintain acidic urine.
5. Provide heat to the abdomen or sitz baths for complaints of discomfort.
6. Note that if the client is prescribed an aminoglycoside, sulfonamide, or nitrofurantoin (Macrochantin), the actions of these medications are decreased by acidic urine. 
7. Use sterile technique when inserting a urinary catheter. 
8. Maintain closed urinary drainage systems for the client with an indwelling catheter and avoid elevating the urinary drainage bag above the level of the bladder. 
9. Provide meticulous perineal care for the client with an indwelling catheter. 
10. Discourage caffeine products such as coffee, tea, and cola.
11. Client education
  - a. Avoid alcohol.
  - b. Take medications as prescribed.

**Box 62-14 Teaching for Prevention of Cystitis**

Use good perineal care, wiping front to back.  
 Avoid bubble baths, tub baths, and vaginal deodorants or sprays.  
 Void every 2 to 3 hours.  
 Wear cotton pants and avoid wearing tight clothes or pantyhose with slacks.  
 Avoid sitting in a wet bathing suit for prolonged periods of time.  
 If pregnant, void every 2 hours.  
 If menopausal, use estrogen vaginal creams to restore pH.  
 Use water-soluble lubricants for intercourse, especially after menopause.  
 Void and drink a glass of water after intercourse.

c. Take antibiotics on schedule and complete the entire course of medications as prescribed, which may be 10 to 14 days.

d. Repeat the urine culture following treatment.  
 e. Prevent recurrence of cystitis (Box 62-14).

**XIV. UROSEPSIS****A. Description**

1. Urosepsis is a gram-negative bacteremia originating in the urinary tract.
2. The most common causative organism is *Escherichia coli*.
3. In a client who is immunocompromised, the most common cause is infection from an indwelling urinary catheter or an untreated UTI.
4. The major problem is the ability of this bacterium to develop resistant strains.
5. Urosepsis can lead to septic shock if not treated aggressively.

**B. Assessment:** Fever is the most common and earliest manifestation.

**C. Interventions**

1. Obtain a urine specimen for urine culture and sensitivity before administering antibiotics.
2. Administer antibiotics intravenously as prescribed, usually until the client has been afebrile for 3 to 5 days.
3. Administer oral antibiotics as prescribed after the 3- to 5-day afebrile period.

**XV. URETHRITIS****A. Description**

1. Inflammation of the urethra commonly associated with a sexually transmitted disease; may occur with cystitis.
2. In men, urethritis most often is caused by gonorrhea or chlamydial infection.
3. In women, urethritis most often is caused by feminine hygiene sprays, perfumed toilet paper or sanitary napkins, spermicidal jelly, UTI, or changes in the vaginal mucosal lining.

**B. Assessment**

1. Pain or burning on urination
2. Frequency and urgency
3. Nocturia
4. Difficulty voiding
5. Males may have clear to mucopurulent discharge from the penis.
6. Females may have lower abdominal discomfort.

**C. Interventions**

1. Encourage fluid intake.
2. Prepare the client for testing to determine whether a sexually transmitted infection (STI) is present.
3. Administer antibiotics as prescribed.
4. Instruct the client in the administration of sitz or tub baths.
5. If stricture occurs, prepare the client for dilation of the urethra and instillation of an antiseptic solution.
6. Instruct the female client to avoid the use of perfumed toilet paper or sanitary napkins and feminine hygiene sprays.
7. Instruct the client to avoid intercourse until the symptoms subside or treatment of the STI is complete.
8. Instruct the client about STIs if this is the cause.
  - a. Prevent STIs by the use of latex condoms or abstinence.
  - b. All sexual partners during the 30 days before diagnosis with chlamydial infection should be notified, examined, and treated if indicated.
  - c. Chlamydial infection often coexists with gonorrhea; diagnostic testing is done for both STIs.
  - d. Treatment for STIs includes antibiotics as prescribed to treat the causative organism.
  - e. The most serious complication of chlamydial infection is sterility.
  - f. Follow-up culture may be requested in 4 to 7 days to evaluate the effectiveness of medications.

**XVI. URETERITIS**

**A. Description:** An inflammation of the ureter commonly associated with bacterial or viral infections and pyelonephritis

**B. Assessment**

1. Dysuria
2. Frequent urination
3. Clear to mucopurulent penile discharge in males

**C. Interventions**

1. Treatment includes identifying and treating the underlying cause and providing symptomatic relief.
2. Administer metronidazole (Flagyl) or clotrimazole (Mycelex) as prescribed for treating *Trichomonas* infection.
3. Administer nystatin (Mycostatin) or fluconazole (Diflucan) as prescribed for treating yeast infections.

4. Doxycycline (Vibramycin) or azithromycin (Zithromax) may be prescribed for treating chlamydial infections.

## XVII. PYELONEPHRITIS

### A. Description

1. An inflammation of the renal pelvis and the parenchyma commonly caused by bacterial invasion
2. Acute pyelonephritis often occurs after bacterial contamination of the urethra or following an invasive procedure of the urinary tract.
3. Chronic pyelonephritis most commonly occurs following chronic urinary flow obstruction with reflux.
4. *Escherichia coli* is the most common causative bacterial organism.

### B. Acute pyelonephritis

1. Acute pyelonephritis occurs as a new infection or recurs as a relapse of a previous infection.
2. It can progress to bacteremia or chronic pyelonephritis.
3. Assessment
  - a. Fever and chills
  - b. Nausea
  - c. Flank pain on the affected side
  - d. Costovertebral angle tenderness
  - e. Headache
  - f. Dysuria
  - g. Frequency and urgency
  - h. Cloudy, bloody, or foul-smelling urine
  - i. Increased white blood cells in the urine

### C. Chronic pyelonephritis

1. A slow, progressive disease usually associated with recurrent acute attacks
2. Causes contraction of the kidney and dysfunctioning of the nephrons, which are replaced by scar tissue
3. Causes the ureter to become fibrotic and narrowed by strictures
4. Can lead to **renal failure**
5. Assessment
  - a. Frequently diagnosed incidentally when a client is being evaluated for hypertension
  - b. Poor urine-concentrating ability
  - c. Pyuria
  - d. **Azotemia**
  - e. Proteinuria

### D. Interventions

1. Monitor vital signs, especially for elevated temperature.
2. Encourage fluid intake up to 3000 mL/day to reduce fever and prevent dehydration.
3. Monitor intake and output (ensure that output is a minimum of 1500 mL/24 hr).
4. Monitor weight.
5. Encourage adequate rest.

6. Instruct the client in a high-calorie, low-protein diet.
7. Provide warm, moist compresses to the flank area to help relieve pain.
8. Encourage the client to take warm baths for pain relief.
9. Administer analgesics, antipyretics, antibiotics, urinary antiseptics, and antiemetics as prescribed.
10. Monitor for signs of **renal failure**.
11. Encourage follow-up urine culture.

## XVIII. GLOMERULONEPHRITIS

### A. Description

1. Term that includes a variety of disorders, most of which are caused by an immunological reaction
2. Results in proliferative and inflammatory changes within the glomerular structure
3. Destruction, inflammation, and sclerosis of the glomeruli of both kidneys occur.
4. The inflammation of the glomeruli results from an antigen-antibody reaction produced from an infection or autoimmune process elsewhere in the body.
5. Loss of kidney function occurs.

### B. Causes

1. Immunological or autoimmune diseases
2. Group A beta-hemolytic streptococcal infection
3. History of pharyngitis or tonsillitis 2 to 3 weeks before symptoms

### C. Types

1. Acute glomerulonephritis occurs 5 to 21 days after a streptococcal infection.
2. Chronic glomerulonephritis can occur after the acute phase or slowly over time.

### D. Assessment

1. Gross hematuria
2. Dark, smoky, cola-colored or red-brown urine
3. Proteinuria that produces a persistent and excessive foam in the urine
4. Urinary debris
5. Moderately elevated to high urine specific gravity
6. Low urinary pH
7. Urinalysis shows large numbers of erythrocytes
8. **Oliguria** or **anuria**
9. Headache
10. Chills and fever
11. Fatigue and weakness
12. Anorexia, nausea, and vomiting
13. Pallor
14. Edema in the face, periorbital area, feet, or generalized
15. Shortness of breath, ascites, pleural effusion, and CHF
16. Abdominal or flank pain
17. Hypertension
18. Reduced visual acuity

19. Increased blood urea nitrogen and serum creatinine levels
20. Increased antistreptolysin O titer (used to diagnose disorders caused by streptococcal infections)

#### E. Interventions

1. Monitor vital signs, especially for hypertension and temperature elevations.
2. Monitor intake and output and urine characteristics closely.
3. Monitor daily weight.
4. Monitor for edema.
5. Monitor for fluid overload, ascites, pulmonary edema, and CHF.
6. Restrict fluid intake as prescribed.
7. Provide a high-calorie, low-protein, low-sodium, and low-potassium diet to prevent worsening **azotemia**, fluid retention, and hyperkalemia.
8. Provide bed rest and limit activity.
9. Administer diuretics, antihypertensives, and antibiotics as prescribed.
10. Monitor for signs of **renal failure**, cardiac failure, and hypertensive encephalopathy.
11. Instruct the client to report signs of bloody urine, headache, or edema.
12. Instruct the client to obtain treatment for infections, especially sore throats, skin lesions, and upper respiratory infections.

#### F. Complications

1. Heart failure
2. Hypertensive encephalopathy
3. Pulmonary edema
4. **Renal failure**
5. Nephrotic syndrome

### XIX. NEPHROTIC SYNDROME

**A. Description:** A set of clinical manifestations arising from protein wasting caused by diffuse glomerular damage

#### B. Assessment

1. Proteinuria
2. Hematuria
3. Hypoalbuminemia
4. Edema (periorbital that is most notable in the morning, and dependent, such as in the ankles when sitting and in the sacrum or scrotum when lying)
5. Hyperlipidemia
6. Anemia
7. Waxy pallor to the skin
8. Anorexia
9. Malaise
10. Irritability
11. Amenorrhea or abnormal menses

#### C. Interventions

1. Monitor vital signs, especially for signs of hypertension from fluid excess or hypotension from fluid shifting into the tissues.

2. Monitor intake and output.
3. Bed rest is necessary if severe edema is present.
4. Monitor daily weights.
5. Measure abdominal girth or extremity size.
6. Provide a low- to moderate-protein and -sodium diet that is adequate in carbohydrates and calories as prescribed to prevent worsening **azotemia** and fluid retention.
7. Monitor the serum potassium level; potassium may be restricted from the diet if the serum potassium level rises.
8. Administer antihypertensives, diuretics, and lipid-lowering agents as prescribed.
9. Administer corticosteroids and cytotoxic medications as prescribed.
10. Administer plasma volume expanders, such as albumin, plasma, and dextran, to increase the osmotic pressure.
11. Administer anticoagulants as prescribed for clients who develop renal vein thrombosis.
12. Avoid trauma to edematous tissues.
13. Instruct the client to keep the nails trimmed to avoid tissue trauma.

### XX. POLYCYSTIC KIDNEY DISEASE

#### A. Description

1. A cystic formation and hypertrophy of the kidneys, which leads to cystic rupture, infection, formation of scar tissue, and damaged nephrons
2. There is no specific treatment to arrest the progress of the destructive cysts.
3. The ultimate result of this disease is **renal failure**.

#### B. Types

1. Infantile polycystic disease: An inherited autosomal recessive trait that results in the death of the infant within a few months after birth
2. Adult polycystic disease: An autosomal dominant trait that manifests between 30 and 40 years of age and results in end-stage renal disease

#### C. Assessment

1. Often asymptomatic until the ages of 30 to 40 years
2. Flank, lumbar, or abdominal pain that worsens with activity and is relieved when lying
3. Fever and chills
4. Recurrent urinary tract infections
5. Hematuria, proteinuria, pyuria
6. Calculi
7. Hypertension
8. Palpable abdominal masses and enlarged kidneys

#### D. Interventions

1. Monitor for gross hematuria, which indicates cyst rupture.
2. Increase sodium and water intake because sodium loss rather than retention occurs.
3. Provide bed rest if ruptured cysts and bleeding occur.

4. Prepare the client for percutaneous cyst puncture for relief of obstruction or for draining an abscess.
5. Administer antihypertensives as prescribed.
6. Prevent and/or treat urinary tract infections.
7. Prepare the client for **dialysis** or renal transplantation.
8. Encourage the client to seek genetic counseling.
9. Provide psychological support to the client and family.
10. Provide psychosocial support and genetic counseling for family who may want to donate a kidney.

## XXI. HYDRONEPHROSIS

### A. Description (Fig. 62-5)

1. Distention of the renal pelvis and calices caused by an obstruction of normal urine flow
2. The urine becomes trapped proximal to the obstruction.
3. The causes include calculus, tumors, scar tissue, ureter obstructions, and hypertrophy of the prostate.

### B. Assessment

1. Hypertension
2. Headache
3. Colicky or dull flank pain that radiates to the groin

### C. Interventions

1. Monitor vital signs frequently.
2. Monitor for fluid and electrolyte imbalances, including dehydration after the obstruction is relieved.
3. Monitor for diuresis, which can lead to fluid depletion.
4. Monitor weights daily.
5. Monitor urine for specific gravity and albumin and glucose levels.
6. Administer fluid replacement as prescribed.
7. Prepare the client for insertion of a nephrostomy tube or a surgical procedure to relieve the obstruction if prescribed.

## XXII. RENAL CALCULI

### A. Description

1. Calculi are stones that can form anywhere in the urinary tract; however, the most frequent site is the kidneys.
2. Problems resulting from calculi are pain, obstruction, tissue trauma, secondary hemorrhage, and infection.
3. The stone can be located through radiography of the kidneys, ureters, and bladder; intravenous pyelography; CT scanning; and renal ultrasonography.
4. A stone analysis will be done after passage to determine the type of stone and assist in determining treatment.
5. **Urolithiasis** refers to the formation of urinary calculi; these form in the ureters.

▲ **FIGURE 62-5** Hydronephrosis and hydroureter. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

6. **Nephrolithiasis** refers to the formation of kidney calculi; these form in the renal parenchyma.
7. When a calculus occludes the ureter and blocks the flow of urine, the ureter dilates, producing hydroureter (see Fig. 62-5).
8. If the obstruction is not removed, urinary stasis results in infection, impairment of renal function on the side of the blockage, hydronephrosis (see Fig. 62-5), and irreversible kidney damage.

### B. Causes

1. Family history of stone formation
2. Diet high in calcium, vitamin D, protein, oxalate, purines, or alkali
3. Obstruction and urinary stasis
4. Dehydration
5. Use of diuretics, which can cause volume depletion
6. Urinary tract infections and prolonged urinary catheterization
7. Immobilization
8. Hypercalcemia and hyperparathyroidism
9. Elevated uric acid level, such as in gout

### C. Assessment

1. Renal colic, which originates in the lumbar region and radiates around the side and down to the testicles in men and to the bladder in women
2. Ureteral colic, which radiates toward the genitalia and thighs
3. Sharp, severe pain of sudden onset
4. Dull, aching pain in the kidney
5. Nausea and vomiting, pallor, and diaphoresis during acute pain

6. Urinary frequency, with alternating retention
7. Signs of a urinary tract infection
8. Low-grade fever
9. High numbers of red blood cells, white blood cells, and bacteria noted in the urinalysis report
10. Gross hematuria

#### D. Interventions

1. Monitor vital signs, especially the temperature, for signs of infection.
2. Monitor intake and output.
3. Assess for fever, chills, and infection.
4. Monitor for nausea, vomiting, and diarrhea.
5. Encourage fluid intake up to 3000 mL/day, unless contraindicated, to facilitate the passage of the stone and prevent infection.
6. Administer fluids intravenously as prescribed if unable to take fluids orally or in adequate amounts to increase the flow of urine and facilitate passage of the stone.
7. Provide warm baths and heat to the flank area (massage therapy should be avoided).
8. Administer analgesics at regularly scheduled intervals as prescribed to relieve pain.
9. Assess the client's response to pain medication.
10. Assist the client in performing relaxation techniques to assist in relieving pain.
11. Encourage client ambulation, if stable, to promote the passage of the stone.
12. Turn and reposition the immobilized client to promote passage of the stone.
13. Instruct the client in the diet restrictions specific to the stone composition if prescribed.
14. Prepare the client for surgical procedures if prescribed

 For the client with renal calculi, strain all urine for the presence of stones and send the stones to the laboratory for analysis.

#### E. Stone composition

1. A special diet, such as an alkaline-ash or acid-ash diet, may be prescribed, depending on the physician's preference (Boxes 62-15 and 62-16).
2. Calcium phosphate stones
  - a. Caused by supersaturation of urine with calcium and phosphate
  - b. Diet includes acid-ash foods because calcium stones are alkaline.
- c. Dietary prescription may include decreasing intake of foods high in calcium and phosphate to reduce urinary calcium content and avoiding excess vitamin D intake to prevent stones from forming.
- d. Medications prescribed for calcium stones may include phosphates, thiazide diuretics, and allopurinol (Zyloprim).

#### Box 62-15 Alkaline-Ash Diet

##### Outcome

Diet increases the pH of the urine.  
Diet reduces the acidity of the urine.

##### Foods to Include

Fruits except cranberries, plums, prunes, and tomatoes  
Milk  
Most vegetables  
Rhubarb  
Small amounts of beef, halibut, veal, trout, and salmon

#### Box 62-16 Acid-Ash Diet

##### Outcome

Diet decreases the pH of the urine.  
Diet makes the urine more acidic.

##### Foods to Include

Bread, cereal, whole grains  
Cheese, eggs  
Corn and legumes  
Cranberries, prunes, plums, tomatoes  
Meat, fish, oysters, poultry

3. Calcium oxalate stones
  - a. Caused by supersaturation of urine with calcium and oxalate
  - b. Diet includes acid-ash foods because calcium stones are alkaline.
  - c. Dietary prescription may include decreasing the intake of foods high in calcium and avoiding oxalate food sources to reduce urinary oxalate content and stone formation.
  - d. Oxalate-rich food sources include tea, almonds, cashews, chocolate, cocoa, beans, spinach, and rhubarb.
  - e. Allopurinol, pyridoxine (vitamin B<sub>6</sub>), or magnesium oxide may be prescribed for clients with oxalate stones.
4. Struvite stones
  - a. Composed of magnesium and ammonium phosphate
  - b. Struvite stones are caused by urea-splitting bacteria and tend to form in alkaline urine.
  - c. Diet includes acid-ash foods and includes limiting high-phosphate foods such as dairy products, red and organ meats, and whole grains to reduce urinary phosphate content.
  - d. Treatment includes controlling infection with antibiotics (long-term antibiotic use may be prescribed).
5. Uric acid stones
  - a. Caused by excess dietary purine or from gout
  - b. Tend to form in acidic urine

- c. Dietary prescription to reduce urinary purine content may include alkaline-ash foods and decreased intake of high-purine foods such as organ meats, gravies, red wines, and sardines.
  - d. Allopurinol may be prescribed to lower uric acid levels.
6. Cystine stones
    - a. Caused by cystine crystal formation; tend to form in acidic urine
    - b. Diet includes alkaline-ash foods; dietary prescription also may include a low intake of methionine, an essential amino acid that forms cystine. Therefore, the client would be instructed to avoid meat, milk, cheese, and eggs.
    - c. Dietary measures also focus on encouraging fluid intake up to 3 L/day, unless contraindicated, to help dilute the urine and prevent cystine crystals from forming.
    - d. Long-term antibiotic use may be prescribed for clients with cystine stones.

### XXIII. TREATMENT OPTIONS FOR RENAL CALCULI (Fig. 62-6)

#### A. Cystoscopy

1. Cystoscopy may be done for stones in the bladder or lower ureter.
2. No incision is made.
3. One or two ureteral catheters are inserted past the stone; the stone may be manipulated and dislodged by the procedure and the catheters may guide the stones mechanically downward as they are removed.
4. The catheters are left in place for 24 hours to drain the urine trapped proximal to the stone and to dilate the ureter.
5. A continuous chemical irrigation may be prescribed to dissolve the stone.

#### B. Extracorporeal shock wave lithotripsy (ESWL)

1. A noninvasive mechanical procedure for breaking up stones located in the kidney or upper ureter so that they can pass spontaneously or be removed by other methods
2. No incision is made and no drains are placed; a stent may be placed to facilitate passing stone fragments.
3. Fluoroscopy is used to visualize the stone and ultrasonic waves are delivered to the area of the stone to disintegrate it.
4. The stones are passed in the urine within a few days.
5. Preprocedure: Maintain the client on an NPO status for 8 hours before the procedure.
6. Postprocedure
  - a. Monitor vital signs, especially for hypotension and tachycardia, which could indicate bleeding.
  - b. Monitor intake and output.
  - c. Monitor for bleeding.
  - d. Monitor for pain and signs of urinary obstruction.
  - e. Instruct the client that if a ureteral stent is placed to help the stone pass, it is usually removed in 1 to 2 weeks.
  - f. Instruct the client to increase fluid intake to flush out the stone fragments.
  - g. Inform the client that ambulation is important.

#### C. Percutaneous lithotripsy

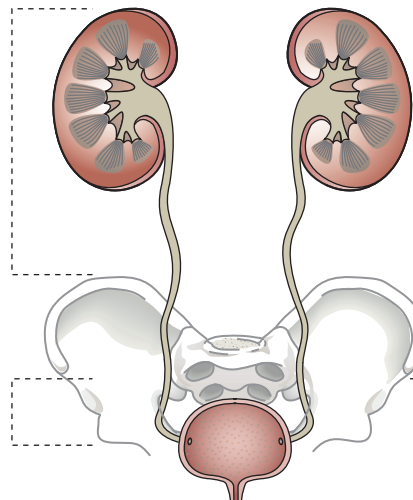

1. Performed for stones in the bladder, ureter, or kidney
2. An invasive procedure in which a guide is inserted under fluoroscopy near the area of the stone; an ultrasonic wave is aimed at the stone to break it into fragments.
3. Percutaneous lithotripsy may be performed via cystoscopy or nephroscopy.

#### PROXIMAL URETER

- ESWL
- Retrograde ureteroscopy
- Antegrade nephrostouretrolithotomy
- Stenting alone
- Percutaneous ureterolithotomy or nephrolithotomy

#### DISTAL URETER

- ESWL/ureteroscopy
- Antegrade nephrostouretrolithotomy
- Stenting alone
- Open ureterolithotomy

#### MIDURETER

- Retrograde ureteroscopy
- ESWL
- Antegrade nephrostouretrolithotomy
- Open ureterolithotomy

▲ **FIGURE 62-6** Treatment options for ureteral stones. ESWL, extracorporeal shock wave lithotripsy. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

4. No incision is required for cystoscopy; a small flank incision is needed for nephroscopy.
5. The client might have an indwelling bladder catheter.
6. A nephrostomy tube may be placed to administer chemical irrigations to break up the stone; the nephrostomy tube may remain in place for 1 to 5 days.
7. Encourage the client to drink 3000 to 4000 mL of fluid/day following the procedure.
8. Monitor for and instruct the client to monitor for complications of infection, hemorrhage, and extravasation of fluid into the retroperitoneal cavity.

#### D. Ureterolithotomy

1. An open surgical procedure performed if lithotripsy is not effective for removal of a stone in the ureter
2. An incision is made through the lower abdomen or flank and then into the ureter to remove the stone.
3. The client may have a Penrose drain, ureteral stent catheter, and/or indwelling bladder catheter.

#### E. Pyelolithotomy and nephrolithotomy

1. Pyelolithotomy is an incision into the renal pelvis to remove a stone; a large flank incision is required and the client may have a Penrose drain and indwelling bladder catheter.
2. Nephrolithotomy is an incision into the kidney made to remove a stone; a large flank incision is required, and the client may have a nephrostomy tube and an indwelling bladder catheter.

#### F. Partial or total nephrectomy

1. Performed for extensive kidney damage, renal infection, severe obstruction from stones or tumors, and prevention of stone recurrence
2. Postoperative interventions
  - a. The plan of care depends on the incision location and the type of drainage tubes present.
  - b. Monitor the incision, particularly if a Penrose drain is in place, because it will drain large amounts of urine.
  - c. Protect the skin from urinary drainage, changing dressings frequently if necessary.
  - d. Place an ostomy pouch over the Penrose drain to protect the skin if urinary drainage is excessive.
  - e. Monitor the nephrostomy tube, which may be attached to a drainage bag, for a continuous flow of urine.
  - f. Do not irrigate the nephrostomy or bladder catheters unless specifically prescribed.
  - g. Monitor the indwelling bladder catheter for drainage.
  - h. Encourage fluid intake to ensure a urine output of 2500 to 3000 mL/day or more.
  - i. Measure intake and output accurately.

- j. If a stone was removed, determine its composition from laboratory analysis.

### XXIV. KIDNEY TUMORS

#### A. Description

1. Kidney tumors may be benign or malignant, bilateral or unilateral.
2. Common sites of metastasis of malignant tumors include bone, lungs, liver, spleen, and other kidney.
3. The exact cause of renal carcinoma is unknown.

#### B. Assessment

1. Dull flank pain
2. Palpable renal mass
3. Painless gross hematuria

#### C. Radical nephrectomy

##### 1. Description

- a. Surgical removal of the entire kidney, adjacent adrenal gland, and renal artery and vein
- b. Radiation therapy and possibly chemotherapy may follow radical nephrectomy.
- c. Before surgery, radiation may be used to embolize (occlude) the arteries supplying the kidney to reduce bleeding during nephrectomy.

##### 2. Postoperative interventions

- a. Monitor vital signs for signs of bleeding (hypotension and tachycardia).
- b. Monitor for abdominal distention, decreases in urinary output, and alterations in level of consciousness as signs of bleeding; check the bed linens under the client for bleeding.
- c. Monitor for signs of adrenal insufficiency, which include a large urinary output followed by hypotension and subsequent **oliguria**.
- d. Administer fluids and packed red blood cells intravenously as prescribed.
- e. Monitor intake and output and daily weight.
- f. Monitor for a urinary output of 30 to 50 mL/hr to ensure adequate renal function.
- g. Monitor urine specific gravity.
- h. Maintain the client in a semi-Fowler's position.
- i. Monitor for signs of respiratory complications related to surgery; encourage coughing and deep-breathing exercises.
- j. Monitor for passing of flatus and bowel sounds (lack of flatus and bowel sounds can be indicative of paralytic ileus).
- k. Apply antiembolism stockings as prescribed.
- l. If a nephrostomy tube is in place, do not irrigate (unless specifically prescribed) or manipulate the tube.
- m. Administer pain medications as prescribed.

### XXV. EPIDIDYMITIS

#### A. Description

1. Acute or chronic inflammation of the epididymis that occurs as a result of a UTI, STI, prostatitis, or long-term use of a bladder catheter

2. The infective organism travels upward through the urethra and ejaculatory duct and along the vas deferens to the epididymis.

**B. Assessment**

1. Scrotal pain
2. Groin pain
3. Swelling in the scrotum and groin
4. Pus and bacteria in the urine
5. Fever and chills
6. Abscess development

**C. Interventions**

1. Encourage fluid intake.
2. Encourage bed rest with the scrotum elevated to prevent traction on the spermatic cord, facilitate drainage, and relieve pain.
3. Instruct the client in the intermittent application of cold compresses to the scrotum.
4. Instruct the client in the use of tub or sitz baths.
5. Instruct the client in the administration of antibiotics for self and sexual partner if the cause is chlamydial or gonorrheal infection.
6. Instruct the client to avoid lifting, straining, and sexual contact until the infection subsides.
7. Instruct the client to limit the force of the stream because organisms can be forced into the vas deferens and epididymis from strain or pressure during voiding.
8. Teach the client that condom use can help prevent urethritis and epididymitis.
9. Teach the client measures to prevent UTI or STI recurrence.

## XXVI. PROSTATITIS

**A. Description**

1. Inflammation of the prostate gland commonly caused by an infectious agent; may be acute or chronic.
2. The bacterial type occurs as a result of the organism reaching the prostate via the urethra, bladder, bloodstream, or lymphatic channels.
3. The abacterial type usually occurs following a viral illness or a decrease in sexual activity.

**B. Assessment**

1. Bacterial prostatitis
  - a. Client becomes acutely ill
  - b. Fever and chills
  - c. Frequency and urgency of urination; dysuria
  - d. Perineal and low back pain
  - e. Urethral discharge
  - f. Prostate is tender, indurated, and warm to the touch.
  - g. Urethral discharge on palpation of prostate
  - h. White blood cells are found in prostatic secretions.
  - i. Urine culture is usually positive for gram negative bacteria, especially after prostate massage.

2. Abacterial prostatitis (most common form of chronic prostatitis)

- a. Backache
- b. Dysuria
- c. Perineal pain
- d. Frequency
- e. Hematuria
- f. Irregularly enlarged, firm, and tender prostate

**C. Interventions**

1. Encourage adequate fluid intake.
2. Instruct the client in the use of tub or sitz baths to promote comfort.
3. Administer antibiotics, analgesics, antispasmodics, and stool softeners as prescribed.
4. Inform the client of activities to drain the prostate, such as intercourse, masturbation, and prostatic massage.
5. Instruct the client to avoid spicy foods, coffee, alcohol, prolonged automobile rides, and sexual intercourse during an acute inflammation.

## XXVII. BENIGN PROSTATIC HYPERTROPHY (HYPERPLASIA)

**A. Description**

1. Benign prostatic hypertrophy (benign prostatic hyperplasia; BPH) is a slow enlargement of the prostate gland, with hypertrophy and hyperplasia of normal tissue.
2. Enlargement compresses the urethra, resulting in partial or complete obstruction.
3. Usually occurs in men older than 50 years

**B. Assessment**

1. Diminished size and force of urinary stream (early sign of BPH)
2. Urinary urgency and frequency
3. Nocturia
4. Inability to start (hesitancy) or continue a urinary stream
5. Feelings of incomplete bladder emptying
6. Postvoid dribbling from overflow incontinence (later sign)
7. Urinary retention and bladder distention
8. Hematuria
9. Urinary stasis
10. Dysuria and bladder pain
11. UTIs

**C. Interventions**

1. Encourage fluid intake of up to 2000 to 3000 mL/day unless contraindicated.
2. Prepare for urinary catheterization to drain the bladder and prevent distention.
3. Avoid administering medications that cause urinary retention, such as anticholinergics, antihistamines, decongestants, and antidepressants.

**Box 62-17 Surgical and Invasive Procedures for Prostatic Hyperplasia**

**Laser prostatectomy:** Ablation of the enlarged prostate using laser instead of radiofrequency waves.

**Perineal prostatectomy:** Removal of prostatic tissue (may be performed for prostatic cancer) low in the pelvic region through an incision between the scrotum and rectum; impotence and incontinence usually result.

**Retropubic prostatectomy:** Removal of hypertrophied prostatic tissue high in the pelvic region through a low abdominal incision; the bladder is not incised.

**Suprapubic prostatectomy:** Removal of prostatic tissue mass through a low midline incision; an incision is made into the bladder and urethral mucosa to the anterior aspect of the prostate.

**Transurethral electrovaporization of the prostate:** Placement of a special metal instrument that emits a high-frequency electrical current that cuts and vaporizes excess tissue and seals the remaining tissue to prevent bleeding; this is especially useful for men on anticoagulants and those at risk for complications.

**Transurethral incision of the prostate (TUIP):** Removal of prostatic tissue through an incision made in the bladder neck.

**Transurethral microwave thermotherapy:** Application of heat to destroy the hypertrophied tissue.

**Transurethral needle ablation of the prostate (TUNA):** Placement of interstitial radiofrequency needles through the urethra and into the lateral lobes of the prostate, causing heat-induced coagulation necrosis of the prostate for treating benign prostatic hypertrophy (BPH).

**Transurethral resection of the prostate (TURP):** Removal of benign prostatic tissue surrounding the urethra with use of a resectoscope introduced through the urethra; there is little risk of impotence and it is most commonly used for BPH.

**Urethral stents:** Application of stents or coils in the urethra where it is narrowed by the prostate.

4. Administer medications as prescribed to shrink the prostate gland and improve urine flow.
5. Administer medications as prescribed to relax prostatic smooth muscle and improve urine flow.
6. Instruct the client to decrease intake of caffeine and artificial sweeteners and limit spicy or acidic foods.
7. Instruct the client to follow a timed voiding schedule.
8. Prepare the client for surgery or invasive procedures as prescribed (Box 62-17; Figs. 62-7 and 62-8).

**D. Surgical interventions and postoperative care** (see Chapter 52)

### XXVIII. BLADDER TRAUMA

**A. Description**

1. Occurs following a blunt or penetrating injury to the lower abdomen
2. Blunt trauma causes compression of the abdominal wall and bladder.
3. Penetrating wounds occur as a result of a stabbing, gunshot wound, or other objects piercing the abdominal wall.
4. A fractured pelvis that causes bone fragments to puncture the bladder is a common cause of bladder trauma.

**B. Assessment**

1. **Anuria**
2. Hematuria
3. Pain below the level of the umbilicus; can radiate to the shoulders
4. Nausea and vomiting

**C. Interventions**

1. Monitor vital signs.
2. Monitor for hematuria, bleeding, and signs of shock.
3. Promote bed rest.
4. Monitor pain level.
5. If blood is seen at the meatus, avoid urinary catheterization until a retrograde ureterogram can be obtained.
6. Prepare the client for insertion of a suprapubic catheter to aid in urinary drainage if prescribed.
7. Prepare the client for surgical repair of the laceration if indicated.

**▲ FIGURE 62-7** Transurethral resection of the prostate. (From Lewis, S., Heitkemper, M., Dirksen, S., O'Brien, P., & Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

**▲ FIGURE 62-8** Surgical approaches for prostatectomy. **A**, Retropubic approach involves a low abdominal incision. **B**, Perineal approach involves an incision between the scrotum and anus. **C**, Suprapubic approach involves a midline abdominal incision. (From Lewis, S., Heitkemper, M., Dirksen, S., O'Brien, P., & Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 733.** The client with acute renal failure has a serum potassium level of 6.0 mEq/L. The nurse would plan which of the following as a priority action?
1. Check the sodium level.
  2. Place the client on a cardiac monitor.
  3. Encourage increased vegetables in the diet.
  4. Allow an extra 500 mL of fluid intake to dilute the electrolyte concentration.
- 734.** The client being hemodialyzed suddenly becomes short of breath and complains of chest pain. The client is tachycardic, pale, and anxious. The nurse suspects air embolism. The priority action for the nurse is to:
1. Discontinue dialysis and notify the physician.
  2. Monitor vital signs every 15 minutes for the next hour.
  3. Continue dialysis at a slower rate after checking the lines for air.
  4. Bolus the client with 500 mL of normal saline to break up the air embolus.
- 735.** The client arrives at the emergency department with complaints of low abdominal pain and hematuria. The client is afebrile. The nurse next assesses the client to determine a history of:
1. Pyelonephritis
  2. Glomerulonephritis
  3. Trauma to the bladder or abdomen
  4. Renal cancer in the client's family
- 736.** The client is admitted to the emergency department following a motor vehicle accident. The client was wearing a lap seat belt when the accident occurred and now the client has hematuria and lower abdominal pain. To assess further whether the pain is caused by bladder trauma, the nurse asks the client if the pain is referred to which of the following areas?
1. Hip
  2. Shoulder
  3. Umbilicus
  4. Costovertebral angle
- 737.** The female client is admitted to the emergency department following a fall from a horse and the physician prescribes insertion of a Foley catheter.

While preparing for the procedure, the nurse notes blood at the urinary meatus. The nurse should:

1. Notify the physician.
2. Use a small-sized catheter.
3. Administer pain medication before inserting the catheter.
4. Use extra povidone-iodine solution in cleansing the meatus.

**738.** A nurse is assessing the patency of a client's left arm arteriovenous fistula prior to initiating hemodialysis. Which finding indicates that the fistula is patent?

1. Palpation of a thrill over the fistula
2. Presence of a radial pulse in the left wrist
3. Absence of a bruit on auscultation of the fistula
4. Capillary refill less than 3 seconds in the nail beds of the fingers on the left hand

**739.** The male client has a tentative diagnosis of urethritis. The nurse assesses the client for which of the following manifestations of the disorder?

1. Hematuria and pyuria
2. Dysuria and proteinuria
3. Hematuria and urgency
4. Dysuria and penile discharge

**740.** The nurse is assessing the client with epididymitis. The nurse anticipates which of the following findings on physical examination?

1. Fever, diarrhea, groin pain, and ecchymosis
2. Nausea, vomiting, scrotal edema, and ecchymosis
3. Fever, nausea, vomiting, and painful scrotal edema
4. Diarrhea, groin pain, testicular torsion, and scrotal edema

**741.** The client complains of fever, perineal pain, and urinary urgency, frequency, and dysuria. To assess whether the client's problem is related to bacterial prostatitis, the nurse would look at the results of the prostate examination, which should reveal that the prostate gland is:

1. Soft and swollen
2. Reddened, swollen, and boggy
3. Tender and edematous with ecchymosis
4. Tender, indurated, and warm to the touch

**742.** The nurse is taking the history of a client who has had benign prostatic hyperplasia in the past. To determine whether the client currently is experiencing difficulty, the nurse asks the client about the presence of which early symptom?

1. Nocturia
2. Urinary retention
3. Urge incontinence
4. Decreased force in the stream of urine

**743.** The client newly diagnosed with chronic renal failure recently has begun hemodialysis. Knowing that the client is at risk for disequilibrium syndrome, the nurse assesses the client during dialysis for:

1. Hypertension, tachycardia, and fever
2. Hypotension, bradycardia, and hypothermia
3. Restlessness, irritability, and generalized weakness
4. Headache, deteriorating level of consciousness, and twitching

**744.** The hemodialysis client with a left arm fistula is at risk for arterial steal syndrome. The nurse assesses this client for which of the following manifestations?

1. Warmth, redness, and pain in the left hand
2. Pallor, diminished pulse, and pain in the left hand
3. Edema and reddish discoloration of the left arm
4. Aching pain, pallor, and edema of the left arm

**745.** The nurse is reviewing the client's record and notes that the physician has documented that the client has a renal disorder. On review of the laboratory results, the nurse most likely would expect to note which of the following?

1. Decreased hemoglobin level
2. Elevated creatinine level
3. Decreased red blood cell count
4. Decreased white blood cell count

**746.** The client with chronic renal failure returns to the nursing unit following a hemodialysis treatment. On assessment, the nurse notes that the client's temperature is 100.2° F. Which of the following is the appropriate nursing action?

1. Encourage fluids.
2. Notify the physician.
3. Continue to monitor vital signs.
4. Monitor the site of the shunt for infection.

**747.** The nurse is performing an assessment on a client who has returned from the dialysis unit following hemodialysis. The client is complaining of headache and nausea and is extremely restless. Which of the following is the most appropriate nursing action?

1. Monitor the client.
2. Notify the physician.
3. Elevate the head of the bed.
4. Medicate the client for nausea.

**748.** A client newly diagnosed with renal failure has just been started on peritoneal dialysis. During the infusion of the dialysate, the client complains of abdominal pain. Which action by the nurse is appropriate?

1. Stop the dialysis.
2. Slow the infusion.

3. Decrease the amount to be infused.
  4. Explain that the pain will subside after the first few exchanges.
- 749.** The nurse is instructing a client with diabetes mellitus about peritoneal dialysis. The nurse tells the client that it is important to maintain the prescribed dwell time for the dialysis because of the risk of:
1. Infection
  2. Hyperglycemia
  3. Hypophosphatemia
  4. Disequilibrium syndrome
- 750.** A week after kidney transplantation, the client develops a temperature of 101° F, the blood pressure is elevated, and the kidney is tender. The x-ray indicates that the transplanted kidney is enlarged. Based on these assessment findings, the nurse would suspect which of the following complications?
1. Acute rejection
  2. Kidney infection
  3. Chronic rejection
  4. Kidney obstruction
- 751.** The client is admitted to the hospital with a diagnosis of benign prostatic hyperplasia, and a

transurethral resection of the prostate is performed. Four hours after surgery, the nurse takes the client's vital signs and empties the urinary drainage bag. Which of the following assessment findings would indicate the need to notify the physician?

1. Red bloody urine
2. Pain related to bladder spasms
3. Urinary output of 200 mL higher than intake
4. Blood pressure, 100/50 mm Hg; pulse, 130 beats/min

### Alternate Item Format: Multiple Response

- 752.** The nurse monitoring a client receiving peritoneal dialysis notes that the client's outflow is less than the inflow. Which nursing actions should the nurse take? **Select all that apply.**
- 1. Contact the physician.
  - 2. Check the level of the drainage bag.
  - 3. Reposition the client to his or her side.
  - 4. Place the client in good body alignment.
  - 5. Check the peritoneal dialysis system for kinks.
  - 6. Increase the flow rate of the peritoneal dialysis solution.

## ANSWERS

### 733. 2

**Rationale:** The client with hyperkalemia is at risk of developing cardiac dysrhythmias and cardiac arrest. Because of this, the client should be placed on a cardiac monitor. Fluid intake is not increased because it contributes to fluid overload and would not affect the serum potassium level significantly. Vegetables are a natural source of potassium in the diet, and their use would not be increased. The nurse also may assess the sodium level because sodium is another electrolyte commonly measured with the potassium level. However, this is not a priority action of the nurse.

**Test-Taking Strategy:** First, note that the potassium level is elevated. Next, use the ABCs—airway, breathing, and circulation—to direct you to option 2. Review care of the client with hyperkalemia if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Renal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 191, 1610). St. Louis: Saunders.

### 734. 1

**Rationale:** If the client experiences air embolus during hemodialysis, the nurse should terminate dialysis immediately, notify the physician, and administer oxygen as needed. Options 2, 3, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Recalling that air embolism is an emergency situation that affects the cardiopulmonary system suddenly and profoundly will direct you to option 1. Review the emergency care of a client who develops air embolism if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Renal

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 828). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 225). St. Louis: Mosby.

### 735. 3

**Rationale:** Bladder trauma or injury should be considered or suspected in the client with low abdominal pain and hematuria. Glomerulonephritis and pyelonephritis would be accompanied by fever and are thus not applicable to the client described in this question. Renal cancer would not cause pain that is felt in the low abdomen; rather pain would be in the flank area.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 2, knowing that any inflammatory disease or infection is accompanied by fever. Because this client is afebrile, these are not possible options. Use knowledge of

anatomy and pain assessment to select option 3. Pain from renal cancer is a later finding and is localized in the flank area. Review renal assessment techniques and findings if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Renal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1578). St. Louis: Saunders.

### 736. 2

**Rationale:** Bladder trauma or injury is characterized by lower abdominal pain that may radiate to one of the shoulders due to phrenic nerve irritation. Bladder injury pain does not radiate to the umbilicus, costovertebral angle, or hip.

**Test-Taking Strategy:** Use the process of elimination. Recalling the concepts related to dermatomes of the body and pain characteristics of bladder trauma will direct you to option 2. Review the characteristics of bladder trauma if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Renal

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 774). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1578). St. Louis: Saunders.

### 737. 1

**Rationale:** The presence of blood at the urinary meatus may indicate urethral trauma or disruption. The nurse notifies the physician, knowing that the client should not be catheterized until the cause of the bleeding is determined by diagnostic testing. Therefore options 2, 3, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Noting the strategic words *blood at the urinary meatus* will direct you to option 1. Review the assessment findings in a client with trauma to the urinary tract if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Renal

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 775–776). St. Louis: Saunders.

### 738. 1

**Rationale:** The nurse assesses the patency of the fistula by palpating for the presence of a thrill or auscultating for a bruit. The presence of a thrill and bruit indicate patency of the fistula. Although the presence of a radial pulse in the left wrist and capillary refill shorter than 3 seconds in the nail beds of the fingers on the left hand are normal findings, they do not assess fistula patency.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 2 and 4 first because they are comparable or

alike and assess for adequate circulation in the distal portion of the extremity (not the fistula). From the remaining options, focusing on the subject (patency) and noting the word *absence* in option 3 will assist you in eliminating this option. Review the expected findings when assessing an arteriovenous fistula if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Renal

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1623, 1625). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 226). St. Louis: Mosby.

### 739. 4

**Rationale:** Urethritis in the male client often results from chlamydial infection and is characterized by dysuria, which is accompanied by a clear to mucopurulent discharge. Because this disorder often coexists with gonorrhea, diagnostic tests are done for both and include culture and rapid assays.

**Test-Taking Strategy:** Use the process of elimination. Recalling that urethritis generally is accompanied by dysuria in the male client will assist you in eliminating options 1 and 3. Knowing that the problem originates in the urethra, not the kidney, will assist you in eliminating option 2, because proteinuria indicates a problem with kidney function. Review the clinical manifestations of urethritis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Renal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1747). St. Louis: Saunders.

### 740. 3

**Rationale:** Typical signs and symptoms of epididymitis include scrotal pain and edema, which often are accompanied by fever, nausea and vomiting, and chills. Epididymitis most often is caused by infection, although sometimes it can be caused by trauma. Epididymitis needs to be distinguished correctly from testicular torsion.

**Test-Taking Strategy:** Use the process of elimination. Any disorder that ends in *-itis* results from inflammation or infection. Therefore an expected finding would be elevated temperature. With this in mind, eliminate options 2 and 4 because they do not contain fever as part of the option. Knowing that ecchymosis results from bleeding, which is not part of this clinical picture, directs you to option 3. Review the clinical manifestations of epididymitis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Renal

**Reference:** Copstead, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 745). St. Louis: Mosby.

**741. 4**

**Rationale:** The client with prostatitis has a swollen and tender prostate gland that is also warm to the touch, firm, and indurated. Systemic symptoms include fever with chills, perineal and low back pain, and signs of urinary tract infection, which often accompany the disorder.

**Test-Taking Strategy:** Use the process of elimination. Begin to answer this question by reasoning that inflammation of the prostate gland would cause the area to be tender. This would allow you to eliminate options 1 and 2. Recalling that inflammation is accompanied by local warmth will direct you to option 4. Review the signs of prostatitis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Renal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1733). St. Louis: Saunders.

**742. 4**

**Rationale:** Decreased force in the stream of urine is an early sign of benign prostatic hyperplasia. The stream later becomes weak and dribbling. The client then may develop hematuria, frequency, urgency, urge incontinence, and nocturia. If untreated, complete obstruction and urinary retention can occur.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *early*. If you know that benign prostatic hyperplasia can lead to urinary obstruction, look for the option that identifies the least severe symptom. Review early signs of benign prostatic hyperplasia if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Renal

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 876). St. Louis: Saunders.

**743. 4**

**Rationale:** Disequilibrium syndrome is characterized by headache, mental confusion, decreasing level of consciousness, nausea, vomiting, twitching, and possible seizure activity. Disequilibrium syndrome is caused by rapid removal of solutes from the body during hemodialysis. At the same time, the blood-brain barrier interferes with the efficient removal of wastes from brain tissue. As a result, water goes into cerebral cells because of the osmotic gradient, causing increased intracranial pressure and onset of symptoms. The syndrome most often occurs in clients who are new to dialysis and is prevented by dialyzing for shorter times or at reduced blood flow rates.

**Test-Taking Strategy:** Use the process of elimination. Focus on the name, disequilibrium syndrome, to assist in directing you to option 4. Review the manifestations of this syndrome if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Renal

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 828). St. Louis: Saunders.

**744. 2**

**Rationale:** Steal syndrome results from vascular insufficiency after creation of a fistula. The client exhibits pallor and a diminished pulse distal to the fistula. The client also complains of pain distal to the fistula, caused by tissue ischemia. Warmth and redness probably would characterize a problem with infection. The manifestations described in options 3 and 4 are incorrect.

**Test-Taking Strategy:** You must understand steal syndrome and know the signs and symptoms to answer this question. Recalling that steal syndrome results from vascular insufficiency after creation of a fistula will direct you to option 2. Review this syndrome and associated signs and symptoms if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Renal

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1623). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 225). St. Louis: Mosby.

**745. 2**

**Rationale:** Measuring the creatinine level is a frequently used laboratory test to determine renal function. The creatinine level increases when at least 50% of renal function is lost. A decreased hemoglobin level and red blood cell count may be noted if bleeding from the urinary tract occurs or if erythropoietic function by the kidney is impaired. An increased white blood cell count is most likely to be noted in renal disease.

**Test-Taking Strategy:** Use the process of elimination. Recalling the relationship between the creatinine level and renal function will direct you to option 2. Review significant laboratory tests related to renal function if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Renal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1604). St. Louis: Saunders.

**746. 3**

**Rationale:** The client may have an elevated temperature following dialysis because the dialysis machine warms the blood slightly. If the temperature is elevated excessively and remains elevated, sepsis would be suspected and a blood sample would be obtained as prescribed for culture and sensitivity determinations.

**Test-Taking Strategy:** Use the process of elimination and focus on the data in the question. Recalling that an elevation in temperature is expected following dialysis will direct you to

option 3. Review the normal expected findings following dialysis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Renal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1621, 1625–1626). St. Louis: Saunders.

#### 747. 2

**Rationale:** Disequilibrium syndrome may be caused by the rapid decreases in the blood urea nitrogen level during hemodialysis. These changes can cause cerebral edema that leads to increased intracranial pressure. The client is exhibiting early signs of disequilibrium syndrome and appropriate treatments with anticonvulsive medications and barbiturates may be necessary to prevent a life-threatening situation. The physician must be notified.

**Test-Taking Strategy:** Use the process of elimination and focus on the client's signs and symptoms. Recalling the complications associated with hemodialysis will direct you to option 2. Review the signs and symptoms of disequilibrium syndrome if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Renal

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 828). St. Louis: Saunders.

#### 748. 4

**Rationale:** Pain during the inflow of dialysate is common during the first few exchanges because of peritoneal irritation; however, the pain usually disappears after 1 to 2 weeks of treatment. The infusion amount should not be decreased, and the infusion should not be slowed or stopped.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1, 2, and 3 because they are comparable or alike actions. Review the complications associated with peritoneal dialysis and the appropriate nursing actions if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Renal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1629). St. Louis: Saunders.

#### 749. 2

**Rationale:** An extended dwell time increases the risk of hyperglycemia in the client with diabetes mellitus as a result of absorption of glucose from the dialysate and electrolyte changes. Diabetic clients may require extra insulin when receiving peritoneal dialysis.

**Test-Taking Strategy:** Use the process of elimination. Noting the client's diagnosis and recalling that the dialysate solution contains glucose will direct you to option 2. Review the

complications associated with peritoneal dialysis if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Renal

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 823). St. Louis: Saunders.

#### 750. 1

**Rationale:** Acute rejection most often occurs in the first 2 weeks after transplantation. Clinical manifestations include fever, malaise, elevated white blood cell count, acute hypertension, graft tenderness, and manifestations of deteriorating renal function. Chronic rejection occurs gradually over a period of months to years. Although kidney infection or obstruction can occur, the symptoms presented in the question do not relate specifically to these disorders.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *a week after kidney transplantation*. These words should direct you easily to option 1, *acute rejection*. Review the signs of acute rejection if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Adult Health—Renal

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1632–1633). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 239). St. Louis: Mosby.

#### 751. 4

**Rationale:** Frank bleeding (arterial or venous) may occur during the first day after surgery. Some hematuria is usual for several days after surgery. A urinary output of 200 mL more than intake is adequate. Bladder spasms are expected to occur following surgery. A rapid pulse with a low blood pressure is a potential sign of excessive blood loss. The physician should be notified.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject, need to notify the physician. Think about the expected findings following this procedure and note that the vital signs presented in option 4 indicate excessive blood loss. Review the expected findings following transurethral resection of the prostate if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Adult Health—Renal

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 882). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1718). St. Louis: Saunders.

**ALTERNATE ITEM FORMAT:  
MULTIPLE RESPONSE****752. 2, 3, 4, 5**

**Rationale:** If outflow drainage is inadequate, the nurse attempts to stimulate outflow by changing the client's position. Turning the client to the other side or making sure that the client is in good body alignment may assist with outflow drainage. The drainage bag needs to be lower than the client's abdomen to enhance gravity drainage. The connecting tubing and peritoneal dialysis system are also checked for kinks or twisting and the clamps on the system are checked to ensure that they are open. There is no reason to contact the physician. Increasing the flow rate is an inappropriate

action and is not associated with the amount of outflow solution.

**Test-Taking Strategy:** Use the principles related to gravity flow and preventing obstruction to flow to answer this question. This will assist in determining the correct interventions. Review the nursing interventions related to insufficient flow of dialysate if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Renal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1630). St. Louis: Saunders.

# Renal Medications

## I. URINARY TRACT ANTISEPTICS

### A. Description

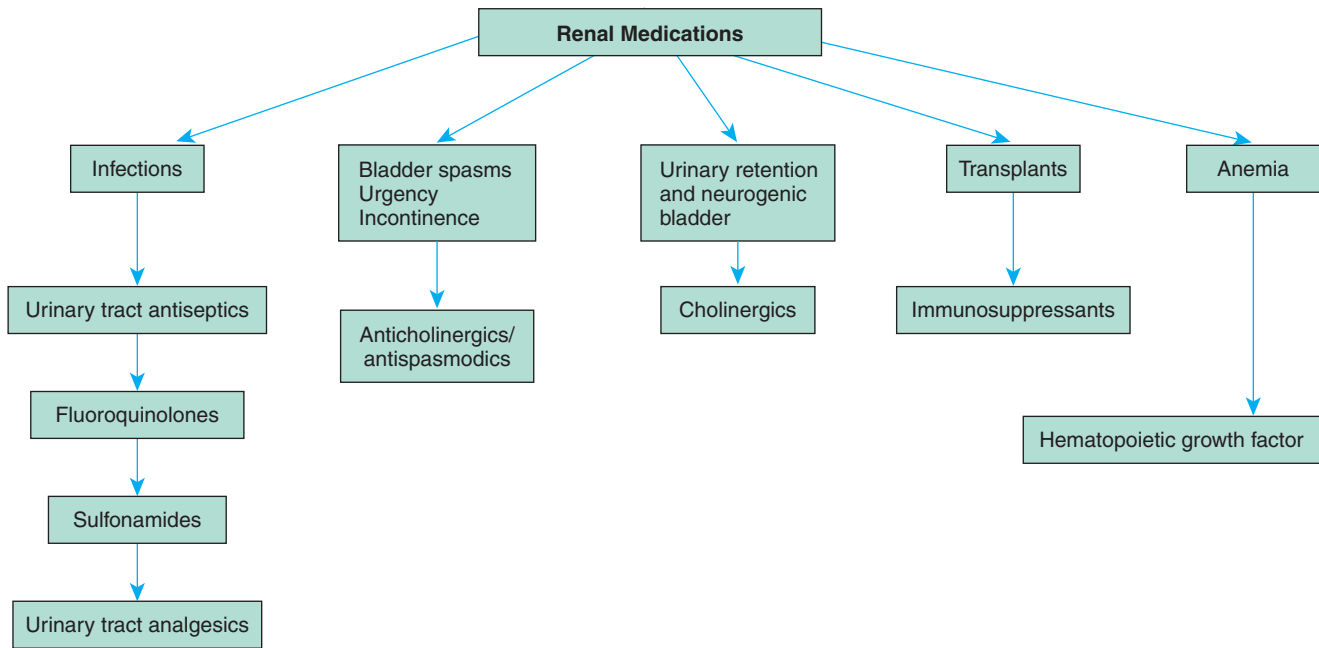

1. Urinary tract antiseptics inhibit the growth of bacteria in the urine (Fig. 63-1; Box 63-1).
2. Act as disinfectants within the urinary tract
3. Used to treat acute cystitis or urinary tract infections (UTIs)
4. Urinary tract antiseptics do not achieve effective antibacterial concentrations in blood or tissues and therefore cannot be used for infections outside the urinary tract.

### B. Side effects and nursing considerations

1. Cinoxacin (Cinobac)
  - a. Side effects are similar to those of nalidixic acid.
  - b. Dosage should be reduced in clients with renal impairment; failure to do so could result in accumulation of the medication to toxic levels.
2. Methenamine (Mandelamine, Hiprex, Urex)
  - a. Used to treat chronic UTIs, but not recommended for acute infections
  - b. Administer after meals and at bedtime to minimize gastric distress.
  - c. Chronic high-dose therapy can cause bladder irritation.
  - d. Methenamine can cause crystalluria and should not be used in clients with renal impairment.
  - e. Decomposition of the medication generates ammonia; therefore, it should not be used for clients with liver dysfunction.
  - f. Methenamine requires acidic urine with a pH of 5.5 or lower.
  - g. Increasing fluid intake reduces antibacterial effects by diluting the medication and raising urine pH.
  - h. Methenamine should not be combined with sulfonamides because of the risk of crystalluria and urinary tract injury.
  - i. Clients taking this medication should avoid alkalinizing agents, including over-the-counter antacids containing sodium bicarbonate or sodium carbonate.

### 3. Nalidixic acid (NegGram)

- a. Gastrointestinal side effects include anorexia, nausea, vomiting, and diarrhea.
  - b. Integumentary side effects include rash and photosensitivity.
  - c. Central nervous system (CNS) side effects include visual disturbances and insomnia.
  - d. Nalidixic acid may produce intracranial hypertension in pediatric clients and should not be administered to children younger than 3 months.
  - e. When nalidixic acid is used for more than 2 weeks, complete blood cell counts and liver function tests should be performed.
  - f. Nalidixic acid can intensify the effects of orally administered anticoagulants.
  - g. Nalidixic acid is contraindicated in clients with a history of convulsive disorders.
4. Nitrofurantoin (Furadantin, Macrochantin, Macrobid)
    - a. Gastrointestinal side effects include anorexia, nausea, vomiting, and diarrhea; administration with milk or meals minimizes gastrointestinal distress.
    - b. Pulmonary reactions include dyspnea, chest pain, chills, fever, cough, and alveolar infiltrates; these resolve in 2 to 4 days following cessation of treatment.
    - c. Hematological side effects include agranulocytosis, leukopenia, thrombocytopenia, and megaloblastic anemia.
    - d. Peripheral neuropathy side effects include muscle weakness, tingling sensations, and numbness.
    - e. Neurological side effects include headache, vertigo, drowsiness, and nystagmus.
    - f. Allergic reactions include anaphylaxis, hives, rash, and tingling sensations around the mouth.
    - g. Nitrofurantoin may produce a harmless brown color to the urine.
    - h. Nitrofurantoin is contraindicated in clients with renal impairment.

▲ **FIGURE 63-1** Renal conditions and medications. (Developed by Kathleen Ohman).

### Box 63-1 Urinary Tract Antiseptics

Cinoxacin (Cinobac)  
 Methenamine (Mandelamine, Hiprex, Urex)  
 Nalidixic acid (NegGram)  
 Nitrofurantoin (Furadantin, Macrochantin, Macrobid)

- i. Instruct the client in expected side effects, signs warranting notification of the physician, and not to take nitrofurantoin with antacids.

## II. FLUOROQUINOLONES (Box 63-2)

**A.** Description: Suppress bacterial growth by inhibiting an enzyme necessary for DNA synthesis; active against a broad spectrum of microbes

**B.** Side effects and nursing considerations

1. Side effects include dizziness, drowsiness, gastric distress, diarrhea, vaginitis (trovafloxacin), nausea, and vomiting.
2. Adverse effects include psychoses, hallucinations, confusion, tremors, hypersensitivity, and interstitial nephritis.
3. Fluoroquinolones should be used with caution in clients with hepatic, renal, or CNS disorders.
4. Monitor client for side effects or signs of adverse reactions.
5. Enoxacin and norfloxacin (Noroxin) are to be taken on an empty stomach.
6. Ciprofloxacin (Cipro), lomefloxacin (Maxaquin), and ofloxacin (Floxin) may be taken with or without food.
7. Intravenously administered ciprofloxacin and ofloxacin are infused slowly over 60 minutes to minimize discomfort and vein irritation.

### Box 63-2 Fluoroquinolones

|                         |                        |
|-------------------------|------------------------|
| Ciprofloxacin (Cipro)   | Moxifloxacin (Avelox)  |
| Enoxacin                | Norfloxacin (Noroxin)  |
| Gemifloxacin (Factive)  | Ofloxacin (Floxin)     |
| Levofloxacin (Levaquin) | Sparfloxacin           |
| Lomefloxacin (Maxaquin) | Trovafloxacin (Trovan) |

8. Advise the client to report dizziness, lightheadedness, visual disturbances, increased light sensitivity, and feelings of depression, because these signs could indicate CNS toxicity.
9. Inform the client of signs of hepatic and renal toxicity and the importance of reporting these signs to the physician.

⚠ Administer fluoroquinolones with a full glass of water and ensure that the client maintains a urine output of at least 1200 to 1500 mL daily to minimize the development of crystalluria.

## III. SULFONAMIDES (Box 63-3)

**A.** Description: Suppress bacterial growth by inhibiting the synthesis of folic acid; active against a broad spectrum of microbes; used primarily to treat acute urinary tract infections

**B.** Side effects and nursing considerations

1. Hypersensitivity reactions include rash, fever, and photosensitivity.
2. Stevens-Johnson syndrome, the most severe hypersensitivity response, produces symptoms that include widespread lesions of the skin and mucous membranes, fever, malaise, and toxemia.

**Box 63-3 Sulfonamides**

Sulfadiazine  
 Sulfamethizole  
 Sulfamethoxazole  
 Sulfisoxazole  
 Trimethoprim (Proloprim, Trimplex)  
 Trimethoprim-sulfamethoxazole (TMP/SMZ) (Bactrim, Cotrim)

3. Sulfonamides can cause hemolytic anemia, agranulocytosis, leukopenia, and thrombocytopenia; instruct the client to notify the physician if sore throat or fever occurs.
4. Administer sulfonamides with caution in clients with renal impairment.
5. Sulfonamides are contraindicated if a hypersensitivity exists to sulfonamides, sulfonylureas, or thiazide or loop diuretics.
6. Sulfonamides are contraindicated in infants younger than 2 months and in pregnant women or mothers who are breast-feeding.
7. Sulfonamides can potentiate the effects of warfarin sodium (Coumadin), phenytoin (Dilantin), and orally administered hypoglycemics such as tolbutamide (Orinase); when combined with sulfonamides, these medications may require a reduction in dosage.
8. Instruct the client to take the medication on an empty stomach with a full glass of water.
9. Instruct the client to complete the entire course of the prescribed medication.
10. Instruct the client to avoid prolonged exposure to sunlight, wear protective clothing, and apply a sunscreen to exposed skin.
11. Adults should maintain a daily urine output of 1200 mL by consuming 8 to 10 glasses of water each day to minimize the risk of renal damage from the medication.
12. Inform the client that some combination medications of sulfonamides can cause the urine to turn dark brown or red.
13. The sulfonamide combination of trimethoprim-sulfamethoxazole (TMP-SMZ; Bactrim, Cotrim) is more effective than either medication alone because it inhibits the sequential steps in bacterial folic acid synthesis.
14. TMP-SMZ is used cautiously with clients experiencing impaired kidney function, folate deficiency, severe allergy, or bronchial asthma.
15. An intravenous dose of TMP-SMZ is administered over 60 to 90 minutes and is not mixed with other medications.

 Sulfonamides should be withheld if a rash is noted. Inform the client to contact the physician if a rash appears.

**Box 63-4 Urinary Tract Analgesic**

Phenazopyridine (Pyridium, Azo-Standard, Pyridiate, Urogesic)

**Box 63-5 Anticholinergics—Antispasmodics**

Darifenacin (Enablex)  
 Oxybutynin chloride (Ditropan, Ditropan XL)  
 Solifenacin (VESIcare)  
 Tolterodine (Detrol, Detrol LA)  
 Trospium (Sanctura, Sanctura XR)

**IV. URINARY TRACT ANALGESIC (Box 63-4)****A. Description**

1. Phenazopyridine is a urinary tract analgesic used to treat pain from urinary tract irritation or infection.
2. A urinary tract analgesic is administered with an antibiotic because the analgesic only treats pain, not the infection. 

**B. Side effects**

1. Nausea
2. Headache
3. Vertigo

**C. Nursing considerations**

1. Instruct the client that the urine will turn red or orange and stain clothing. 
2. A urinary tract analgesic is contraindicated in clients with renal or hepatic disease.
3. The medication interferes with accurate urine testing for glucose and ketones.

**V. ANTICHOLINERGICS—ANTISPASMODICS (Box 63-5)****A. Description:** Used for overactive bladder (urge incontinence)**B. Side effects**

1. Anorexia, nausea, vomiting, and dry mouth 
2. Blurred vision
3. Confusion in older clients
4. Constipation
5. Decreased sweating
6. Dizziness
7. Drowsiness
8. Dry eyes
9. Gastric distress
10. Headache
11. Tachycardia
12. Urinary retention

**C. Nursing considerations**

1. Extended-release capsules should not be split, chewed, or crushed
2. Detrol LA should be used cautiously in clients with narrow-angle glaucoma.

**Box 63-6 Cholinergic**

Bethanechol chloride (Urecholine)

3. Do not administer oxybutynin to clients with known hypersensitivity, gastrointestinal or genitourinary obstruction, glaucoma, severe colitis, or myasthenia gravis.
4. Do not administer propantheline bromide to clients with narrow-angle glaucoma, obstructive uropathy, gastrointestinal disease, or ulcerative colitis.
5. Instruct the client to avoid hazardous activities because of the side effects of dizziness and drowsiness.
6. Monitor intake and output.
7. Provide gum or hard candy for dry mouth.
8. Monitor for signs of toxicity (CNS stimulation) such as hypotension, hypertension, confusion, tachycardia, flushed or red face, signs of respiratory depression, nervousness, restlessness, hallucinations, and irritability.

**VI. CHOLINERGIC** (Box 63-6)

- A.** Description: Bethanechol chloride (Urecholine) is a cholinergic used to increase bladder tone and function and to treat nonobstructive urinary retention and neurogenic bladder.
- B.** Side effects
  1. Headache
  2. Hypotension
  3. Flushing and sweating
  4. Increased salivation
  5. Abdominal cramps
  6. Nausea and vomiting
  7. Diarrhea
  8. Urinary urgency
  9. Bronchoconstriction
  10. Transient complete heart block
- C.** Nursing considerations
  1. Administer on an empty stomach, 1 hour before or 2 hours after meals to lessen nausea and vomiting.
  2. Never administer by the intramuscular or intravenous (IV) route.
  3. Monitor intake and output.
  4. Monitor for increased bladder tone and function.
  5. Monitor for cholinergic overdose (excessive salivation, sweating, involuntary urination and defecation, bradycardia, and severe hypotension).
  6. Have atropine sulfate (antidote) readily available for IV or subcutaneous administration.

 A cholinergic such as bethanechol chloride (Urecholine) is not given to a client who has a urinary stricture or obstruction.

**Box 63-7 Preventing Organ Rejection****Immunosuppressants**

Cyclosporine (Sandimmune, Gengraf, Neoral)  
 Sirolimus (Rapamune)  
 Tacrolimus (Prograf)

**Glucocorticoid**

Prednisone

**Cytotoxic Medications**

Azathioprine (Imuran)  
 Mycophenolate mofetil (CellCept)

**Antibodies**

Antithymocyte globulin, equine (Atgam)  
 Basiliximab (Simulect)  
 Daclizumab (Zenapax)  
 Muromonab-CD3 (Orthoclone OKT3)

**VII. MEDICATIONS FOR PREVENTING ORGAN REJECTION** (Box 63-7)

- A.** Medications include immunosuppressants, corticosteroids, cytotoxic medications, and antibodies.
- B.** Some medications may be used in combination with one another to produce different actions on the immune system; combination therapy also allows for administration of the medications in lower doses, reducing the possibility of side effects.
- C.** Cyclosporine (Sandimmune, Gengraf, Neoral)
  1. Cyclosporine inhibits calcineurin and acts on T lymphocytes to suppress the production of interleukin-2, interferon- $\gamma$ , and other cytokines.
  2. Cyclosporine may be used to prevent rejection of allogeneic kidney, liver, and heart transplants.
  3. Prednisone may be administered concurrently.
  4. Oral administration of cyclosporine is preferred; intravenous administration is reserved for clients who cannot take the medication orally.
  5. Blood levels of the medication should be measured regularly because of its nephrotoxic effects.
  6. The most common adverse effects are nephrotoxicity, infection, hypertension, tremor, and hirsutism.
  7. Assure the client that hirsutism is reversible; instruct on the use of a depilatory.
  8. Other adverse effects include neurotoxicity, gastrointestinal effects, hyperkalemia, and hyperglycemia.
  9. The risk of infection and lymphomas is increased with the use of cyclosporine.
  10. Cyclosporine is contraindicated in the presence of hypersensitivity, pregnancy and breastfeeding, recent inoculation with live virus vaccines, and recent contact with an active infection such as chickenpox or herpes zoster.

11. Cyclosporine is embryotoxic, and women of childbearing age should use a mechanical form of contraception and avoid oral contraceptives.
12. The client should be informed about the possibility of renal damage and liver damage and the need for periodic liver function tests and determination of coagulation factors and blood urea nitrogen, serum creatinine, serum potassium, and blood glucose levels.
13. The client should be instructed to monitor for early signs of infection and to report these signs immediately.
14. Available in a pill form; if the client is unable to swallow the pill, instruct the client to dispense the oral liquid medication into a glass container by using a specially calibrated pipette, mix well, and drink immediately; rinse the glass container with diluent and drink it to ensure ingestion of the complete dose; dry the outside of the pipette and return to its cover for storage.
15. To promote palatability, instruct the client to mix the liquid medication with milk, chocolate milk, or orange juice just before administration.
16. Consuming grapefruit juice is prohibited because it raises cyclosporine levels and increases the risk of toxicity.
17. Ketoconazole (Nizoral), erythromycin, and amphotericin B (Abelcet, Amphotec, AmBisome) can elevate cyclosporine levels.
18. Phenytoin (Dilantin), phenobarbital, rifampin (Rifadin), and TMP-SMX can decrease cyclosporine levels.
19. Renal damage can be intensified by the concurrent use of other nephrotoxic medications.

#### D. Sirolimus (Rapamune)

1. Sirolimus is used for the prevention of renal transplant rejection by inhibiting the response of helper T lymphocytes and B lymphocytes to cytokinesis.
2. It may be used with cyclosporine or tacrolimus (CellCept) and corticosteroids.
3. Increases the risk of infection, increases the risk of renal injury, increases the risk of lymphocele (a complication of renal transplant surgery), and raises cholesterol and triglyceride levels.
4. Side effects include rash, acne, anemia, thrombocytopenia, joint pain, diarrhea, and hypokalemia.

#### E. Tacrolimus (Prograf)

1. Tacrolimus inhibits calcineurin and thereby prevents T cells from producing interleukin-2, interferon- $\gamma$ , and other cytokines.
2. Tacrolimus is more effective than cyclosporine, but is more toxic.
3. Adverse effects are similar to those of cyclosporine and include nephrotoxicity, infection, hypertension, tremor, hirsutism, neurotoxicity,

gastrointestinal effects, hyperkalemia, and hyperglycemia.

4. Tacrolimus should be used cautiously in immunosuppressed clients and those with renal, hepatic, or pancreatic impairment.
5. Tacrolimus is contraindicated for clients hypersensitive to cyclosporine.
6. Monitor blood glucose levels and administer prescribed insulin or oral hypoglycemics.

#### F. Prednisone

1. Prednisone is a glucocorticoid that inhibits accumulation of inflammatory cells at inflammation sites.
2. Hyperglycemia and hypokalemia can occur with prednisone use; monitor glucose and serum potassium levels.
3. See Chapter 55 for additional information about prednisone.

#### G. Azathioprine (Imuran)

1. Azathioprine suppresses cell-mediated and humoral immune responses by inhibiting the proliferation of B and T lymphocytes.
2. Not used routinely since the advent of newer medications that prevent transplant rejection.
3. Can cause neutropenia and thrombocytopenia from bone marrow suppression.
4. Contraindicated in pregnancy; associated with an increased incidence of neoplasms.
5. Monitor hematocrit, white blood cell count, platelet count, liver enzyme levels, and coagulation factors.

#### H. Mycophenolate mofetil (CellCept)

1. Mycophenolate mofetil causes selective inhibition of B- and T-lymphocyte proliferation.
2. May be used with cyclosporine or tacrolimus and glucocorticoids for prophylaxis against organ rejection.
3. Adverse effects include diarrhea, severe neutropenia, vomiting, and sepsis.
4. Mycophenolate mofetil is associated with an increased risk of infection and malignancies.
5. Absorption is decreased by the use of magnesium and aluminum antacids and by cholestyramine (Questran, Prevalite).
6. It is contraindicated in pregnancy and during breast-feeding.
7. Instruct the client to take the medication on an empty stomach and not to open or crush capsules.
8. Instruct the client to contact the physician for unusual bleeding or bruising, sore throat, mouth sores, abdominal pain, or fever.

#### I. Daclizumab (Zenapax) and basiliximab (Simulect)

1. Daclizumab and basiliximab bind to interleukin-2 receptors on lymphocytes, resulting in diminished cell-mediated immune reactions.
2. Used primarily as an induction agent at the time of transplantation; may be used with other

**Box 63-8 Hematopoietic Growth Factors****Erythropoietic Growth Factors**

Epoetin alfa (Epogen, Procrit)  
 Darbepoetin alfa (Aranesp)  
 MPEG-epoetin beta (Mircera)

**Leukopoietic Growth Factors**

Filgrastim (Neupogen)  
 Pegfilgrastim (Neulasta)  
 Sargramostim (Leukine)

**Thrombopoietic Growth Factor**

Oprelvekin (Neumega)

immunosuppressants to prevent acute rejection of transplanted kidneys

3. Administered by the intravenous route
4. Daclizumab (Zenapax)
  - a. Initial dose is administered within 24 hours before transplantation.
  - b. Side effects include chest pain, gastrointestinal distress, edema, shortness of breath, pain in the joints, and slow wound healing.
5. Basiliximab (Simulect)
  - a. Initial dose is administered within 2 hours before transplantation.
  - b. Side effects are similar to those for daclizumab; in addition, headache, insomnia, dizziness, and tremors can occur.

**J. Antithymocyte globulin, equine (Atgam)**

1. Antithymocyte globulin, equine, causes a decrease in the number and activity of thymus-derived lymphocytes and is used to suppress organ rejection following renal, liver, bone marrow, and heart transplantation.
2. It is used primarily to treat acute rejection episodes.
3. Before the first infusion, the client should undergo intradermal skin testing to determine hypersensitivity.
4. Because this product is made using equine and human blood components, it may carry a risk of transmitting infectious agents, such as viruses.
5. Monitor the platelet count and report it if below 100,000/mm<sup>3</sup>.
6. Arrange for outpatient referral for repeated infusions after discharge.

**K. Muromonab-CD3 (Orthoclone OKT3)**

1. Blocks all T-cell functions; used to prevent acute allograft rejection of kidney transplants
2. Adverse reactions include fever, chills, dyspnea, chest pain, and nausea and vomiting.
3. Administered via the IV route; the client is pretreated with IV glucocorticoid.

**VIII. HEMATOPOIETIC GROWTH FACTORS (Box 63-8)****A. Erythropoietic growth factors**

1. Stimulate the production of red blood cells

2. Used to treat anemia of **chronic renal failure**, chemotherapy-induced anemia, anemia caused by zidovudine (AZT), and anemia in clients requiring surgery
3. Initial effects can be seen within 1 to 2 weeks, and the hematocrit reaches normal levels (30% to 33%) in 2 to 3 months.
4. Side effect: Major side effect is hypertension.
5. Adverse effects can include heart failure, thrombotic effects such as stroke or myocardial infarction, and cardiac arrest.

**B. Leukopoietic growth factors**

1. Stimulate the production of white blood cells (leukocytes)
2. Used for clients undergoing myelosuppressive chemotherapy or bone marrow transplantation and those with severe chronic neutropenia
3. Can cause bone pain, leukocytosis, and elevation of plasma uric acid, lactate dehydrogenase, and alkaline phosphatase levels; long-term therapy has caused splenomegaly

**C. Thrombopoietic growth factor**

1. Stimulates the production of platelets
2. Used for clients undergoing myelosuppressive chemotherapy to minimize thrombocytopenia and to decrease the need for platelet transfusions
3. Adverse effects include fluid retention, cardiac dysrhythmias, conjunctival infection, visual blurring, and papilledema.

**MORE QUESTIONS ON THE CD!****Practice Questions**

- 753.** The client who has a cold is seen in the emergency department with an inability to void. Because the client has a history of benign prostatic hyperplasia, the nurse determines that the client should be questioned about the use of which of the following medications?
1. Diuretics
  2. Antibiotics
  3. Antitussives
  4. Decongestants
- 754.** Nalidixic acid (NegGram) is prescribed for a client with a urinary tract infection. On review of the client's record, the nurse notes that the client is taking warfarin sodium (Coumadin) daily. Which prescription should the nurse anticipate for this client?
1. Discontinuation of warfarin sodium (Coumadin)
  2. A decrease in the warfarin sodium (Coumadin) dosage
  3. An increase in the warfarin sodium (Coumadin) dosage
  4. A decrease in the usual dose of nalidixic acid (NegGram)

- 755.** A nurse is providing discharge instructions to a client receiving sulfisoxazole. Which of the following would be included in the list of instructions?
1. Restrict fluid intake.
  2. Maintain a high fluid intake.
  3. If the urine turns dark brown, call the physician immediately.
  4. Decrease the dosage when symptoms are improving to prevent an allergic response.
- 756.** Trimethoprim-sulfamethoxazole (TMP-SMZ; Bactrim) is prescribed for a client. A nurse would instruct the client to report which symptom if it developed during the course of this medication therapy?
1. Nausea
  2. Diarrhea
  3. Headache
  4. Sore throat
- 757.** Phenazopyridine hydrochloride (Pyridium) is prescribed for a client for symptomatic relief of pain resulting from a lower urinary tract infection. The nurse teaches the client:
1. To take the medication at bedtime
  2. To take the medication before meals
  3. To discontinue the medication if a headache occurs
  4. That a reddish orange discoloration of the urine may occur
- 758.** Bethanechol chloride (Urecholine) is prescribed for a client with urinary retention. Which disorder would be a contraindication to the administration of this medication?
1. Gastric atony
  2. Urinary strictures
  3. Neurogenic atony
  4. Gastroesophageal reflux
- 759.** A nurse who is administering bethanechol chloride (Urecholine) is monitoring for acute toxicity associated with the medication. The nurse checks the client for which sign of toxicity?
1. Dry skin
  2. Dry mouth
  3. Bradycardia
  4. Signs of dehydration
- 760.** Oxybutynin chloride (Ditropan) is prescribed for a client with neurogenic bladder. Which sign would indicate a possible toxic effect related to this medication?
1. Pallor
  2. Drowsiness
  3. Bradycardia
  4. Restlessness
- 761.** Following kidney transplantation, cyclosporine (Sandimmune) is prescribed for a client. Which laboratory result would indicate an adverse effect from the use of this medication?
1. Decreased creatinine level
  2. Decreased hemoglobin level
  3. Elevated blood urea nitrogen level
  4. Decreased white blood cell count
- 762.** A nurse is providing dietary instructions to a client who has been prescribed cyclosporine (Sandimmune). Which food item would the nurse instruct the client to avoid?
1. Red meats
  2. Orange juice
  3. Grapefruit juice
  4. Green leafy vegetables
- 763.** Tacrolimus (Prograf) is prescribed for a client. Which disorder, if noted in the client's record, would indicate that the medication needs to be administered with caution?
1. Pancreatitis
  2. Ulcerative colitis
  3. Diabetes insipidus
  4. Coronary artery disease
- 764.** A nurse is reviewing the laboratory results for a client receiving tacrolimus (Prograf). Which laboratory result would indicate to the nurse that the client is experiencing an adverse effect of the medication?
1. Blood glucose of 200 mg/dL
  2. Potassium level of 3.8 mEq/L
  3. Platelet count of 300,000 cells/mm<sup>3</sup>
  4. White blood cell count of 6000 cells/mm<sup>3</sup>
- 765.** The nurse receives a call from a client concerned about eliminating brown-colored urine after taking nitrofurantoin (Furadantin) for a urinary tract infection. Which of the following is the appropriate response from the nurse?
1. "Discontinue taking the medication and make an appointment for a urine culture."
  2. "Continue taking the medication because the urine is discolored from the medication."
  3. "Decrease your medication to half the dose because your urine is too concentrated."
  4. "Take magnesium hydroxide (Maalox) with your medication to lighten the urine color."
- 766.** A client with chronic renal failure is receiving epoetin alfa (Epogen, Procrit). Which laboratory result would indicate a therapeutic effect of the medication?

1. Hematocrit of 32%
2. Platelet count of 400,000 cells/mm<sup>3</sup>
3. Blood urea nitrogen level of 15 mg/dL
4. White blood cell count of 6000 cells/mm<sup>3</sup>

### Alternate Item Format: Chart/Exhibit

**767.** Cinoxacin (Cinobac), a urinary antiseptic, is prescribed for the client. The nurse reviews the client's medical record and would contact the physician regarding which documented finding to verify the prescription?

1. Renal insufficiency
2. Chest x-ray: normal
3. Blood glucose, 102 mg/dL
4. Folic acid (vitamin B<sub>6</sub>) 0.5 mg, orally daily

#### CHART/EXHIBIT

##### CLIENT'S MEDICAL RECORD

**Laboratory Test Result:** Blood glucose, 102 mg/dL

**Diagnostic Test Result:** Chest x-ray: normal

**Client's History:** Renal Insufficiency

**Medication History:** Folic acid (vitamin B<sub>6</sub>) 0.5 mg, orally daily

## ANSWERS

### 753. 4

**Rationale:** In the client with benign prostatic hyperplasia, episodes of urinary retention can be triggered by certain medications, such as decongestants, anticholinergics, and antidiuretics. The client should be questioned about the use of these medications if the client has urinary retention. Retention also can be precipitated by other factors, such as alcoholic beverages, infection, bed rest, and becoming chilled.

**Test-Taking Strategy:** Use the process of elimination. The question is asking about medications that could exacerbate or contribute to urinary retention in the client with benign prostatic hyperplasia. Diuretics should help voiding; therefore, eliminate option 1. Antibiotics should have no effect at all, and thus eliminate option 2. From the remaining options, recalling that medications that contain anticholinergics may cause urinary retention will direct you to option 4. Review the factors that can precipitate urinary retention in the client with benign prostatic hyperplasia if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Renal

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 878). St. Louis: Saunders.

### 754. 2

**Rationale:** Nalidixic acid can intensify the effects of oral anticoagulants by displacing these agents from binding sites on plasma protein. When an oral anticoagulant is combined with nalidixic acid, a decrease in the anticoagulant dosage may be needed.

**Test-Taking Strategy:** Knowledge about the medication interactions associated with the use of nalidixic acid is needed to answer this question. Remember that nalidixic acid can intensify the effects of oral anticoagulants. Review these interactions if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 490). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 1036). St. Louis: Saunders.

### 755. 2

**Rationale:** Each dose of sulfisoxazole should be administered with a full glass of water, and the client should maintain a high fluid intake. The medication is more soluble in alkaline urine. The client should not be instructed to taper or discontinue the dose. Some forms of sulfisoxazole cause urine to turn dark brown or red. This does not indicate the need to notify the physician.

**Test-Taking Strategy:** Use the process of elimination. Recalling that this medication is used to treat urinary tract infections will direct you to option 2. Review client instructions regarding this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 1030). St. Louis: Saunders.

### 756. 4

**Rationale:** Clients taking trimethoprim (TMP)-sulfamethoxazole (SMZ) should be informed about early signs of blood disorders that can occur from this medication. These include sore throat, fever, and pallor, and the client should be instructed to notify the physician if these symptoms occur. The other options do not require physician notification.

**Test-Taking Strategy:** Use the process of elimination. Knowledge that this medication can cause blood dyscrasias will direct you to option 4. If you are unfamiliar with this medication, review this content.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 1156). St. Louis: Saunders.

### 757. 4

**Rationale:** The nurse should instruct the client that a reddish-orange discoloration of urine may occur. The nurse also should instruct the client that this discoloration can stain fabric. The medication should be taken after meals to reduce the possibility of gastrointestinal upset. A headache is an occasional side effect of the medication and does not warrant discontinuation of the medication.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 2 first because they are comparable or alike in that they address time schedules for the administration of the medication. From the remaining options, eliminate option 3 because the nurse would not advise the client to discontinue this medication. Review client instructions regarding this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 900). St. Louis: Saunders.

### 758. 2

**Rationale:** Bethanechol chloride (Urecholine) can be hazardous to clients with urinary tract obstruction or weakness of the bladder wall. The medication has the ability to contract the bladder and thereby increase pressure within the urinary tract. Elevation of pressure within the urinary tract could rupture the bladder in clients with these conditions.

**Test-Taking Strategy:** Use the process of elimination. Noting that the medication is used for urinary retention may assist in directing you to option 2. Review the contraindications associated with this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**References:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 125). St. Louis: Saunders.

Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 288). St. Louis: Saunders.

### 759. 3

**Rationale:** Toxicity (overdose) of bethanechol chloride produces manifestations of excessive muscarinic stimulation such as salivation, sweating, involuntary urination and defecation, bradycardia, and severe hypotension. Treatment includes supportive measures and the administration of atropine sulfate subcutaneously or intravenously.

**Test-Taking Strategy:** Use the process of elimination. Noting the similarity in options 1, 2, and 4 will assist in eliminating these options. Review the signs of toxicity if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**References:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 125). St. Louis: Saunders.

Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 285). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 122, 130). St. Louis: Saunders.

### 760. 4

**Rationale:** Toxicity (overdosage) of oxybutynin chloride produces central nervous system excitation, such as nervousness, restlessness, hallucinations, and irritability. Other signs of toxicity include hypotension or hypertension, confusion, tachycardia, flushed or red face, and signs of respiratory depression. Drowsiness is a frequent side effect of the medication but does not indicate overdosage.

**Test-Taking Strategy:** Knowledge regarding the manifestations related to toxicity is required to answer this question. Remember restlessness is a sign of toxicity. Review the signs that indicate toxicity if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2007). *Saunders nursing drug handbook 2007* (p. 861). St. Louis: Saunders.

### 761. 3

**Rationale:** Nephrotoxicity can occur from the use of cyclosporine (Sandimmune). Nephrotoxicity is evaluated by monitoring for elevated blood urea nitrogen and serum creatinine levels. Cyclosporine does not depress the bone marrow.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 2 and 4 first because they are unrelated to renal function. Next, eliminate option 1 because the creatinine level would be elevated, not decreased. Option 3 is the only option that indicates an increased level of a renal function test. Review the adverse effects related to this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 815, 820). St. Louis: Saunders.

### 762. 3

**Rationale:** A compound present in grapefruit juice inhibits metabolism of cyclosporine. As a result, consumption of grapefruit juice can raise cyclosporine levels by 50% to 100%, thereby greatly increasing the risk of toxicity.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic word *avoid*. Use of general pharmacology guidelines will direct you to option 3. If you had difficulty with this question, review this medication and the client instructions regarding its use.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 815, 820). St. Louis: Saunders.

### 763. 1

**Rationale:** Tacrolimus (Prograf) is used with caution in immunosuppressed clients and in clients with renal, hepatic, or pancreatic function impairment. Tacrolimus is contraindicated in clients with hypersensitivity to this medication or hypersensitivity to cyclosporine.

**Test-Taking Strategy:** Use the process of elimination. Many medications affect renal, hepatic, and pancreatic function. If you had to select an option and were unsure, select the option that addresses these body systems. Review the cautions and contraindications associated with the administration of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 816). St. Louis: Saunders.

### 764. 1

**Rationale:** A blood glucose level of 200 mg/dL is significantly elevated above the normal range of 70 to 110 mg/dL and suggests an adverse reaction. Other adverse reactions include neurotoxicity evidenced by headache, tremor, and insomnia; gastrointestinal effects such as diarrhea, nausea, and vomiting; hypertension; and hyperkalemia.

**Test-Taking Strategy:** Use the process of elimination, noting that options 2, 3, and 4 represent normal values. Option 1 is the only abnormal value, reflecting an elevation. Review the adverse effects related to this medication and normal laboratory values if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1498). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 816). St. Louis: Saunders.

### 765. 2

**Rationale:** Nitrofurantoin (Furadantin) produces a harmless brown color to the urine and the medication should not be discontinued until the prescribed dose is completed. Magnesium hydroxide (Maalox) will not affect urine color. Additionally, antacids should be avoided because they interfere with medication effectiveness.

**Test-Taking Strategy:** Use the process of elimination. Option 1 can be eliminated because the client should not need a urine culture at this time. These are done before treatment is initiated, if treatment is ineffective, and during follow-up appointment. Option 3 can be eliminated, because the nurse cannot change a medication dosage without a physician's prescription. Additionally, there is no data in the question to indicate that the urine is concentrated. Option 4 can be

eliminated because antacids should be avoided as a result of their interference with the effectiveness of nitrofurantoin. Additionally, magnesium hydroxide will not have an effect on urine color. Review the effects of nitrofurantoin if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 824). St. Louis: Saunders.

### 766. 1

**Rationale:** Epoetin alfa is used to reverse anemia associated with chronic renal failure. Therapeutic effect is seen when the hematocrit is between 30% and 33%. Options 2, 3, and 4 are not associated with the action of this medication.

**Test-Taking Strategy:** Use the process of elimination. Relate the name of the medication, erythropoietin, to the potential action or effect. The only laboratory test that would reflect the effect of this medication is option 1. Review the therapeutic effect of this medication and normal serum laboratory results if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 417). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: CHART/EXHIBIT

### 767. 1

**Rationale:** Cinoxacin should be administered with caution in clients with renal impairment. The dosage should be reduced, and failure to do so could result in accumulation of cinoxacin to toxic levels. Therefore, the nurse would verify the prescription with the physician if the client had a documented history of renal insufficiency. The laboratory and diagnostic test results are normal findings. Folic acid (vitamin B<sub>9</sub>) may be prescribed for a client with renal insufficiency to prevent anemia.

**Test-Taking Strategy:** Focus on the subject, the need to contact the physician. Eliminate options 2 and 3 because the laboratory and diagnostic test results are normal findings. From the remaining options, note the disorder in the client's history. This directs you to option 1. Review the contraindications associated with this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., pp. 488–489). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 1036). St. Louis: Saunders.

## UNIT XV

# The Adult Client With an Eye or Ear Disorder

### PYRAMID TERMS

**accommodation** Process whereby a clear visual image is maintained as the gaze is shifted from a distant to a near point.

**astigmatism** Visual distortion that results from an uneven curvature of the cornea or lens in which light rays focus on two different points on the retina.

**cataract** An opacity of the lens that distorts the image projected onto the retina and that can progress to blindness.

**conductive hearing loss** A mechanical dysfunction or blockage of sound waves to the inner ear fibers because of external ear or middle ear disorders. The blockage can be caused by impacted cerumen, foreign bodies, pus, or serum in the middle ear. Disorders often can be corrected with no damage to hearing or minimal permanent hearing loss.

**cycloplegia** The paralysis of the ciliary muscles by medications that block muscarinic receptors. Cycloplegia causes blurred vision because the shape of the lens can no longer be adjusted to near-vision.

**fenestration** Removal of the stapes with a small hole drilled in the footplate and connection of a prosthesis between the incus and foot plate. Sounds cause the prosthesis to vibrate in the same manner as the stapes.

**glaucoma** Increased intraocular pressure as a result of inadequate drainage of aqueous humor from the canal of Schlemm or from overproduction of aqueous humor. The condition damages the optic nerve and can result in blindness.

**hyperopia** Farsightedness; objects converge to a point behind the retina. Vision beyond 20 feet is normal, but near-vision is poor. The condition is corrected by a convex lens.

**legally blind** The best visual acuity with corrective lenses in the better eye of 20/200 or less, or the visual field is no greater than 20 degrees in its widest diameter in the better eye.

**macular degeneration** A blurred central vision caused by progressive degeneration of the center of the retina. The condition may be atrophic or age-related, or dry or exudative (wet).

**Meniere's syndrome** Also called endolymphatic hydrops, this syndrome involves dilation of the endolymphatic system by overproduction or decreased reabsorption of endolymphatic fluid. It is characterized by tinnitus, unilateral sensorineural hearing loss, and vertigo.

**miosis** A constricted pupil that occurs primarily by stimulation of the muscarinic receptors of the sphincter muscles. It is seen with the use of pilocarpine drops when treating glaucoma, when using opioids, or when there is brain damage of the pons.

**miotic** Medication that causes contraction of the pupil.

**mydriasis** A dilated pupil that occurs because of blockage of the muscarinic receptors of the sphincter muscles or by stimulation of the alpha receptors of the dilator muscles. Enlarged pupils occur with stimulation of the sympathetic nervous system, use of dilating drops, acute glaucoma, or past or recent trauma.

**mydriatic** Medication that dilates the pupil.

**myopia** Nearsightedness; rays coming from an object are focused in front of the retina. Near-vision is normal, but distant vision is defective. A biconcave lens is used for correction.

**otosclerosis** Disease of the labyrinthine capsule of the middle ear that results in a bony overgrowth of tissue surrounding the ossicles. Otosclerosis causes the development of irregular areas of new bone formation and causes fixation of the bones, leading to a conductive hearing loss.

**presbycusis** Gradual nerve degeneration associated with aging; a common cause of sensorineural hearing loss.

**retinal detachment** Separation of the layers of the retina because of the accumulation of fluid between them or because both retinal layers elevate away from the choroid as a result of a tumor. Partial separation becomes complete if untreated. When detachment becomes complete, blindness occurs.

**sensorineural hearing loss** A pathological process of the inner ear or of the sensory fibers that lead to the cerebral cortex. Such hearing loss often is permanent, and measures must be taken to reduce further damage or to attempt to amplify sound as a means of improving hearing to some degree.

## PYRAMID TO SUCCESS

Pyramid Points focus on nursing interventions for clients with impairment of sight or hearing and on the nursing care related to disorders such as cataracts, glaucoma, and retinal detachment. Pyramid Points also focus on emergency interventions for eye and ear disorders and injuries. Review nursing care related to tissue (corneal) donation for the donor and the recipient. Pyramid Points also focus on client instructions related to medication administration, sensory perceptual alterations and safety issues, and available support systems.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Caring for the recipient of a tissue (corneal) donation
- Consulting with members of the health care team
- Establishing priorities
- Maintaining asepsis with procedures and treatments
- Maintaining standard and other precautions
- Obtaining informed consent for invasive procedures
- Preventing accidents that can occur as a result of sensory impairments
- Upholding client rights

## Health Promotion and Maintenance

- Changes that occur with the aging process
- Discussing expected body image changes and self-care deficits
- Implementing measures for the prevention and early detection of health problems and diseases related to the eye and the ear
- Performing physical assessments of eye and ear disorders
- Providing home care instructions following procedures related to the eye and ear
- Providing instructions regarding the administration of eye and ear medications
- Providing instructions regarding activity limitations or postoperative activities
- Teaching regarding the importance of compliance with the prescribed therapy

## Psychosocial Integrity

- Assessing the client's ability to cope with feelings of isolation, fear or anxiety regarding a possible change in vision and/or hearing status, and loss of independence
- Discussing role changes
- Identifying family support systems
- Informing the client about available community resources
- Monitoring for sensory perceptual alterations
- Using appropriate communication techniques for impaired vision and hearing

## Physiological Integrity

- Monitoring for complications related to procedures
- Monitoring for expected responses to therapy
- Providing care for assistive devices such as eyeglasses, contact lenses, and hearing aids
- Taking action in medical emergencies

# The Eye and the Ear

## I. ANATOMY AND PHYSIOLOGY OF THE EYE

### A. The eye

1. The eye is 1 inch in diameter and is located in the anterior portion of the orbit.
2. The orbit is the bony structure of the skull that surrounds the eye and offers protection to the eye.

### B. Layers of the eye

1. External layer
  - a. The fibrous coat that supports the eye
  - b. Contains the cornea, the dense transparent outer layer
  - c. Contains the sclera, the fibrous “white of the eye”
2. Middle layer
  - a. Called the uveal tract
  - b. Consists of the choroid, ciliary body, and iris
  - c. The choroid is the dark brown membrane located between the sclera and the retina that has dark pigmentation to prevent light from reflecting internally.
  - d. The choroid lines most of the sclera and is attached to the retina but can detach easily from the sclera.
  - e. The choroid contains many blood vessels and supplies nutrients to the retina.
  - f. The ciliary body connects the choroid with the iris and secretes aqueous humor that helps give the eye its shape; the muscles of the ciliary body control the thickness of the lens.
  - g. The iris is the colored portion of the eye, located in front of the lens, and it has a central circular opening called the pupil. The pupil controls the amount of light admitted into the retina (darkness produces dilation and light produces constriction).

### 3. Internal layer

- a. Consists of the retina, a thin, delicate structure in which the fibers of the optic nerve are distributed
- b. The retina is bordered externally by the choroid and sclera and internally by the vitreous.
- c. The retina is the visual receptive layer of the eye in which light waves are changed into

nerve impulses; it contains blood vessels and photoreceptors called rods and cones.

### C. Vitreous body

1. Contains a gelatinous substance that occupies the vitreous chamber, the space between the lens and the retina
2. The vitreous body transmits light and gives shape to the posterior eye.

### D. Vitreous

1. Gel-like substance that maintains the shape of the eye
2. Provides additional physical support to the retina

### E. Rods and cones

1. Rods are responsible for peripheral vision and function at reduced levels of illumination.
2. Cones function at bright levels of illumination and are responsible for color vision and central vision.

### F. Optic disc

1. The optic disc is a creamy pink to white depressed area in the retina.
2. The optic nerve enters and exits the eyeball at this area.
3. This area is called the blind spot because it contains only nerve fibers, lacks photoreceptor cells, and is insensitive to light.

### G. Macula lutea

1. Small, oval, yellowish-pink area located laterally and temporally to the optic disc
2. The central depressed part of the macula is the fovea centralis, the area of sharpest and keenest vision, where most acute vision occurs.

### H. Aqueous humor

1. The aqueous humor is a clear watery fluid that fills the anterior and posterior chambers of the eye.
2. The aqueous humor is produced by the ciliary processes, and the fluid drains into the canal of Schlemm.
3. The anterior chamber lies between the cornea and the iris.
4. The posterior chamber lies between the iris and the lens.

**I. Canal of Schlemm:** Passageway that extends completely around the eye; it permits fluid to drain out of the eye into the systemic circulation so a constant intraocular pressure is maintained.

**J. Lens**

1. Transparent convex structure behind the iris and in front of the vitreous body
2. The lens bends rays of light so that the light falls on the retina.
3. The curve of the lens changes to focus on near or distant objects.

**K. Conjunctivae:** Thin transparent mucous membranes of the eye that line the posterior surface of each eyelid, located over the sclera

**L. Lacrimal gland**

1. The lacrimal gland produces tears.
2. Tears are drained through the punctum into the lacrimal duct and sac.

**M. Eye muscles**

1. Muscles do not work independently but work with the muscle that produces the opposite movement.
2. Rectus muscles exert their pull when the eye turns temporally.
3. Oblique muscles exert their pull when the eye turns nasally.

**N. Nerves (Fig. 64-1)**

1. Cranial nerve II: Optic nerve (nerve of sight)
2. Cranial nerve III: Oculomotor
3. Cranial nerve IV: Trochlear
4. Cranial nerve VI: Abducens

**O. Blood vessels**

1. The ophthalmic artery is the major artery supplying the structures in the eye.
2. The ophthalmic veins drain the blood from the eye.

**II. ASSESSMENT OF VISION** (also see Chapter 34)

**A. Acuity**

1. Visual acuity tests measure the client's distance and near vision
2. Snellen chart—"eye chart"
  - a. The chart is a simple tool to measure distance vision.

**▲ FIGURE 64-1** Checking extraocular muscles in the six cardinal positions. This indicates the functioning of cranial nerves III, IV, and VI. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

**b.** The client stands 20 feet from the chart, covers one eye, and uses the other eye to read the line that appears most clearly.

**c.** If the client is able to do this accurately, the client reads the next lower line.

**d.** This sequence is repeated until the client is unable to identify correctly more than half the characters on the line.

**e.** The procedure is repeated for the other eye, and then both eyes together may be tested.

**f.** The findings are recorded as a comparison between what the client can read at 20 feet and the distance at which an individual with normal vision can read the same line.

**g.** A result of 20/50 means that the client is able to read at 20 feet from the chart what a healthy eye can read at 50 feet.

**h.** Clients who wear corrective lenses other than for reading should have their vision tested with the lens in place.

**B. Confrontational test**

1. The confrontational test is performed to examine visual fields or peripheral vision.
2. The examiner and the client sit facing each other.
3. The client is asked to look directly into the eyes of the examiner throughout the test.
4. The examiner covers his or her right eye while the client covers his or her left eye (the client covers the eye directly opposite to the examiner's covered eye).
5. The examiner moves a finger from a nonvisible area into the client's line of vision.
6. The examiner and client should see the object at approximately the same time.
7. When the client sees the object coming into the line of vision, the client informs the examiner.
8. The procedure is repeated on the opposite eye.
9. The test assumes that the examiner has normal peripheral vision.

**C. Extraocular muscle function (see Fig. 64-1)**

1. The six muscles that attach the eyeball to its orbit and serve to direct the eye to points of interest are tested.
2. Six cardinal positions of gaze include the following:
  - a. Client's right (lateral position)
  - b. Upward and right (temporal position)
  - c. Down and right
  - d. Client's left (lateral position)
  - e. Upward and left (temporal position)
  - f. Down and left
3. Client holds head still and is asked to move his or her eyes and follow a small object.
4. The examiner notes for any parallel movements of the eye or for nystagmus, an involuntary, rhythmic, rapid twitching of the eyeballs.

**D. Color vision**

1. Tests for color vision involve picking numbers or letters out of a complex and colorful picture.
2. Ishihara chart
  - a. The Ishihara chart consists of numbers composed of colored dots located within a circle of colored dots.
  - b. The client is asked to read the numbers on the chart.
  - c. Each eye is tested separately.
  - d. Reading the numbers correctly indicates normal color vision
  - e. The test is sensitive for the diagnosis of red-green blindness but cannot detect discrimination of blue.

 The first slide on the Ishihara chart is one that everyone can discriminate; failure to identify numbers on this slide suggests a problem with performing the test, not a problem with color vision.

**E. Pupils**

1. The pupils are round and of equal size.
2. Increasing light causes pupillary constriction.
3. Decreasing light causes pupillary dilation.
4. Constriction of both pupils is a normal response to direct light.
5. The client is asked to look straight ahead while the examiner quickly brings a beam of light (flashlight) in from the side and directs it onto the eye.
6. The constriction of the eye is a direct response to shining a light into that eye; constriction of the opposite eye is known as a consensual response.

**F. Sclera and cornea**

1. Normal sclera color is white.
2. A yellow color to the sclera may indicate jaundice or systemic problems.
3. In a dark-skinned person, the sclera may normally appear yellow; pigmented dots may be present.
4. The cornea is transparent, smooth, shiny, and bright.
5. Cloudy areas or specks on the cornea may be the result of an accident or eye injury.

**G. Ophthalmoscopy**

1. The ophthalmoscope is an instrument used to examine the external structures and the interior of the eye.
2. The room is darkened so that the pupil will dilate.
3. The instrument is held with the right hand when examining the right eye and with the left hand when examining the left eye.
4. The client is asked to look straight ahead at an object on the wall.
5. The examiner should approach the client's eye from about 12 to 15 inches away and 15 degrees lateral to the client's line of vision.

6. As the instrument is directed at the pupil, a red glare (red reflex) is seen in the pupil.
7. The red reflex is the reflection of light on the vascular retina.
8. Absence of the red reflex may indicate opacity of the lens.
9. The retina, optic disc, optic vessels, fundus, and macula can be examined.

**III. DIAGNOSTIC TESTS FOR THE EYE****A. Fluorescein angiography****1. Description**

- a. A detailed imaging and recording of ocular circulation by a series of photographs after the administration of a dye
- b. This test is useful for assessing problems with retinal circulation, such as those that occur in diabetic retinopathy, retinal bleeding, and **macular degeneration**, or to rule out intraocular tumors.

**2. Preprocedure interventions**

- a. Assess the client for allergies and previous reactions to dyes.
- b. Obtain informed consent.
- c. A **mydriatic** medication, which causes pupil dilation, is instilled into the eye 1 hour before the test.
- d. The dye is injected into a vein of the client's arm.
- e. Inform the client that the dye may cause the skin to appear yellow for several hours after the test and is eliminated gradually through the urine.
- f. The client may experience nausea, vomiting, sneezing, paresthesia of the tongue, or pain at the injection site.
- g. If hives appear, antihistamines such as diphenhydramine (Benadryl) are administered as prescribed.

**3. Postprocedure interventions**

- a. Encourage rest.
- b. Encourage fluid intake to assist in eliminating the dye from the client's system.
- c. Remind the client that the yellow skin appearance will disappear.
- d. Inform the client that the urine will appear bright green until the dye is excreted.
- e. Advise the client to avoid direct sunlight for a few hours after the test and to wear sunglasses if staying inside is not possible.
- f. Inform the client that the photophobia will continue until pupil size returns to normal.

**B. Computed tomography (CT)****1. Description**

- a. The test is performed to examine the eyes, bony structures around the eye, and extraocular muscles.
- b. A beam of x-rays scans the skull and orbits of the eye.

- c. A cross-sectional image is formed by the use of a computer.
  - d. Contrast material may be used unless eye trauma is suspected.
2. Interventions
- a. No special client preparation or follow-up care is required.
  - b. Instruct the client that he or she will be positioned in a confined space and will need to keep the head still during the procedure.

### C. Slit lamp

1. Description
- a. A slit lamp allows examination of the anterior ocular structures under microscopic magnification.
  - b. The client leans on a chin rest to stabilize the head while a narrowed beam of light is aimed so that it illuminates only a narrow segment of the eye.
2. Interventions
- a. Explain the procedure to the client.
  - b. Advise the client about the brightness of the light and the need to look forward at a point over the examiner's ear.

### D. Corneal staining

1. Description
- a. A topical dye is instilled into the conjunctival sac to outline irregularities of the corneal surface that are not easily visible.
  - b. The eye is viewed through a blue filter, and a bright green color indicates areas of a nonintact corneal epithelium.
2. Interventions
- a. If the client wears contact lenses, the lenses must be removed.
  - b. The client is instructed to blink after the dye has been applied to distribute the dye evenly across the cornea.

### E. Tonometry

1. Description: The test is used primarily to assess for an increase of intraocular pressure and potential **glaucoma**.
2. Noncontact tonometry
- a. No direct contact with the client's cornea is needed and no topical eye anesthetic is needed.
  - b. A puff of air is directed at the cornea to indent the cornea, which can be unpleasant and may startle the client.
  - c. It is a less accurate method of measurement as compared with contact tonometry.
3. Contact tonometry
- a. Requires a topical anesthetic
  - b. A flattened cone is brought into contact with the cornea and the amount of pressure needed to flatten the cornea is measured.
  - c. The client must be instructed to avoid rubbing the eye following the examination if

### Box 64-1 Risk Factors for Eye Disorders

|                   |             |
|-------------------|-------------|
| Aging process     | Hereditary  |
| Congenital        | Medications |
| Diabetes mellitus | Trauma      |

the eye has been anesthetized because of the potential for scratching the cornea.

Normal intraocular pressure is 10 to 21 mm Hg; intraocular pressure varies throughout the day and is normally higher in the morning (always document the time of intraocular pressure measurement).

- F. Ultrasound: Procedure is similar to an ultrasound procedure done in other parts of the body and is done to detect lesions or tumors in the eye.
- G. Magnetic resonance imaging (MRI): Similar to an MRI done in other parts of the body; refer to Chapter 66 for additional information on MRI.

## IV. DISORDERS OF THE EYE

### A. Risk factors related to eye disorders (Box 64-1)

### B. Refractive errors

1. Description
- a. Refraction is the bending of light rays; any problem associated with eye length or refraction can lead to refractive errors.
  - b. **Myopia** (nearsightedness): Refractive ability of the eye is too strong for the eye length; images are bent and fall in front of, not on, the retina.
  - c. **Hyperopia** (farsightedness): Refractive ability of the eye is too weak; images are focused behind the retina.
  - d. Presbyopia: Loss of lens elasticity because of aging; less able to focus the eye for close work and images fall behind the retina.
  - e. **Astigmatism**: Occurs because of the irregular curvature of the cornea; image focuses at two different points on the retina.
2. Assessment
- a. Refractive errors are diagnosed through a process called refraction.
  - b. The client views an eye chart while various lenses of different strengths are systematically placed in front of the eye and is asked whether the lenses sharpen or worsen the vision.
3. Nonsurgical interventions: Eyeglasses or contact lenses
4. Surgical interventions
- a. Radial keratotomy: Incisions are made through the peripheral cornea to flatten the cornea, which allows the image to be focused closer to the retina; used to treat **myopia**.

- b. Photorefractive keratotomy: A laser beam is used to remove small portions of the corneal surface to reshape the cornea to focus an image properly on the retina; used to treat **myopia** and **astigmatism**.
- c. Laser-assisted in-situ keratomileusis (LASIK): The superficial layers of the cornea are lifted as a flap, a laser reshapes the deeper corneal layers, and then the corneal flap is replaced; used to treat **hyperopia**, **myopia**, and **astigmatism**.
- d. Corneal ring: The shape of the cornea is changed by placing a flexible ring in the outer edges of the cornea; used to treat **myopia**.

### C. Legally blind

1. Description: The best visual acuity with corrective lenses in the better eye of 20/200 or less, or the visual field is no greater than 20 degrees in its widest diameter in the better eye
2. Interventions
  - a. When speaking to the client who has limited sight or is blind, the nurse uses a normal tone of voice.
  - b. Alert the client when approaching.
  - c. Orient the client to the environment.
  - d. Use a focal point and provide further orientation to the environment from that focal point.
  - e. Allow the client to touch objects in the room.
  - f. Use the clock placement of foods on the meal tray to orient the client.
  - g. Promote independence as much as is possible.
  - h. Provide radios, televisions, and clocks that give the time orally, or provide a Braille watch.
  - i. When ambulating, allow the client to grasp the nurse's arm at the elbow; the nurse keeps his or her arm close to the body so that the client can detect the direction of movement.
  - j. Instruct the client to remain one step behind the nurse when ambulating.
  - k. Instruct the client in the use of the cane for the blind, which is differentiated from other canes by its straight shape and white color with red tip.
  - l. Instruct the client that the cane is held in the dominant hand several inches off the floor.
  - m. Instruct the client that the cane sweeps the ground where the client's foot will be placed next to determine the presence of obstacles.

### D. Cataracts (Fig. 64-2)

1. Description
  - a. A **cataract** is an opacity of the lens that distorts the image projected onto the retina and that can progress to blindness.

▲ **FIGURE 64-2** The cloudy appearance of a lens affected by cataract. (From Black, J., & Hawks, J. [2009]. *Medical-surgical nursing: Clinical management for positive outcomes* [8th ed.]. St. Louis: Saunders. Courtesy of Ophthalmic Photography at the University of Michigan, W.K. Kellogg Eye Center, Ann Arbor, MI.)

- b. Causes include the aging process (senile **cataracts**), inherited (congenital **cataracts**), and injury (traumatic **cataracts**); **cataracts** also can result from another eye disease (secondary **cataracts**).
  - c. Causes of secondary **cataracts** include diabetes mellitus, maternal rubella, severe **myopia**, ultraviolet light exposure, and medications such as corticosteroids.
  - d. Intervention is indicated when visual acuity has been reduced to a level that the client finds to be unacceptable or adversely affects his or her lifestyle.
2. Assessment
    - a. Blurred vision and decreased color perception are early signs
    - b. Diplopia, reduced visual acuity, absence of the red reflex, and the presence of a white pupil are late signs. Pain or eye redness is associated with age-related **cataract** formation.
    - c. Loss of vision is gradual.
  3. Interventions
    - a. Surgical removal of the lens, one eye at a time, is performed.
    - b. With extracapsular extraction, the lens is lifted out without removing the lens capsule; the procedure may be performed by phacemulsification, in which the lens is broken up by ultrasonic vibrations and extracted.
    - c. With intracapsular extraction, the lens and capsule are removed completely.
    - d. A partial iridectomy may be performed with the lens extraction to prevent acute secondary **glaucoma**.
    - e. A lens implantation may be performed at the time of the surgical procedure.

### Box 64-2 Client Education Following Cataract Surgery

Avoid eye straining.  
 Avoid rubbing or placing pressure on the eyes.  
 Avoid rapid movements, straining, sneezing, coughing, bending, vomiting, or lifting objects heavier than 5 lb.  
 Take measures to prevent constipation.  
 Follow instructions for dressing changes and prescribed eye drops and medications.  
 Wipe excess drainage or tearing with a sterile wet cotton ball from the inner to the outer canthus.  
 Use an eye shield at bedtime.  
 If lens implantation is not performed, accommodation is affected and glasses must be worn at all times.  
 Cataract glasses act as magnifying glasses and replace central vision only.  
 Because cataract glasses magnify, objects will appear closer; therefore, the client needs to accommodate, judge distance, and climb stairs carefully.  
 Contact lenses provide sharp visual acuity but dexterity is needed to insert them.  
 Contact the physician about any decrease in vision, severe eye pain, or increase in eye discharge.

#### 4. Preoperative interventions

- Instruct the client regarding the postoperative measures to prevent or decrease intraocular pressure, such as bending over, coughing, straining, and rubbing the eye.
- Stress to the client that care after surgery requires instillation of different types of eye drops several times a day for 2 to 4 weeks.
- Administer eye medications preoperatively, including **mydriatics** and cycloplegics as prescribed.

#### 5. Postoperative interventions

- Elevate the head of the bed 30 to 45 degrees.
- Turn the client to the back or nonoperative side.
- Maintain an eye patch as prescribed; orient the client to the environment.
- Position the client's personal belongings to the nonoperative side.
- Use side rails for safety.
- Assist with ambulation.

#### 6. Client education (Box 64-2)

### E. Glaucoma

#### 1. Description

- A group of ocular diseases resulting in increased intraocular pressure
- Intraocular pressure is the fluid (aqueous humor) pressure within the eye (normal intraocular pressure is 10 to 21 mm Hg).
- Increased intraocular pressure results from inadequate drainage of aqueous humor from

the canal of Schlemm or overproduction of aqueous humor.

- The condition damages the optic nerve and can result in blindness.
  - The gradual loss of visual fields may go unnoticed because central vision is unaffected.
- Types
    - Primary open-angle **glaucoma** (POAG) results from obstruction to outflow of aqueous humor and is the most common type.
    - Primary angle-closure **glaucoma** (PACG) results from blocking the outflow of aqueous humor into the trabecular meshwork; causes include lens or pupil dilation from medications or sympathetic stimulation.
  - Assessment
    - Early signs include diminished **accommodation** and increased intraocular pressure.
    - Primary open-angle **glaucoma** (POAG): Painless, and vision changes are slow; results in "tunnel" vision.
    - Primary angle-closure **glaucoma** (PACG): Blurred vision, halos around lights, and ocular erythema.
  - Interventions for acute angle-closure **glaucoma**

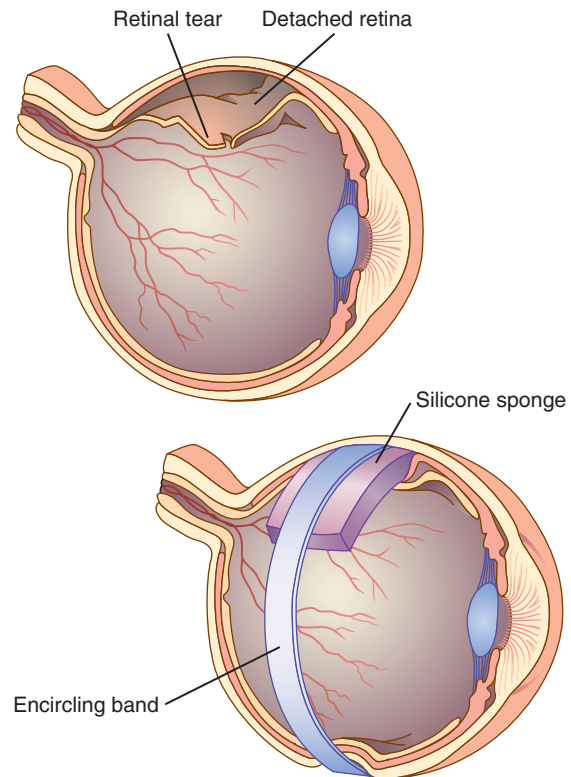

**!** Acute angle-closure glaucoma is a medical emergency that causes sudden eye pain and possible nausea and vomiting.

- Treat acute angle-closure **glaucoma** as a medical emergency.
  - Administer medications as prescribed to lower intraocular pressure.
  - Prepare the client for peripheral iridectomy, which allows aqueous humor to flow from the posterior to the anterior chamber.
- Interventions for the client with **glaucoma**
    - Instruct the client on the importance of medications to constrict the pupils (**miotics**), to decrease the production of aqueous humor (carbonic anhydrase inhibitors), and to decrease the production of aqueous humor and intraocular pressure ( $\beta$ -blockers).
    - Instruct the client of the need for lifelong medication use.
    - Instruct the client to wear a Medic-Alert bracelet.
    - Instruct the client to avoid anticholinergic medications.
    - Instruct the client to report eye pain, halos around the eyes, and changes in vision to the physician.
    - Instruct the client that when maximal medical therapy has failed to halt the progression of visual field loss and optic nerve damage, surgery will be recommended.

- g. Instruct the client to contact the physician before taking medications, including over-the-counter medications.
- h. Prepare the client for trabeculoplasty as prescribed to facilitate aqueous humor drainage.
- i. Prepare the client for trabeculectomy as prescribed, which allows drainage of aqueous humor into the conjunctival spaces by the creation of an opening.

## F. Retinal detachment

1. Description
  - a. Detachment or separation of the retina from the epithelium
  - b. **Retinal detachment** occurs when the layers of the retina separate because of the accumulation of fluid between them, or when both retinal layers elevate away from the choroid as a result of a tumor.
  - c. Partial detachment becomes complete if untreated.
  - d. When detachment becomes complete, blindness occurs.
2. Assessment
  - a. Flashes of light
  - b. Floaters or black spots (signs of bleeding)
  - c. Increase in blurred vision
  - d. Sense of a curtain being drawn over the eye
  - e. Loss of a portion of the visual field; painless loss of central or peripheral vision
3. Immediate interventions
  - a. Provide bedrest.
  - b. Cover both eyes with patches as prescribed to prevent further detachment.
  - c. Speak to the client before approaching.
  - d. Position the client's head as prescribed.
  - e. Protect the client from injury.
  - f. Avoid jerky head movements.
  - g. Minimize eye stress.
  - h. Prepare the client for a surgical procedure as prescribed.
4. Surgical procedures
  - a. Draining fluid from the subretinal space so that the retina can return to the normal position
  - b. Sealing retinal breaks by cryosurgery, a cold probe applied to the sclera, to stimulate an inflammatory response leading to adhesions
  - c. Diathermy, the use of an electrode needle and heat through the sclera, to stimulate an inflammatory response
  - d. Laser therapy, to stimulate an inflammatory response and seal small retinal tears before the detachment occurs
  - e. Scleral buckling, to hold the choroid and retina together with a splint until scar tissue forms, closing the tear (Fig. 64-3)

**▲ FIGURE 64-3** The scleral buckling procedure for repair of retinal detachment. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

- f. Insertion of gas or silicone oil to promote reattachment; these agents float against the retina to hold it in place until healing occurs.

5. Postoperative interventions
  - a. Maintain eye patches as prescribed.
  - b. Monitor for hemorrhage.
  - c. Prevent nausea and vomiting and monitor for restlessness, which can cause hemorrhage.
  - d. Monitor for sudden, sharp eye pain (notify the physician).
  - e. Encourage deep breathing but avoid coughing.
  - f. Provide bedrest for 1 to 2 days as prescribed.
  - g. Position the client as prescribed (positioning depends on the location of the detachment).
  - h. Administer eye medications as prescribed.
  - i. Assist the client with activities of daily living.
  - j. Avoid sudden head movements or anything that increases intraocular pressure.
  - k. Instruct the client to limit reading for 3 to 5 weeks.
  - l. Instruct the client to avoid squinting, straining and constipation, lifting heavy objects, and bending from the waist.
  - m. Instruct the client to wear dark glasses during the day and an eye patch at night.
  - n. Encourage follow-up care because of the danger of recurrence or occurrence in the other eye.

-  **G. Macular degeneration**
1. A deterioration of the macula, the area of central vision
  2. Can be atrophic (age-related or dry) or exudative (wet)
  3. Age-related: Caused by gradual blocking of retinal capillaries leading to an ischemic and necrotic macula; rods and cones photoreceptors die.
  4. Exudative: Serous detachment of pigment epithelium in the macula occurs; fluid and blood collect under the macula, resulting in scar formation and visual distortion.
  5. Interventions are aimed at maximizing the remaining vision.
  6. Assessment
    - a. A decline in central vision
    - b. Blurred vision and distortion
  7. Interventions
    - a. Initiate strategies to assist in maximizing remaining vision and maintaining independence.
    - b. Provide referrals to community organizations.
    - c. Laser therapy, photodynamic therapy, or other therapies may be prescribed to seal the leaking blood vessels in or near the macula.
-  **H. Ocular melanoma**
1. Most common malignant eye tumor in adults
  2. Tumor usually found in the uveal tract and can spread easily because of the rich blood supply
  3. Assessment
    - a. Tumor can be discovered during routine examination.
    - b. If macular area is invaded, blurring of vision occurs.
    - c. Increased intraocular pressure (IOP) is present if the canal of Schlemm is invaded.
    - d. Change of iris color is noted if the tumor invades the iris.
    - e. Ultrasonography may be performed to determine tumor size and location.
  4. Interventions
    - a. Enucleation: The entire eyeball is removed surgically and a ball implant is inserted to provide a base for a socket prosthesis.
    - b. Radiation is given via a radioactive plaque that is sutured to the sclera; the radioactive plaque remains in place until the prescribed radiation dose is delivered.
- I. Enucleation and exenteration**
1. Description
    - a. Enucleation is the removal of the entire eyeball.
    - b. Exenteration is the removal of the eyeball and surrounding tissues and bone.
    - c. The procedures are performed for the removal of ocular tumors.
    - d. After the eye is removed, a ball implant is inserted to provide a firm base for a socket prosthesis and to facilitate the best cosmetic result.
  - e. A prosthesis is fitted about 1 month after surgery.
- 2. Preoperative interventions**
- a. Provide emotional support to the client.
  - b. Encourage the client to verbalize feelings related to loss.
- 3. Postoperative interventions**
- a. Monitor vital signs.
  - b. Assess a pressure patch or dressing as prescribed.
  - c. Report changes in vital signs or the presence of bright red drainage on the pressure patch or dressing. 
- J. Hyphema** 
1. Description
    - a. Presence of blood in the anterior chamber that occurs as a result of an injury
    - b. The condition usually resolves in 5 to 7 days.
  2. Interventions 
    - a. Encourage rest with the client in a semi-Fowler's position.
    - b. Avoid sudden eye movements for 3 to 5 days to decrease the likelihood of bleeding.
    - c. Administer cycloplegic eye drops as prescribed to relax the eye muscles and place the eye at rest.
    - d. Instruct the client in the use of eye shields or eye patches as prescribed.
    - e. Instruct the client to restrict reading and limit watching television.
- K. Contusions** 
1. Description
    - a. Bleeding into the soft tissue as a result of an injury.
    - b. A contusion causes a black eye; the discoloration disappears in about 10 days.
    - c. Pain, photophobia, edema, and diplopia may occur.
  2. Interventions 
    - a. Place ice on the eye immediately.
    - b. Instruct the client to receive a thorough eye examination.
- L. Foreign bodies** 
1. Description: An object such as dust or dirt that enters the eye and causes irritation
  2. Interventions 
    - a. Have the client look upward, expose the lower lid, wet a cotton-tipped applicator with sterile normal saline, gently twist the swab over the particle, and remove it.
    - b. If the particle cannot be seen, have the client look downward, place a cotton applicator horizontally on the outer surface of the upper eye lid, grasp the lashes, and pull the upper

lid outward and over the cotton applicator; if the particle is seen, gently twist a swab over it to remove.

-  **M. Penetrating objects**
1. Description: An eye injury in which an object penetrates the eye
  2. Interventions
    - a. Never remove the object because it may be holding ocular structures in place; the object must be removed by the physician.
    - b. Cover the object with a cup.
    - c. Do not allow the client to bend over or lie flat; these positions may move the object.
    - d. Do not place pressure on the eye.
    - e. Client is to be seen by a physician immediately.
    - f. X-rays and CT scans of the orbit are usually obtained.
    - g. Magnetic resonance imaging (MRI) is contraindicated because of the possibility of metal-containing projectile movement during the procedure.
-  **N. Chemical burns (see Priority Nursing Actions)**
1. Description: An eye injury in which a caustic substance enters the eye
  2. Interventions
 

 **If a chemical splash to the eye occurs, treatment should begin immediately; immediately flush the eyes at the scene of the injury with water for at least 15 to 20 minutes.**

    - a. At the scene of the injury, obtain a sample of the chemical involved.
    - b. At the emergency department, the eye is irrigated with normal saline solution or an ophthalmic irrigation solution for at least 10 minutes or longer as prescribed; the pH is then checked.
    - c. The solution is directed across the cornea and toward the lateral canthus.
    - d. Prepare for visual acuity assessment.
    - e. Apply an antibiotic ointment as prescribed.
    - f. Cover the eye with a patch as prescribed.
-  **O. Eye (tissue) donation**
1. Donor eyes
    - a. Donor eyes are obtained from cadavers.
    - b. Donor eyes must be enucleated soon after death because of rapid endothelial cell death.
    - c. Donor eyes must be stored in a preserving solution.
    - d. Storage, handling, and coordination of donor tissue with surgeons is provided by a network of state eye bank associations.
  2. Care to the deceased client as a potential eye donor
    - a. Discuss the option of eye donation with the physician and family.

### Box 64-3 Signs of Graft Rejection Following Corneal Transplantation: RSVP

|          |                         |
|----------|-------------------------|
| Redness  | Visual acuity decreased |
| Swelling | Pain                    |

- a. Raise the head of the bed 30 degrees.
  - c. Instill antibiotic eye drops as prescribed.
  - d. Close the eyes and apply a small ice pack to the closed eyes.
3. Preoperative care to the recipient of the cornea 
- a. Recipient may be told of the tissue (cornea) availability only several hours to 1 day before the surgery.
  - b. Assist in alleviating client anxiety.
  - c. Assess the recipient's eye for signs of infection.
  - d. Report the presence of any redness, watery or purulent drainage, or edema around the recipient's eye to the physician.
  - e. Instill antibiotic drops into the recipient's eye as prescribed to reduce the number of microorganisms present.
  - f. Administer fluids and medications intravenously as prescribed.
4. Postoperative care to the recipient 
- a. Eye is covered with a pressure patch and protective shield that is left in place for 1 day.
  - b. Do not remove or change the dressing without a physician's prescription.
  - c. Monitor vital signs.
  - d. Monitor level of consciousness.
  - e. Assess the eye dressing.
  - f. Position the client with the head elevated and on the nonoperative side to reduce intraocular pressure.
  - g. Orient the client frequently.
  - h. Monitor for complications of bleeding, wound leakage, infection, and tissue rejection.
  - i. Instruct the client how to apply a patch and eye shield.
  - j. Instruct the client to wear the eye shield at night for 1 month and whenever around small children or pets.
  - k. Advise the client not to rub the eye.
5. Graft rejection (Box 64-3; Fig. 64-4) 
- a. Rejection can occur at any time.
  - b. Inform the client of the signs of rejection.
  - c. Signs include redness, swelling, decreased vision, and pain (RSVP).
  - d. The eye is treated with topical corticosteroids.

▲ **FIGURE 64-4** Graft rejection. **A**, Clinical appearance of the eye after keratoplasty. **B**, Acute graft rejection. (From Black, J., & Hawks, J. [2009]. *Medical-surgical nursing: Clinical management for positive outcomes* [8th ed.]. St. Louis: Saunders. Courtesy of Ophthalmic Photography at the University of Michigan, W.K. Kellogg Eye Center, Ann Arbor, MI.)

### PRIORITY NURSING ACTIONS!

#### Actions to Take if a Client Sustains a Chemical Eye Injury

1. Irrigate the eye.
2. Check the pH of the eye.
3. Assess visual acuity.
4. Document the event, actions taken, and the client's response.

Emergency care following a chemical burn to the eye includes irrigating the eye immediately with sterile normal saline or ocular irrigating solution. If the injury occurred outside the hospital, the eye is irrigated immediately with tap water and then the client is brought to the emergency department. In the emergency department, the irrigation should be maintained for at least 10 minutes (and at least 1 liter should be used to irrigate). After irrigation, the pH of the eye is checked and, if a pH of 6 to 7 has not returned, the irrigation should be continued. Some physician's prefer the use of lactated Ringer's solution for irrigation because its pH is 6 to 7.5, which is closer to the pH of tears (7.1) than that of normal saline, which may range from 4.5 to 7.

Following this emergency treatment, visual acuity is assessed. It is also important for the nurse to find out what chemical splashed into the eye.

Finally, the event is documented, as well as the actions taken and the client's response.

## V. ANATOMY AND PHYSIOLOGY OF THE EAR

- A. Functions**
  1. Hearing
  2. Maintenance of balance
- B. External ear (pinna)**
  1. The external ear is embedded in the temporal bone bilaterally at the level of the eyes.
  2. The external ear extends from the auricle through the external canal to the tympanic membrane or eardrum.
  3. The external ear includes the mastoid process, the bony ridge located over the temporal bone.
- C. Middle ear**
  1. The middle ear consists of the medial side of the tympanic membrane.
  2. The middle ear contains three bony ossicles.
    - a. Malleus
    - b. Incus
    - c. Stapes
  3. Functions of the middle ear
    - a. Conduct sound vibrations from the outer ear to the central hearing apparatus in the inner ear
    - b. Protect the inner ear by reducing the amplitude of loud sounds
    - c. The auditory canal (eustachian tube) allows equalization of air pressure on each side of the tympanic membrane so that the membrane does not rupture.
- D. Inner ear**
  1. The inner ear contains the semicircular canals, cochlea, and distal end of the eighth cranial nerve.

2. The semicircular canals contain fluid and hair cells connected to sensory nerve fibers of the vestibular portion of the eighth cranial nerve.
3. The inner ear maintains sense of balance or equilibrium.
4. The cochlea is the spiral-shaped organ of hearing.
5. The organ of Corti (within the cochlea) is the receptor and organ of hearing.
6. Eighth cranial nerve
  - a. The cochlear branch of the nerve transmits neuroimpulses from the cochlea to the brain, where they are interpreted as sound.
  - b. The vestibular branch maintains balance and equilibrium.

#### E. Hearing and equilibrium

1. The external ear conducts sound waves to the middle ear.
2. The middle ear, also called the tympanic cavity, conducts sound waves to the inner ear.
3. The middle ear is filled with air, which is kept at atmospheric pressure by the opening of the auditory canal.
4. The inner ear contains sensory receptors for sound and for equilibrium.
5. The receptors in the inner ear transmit sound waves and changes in body position to the nerve impulses.

### VI. ASSESSMENT OF THE EAR (also see Chapter 34)

#### A. Otoscopic examination

1. The client's head is tilted slightly away and the otoscope is held upside down as if it were a large pen; this permits the examiner's hand to lay against the client's head for support.
2. In an adult, pull the pinna up and back to straighten the external canal.
3. Visualize the external canal while slowly inserting the speculum.
4. The normal external canal is pink and intact, without lesions and with varying amounts of cerumen and fine little hairs.
5. Assess the tympanic membrane for intactness; the normal tympanic membrane is intact, without perforations, and should be free from lesions.
6. The tympanic membrane is transparent, opaque, pearly gray, and slightly concave.
7. A fluid line or the presence of air bubbles is not normally visible.
8. If the tympanic membrane is bulging or retracting, the edges of the light reflex will be fuzzy (diffuse) and may spread over the tympanic membrane.

 The otoscope is never introduced blindly into the external canal because of the risk of perforating the tympanic membrane.

#### B. Auditory assessment

1. Sound is transmitted by air conduction and bone conduction.
2. Air conduction takes two or three times longer than bone conduction.
3. Hearing loss is categorized as **conductive**, **sensorineural**, or mixed **conductive** and **sensorineural**.
4. **Conductive hearing loss** is caused by any physical obstruction to the transmission of sound waves.
5. **Sensorineural hearing loss** is caused by a defect in the cochlea, eighth cranial nerve, or the brain itself.
6. A mixed **conductive-sensorineural hearing loss** results in profound hearing loss.

#### C. Voice test

1. Ask the client to block one external canal.
2. The examiner stands 1 to 2 feet away and whispers a statement.
3. The client is asked to repeat the whispered statement.
4. Each ear is tested separately.

#### D. Watch test

1. A ticking watch is used to test for high-frequency sounds.
2. The examiner holds a ticking watch about 5 inches from each ear and asks the client if the ticking is heard.

#### E. Tuning fork tests

1. Weber's tuning fork test
  - a. Place the vibrating tuning fork stem in the middle of the client's head, at the midline of the forehead, or above the upper lip over the teeth.
  - b. Hold the fork by the stem only.
  - c. The client is asked whether the sound is heard equally in both ears or whether the sound is louder in one ear.
  - d. Normal test result is hearing the sound equally in both ears.
  - e. If the client hears the sound louder in one ear, the term *lateralization* is applied to the side that hears the loudest.
  - f. Such a finding may indicate that the client has a **conductive hearing loss** in the ear to which the sound is lateralized or that **sensorineural hearing loss** has occurred in the opposite ear.
2. Rinne tuning fork test
  - a. The test compares the client's hearing by air conduction and bone conduction.
  - b. Air conduction is two or three times longer than bone conduction.
  - c. The vibrating tuning fork stem is placed on the client's mastoid process and the client is asked to indicate when he or she no longer hears the sound.

- d. The examiner quickly brings the tuning fork in front of the pinna without touching the client and asks the client to indicate whether he or she still hears the sound.
- e. The client normally continues to hear the sound two times longer in front of the pinna; such results are a positive Rinne test.
- f. The examiner records the duration of both phases, bone conduction followed by air conduction, and compares the times.
- g. If the client is unable to hear the sound through the ear in front of the pinna, the client may have a **conductive hearing loss** on the side tested; in this situation, the bone conduction is greater than the air conduction (negative Rinne test).
- h. Both the Rinne test and the Weber tuning fork test are limited in distinguishing between **conductive** and **sensorineural hearing losses**.

#### F. Vestibular assessment

1. Test for falling
  - a. The examiner asks the client to stand with the feet together, arms hanging loosely at the side, and eyes closed.
  - b. The client normally remains erect, with only slight swaying.
  - c. A significant sway is a positive Romberg sign.
2. Test for past pointing
  - a. The client sits in front of the examiner.
  - b. The client closes the eyes and extends the arms in front, pointing both index fingers at the examiner.
  - c. The examiner holds and touches his or her own extended index fingers under the client's extended index fingers to give the client a point of reference.
  - d. The client is instructed to raise both arms and then lower them, attempting to return to the examiner's extended index fingers.
  - e. The normal test response is that the client can easily return to the point of reference.
  - f. The client with a vestibular function problem lacks a normal sense of position and cannot return the extended fingers to the point of reference; instead, the fingers deviate to the right or left of the reference point.
3. Gaze nystagmus evaluation
  - a. The client's eyes are examined as the client looks straight ahead, 30 degrees to each side, upward and downward.
  - b. Any spontaneous nystagmus—an involuntary, rhythmic, rapid twitching of the eyeballs—represents a problem with the vestibular system.
4. Dix-Hallpike maneuver
  - a. The client starts in a sitting position; the examiner lowers the client to the exam table

and rather quickly turns the client's head to 45 degrees position.

- b. If after about 30 seconds there is no nystagmus, the client is returned to a sitting position and the test is repeated on the other side.

### VII. DIAGNOSTIC TESTS FOR THE EAR

#### A. Tomography

##### 1. Description

- a. Tomography may be performed with or without contrast medium.
- b. Tomography assesses the mastoid, middle ear, and inner ear structures.
- c. Multiple radiographs of the head are obtained.
- d. Tomography is especially helpful in the diagnosis of acoustic tumors.

##### 2. Interventions

- a. All jewelry is removed.
- b. Lead eye shields are used to cover the cornea to diminish the radiation dose to the eyes.
- c. The client must remain still in a supine position.
- d. No follow-up care is required.

#### B. Audiometry

##### 1. Description

- a. Audiometry measures hearing acuity.
- b. Audiometry uses two types, pure tone audiometry and speech audiometry.
- c. Pure tone audiometry is used to identify problems with hearing, speech, music, and other sounds in the environment.
- d. In speech audiometry, the client's ability to hear spoken words is measured.
- e. After testing, audiographic patterns are depicted on a graph to determine the type and level of the hearing loss.

##### 2. Interventions

- a. Inform the client regarding the procedure.
- b. Instruct the client to identify the sounds as they are heard.

#### C. Electronystagmography (ENG)

##### 1. Description

- a. Electronystagmography is a vestibular test that evaluates spontaneous and induced eye movements known as nystagmus.
- b. ENG is used to distinguish between normal nystagmus and medication-induced nystagmus, or nystagmus caused by a lesion in the central or peripheral vestibular pathway.
- c. ENG records changing electrical fields with the movement of the eye, as monitored by electrodes placed on the skin around the eye.

##### 2. Interventions

- a. The client is instructed to remain NPO for 3 hours before testing, avoiding caffeine-containing beverages for 24 to 48 hours before the test.

- b. Unnecessary medications are withheld for 24 hours before testing.
  - c. Instruct the client that this is a long and tiring procedure.
  - d. The client should bring prescription eyeglasses to the examination.
  - e. The client sits and is instructed to gaze at lights, focus on a moving pattern, focus on a moving point, and then close the eyes.
  - f. While sitting in a chair, the client may be rotated to obtain information about vestibular function.
  - g. In addition, the client's ears are irrigated with cool and warm water, which may cause nausea and vomiting.
  - h. Following the procedure, the client begins taking clear fluids slowly and cautiously because nausea and vomiting may occur.
    - i. Assistance with ambulation may also be necessary following the procedure.
- D. Magnetic resonance imaging (MRI):** Refer to Chapter 66 for information on MRI.

### VIII. DISORDERS OF THE EAR

**A. Risk factors related to ear disorders (Box 64-4)**

**B. Conductive hearing loss**

1. Description
  - a. **Conductive hearing loss** occurs when sound waves are blocked to the inner ear fibers because of external or middle ear disorders.
  - b. Disorders often can be corrected with no damage to hearing or minimal permanent hearing loss.
2. Causes
  - a. Any inflammatory process or obstruction of the external or middle ear
  - b. Tumors
  - c. **Otosclerosis**
  - d. A buildup of scar tissue on the ossicles from previous middle ear surgery

**C. Sensorineural hearing loss**

1. Description
  - a. **Sensorineural hearing loss** is a pathological process of the inner ear or of the sensory fibers that lead to the cerebral cortex.
  - b. **Sensorineural hearing loss** is often permanent, and measures must be taken to reduce further damage.
2. Causes
  - a. Damage to the inner ear structures
  - b. Damage to the eighth cranial nerve or brain itself

- c. Prolonged exposure to loud noise
- d. Medications
- e. Trauma
- f. Inherited disorders
- g. Metabolic and circulatory disorders
- h. Infections
- i. Surgery
- j. **Meniere's syndrome**
- k. Diabetes mellitus
- l. Myxedema

**D. Mixed hearing loss**

1. Mixed hearing loss also is known as **conductive-sensorineural hearing loss**.
2. Client has **sensorineural** and **conductive hearing loss**.

**E. Central hearing loss:** Involves the inability to interpret sound, including speech, due to a problem in the brain.

**F. Signs of hearing loss and facilitating communication (Boxes 64-5 and 64-6)**

**G. Cochlear implantation (Fig. 64-5)**

1. Cochlear implants are used for **sensorineural hearing loss**.
2. A small computer converts sound waves into electrical impulses.
3. Electrodes are placed by the internal ear with a computer device attached to the external ear.
4. Electronic impulses directly stimulate nerve fibers.

**H. Hearing aids**

1. Hearing aids are used for the client with **conductive hearing loss**.
2. Hearing aids have limited value for the client with **sensorineural hearing loss**, because they only make sounds louder, not clearer.
3. A difficulty that exists in the use of hearing aids is the amplification of background noise and voices.
4. Client education (Box 64-7)

**I. Presbycusis**

1. Description
  - a. Presbycusis is a **sensorineural hearing loss** associated with aging.

#### Box 64-4 Risk Factors for Ear Disorders

|               |             |
|---------------|-------------|
| Aging process | Ototoxicity |
| Infection     | Trauma      |
| Medications   | Tumors      |

#### Box 64-5 Signs of Hearing Loss

Frequently asking others to repeat statements  
 Straining to hear  
 Turning head or leaning forward to favor one ear  
 Shouting in conversation  
 Ringing in the ears  
 Failing to respond when not looking in the direction of the sound  
 Answering questions incorrectly  
 Raising the volume of the television or radio  
 Avoiding large groups  
 Better understanding of speech when in small groups  
 Withdrawing from social interactions

- b. **Presbycusis** leads to degeneration or atrophy of the ganglion cells in the cochlea and a loss of elasticity of the basilar membranes.
- c. **Presbycusis** leads to compromise of the vascular supply to the inner ear, with changes in several areas of the ear structure.

- 2. Assessment
  - a. Hearing loss is gradual and bilateral.
  - b. Client states that he or she has no problem with hearing but cannot understand what the words are.
  - c. Client thinks that the speaker is mumbling.

### Box 64-6 Facilitating Communication

Using written words if the client is able to see, read, and write

Providing plenty of light in the room

Getting the attention of the client before beginning to speak

Facing the client when speaking

Talking in a room without distracting noises

Moving close to the client and speaking slowly and clearly

Keeping hands and other objects away from the mouth when talking to the client

Talking in normal volume and at a lower pitch because shouting is not helpful and higher frequencies are less easily heard

Rephrasing sentences and repeating information

Validating with the client the understanding of statements made by asking the client to repeat what was said

Reading lips

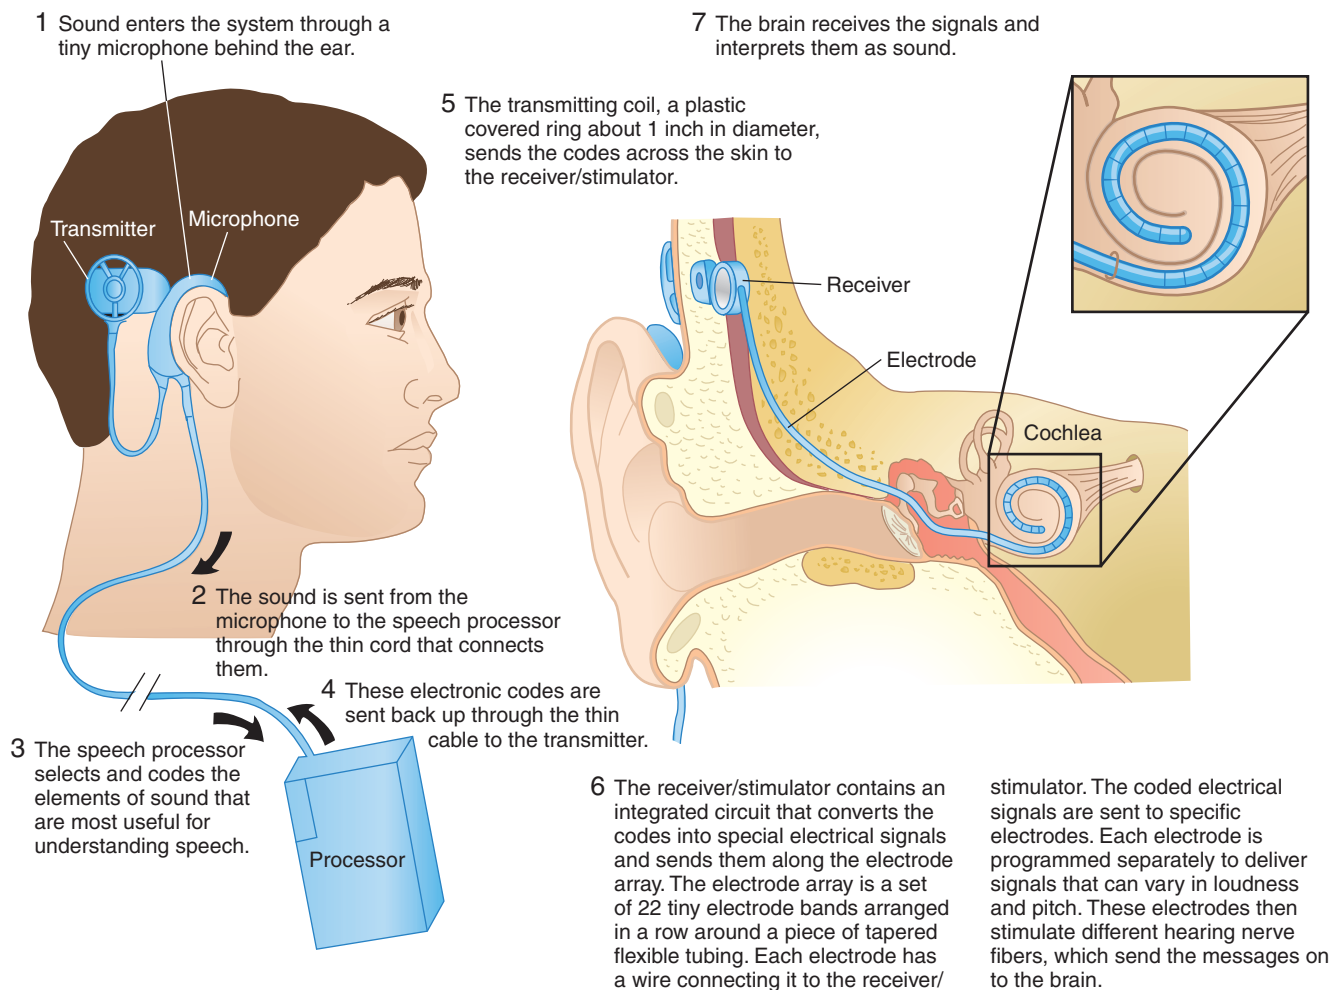

Encouraging the client to wear glasses when talking to someone to improve vision for lip reading

Using sign language, which combines speech with hand movements that signify letters, words, or phrases

Using telephone amplifiers

Using flashing lights that are activated by ringing of the telephone or doorbell

Using specially trained dogs to help the client be aware of sound and alert the client to potential danger

▲ **FIGURE 64-5** Cochlear implant to restore hearing. (From Black, J., & Hawks, J. [2009]. *Medical-surgical nursing: Clinical management for positive outcomes* [8th ed.]. St. Louis: Saunders.)

**Box 64-7 Client Education Regarding a Hearing Aid**

Begin using the hearing aid slowly to adjust to the device.  
 Adjust the volume to the minimal hearing level to prevent feedback squealing.  
 Concentrate on the sounds that are to be heard and to filter out background noise.  
 Clean the ear mold with mild soap and water.  
 Avoid excessive wetting of the hearing aid and try to keep the hearing aid dry.  
 Clean the ear cannula of the hearing aid with a toothpick or pipe cleaner.

Turn the hearing aid off before removing from the ear to prevent squealing feedback; remove the battery when not in use.  
 Keep extra batteries on hand.  
 Keep the hearing aid in a safe place.  
 Prevent hair sprays, oils, or other hair and face products from coming into contact with the receiver of the hearing aid.

**J. External otitis****1. Description**

- a. External otitis is an infective inflammatory or allergic response involving the structure of the external auditory canal or auricles.
- b. An irritating or infective agent comes into contact with the epithelial layer of the external ear.
- c. Contact leads to an allergic response or signs and symptoms of an infection.
- d. The skin becomes red, swollen, and tender to touch on movement.
- e. The extensive swelling of the canal can lead to **conductive hearing loss** because of obstruction.
- f. External otitis is more common in children; it is termed *swimmer's ear* and occurs more often in hot, humid environments.
- g. Prevention includes the elimination of irritating or infecting agents.

**2. Assessment**

- a. Pain
- b. Itching
- c. Plugged feeling in the ear
- d. Redness and edema
- e. Exudate
- f. Hearing loss

**3. Interventions**

- a. Apply heat locally for 20 minutes three times a day.
- b. Encourage rest to assist in reducing pain.
- c. Administer antibiotics or corticosteroids as prescribed.
- d. Administer analgesics such as aspirin or acetaminophen (Tylenol) for the pain as prescribed.
- e. Instruct the client that the ears should be kept clean and dry.
- f. Instruct the client to use earplugs for swimming.
- g. Instruct the client that cotton-tipped applicators should not be used because their use can lead to trauma to the canal.
- h. Instruct the client that irritating agents such as hair products or headphones should be discontinued.

**Box 64-8 Client Education Following Myringotomy**

Avoid strenuous activities.  
 Avoid rapid head movements, bouncing, or bending.  
 Avoid straining on bowel movement.  
 Avoid drinking through a straw.  
 Avoid traveling by air.  
 Avoid forceful coughing.  
 Avoid contact with persons with colds.  
 Avoid washing hair, showering, or getting the head wet for 1 week as prescribed.  
 Instruct the client that if he or she needs to blow the nose, to blow one side at a time with the mouth open.  
 Instruct the client to keep ears dry by keeping a ball of cotton coated with petroleum jelly in the ear and to change the cotton ball daily.  
 Instruct the client to report excessive ear drainage to the physician.

**K. Otitis media: See Chapter 37.**

1. Myringotomy: See Chapter 37.
2. Client education (Box 64-8)

**L. Chronic otitis media****1. Description**

- a. Chronic otitis media is a chronic infective, inflammatory, or allergic response involving the structure of the middle ear.
- b. Frequent removal of debris from the canal may be required.
- c. Myringoplasty can reconstruct the tympanic membrane and ossicles and improve **conductive hearing loss**.
- d. Mastoidectomy may be performed if the infection has spread to involve the mastoid bone.

 Monitor the client with otitis media closely for response to treatment. Otic and systemic antibiotics may be used to treat the infection, but often the organism is resistant.

2. Preoperative interventions
  - a. Administer antibiotic drops as prescribed.
  - b. Clean the ear of debris as prescribed; irrigate the ear with a solution of equal parts of vinegar and sterile water as prescribed to restore the normal pH of the ear.
  - c. Instruct the client to avoid persons with upper respiratory infections.
  - d. Instruct the client to obtain adequate rest, eat a balanced diet, and drink adequate fluids.
  - e. Instruct the client in deep breathing and coughing; forceful coughing, which increases pressure in the middle ear, is to be avoided postoperatively.
3. Postoperative interventions
  - a. Inform the client that initial hearing after surgery is diminished because of the packing in the ear canal; hearing improvement will occur after the ear canal packing is removed.
  - b. Keep the dressing clean and dry.
  - c. Keep the client flat, with the operative ear up for at least 12 hours.
  - d. Administer antibiotics as prescribed.
5. Postoperative interventions
  - a. Monitor for dizziness.
  - b. Monitor for signs of meningitis, as evidenced by a stiff neck and vomiting.
  - c. Prepare for a wound dressing change 24 hours postoperatively.
  - d. Monitor the surgical incision for edema, drainage, and redness.
  - e. Position the client flat with the operative side up.
  - f. Restrict the client to bed with bedside commode privileges for 24 hours as prescribed.
  - g. Assist the client with getting out of bed to prevent falling or injuries from dizziness.
  - h. With reconstruction of the ossicles via a graft, take precautions to prevent dislodging of the graft.

#### M. Mastoiditis

1. Description
  - a. Mastoiditis may be acute or chronic and results from untreated or inadequately treated chronic or acute otitis media.
  - b. The pain is not relieved by myringotomy.
2. Assessment
  - a. Swelling behind the ear and pain with minimal movement of the head
  - b. Cellulitis on the skin or external scalp over the mastoid process
  - c. A reddened, dull, thick, immobile tympanic membrane, with or without perforation
  - d. Tender and enlarged postauricular lymph nodes
  - e. Low-grade fever
  - f. Malaise
  - g. Anorexia
3. Interventions
  - a. Prepare the client for surgical removal of infected material.
  - b. Monitor for complications.
  - c. Simple or modified radical mastoidectomy with tympanoplasty is the most common treatment.
  - d. Once tissue that is infected is removed, the tympanoplasty is performed to reconstruct the ossicles and tympanic membranes in an attempt to restore normal hearing.
4. Complications
  - a. Damage to the abducens and facial cranial nerves
  - b. Damage is exhibited by inability to look laterally (cranial nerve VI, abducens) and a drooping of the mouth on the affected side (cranial nerve VII, facial).

#### N. Otosclerosis

1. Description
  - a. **Otosclerosis** is a genetic disorder of the labyrinthine capsule of the middle ear that results in a bony overgrowth of the tissue surrounding the ossicles.
  - b. **Otosclerosis** causes the development of irregular areas of new bone formation and causes the fixation of the bones.
  - c. Stapes fixation leads to a **conductive hearing loss**.
  - d. If the disease involves the inner ear, **sensorineural hearing loss** is present.
  - e. Bilateral involvement is common, although hearing loss may be worse in one ear.
  - f. It is thought to be a hereditary autosomal dominant disorder and is most commonly seen in young woman.
  - g. Nonsurgical intervention promotes the improvement of hearing through amplification.
  - h. Surgical intervention involves removal of the bony growth causing the hearing loss.
  - i. A partial stapedectomy or complete stapedectomy with prosthesis (**fenestration**) may be performed surgically.
2. Assessment
  - a. Slowly progressing **conductive hearing loss**
  - b. Bilateral hearing loss
  - c. A ringing or roaring type of constant tinnitus
  - d. Loud sounds heard in the ear when chewing
  - e. Pinkish discoloration (Schwartz's sign) of the tympanic membrane, which indicates vascular changes within the ear.
  - f. Negative Rinne test

- g. Weber's test shows lateralization of sound to the ear with the most **conductive hearing loss**.

#### O. Fenestration

1. Description
  - a. **Fenestration** is removal of the stapes, with a small hole drilled in the footplate; a prosthesis is connected between the incus and footplate.
  - b. Sounds cause the prosthesis to vibrate in the same manner as the stapes.
  - c. Complications include complete hearing loss, prolonged vertigo, infection, or facial nerve damage.
2. Preoperative interventions
  - a. Instruct the client in measures to prevent middle ear or external ear infections.
  - b. Instruct the client to avoid excessive nose blowing.
  - c. Instruct the client not to clean the ear canal with cotton-tipped applicators and to avoid trauma or injury to the ear canal.
3. Postoperative interventions
  - a. Inform the client that hearing is initially worse after the surgical procedure because of swelling and that no noticeable improvement in hearing may occur for as long as 6 weeks.
  - b. Inform the client that the Gelfoam ear packing (if used) interferes with hearing but is used to decrease bleeding.
  - c. Assist with ambulating during the first 1 to 2 days after surgery.
  - d. Provide side rails when the client is in bed.
  - e. Administer antibiotic, antivertiginous, and pain medications as prescribed.
  - f. Assess for facial nerve damage, weakness, changes in tactile sensation and taste sensation, vertigo, nausea, and vomiting.
  - g. Instruct the client to move the head slowly when changing positions to prevent vertigo.
  - h. Instruct the client to avoid persons with upper respiratory tract infections.
  - i. Instruct the client to avoid showering and getting the head and wound wet.
  - j. Instruct the client to avoid using small objects (cotton-tipped applicators) to clean the external ear canal.
  - k. Instruct the client to avoid rapid extreme changes in pressure caused by quick head movements, sneezing, nose blowing, straining, and changes in altitude.
  - l. Instruct the client to avoid changes in middle ear pressure because they could dislodge the graft or prosthesis.

#### P. Labyrinthitis

1. Description: Infection of the labyrinth that occurs as a complication of acute or chronic otitis media

2. May result from growth of a cholesteatoma—benign overgrowth of squamous cell epithelium
3. Assessment
  - a. Hearing loss that may be permanent on the affected side
  - b. Tinnitus
  - c. Spontaneous nystagmus to the affected side
  - d. Vertigo
  - e. Nausea and vomiting
4. Interventions
  - a. Monitor for signs of meningitis, the most common complication, as evidenced by headache, stiff neck, and lethargy.
  - b. Administer systemic antibiotics as prescribed.
  - c. Advise the client to rest in bed in a darkened room.
  - d. Administer antiemetics and antivertiginous medications as prescribed.
  - e. Instruct the client that the vertigo subsides as the inflammation resolves.
  - f. Instruct the client that balance problems that persist may require gait training through physical therapy.

#### Q. Meniere's syndrome

1. Description
  - a. **Meniere's syndrome** is also called endolymphatic hydrops; it refers to dilation of the endolymphatic system by overproduction or decreased reabsorption of endolymphatic fluid.
  - b. The syndrome is characterized by tinnitus, unilateral **sensorineural hearing loss**, and vertigo.
  - c. Symptoms occur in attacks and last for several days, and the client becomes totally incapacitated during the attacks.
  - d. Initial hearing loss is reversible but as the frequency of attacks continues, hearing loss becomes permanent.

 A priority nursing intervention in the care of a client with Meniere's syndrome is instituting safety measures.

#### 2. Causes

- a. Any factor that increases endolymphatic secretion in the labyrinth
- b. Viral and bacterial infections
- c. Allergic reactions
- d. Biochemical disturbances
- e. Vascular disturbance, producing changes in the microcirculation in the labyrinth
- f. Long-term stress may be a contributing factor.

#### 3. Assessment

- a. Feelings of fullness in the ear
- b. Tinnitus, as a continuous low-pitched roar or humming sound, that is present much of the

time but worsens just before and during severe attacks

- c. Hearing loss that is worse during an attack
  - d. Vertigo, periods of whirling, that might cause the client to fall to the ground
  - e. Vertigo that is so intense that even while lying down, the client holds the bed or ground in an attempt to prevent the whirling
  - f. Nausea and vomiting
  - g. Nystagmus
  - h. Severe headaches
4. Nonsurgical interventions
- a. Prevent injury during vertigo attacks.
  - b. Provide bedrest in a quiet environment.
  - c. Provide assistance with walking.
  - d. Instruct the client to move the head slowly to prevent worsening of the vertigo.
  - e. Initiate sodium and fluid restrictions as prescribed.
  - f. Instruct the client to stop smoking.
  - g. Instruct the client to avoid watching television because the flickering of lights may exacerbate symptoms.
  - h. Administer nicotinic acid (niacin) as prescribed for its vasodilatory effect.
  - i. Administer antihistamines as prescribed to reduce the production of histamine and the inflammation.
  - j. Administer antiemetics as prescribed.
  - k. Administer tranquilizers and sedatives as prescribed to calm the client, allow the client to rest, and control vertigo, nausea, and vomiting.
  - l. Mild diuretics may be prescribed to decrease endolymph volume.
  - m. Inform the client about vestibular rehabilitation as prescribed.
5. Surgical interventions
- a. Surgery is performed when medical therapy is ineffective and the functional level of the client has decreased significantly.
  - b. Endolymphatic drainage and insertion of a shunt may be performed early in the course of the disease to assist with the drainage of excess fluids.
  - c. A resection of the vestibular nerve or total removal of the labyrinth or a labyrinthectomy may be performed.
6. Postoperative interventions
- a. Assess packing and dressing on the ear.
  - b. Speak to the client on the side of the unaffected ear.
  - c. Perform neurological assessments.
  - d. Maintain safety with the use of side rails.
  - e. Assist with ambulating.
  - f. Encourage the client to use a bedside commode rather than ambulating to the bathroom.

g. Administer antivertiginous and antiemetic medications as prescribed.

#### R. Acoustic neuroma

##### 1. Description

- a. An acoustic neuroma is a benign tumor of the vestibular or acoustic nerve.
- b. The tumor may cause damage to hearing and to facial movements and sensations.
- c. Treatment includes surgical removal of the tumor via craniotomy.
- d. Care is taken to preserve the function of the facial nerve.
- e. The tumor rarely recurs after surgical removal.
- f. Postoperative nursing care is similar to postoperative craniotomy care.

##### 2. Assessment

- a. Symptoms usually begin with tinnitus and progress to gradual **sensorineural hearing loss**.
- b. As the tumor enlarges, damage to adjacent cranial nerves occurs.

#### S. Trauma

##### 1. Description

- a. The tympanic membrane has a limited stretching ability and gives way under high pressure.
- b. Foreign objects placed in the external canal may exert pressure on the tympanic membrane and cause perforation.
- c. If the object continues through the canal, the bony structure of the stapes, incus, and malleus may be damaged.
- d. A blunt injury to the basal skull and ear can damage the middle ear structures through fractures extending to the middle ear.
- e. Excessive nose blowing and rapid changes of pressure that occur with nonpressurized air flights can increase pressure in the middle ear.
- f. Depending on the damage to the ossicles, hearing loss may or may not return.

##### 2. Interventions

- a. Tympanic membrane perforations usually heal within 24 hours.
- b. Surgical reconstruction of the ossicles and tympanic membrane through tympanoplasty or myringoplasty may be performed to improve hearing.

#### T. Cerumen and foreign bodies

##### 1. Description

- a. Cerumen, or wax, is the most common cause of impacted canals.
- b. Foreign bodies can include vegetables, beads, pencil erasers, insects, and other objects.

##### 2. Assessment

- a. Sensation of fullness in the ear with or without hearing loss
- b. Pain, itching, or bleeding

3. Cerumen
  - a. Removal of wax by irrigation is a slow process.
  - b. Irrigation is contraindicated in clients with a history of tympanic membrane perforation or otitis media.
  - c. If prescribed to soften cerumen, glycerin or mineral oil is placed in the ear at bedtime; hydrogen peroxide may also be prescribed.
  - d. After several days, the ear is irrigated.
  - e. The maximum amount of solution that should be used for irrigation is 50 to 70 mL.

**!** Inform that client that ear candles should never be used to remove cerumen. Their use can cause burns and a vacuum effect, causing a perforation in the tympanic membrane.

4. Foreign bodies
  - a. With a foreign object of vegetable matter, irrigation is used with care because this material expands with hydration.
  - b. Insects are killed before removal, unless they can be coaxed out by flashlight or a humming noise; lidocaine may be placed in the ear to relieve pain.
  - c. Mineral oil or diluted alcohol is instilled to suffocate the insect, which then is removed using ear forceps.
  - d. Use a small ear forceps to remove the object and avoid pushing the object farther into the canal and damaging the tympanic membrane.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 768.** During the early postoperative period, the client who has had a cataract extraction complains of nausea and severe eye pain over the operative site. The initial nursing action is to:
1. Call the physician.
  2. Reassure the client that this is normal.
  3. Turn the client on his or her operative side.
  4. Administer the prescribed pain medication and antiemetic.
- 769.** The nurse is developing a teaching plan for the client with glaucoma. Which of the following instructions would the nurse include in the plan of care?
1. Avoid overuse of the eyes.
  2. Decrease the amount of salt in the diet.
  3. Eye medications will need to be administered for the client's entire life.
  4. Decrease fluid intake to control the intra-ocular pressure.
- 770.** The nurse is performing an admission assessment on a client with a diagnosis of detached retina. Which of the following is associated with this eye disorder?
1. Total loss of vision
  2. Pain in the affected eye
  3. A yellow discoloration of the sclera
  4. A sense of a curtain falling across the field of vision
- 771.** The nurse is performing an otoscopic examination on a client with mastoiditis. On examination of the tympanic membrane, which of the following would the nurse expect to observe?
1. A pink-colored tympanic membrane
  2. A pearly colored tympanic membrane
  3. A transparent and clear tympanic membrane
  4. A red, dull, thick, and immobile tympanic membrane
- 772.** The client is diagnosed with a disorder involving the inner ear. Which of the following is the most common client complaint associated with a disorder involving this part of the ear?
1. Pruritus
  2. Tinnitus
  3. Hearing loss
  4. Burning in the ear
- 773.** The nurse is performing an assessment on a client with a suspected diagnosis of cataract. The chief clinical manifestation that the nurse would expect to note in the early stages of cataract formation is:
1. Diplopia
  2. Eye pain
  3. Floating spots
  4. Blurred vision
- 774.** The client arrives in the emergency department following an automobile accident. The client's forehead hit the steering wheel and a hyphema is diagnosed. The nurse places the client in which position?
1. Flat on bedrest
  2. Semi-Fowler's on bedrest
  3. Lateral on the affected side
  4. Lateral on the unaffected side
- 775.** The client sustains a contusion of the eyeball following a traumatic injury with a blunt object. Which intervention is initiated immediately?
1. Notify the physician.
  2. Apply ice to the affected eye.
  3. Irrigate the eye with cool water.
  4. Accompany the client to the emergency department.

- 776.** The client arrives in the emergency department with a penetrating eye injury from wood chips that occurred while cutting wood. The nurse assesses the eye and notes a piece of wood protruding from the eye. What is the initial nursing action?
1. Apply an eye patch.
  2. Perform visual acuity tests.
  3. Irrigate the eye with sterile saline.
  4. Remove the piece of wood using a sterile eye clamp.
- 777.** The nurse is caring for a client following enucleation. The nurse notes the presence of bright red drainage on the dressing. Which nursing action is appropriate?
1. Notify the physician.
  2. Document the finding.
  3. Continue to monitor the drainage.
  4. Mark the drainage on the dressing and monitor for any increase in bleeding.
- 778.** A woman was working in her garden. She accidentally sprayed insecticide into her right eye. She calls the emergency department frantic and screaming for help. The nurse should instruct the woman to take which immediate action?
1. Call the physician.
  2. Irrigate the eyes with water.
  3. Come to the emergency room.
  4. Irrigate the eyes with diluted hydrogen peroxide.
- 779.** The nurse is caring for a hearing-impaired client. Which of the following approaches will facilitate communication?
1. Speak loudly.
  2. Speak frequently.
  3. Speak at a normal volume.
  4. Speak directly into the impaired ear.
- 780.** Tonometry is performed on the client with a suspected diagnosis of glaucoma. The nurse analyzes the test results as documented in the client's chart and understands that normal intraocular pressure is:
1. 2 to 7 mm Hg
  2. 10 to 21 mm Hg
  3. 22 to 30 mm Hg
  4. 31 to 35 mm Hg
- 781.** The nurse is caring for a client following craniotomy for removal of an acoustic neuroma. Assessment of which of the following cranial nerves would identify a complication specifically associated with this surgery?
1. Cranial nerve I, olfactory
  2. Cranial nerve IV, trochlear
  3. Cranial nerve III, oculomotor
  4. Cranial nerve VII, facial nerve
- 782.** The nurse notes that the physician has documented a diagnosis of presbycusis on the client's chart. The nurse plans care knowing that the condition is:
1. Tinnitus that occurs with aging
  2. Nystagmus that occurs with aging
  3. A conductive hearing loss that occurs with aging
  4. A sensorineural hearing loss that occurs with aging
- 783.** A client with Meniere's disease is experiencing severe vertigo. Which instruction should the nurse give to the client to assist in controlling the vertigo?
1. Increase sodium in the diet.
  2. Avoid sudden head movements.
  3. Lie still and watch the television.
  4. Increase fluid intake to 3000 mL a day.
- 784.** The clinic nurse is preparing to test the visual acuity of a client using a Snellen chart. Which of the following identifies the accurate procedure for this visual acuity test?
1. The right eye is tested, followed by the left eye, and then both eyes are tested.
  2. Both eyes are assessed together, followed by the assessment of the right and then the left eyes.
  3. The client is asked to stand at a distance of 40 feet from the chart and is asked to read the largest line on the chart.
  4. The client is asked to stand at a distance of 40 feet from the chart and to read the line that can be read 200 feet away by an individual with unimpaired vision.
- 785.** The client's vision is tested with a Snellen chart. The results of the tests are documented as 20/60. The nurse interprets this as:
1. The client is legally blind.
  2. The client's vision is normal.
  3. The client can read at a distance of 60 feet what a client with normal vision can read at 20 feet.
  4. The client can read only at a distance of 20 feet what a client with normal vision can read at 60 feet.

### Alternate Item Format: Multiple Response

**786.** The nurse is preparing a teaching plan for a client who is undergoing cataract extraction with intraocular implantation. Which home care measures will the nurse include in the plan? **Select all that apply.**

- 1. Avoid activities that require bending over.
- 2. Contact the surgeon if eye scratchiness occurs.

- 3. Place an eye shield on the surgical eye at bedtime.
- 4. Episodes of sudden severe pain in the eye are expected.
- 5. Contact the surgeon if a decrease in visual acuity occurs.
- 6. Take acetaminophen (Tylenol) for minor eye discomfort.

## ANSWERS

### 768. 1

**Rationale:** Severe pain or pain accompanied by nausea following a cataract extraction is an indicator of increased intraocular pressure and should be reported to the physician immediately. Options 2, 3, and 4 are inappropriate actions.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic word *severe*. Eliminate option 2 because this is not a normal condition. The client should not be turned to the operative side; therefore, eliminate option 3. From the remaining options, focusing on the strategic word will direct you to option 1. If you had difficulty with this question, review the postoperative complications of cataract surgery requiring physician notification.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Eye

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1706). St. Louis: Saunders.

### 769. 3

**Rationale:** The administration of eye drops is a critical component of the treatment plan for the client with glaucoma. The client needs to be instructed that medications will need to be taken for the rest of his or her life. Options 1, 2, and 4 are not accurate instructions.

**Test-Taking Strategy:** Use the process of elimination. Recalling that medications are an integral component of the treatment plan will assist in directing you to the correct option. Review the treatment associated with the care of the client with glaucoma if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Eye

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1702). St. Louis: Saunders.

### 770. 4

**Rationale:** A characteristic manifestation of retinal detachment described by the client is the feeling that a shadow or curtain is falling across the field of vision. No pain is associated with detachment of the retina. Options 1 and 3 are not characteristics of this disorder. A retinal detachment is

an ophthalmic emergency and even more so if visual acuity is still normal.

**Test-Taking Strategy:** Use the process of elimination, focusing on the diagnosis. Thinking about the pathophysiology associated with this disorder will direct you to option 4. Review the manifestations associated with this condition if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Eye

**Reference:** Copstead, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 1098). St. Louis: Mosby.

### 771. 4

**Rationale:** Otoscope examination in a client with mastoiditis reveals a red, dull, thick, and immobile tympanic membrane, with or without perforation. Postauricular lymph nodes are tender and enlarged. Clients also have a low-grade fever, malaise, anorexia, swelling behind the ear, and pain with minimal movement of the head.

**Test-Taking Strategy:** Knowledge regarding the pathophysiology associated with mastoiditis is required to answer this question. Remember that mastoiditis reveals a red, dull, thick, and immobile tympanic membrane. If you had difficulty with this question, review the assessment findings associated with this disorder.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Ear

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1125). St. Louis: Saunders.

### 772. 2

**Rationale:** Tinnitus is the most common complaint of clients with otological disorders, especially disorders involving the inner ear. Symptoms of tinnitus range from mild ringing in the ear, which can go unnoticed during the day, to a loud roaring in the ear, which can interfere with the client's thinking process and attention span. Options 1, 3, and 4 are not associated specifically with disorders of the inner ear.

**Test-Taking Strategy:** Use the process of elimination. Recalling the function of the inner ear will direct you to option 2. Review the manifestations associated with an inner ear disorder if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Ear

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1126). St. Louis: Saunders.

### 773. 4

**Rationale:** A gradual, painless blurring of central vision is the chief clinical manifestation of a cataract. Early symptoms include slightly blurred vision and a decrease in color perception. Options 1, 2, and 3 are not signs of a cataract.

**Test-Taking Strategy:** Use the process of elimination. Remember the pathophysiology related to cataract development. As a cataract develops, the lens of the eye becomes opaque. This description will assist in directing you to the correct option. If you had difficulty with this question, review the assessment signs associated with cataract development.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Eye

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1704). St. Louis: Saunders.

### 774. 2

**Rationale:** A hyphema is the presence of blood in the anterior chamber. Hyphema is produced when a force is sufficient to break the integrity of the blood vessels in the eye and can be caused by direct injury, such as a penetrating injury from a BB or pellet, or indirectly, such as from striking the forehead on a steering wheel during an accident. The client is treated by bed-rest in a semi-Fowler's position to assist gravity in keeping the hyphema away from the optical center of the cornea.

**Test-Taking Strategy:** Use the process of elimination to answer this question. Remember that placing the client flat will produce an increase in pressure at the injured site. Also, note that option 2 is the option that identifies a position different from the other options. Review care of the client with hyphema if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Eye

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1103). St. Louis: Saunders.

### 775. 2

**Rationale:** Treatment for a contusion begins at the time of injury. Ice is applied immediately. The client then should be seen by a physician and receive a thorough eye examination to rule out the presence of other eye injuries.

**Test-Taking Strategy:** Note the type of injury sustained. Focus on the strategic word *immediately*. Recalling the principles related to initial treatment of injuries will direct you to option 2. Review emergency treatment of eye injuries if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Eye

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1103). St. Louis: Saunders.

### 776. 2

**Rationale:** If the eye injury is the result of a penetrating object, the object may be noted protruding from the eye. This object must never be removed except by the ophthalmologist because it may be holding ocular structures in place. Application of an eye patch or irrigation of the eye may disrupt the foreign body and cause further tearing of the cornea.

**Test-Taking Strategy:** Use the process of elimination to answer this question. Note the strategic word *penetrating*. This should indicate that a laceration has occurred and that interventions are directed at preventing further disruption of the integrity of the eye. The only option that will prevent further disruption is to assess visual acuity. Review emergency eye care if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Eye

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1103–1104). St. Louis: Saunders.

### 777. 1

**Rationale:** If the nurse notes the presence of bright red drainage on the dressing, it must be reported to the physician, because this indicates hemorrhage. Options 2, 3, and 4 are inappropriate.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *bright red*. Remember that bright red drainage indicates active bleeding. Review postoperative complications associated with an enucleation if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Eye

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1714). St. Louis: Saunders.

### 778. 2

**Rationale:** In this type of accident, the client is instructed to irrigate the eyes immediately with running water for at least 20 minutes, or until the emergency medical service personnel arrive. In the emergency department, the cleansing agent of choice is usually normal saline. Calling the physician and going to the emergency department delays necessary intervention. Hydrogen peroxide is never placed in the eyes.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *immediate*. Focus on the type of injury and eliminate options 1 and 3 because they delay necessary intervention. Next, eliminate option 4 because hydrogen peroxide is never placed in the eyes. Review immediate interventions for a chemical eye injury if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity.

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Eye

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills and techniques* (7th ed., p. 496). St. Louis: Mosby.

### 779. 3

**Rationale:** Speaking in a normal tone to the client with impaired hearing and not shouting are important. The nurse should talk directly to the client while facing the client and speak clearly. If the client does not seem to understand what is said, the nurse should express it differently. Moving closer to the client and toward the better ear may facilitate communication, but the nurse should avoid talking directly into the impaired ear.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding effective communication techniques for the hearing impaired to answer this question. Remember that it is important to speak in a normal tone. If you had difficulty with this question, review these techniques.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Adult Health—Ear

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1135). St. Louis: Saunders.

### 780. 2

**Rationale:** Tonometry is the method of measuring intraocular fluid pressure using a calibrated instrument that indents or flattens the corneal apex. Pressures between 10 and 21 mm Hg are considered within the normal range.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding normal intraocular pressure to answer this question. Remember that normal intraocular pressure is between 10 and 21 mm Hg. If you had difficulty with this question, learn this normal value.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Eye

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1080). St. Louis: Saunders.

### 781. 4

**Rationale:** Treatment for acoustic neuroma is surgical removal via a craniotomy. Extreme care is taken to preserve remaining hearing and preserve the function of the facial nerve. Acoustic neuromas rarely recur following surgical removal.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the anatomical location of an acoustic neuroma to direct you to option 4. If you had difficulty with this question, review the complications associated with this surgical procedure.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Ear

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1129). St. Louis: Saunders.

### 782. 4

**Rationale:** Presbycusis is a type of hearing loss that occurs with aging. Presbycusis is a gradual sensorineural loss caused by nerve degeneration in the inner ear or auditory nerve. Options 1, 2, and 3 are incorrect.

**Test-Taking Strategy:** Knowledge regarding the description of presbycusis is required to answer this question. Remember that presbycusis is a gradual sensorineural loss. If you are unfamiliar with this condition, review this age-related disorder.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Ear

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1130). St. Louis: Saunders.

### 783. 2

**Rationale:** The nurse instructs the client to make slow head movements to prevent worsening of the vertigo. Dietary changes such as salt and fluid restrictions that reduce the amount of endolymphatic fluid are sometimes prescribed. Lying still and watching television will not control vertigo.

**Test-Taking Strategy:** Use the process of elimination. Identify the subject, vertigo. Note the relationship between vertigo and avoiding sudden head movements in the correct option. If you had difficulty with this question, review the measures that will reduce vertigo in the client with Meniere's disease.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Ear

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1126–1127). St. Louis: Saunders.

### 784. 1

**Rationale:** Visual acuity is assessed in one eye at a time, and then in both eyes together, with the client comfortably standing or sitting. The right eye is tested with the left eye covered; then the left eye is tested with the right eye covered. Both eyes are then tested together. Visual acuity is measured with or without corrective lenses and the client stands at a distance of 20 feet from the chart.

**Test-Taking Strategy:** Use the process of elimination. Remember that normal visual acuity as measured by a Snellen chart is 20/20 vision. This should assist in eliminating options 3 and 4. From the remaining options, remember that it is best to test each eye separately and then test both eyes together. This method assesses visual acuity most accurately. Review the procedure for testing visual acuity with a Snellen chart if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Health Assessment/Physical Exam

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1077–1078). St. Louis: Saunders.

Jarvis, C. (2008). *Physical examination and health assessment* (5th ed, p. 308). St. Louis: Saunders.

**785. 4**

**Rationale:** Vision that is 20/20 is normal—that is, the client is able to read from 20 feet what a person with normal vision can read from 20 feet. A client with a visual acuity of 20/60 can only read at a distance of 20 feet what a person with normal vision can read at 60 feet.

**Test-Taking Strategy:** Use the process of elimination. Focus on the test result, 20/60, to direct you to option 4. If you had difficulty with this question, review interpretation of visual acuity test results.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Eye

**Reference:** Jarvis, C. (2008). *Physical examination and health assessment* (5th ed, p. 309). St. Louis: Saunders.

**ALTERNATE ITEM FORMAT:  
MULTIPLE RESPONSE****786. 1, 3, 5, 6**

**Rationale:** Following eye surgery, some scratchiness and mild eye discomfort may occur in the operative eye and

usually is relieved by mild analgesics. If the eye pain becomes severe, the client should notify the surgeon because this may indicate hemorrhage, infection, or increased intraocular pressure. The nurse also would instruct the client to notify the surgeon of increased purulent drainage, increased redness, or any decrease in visual acuity. The client is instructed to place an eye shield over the operative eye at bedtime to protect the eye from injury during sleep and to avoid activities that increase intraocular pressure, such as bending over.

**Test-Taking Strategy:** Note that the client has had eye surgery. Recalling that the eye needs to be protected and that increased intraocular pressure is a concern will assist in determining the home care measures to be included in the plan. Review these measures if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Eye

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1706). St. Louis: Saunders.

# Ophthalmic and Otic Medications

## I. OPHTHALMIC MEDICATION ADMINISTRATION

### A. Guidelines for the use of eye medications

1. Eye medications are usually in the form of drops or ointments.
2. To prevent overflow of medication into the nasal and pharyngeal passages, thus reducing systemic absorption, instruct the client to apply pressure over the inner canthus next to the nose for 30 to 60 seconds following administration of the medication; instruct the client to close the eye gently to help distribute the medication.
3. If both an eye drop and eye ointment are scheduled to be administered at the same time, administer the eye drop first.
4. Wash hands and don gloves before administering eye medications to avoid contaminating the eye or medication dropper or applicator.
5. Use a separate bottle or tube of medication for each client to avoid accidental cross-contamination.
6. Place the prescribed dose of eye medication in the lower conjunctival sac, never directly onto the cornea.
7. Avoid touching any part of the eye with the dropper or applicator.
8. Administer glucocorticoid preparations before other medications.
9. Monitor the pulse of the client receiving an ophthalmic  $\beta$ -blocker, and instruct the client to do the same; if the pulse is less than 50 to 60 beats/min (adult), withhold the next dose of eye medication and notify the physician.
10. Instruct the client how to instill medication correctly and supervise instillation until the client can do it safely.
11. Instruct the client to read the medication labels carefully to ensure administration of the correct medication and correct strength.
12. Remind the client to keep these medications out of the reach of children.
13. Instruct the client to avoid driving or operating hazardous equipment if vision is blurred.
14. Inform the client that he or she may be unable to drive home after eye examinations when a medication to dilate the pupil (**mydriatic**) or to paralyze the ciliary muscle (cycloplegic) is used.
15. If photophobia occurs, instruct the client to wear sunglasses and avoid bright lights.
16. Instruct the client to administer a missed dose of the eye medication as soon as it is remembered, unless the next dose is scheduled to be administered in 1 to 2 hours.
17. Inform the client with **glaucoma** that the disorder cannot be cured, only controlled.
18. Reinforce the importance of using medications to treat **glaucoma** as prescribed and not to discontinue these medications without consulting the physician.
19. Inform the client that medications used to treat **glaucoma** may cause pain and blurred vision, especially when therapy is begun.
20. Instruct the client to report the development of any eye irritation.
21. Inform the client using eye gel to store the gel at room temperature or in the refrigerator, but not to freeze it.
22. Instruct the client to discard unused eye gel kept at room temperature as recommended by the physician and/or the pharmacist.
23. Inform the client that soft contact lenses may absorb certain eye medications and that preservatives in eye medications may discolor the contact lenses.
24. Advise the client wearing contact lenses to question the physician carefully about special precautions to observe with eye medications.
25. Inform the parents of infants that atropine sulfate eye drops may contribute to abdominal distention.
26. Instruct the parents to keep a record of the infant's bowel movements if atropine sulfate eye drops are being administered.
27. Auscultate bowel sounds of the infant or child receiving atropine sulfate eye drops.

**!** Because the timing of medication administration is critical, administer eye medications at frequent, precise intervals; separate the instillation by 3 to 5 minutes if two medications must be administered at the same time.

## B. Instillation of eye medications

### 1. Drops

- a. Wash hands.
- b. Put gloves on.
- c. Check the name, strength, and expiration date of the medication.
- d. Instruct the client to tilt the head backward, open the eyes, and look up.
- e. Pull the lower lid down against the cheekbone.
- f. Hold the bottle like a pencil, with the tip downward.
- g. Holding the bottle, gently rest the wrist of the hand on the client's cheek.
- h. Squeeze the bottle gently to allow the drop to fall into the conjunctival sac.
- i. Instruct the client to close the eyes gently and not to squeeze the eyes shut.
- j. Wait 3 to 5 minutes before instilling another drop, if more than one drop is prescribed, to promote maximal absorption of the medication.
- k. Do not allow the medication bottle, dropper, or applicator to come into contact with the eyelid or conjunctival sac.
- l. To prevent systemic absorption of the medication, apply gentle pressure with a clean tissue to the client's nasolacrimal duct for 30 to 60 seconds.

### 2. Ointments

- a. Instruct the client to lie down or tilt head backward and look up.
- b. Hold the ointment tube near, but not touching, the eye or eyelashes.
- c. Squeeze a thin ribbon of ointment along the lining of the lower conjunctival sac, from the inner to the outer canthus.
- d. Instruct the client to close the eyes gently, rolling the eyeball in all directions (increases contact area of medication to eye).
- e. Instruct the client that vision may be blurred by the ointment.
- f. If possible, apply ointment just before bedtime.

## II. MYDRIATIC-CYCLOPLEGIC AND ANTICHOLINERGIC MEDICATIONS (Box 65-1)

### A. Description (Fig. 65-1)

1. **Mydriatics** and cycloplegics dilate the pupils (**mydriasis**) and relax the ciliary muscles (**cycloplegia**).
2. Anticholinergics block responses of the sphincter muscle in the ciliary body, producing **mydriasis** and **cycloplegia**.

3. These medications are used preoperatively or for eye examinations to produce **mydriasis**.

4. **Mydriatics** are contraindicated in cardiac dysrhythmias and cerebral atherosclerosis and should be used with caution in the older client and in clients with prostatic hypertrophy, diabetes mellitus, or parkinsonism.

### B. Side effects

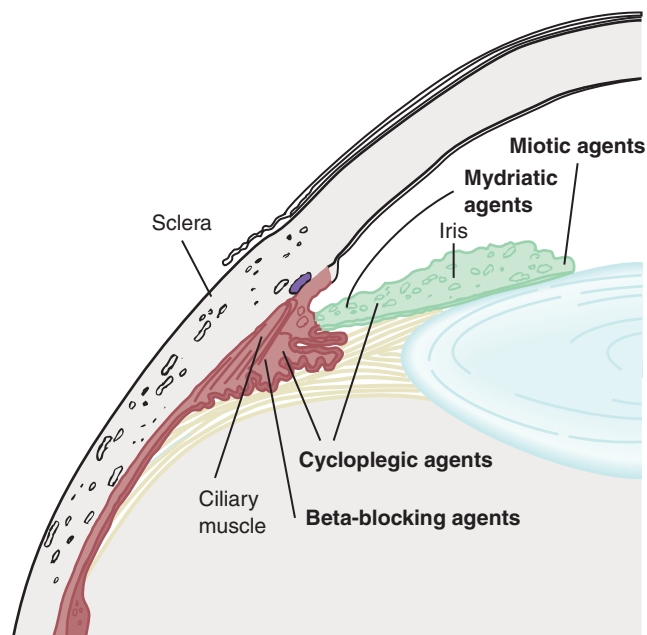

1. Tachycardia
2. Photophobia
3. Conjunctivitis
4. Dermatitis
5. Elevated blood pressure

### C. Atropine toxicity

1. Dry mouth
2. Blurred vision
3. Photophobia
4. Tachycardia
5. Fever
6. Urinary retention
7. Constipation
8. Headache, brow pain

### Box 65-1 Mydriatic and Cycloplegic Medications

Atropine (Isopto Atropine)  
 Cyclopentolate (AK-Pentolate, Cyclogyl, Pentolair)  
 Homatropine (Isopto Homatropine)  
 Scopolamine (Isopto Hyoscine)  
 Tropicamide (Mydriacyl, Tropicacyl, Opticyl)

**▲ FIGURE 65-1** Sites of action of mydriatic,  $\beta$ -blocking, cycloplegic, and miotic agents. (From Black, J., & Hawks, J., [2009]. *Medical-surgical nursing: Clinical management for positive outcomes* [8th ed.]. St. Louis: Saunders.)

9. Confusion
10. Hallucinations, delirium
11. Coma
12. Worsening of **glaucoma**

**D.** Systemic reactions of anticholinergics

1. Dry mouth and skin
2. Fever
3. Thirst
4. Confusion
5. Hyperactivity

**E.** Interventions

1. Monitor for allergic response.
2. Assess for risk of injury.
3. Assess for constipation and urinary retention.
4. Instruct the client that a burning sensation may occur on instillation.
5. Instruct the client not to drive or perform hazardous activities for 24 hours after instillation of the medication unless otherwise directed by the physician.
6. Instruct the client to wear sunglasses until the effects of the medication wear off.
7. Instruct the client to notify the physician if blurring of vision, loss of sight, difficulty breathing, sweating, or flushing occurs.
8. Instruct the client to report eye pain to the physician.

 **Mydriatics are contraindicated in clients with glaucoma because of the risk of increased intraocular pressure.**

**III. ANTI-INFECTIVE EYE MEDICATIONS** (Box 65-2)

**A.** Description: Anti-infective medications kill or inhibit the growth of bacteria, fungi, and viruses.

- B.** Side effects
1. Superinfection
  2. Global irritation

**Box 65-2 Anti-Infective Eye Medications**

**Antibacterial**

Chloramphenicol (Chloromycetin powder)  
Erythromycin (Ilotycin)

**Aminoglycosides**

Gentamicin sulfate (Garamycin, Genoptic)  
Tobramycin (Tobrex)

**Antifungal**

Natamycin (Natacyn)

**Antiviral**

Idoxuridine  
Trifluridine (Viroptic)  
Vidarabine (Vira-A)

**Sulfonamide**

Sulfacetamide (Bleph-10, Sodium Sulamyd)

**C.** Interventions

1. Assess for risk of injury.
2. Instruct the client how to apply the eye medication; remind the client to clean exudates from the eyes before administering the medication.
3. Reinforce the importance of completing the prescribed medication regimen.
4. Instruct the client to wash the hands thoroughly and frequently.
5. Advise the client that if improvement does not occur to notify the physician.

**IV. ANTI-INFLAMMATORY EYE MEDICATIONS**  
(Box 65-3)

**A.** Description

1. Anti-inflammatory medications control inflammation, thereby reducing vision loss and scarring.
2. Anti-inflammatory medications are used for uveitis, allergic conditions, and inflammation of the conjunctiva, cornea, and lids.

**B.** Side effects

1. Cataracts
2. Increased intraocular pressure
3. Impaired healing
4. Masking signs and symptoms of infection

**C.** Interventions

1. Interventions are the same as for anti-infective medications.
2. Note that dexamethasone (Maxidex) should not be used for eye abrasions and wounds.

**Box 65-3 Anti-Inflammatory Eye Medications**

**Antiallergic Agents**

Cromolyn sodium (Crolom, Opticrom)  
Lodoxamide (Alomide)  
Nedocromil sodium (Alocril)  
Pemirolast potassium (Alamast)

**Corticosteroids**

Dexamethasone (Maxidex)  
Fluorometholone; sulfacetamide (FML-S eye drop suspension)  
Loteprednol etabonate (Alrex, Lotemax)  
Prednisolone, gentamicin (Pred-G, Pred Forte)

**Nonsteroidal Anti-Inflammatory Agents**

Cyclosporine (Restasis)  
Diclofenac (Voltaren)  
Flurbiprofen sodium (Ocufen)  
Ketorolac tromethamine (Acular)

**Mast Cell Stabilizers–H<sub>1</sub> Blockers**

Azelastine hydrochloride (Optivar)  
Epinastine (Elestat)  
Ketotifen fumarate (Zaditor, Alaway)  
Olopatadine hydrochloride (Patanol)

**H<sub>1</sub> Receptor Blocker**

Emedastine difumarate (Emadine)

## V. TOPICAL EYE ANESTHETICS

### A. Description

1. Topical anesthetics produce corneal anesthesia.
2. Topical anesthetics are used for anesthesia for eye examinations and surgery or to remove foreign bodies from the eye.
3. Do not use the solution if it is discolored, and store the bottle tightly closed.
4. Medication: Proparacaine hydrochloride (Ophthetic)

### B. Side effects

1. Temporary stinging or burning of the eye
2. Temporary loss of corneal reflex

### C. Interventions

1. Assess for risk of injury.
2. Note that the medications should not be given to the client for home use and are not to be self-administered by the client.
3. Instruct the client not to rub or touch the eye while it is anesthetized.
4. Note that the blink reflex is lost temporarily and that the corneal epithelium needs to be protected.
5. Provide an eye patch to protect the eye from injury until the corneal reflex returns.

## VI. EYE LUBRICANTS (Box 65-4)

### A. Description

1. Eye lubricants replace tears or add moisture to the eyes.
2. Eye lubricants moisten contact lenses or an artificial eye and protect the eyes during surgery or diagnostic procedures.
3. Eye lubricants are used for keratitis, during anesthesia, or for a disorder that results in unconsciousness or decreased blinking.

### B. Side effects

1. Burning on instillation
2. Discomfort or pain on instillation

### C. Interventions

1. Inform the client that burning may occur on instillation.
2. Be alert to allergic responses to the preservatives in the lubricants.

## VII. MEDICATIONS TO TREAT GLAUCOMA

(Box 65-5; see Fig. 65-1)

### A. Description

1. These medications reduce intraocular pressure by constricting the pupil and contracting the

ciliary muscle, thereby increasing the blood flow to the retina and decreasing retinal damage and loss of vision.

2. These medications open the anterior chamber angle and increase the outflow of aqueous humor.
3. Some may be used to achieve **miosis** during eye surgery.
4. Contraindicated in clients with **retinal detachment**, adhesions between the iris and lens, or inflammatory diseases.
5. Use with caution in clients with asthma, hypertension, corneal abrasion, hyperthyroidism, coronary vascular disease, urinary tract obstruction, gastrointestinal obstruction, ulcer disease, parkinsonism, and bradycardia.

### B. Side effects

1. **Myopia**
2. Headache
3. Eye pain
4. Decreased vision in poor light
5. Local irritation
6. Systemic effects
  - a. Flushing
  - b. Diaphoresis
  - c. Gastrointestinal upset and diarrhea

### Box 65-5 Medications to Treat Glaucoma

#### Miotics

Echothiophate  
Pilocarpine hydrochloride (Isopto Carpine)

#### β-Adrenergic Blocking Eye Medications

Betaxolol hydrochloride (Betoptic)  
Carteolol hydrochloride (Ocupress)  
Levobetaxolol (Betaxon)  
Levobunolol hydrochloride (Betagan Liquifilm)  
Metipranolol (OptiPranolol)  
Timolol maleate (Timoptic)

#### α-Adrenergic Agonists

Apraclonidine (Iopidine)  
Brimonidine (Alphagan P)

#### Prostaglandin Analogues

Latanoprost (Xalatan)  
Travoprost (Travatan)  
Bimatoprost (Lumigan)

#### Cholinergic Agonists

Pilocarpine hydrochloride (Isopto Carpine, others)  
Echothiophate iodide (Phospholine Iodide)

#### Carbonic Anhydrase Inhibitors

Dorzolamide (Trusopt)  
Brinzolamide (Azopt)

#### Nonselective Adrenergic Agonist

Dipivefrin (Propine)

### Box 65-4 Eye Lubricants

Hydroxypropyl methylcellulose (Lacril, Isopto Plain)  
Petroleum-based ointment (Artificial Tears)  
Polyvinyl alcohol (Liquifilm Tears)

- d. Frequent urination
  - e. Increased salivation
  - f. Muscle weakness
  - g. Respiratory difficulty
7. Toxicity
- a. Vertigo and syncope
  - b. Bradycardia
  - c. Hypotension
  - d. Cardiac dysrhythmias
  - e. Tremors
  - f. Seizures

### C. Interventions

1. Assess vital signs.
2. Assess for risk of injury.
3. Assess the client for the degree of diminished vision.
4. Monitor for side effects and toxic effects.
5. Monitor for postural hypotension, and instruct the client to change positions slowly.
6. Assess breath sounds for wheezes and rhonchi because cholinergic medications can cause bronchospasms and increased bronchial secretions.
7. Maintain oral hygiene because of the increase in salivation.
8. Have atropine sulfate available as an antidote for pilocarpine.
9. Instruct the client or family regarding the correct administration of eye medications.
10. Instruct the client not to stop the medication suddenly.
11. Instruct the client to avoid activities such as driving while vision is impaired.

 **Instruct the client with glaucoma to read labels on over-the-counter medications and to avoid atropine-like medications because atropine will increase intraocular pressure.**

## VIII. $\beta$ -ADRENERGIC BLOCKER EYE MEDICATIONS (Box 65-5)

### A. Description (see Fig. 65-1)

1. These medications reduce intraocular pressure by decreasing sympathetic impulses and decreasing aqueous humor production without affecting **accommodation** or pupil size.
2. These medications are used to treat **glaucoma**.
3. These medications are contraindicated in the client with asthma or chronic obstructive pulmonary disease because systemic absorption can cause increased airway resistance.
4. Use these medications with caution in the client receiving oral  $\beta$ -blockers.

### B. Side effects

1. Ocular irritation
2. Visual disturbances
3. Bradycardia

4. Hypotension
5. Bronchospasm

### C. Interventions

1. Monitor vital signs, especially blood pressure and pulse, before administering medication.
2. If the pulse is 60 beats/min or less or if the systolic blood pressure is less than 90 mm Hg, withhold the medication and contact the physician.
3. Monitor for shortness of breath.
4. Assess for risk of injury.
5. Monitor intake and output.
6. Instruct the client to notify the physician if shortness of breath occurs.
7. Instruct the client not to discontinue the medication abruptly.
8. Instruct the client to change positions slowly because of the potential for orthostatic hypotension.
9. Instruct the client to avoid hazardous activities.
10. Instruct the client to avoid over-the-counter medications without the physician's approval.
11. Instruct clients with diabetes mellitus using  $\beta$ -adrenergic blockers to monitor blood glucose levels frequently.

## IX. CARBONIC ANHYDRASE INHIBITORS

(see Box 65-5)

### A. Description

1. Carbonic anhydrase inhibitors interfere with the production of carbonic acid, which leads to decreased aqueous humor formation and decreased intraocular pressure.
2. These medications are used for the long-term treatment of **glaucoma**.
3. These medications are contraindicated in the client allergic to sulfonamides.
4. Use with caution for clients with severe renal or liver disease.

### B. Side effects

1. Appetite loss
2. Gastrointestinal upset
3. Paresthesias in the fingers, toes, and face
4. Polyuria
5. Hypokalemia
6. Renal calculi
7. Photosensitivity
8. Lethargy and drowsiness
9. Depression

### C. Interventions

1. Monitor vital signs.
2. Assess visual acuity.
3. Assess for risk of injury.
4. Monitor intake and output.
5. Monitor weight.
6. Maintain oral hygiene.
7. Monitor for side effects such as lethargy, anorexia, drowsiness, polyuria, nausea, and vomiting.

8. Monitor electrolyte levels for hypokalemia.
9. Increase fluid intake unless contraindicated.
10. Advise the client to avoid prolonged exposure to sunlight.
11. Encourage the use of artificial tears for dry eyes.
12. Instruct the client not to discontinue the medication abruptly.
13. Instruct the client to avoid hazardous activities while vision is impaired.
14. Teach the client not to wear contact lenses during or within 15 minutes of instilling these medications.

## X. OCUSERT SYSTEM

### A. Description

1. A thin eye wafer (disk) is impregnated with a time-release dose of pilocarpine (Ocuser Pilo-20, Ocuser Pilo-40).
2. The Ocuser system was devised to overcome the need for frequent instillation of pilocarpine.
3. It is placed in the upper or lower cul-de-sac of the eye.
4. The pilocarpine is released over 1 week.
5. The disk is replaced every 7 days.
6. Drawbacks of its use include sudden leakage of pilocarpine, migration of the system over the cornea, and unnoticed loss of the system.

### B. Interventions

1. Assess the client's ability to insert the medication disk.
2. Store the medication in the refrigerator.
3. Instruct the client to discard damaged or contaminated disks.
4. Inform the client that temporary stinging is expected but to notify the physician if blurred vision or brow pain occurs.
5. Instruct the client to check for the presence of the disk in the conjunctival sac daily at bedtime and on arising.
6. Because vision may change in the first few hours after the eye system is inserted, instruct the client to replace the disk at bedtime.

## XI. OSMOTIC MEDICATIONS (Box 65-6)

### A. Description

1. Osmotic medications lower intraocular pressure.
2. Osmotic medications are used in emergency treatment of **glaucoma**.

3. Osmotic medications are used preoperatively and postoperatively to decrease vitreous humor volume.

### B. Side effects

1. Headache
2. Nausea, vomiting, diarrhea, dehydration
3. Disorientation
4. Electrolyte imbalances

### C. Interventions

1. Assess vital signs.
2. Assess visual acuity.
3. Assess for risk of injury.
4. Monitor intake and output.
5. Monitor weight.
6. Monitor for electrolyte imbalances.
7. Increase fluid intake unless contraindicated.
8. Monitor for changes in level of orientation.

## XII. MEDICATIONS TO TREAT MACULAR DEGENERATION (Box 65-7)

### A. Description

1. Age-related macular degeneration (ARMD) can be dry ARMD (atrophic ARMD) or wet ARMD (neovascular)
2. Dry is more common; macular photoreceptors undergo gradual breakdown, leading to gradual blurring of central vision.
3. Wet progresses faster and macular degeneration is caused by the growth of new subretinal blood vessels, which leads to fluid leakage that lifts the macula and causes permanent injury.
4. Characterized by the presence of drusen (yellow deposits under the retina).

### B. Side effects

1. Endophthalmitis (eye inflammation caused by bacterial, viral, or fungal infection)
2. Blurred vision
3. Cataracts
4. Corneal edema
5. Eye discomfort and discharge
6. Conjunctival hemorrhage
7. Increased intraocular pressure
8. Reduced visual acuity

### C. Interventions

1. Teach the client about administration of the medications.
2. Teach the client about the side effects and the need to notify the physician.

### Box 65-6 Osmotic Medications for the Eye

Glycerin (Osmoglyn)  
Mannitol (Osmitol)

### Box 65-7 Medications to Treat Macular Degeneration

Pegaptanib (Macugen)      Bevacizumab (Avastin)  
Ranibizumab (Lucentis)

**XIII. OTIC MEDICATION ADMINISTRATION** (Box 65-8)

- A.** Instillation of eardrops
1. In an adult, pull the pinna up and back to straighten the external canal to instill eardrops.
  2. Tilt the client's head in the opposite direction of the affected ear and apply the drops into the ear.
  3. With the head tilted, gently move the head back and forth five times.
  4. Pull the pinna down and back for infants and children younger than 3 years, up and back for older children.

- B.** Irrigation of the ear
1. Irrigation of the ear needs to be prescribed by the physician.
  2. Ensure direct visualization of the tympanic membrane.
  3. Warm the irrigating solution to 98° F because a solution temperature that is not close to the client's body temperature will cause ear injury, nausea, and vertigo.
  4. Irrigation must be done gently to avoid damage to the eardrum.
  5. When irrigating, do not direct irrigation solution directly toward the eardrum.

 **If a perforation of the eardrum is suspected, do not perform an ear irrigation.**

**XIV. ANTI-INFECTIVE EAR MEDICATIONS** (Box 65-9)

- A.** Description
1. Anti-infective medications kill or inhibit the growth of bacteria and are used for otitis media or otitis externa.
  2. Anti-infective medications are contraindicated if a prior hypersensitivity exists.

**Box 65-8 Medications That Affect Hearing****Antibiotics**

Amikacin (Amikin)  
Chloramphenicol  
Erythromycin (ERYC, Ery-Tab, PCE Dispertab, Ilotycin)  
Gentamicin (Garamycin)  
Streptomycin sulfate  
Tobramycin sulfate (Nebcin)  
Vancomycin (Vancocin)

**Diuretics**

Ethacrynic acid (Edecrin)  
Furosemide (Lasix)

**Others**

Cisplatin (Platinol)  
Nitrogen mustard  
Quinine  
Quinidine

- B.** Side effects: Overgrowth of nonsusceptible organisms
- C.** Interventions
1. Monitor vital signs.
  2. Assess for allergies.
  3. Assess for pain.
  4. Monitor for nephrotoxicity.
  5. Instruct the client to report dizziness, fatigue, fever, or sore throat, which may indicate a superimposed infection.
  6. Instruct the client to complete the entire course of the medication.
  7. Instruct the client to keep ear canals dry.

**XV. ANTIHISTAMINES AND DECONGESTANTS** (Box 65-10)

- A.** Description
1. These medications produce vasoconstriction.
  2. These medications stimulate the receptors of the respiratory mucosa.
  3. These medications reduce respiratory tissue hyperemia and edema to open obstructed eustachian tubes.
  4. These medications are used for acute otitis media.
- B.** Side effects
1. Drowsiness
  2. Blurred vision
  3. Dry mucous membranes
- C.** Interventions
1. Inform the client that drowsiness, blurred vision, and a dry mouth may occur.
  2. Instruct the client to increase fluid intake unless contraindicated and to suck on hard candy to alleviate the dry mouth.

**Box 65-9 Anti-Infective Ear Medications**

Acetic acid; aluminum acetate (Domeboro Otic)  
Amoxicillin (Amoxil)  
Ampicillin (Principen)  
Cefaclor (Ceclor)  
Chloramphenicol  
Clarithromycin (Biaxin)  
Clindamycin hydrochloride (Cleocin)  
Erythromycin (Ilotycin)  
Gentamicin sulfate otic solution (Garamycin)  
Penicillin V potassium (Veetids)  
Trimethoprim; sulfamethoxazole (Bactrim, Cotrim)

**Box 65-10 Antihistamines and Decongestants**

Cetirizine (Zyrtec)  
Chlorpheniramine (Chlor-Trimeton)  
Naphazoline hydrochloride (Allerest)

**Box 65-11 Ceruminolytic Medications**

Boric acid (Ear-Dry)  
 Carbamide peroxide (Debrox)  
 Trolamine polypeptide oleate-condensate (Cerumenex)

3. Instruct the client to avoid hazardous activities if drowsiness occurs.

**XVI. LOCAL ANESTHETICS****A. Description**

- Local anesthetics block nerve conduction at or near the application site to control pain.
- Local anesthetics are used for pain associated with ear infections.

**B. Medication: Benzocaine-antipyrine-phenylephrine (Tympagesic)****C. Side effects**

- Allergic reaction
- Irritation

**D. Interventions**

- Monitor for effectiveness if used for pain relief.
- Assess for irritation or allergic reaction.

**XVII. CERUMINOLYTIC MEDICATIONS**

(Box 65-11)

**A. Description**

- Ceruminolytic medications emulsify and loosen cerumen deposits.
- Ceruminolytic medications are used to loosen and remove impacted wax from the ear canal.

**B. Side effects**

- Irritation
- Redness or swelling of the ear canal

**C. Interventions**

- Instruct the client not to use drops more often than prescribed.
- Moisten a cotton plug with medication before insertion.
- Keep the container tightly closed and away from moisture.
- Avoid touching the ear with the dropper.
- Thirty minutes after instillation, gently irrigate the ear as prescribed with warm water, using a soft rubber bulb ear syringe.
- Irrigation may be done with hydrogen peroxide solution as prescribed to flush cerumen deposits out of the ear canal.
- For a chronic cerumen impaction, one or two drops of mineral oil (if prescribed) will soften the wax.
- Instruct the client to notify the physician if redness, pain, or swelling persists.

**MORE QUESTIONS ON THE CD!****Practice Questions**

- 787.** Betaxolol hydrochloride (Betoptic) eye drops have been prescribed for the client with glaucoma. Which of the following nursing actions is most appropriate related to monitoring for the side effects of this medication?
- Monitoring temperature
  - Monitoring blood pressure
  - Assessing peripheral pulses
  - Assessing blood glucose level
- 788.** The nurse prepares the client for an ear irrigation as prescribed by the physician. In performing the procedure, the nurse
- Warms the irrigating solution to 98° F
  - Positions the client with the affected side up following the irrigation
  - Directs a slow steady stream of irrigation solution toward the eardrum
  - Assists the client to turn his or her head so that the ear to be irrigated is facing upward
- 789.** In preparation for cataract surgery, the nurse is to administer cyclopentolate (Cyclogyl) eye drops. The nurse administers the eye drops, knowing that the purpose of this medication is to:
- Produce miosis of the operative eye.
  - Dilate the pupil of the operative eye.
  - Provide lubrication to the operative eye.
  - Constrict the pupil of the operative eye.
- 790.** The nurse is providing instructions to a client who will be self-administering eye drops. To minimize the systemic effects that eye drops can produce, the nurse instructs the client to:
- Eat before instilling the drops.
  - Swallow several times after instilling the drops.
  - Blink vigorously to encourage tearing after instilling the drops.
  - Occlude the nasolacrimal duct with a finger over the inner canthus for 30 to 60 seconds after instilling the drops.
- 791.** The client is receiving an eye drop and an eye ointment to the right eye. The nurse should:
- Administer the eye drop first, followed by the eye ointment.
  - Administer the eye ointment first, followed by the eye drop.
  - Administer the eye drop, wait 10 minutes, and administer the eye ointment.
  - Administer the eye ointment, wait 10 minutes, and administer the eye drop.

- 792.** The nurse is caring for a client with glaucoma. Which of the following medications, if prescribed for the client, would the nurse question?
1. Betaxolol (Betoptic)
  2. Atropine sulfate (Isopto Atropine)
  3. Pilocarpine hydrochloride (Isopto Carpine)
  4. Pilocarpine (Ocuser Pilo-20, Ocuser Pilo-40)
- 793.** A miotic medication has been prescribed for the client with glaucoma. The client asks the nurse about the purpose of the medication. The nurse tells the client that:
1. "The medication will help dilate the eye to prevent pressure from occurring."
  2. "The medication will relax the muscles of the eyes and prevent blurred vision."
  3. "The medication causes the pupil to constrict and will lower the pressure in the eye."
  4. "The medication will help block the responses that are sent to the muscles in the eye."
- 794.** A client was just admitted to the hospital to rule out a gastrointestinal (GI) bleed. The client has brought several bottles of medications prescribed by different specialists. During the admission

assessment, the client states, "Lately, I have been hearing some roaring sounds in my ears, especially when I am alone." Which medication would the nurse determine could be the cause of the client's complaint?

1. Doxycycline (Vibramycin)
2. Acetylsalicylic acid (aspirin)
3. Atropine sulfate (Isopto Atropine)
4. Diltiazem hydrochloride (Cardizem)

### Alternate Item Format: Multiple Response

- 795.** The nurse is preparing to administer eye drops. Select the interventions that the nurse takes to administer the drops. **Select all that apply.**
- 1. Wash hands.
  - 2. Put gloves on.
  - 3. Place the drop in the conjunctival sac.
  - 4. Pull the lower lid down against the cheek bone.
  - 5. Instruct the client to squeeze the eyes shut after instilling the eye drop.
  - 6. Instruct the client to tilt the head forward, open the eyes, and look down.

## ANSWERS

### 787. 2

**Rationale:** Hypotension, dizziness, nausea, diaphoresis, headache, fatigue, constipation, and diarrhea are systemic effects of the medication. Nursing interventions include monitoring the blood pressure for hypotension and assessing the pulse for strength, weakness, irregular rate, and bradycardia. Options 1, 3, and 4 are not specifically associated with this medication.

**Test-Taking Strategy:** Use the ABCs—airway, breathing, and circulation—to direct you to option 2. Although option 3, peripheral pulses, also is related to circulation monitoring, the blood pressure is the umbrella option. Review the side effects of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Eye

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 124). St. Louis: Saunders.

### 788. 1

**Rationale:** Irrigation solutions that are not close to the client's body temperature can be uncomfortable and may cause injury, nausea, and vertigo. The client is positioned so that the ear to be irrigated is facing downward, because this allows gravity to assist in the removal of the ear wax and solution. Following the irrigation, the client is to lie on the affected side to finish draining the irrigating solution. A slow steady stream of solution should be directed toward the upper wall of the ear canal and not toward the eardrum. Too much force could cause the tympanic membrane to rupture.

**Test-Taking Strategy:** Use the process of elimination. Read each option carefully and remember that the nurse's concern

is to prevent damage to the tympanic membrane. Additionally, remember that the client should be positioned with the affected side downward to allow drainage of the irrigation solution. Review the procedure for performing an ear irrigation if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Ear

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1123). St. Louis: Saunders.

Proehl, J. (2009). *Emergency nursing procedures* (4th ed., pp. 792–795). St. Louis: Saunders.

### 789. 2

**Rationale:** Cyclopentolate is a rapidly acting mydriatic and cycloplegic medication. Cyclopentolate is effective in 25 to 75 minutes, and accommodation returns in 6 to 24 hours. Cyclopentolate is used for preoperative mydriasis.

**Test-Taking Strategy:** Use the process of elimination. Options 1 and 4 are comparable or alike and are eliminated first. Miosis refers to a constricted pupil. Note that the question identifies a client being prepared for eye surgery. The pupil would need to be dilated for the surgical procedure. Review the action and purpose of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Eye

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 1222–1223). St. Louis: Saunders.

**790. 4**

**Rationale:** Applying pressure on the nasolacrimal duct prevents systemic absorption of the medication. Options 1, 2, and 3 will not prevent systemic absorption.

**Test-Taking Strategy:** Use the process of elimination. Eating and swallowing are comparable options and are not related to the systemic absorption of an eye medication. Blinking vigorously to produce tearing may result in the loss of the administered medication. Review the procedure for administering eye drops to prevent systemic absorption if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Eye

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 34). St. Louis: Saunders.

Perry, A., & Potter, P. (2010). *Clinical nursing skills and techniques* (7th ed., pp. 545–549). St. Louis: Mosby.

**791. 1**

**Rationale:** When an eye drop and an eye ointment are scheduled to be administered at the same time, the eye drop is administered first. The instillation of 2 medications is separated by 3 to 5 minutes.

**Test-Taking Strategy:** Use the process of elimination. Recalling the guidelines for administering eye medications will direct you to option 1. Review these guidelines if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Eye

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills and techniques* (7th ed., p. 549). St. Louis: Mosby.

**792. 2**

**Rationale:** Options 1, 3, and 4 are miotic agents used to treat glaucoma. Option 2 is a mydriatic and cycloplegic medication, and its use is contraindicated in clients with glaucoma. Mydriatic medications dilate the pupil and can cause an increase in intraocular pressure in the eye.

**Test-Taking Strategy:** Use the process of elimination. Knowledge regarding the classifications of the medications identified in the options will assist in answering the question. Remember that mydriatics dilate and that these medications are contraindicated in glaucoma. Review the contraindications related to medications for the client with glaucoma if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Adult Health—Eye

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 750). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 124, 1222–1223). St. Louis: Saunders.

**793. 3**

**Rationale:** Miotics cause pupillary constriction and are used to treat glaucoma. They lower the intraocular pressure, thereby increasing blood flow to the retina and decreasing retinal damage and loss of vision. Miotics cause a contraction of the ciliary muscle and a widening of the trabecular meshwork. Options 1, 2, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Note that the client has glaucoma. Recall that prevention of increased intraocular pressure is the goal in the client with glaucoma. Options 1, 2, and 4 describe actions related to mydriatic medications, which primarily dilate the pupils and relax the ciliary muscles. Review the action of a miotic medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Eye

**References:** Edmunds, M. (2010). *Introduction to clinical pharmacology* (6th ed., p. 396). St. Louis: Mosby.

Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., pp. 743–744). St. Louis: Saunders.

**794. 2**

**Rationale:** Aspirin is contraindicated for gastrointestinal bleeding and is potentially ototoxic. The client should be advised to notify the prescribing physician so the medication can be discontinued and/or a substitute that is less toxic to the ear can be taken instead. Options 1, 3, and 4 do not have side effects that are potentially associated with hearing difficulties.

**Test-Taking Strategy:** Focus on the client's complaint. Review the classifications and/or therapeutic effects as well as the side effects of each medication in the options. Of the medications identified, only aspirin can cause ototoxicity. Additionally, it is contraindicated for GI bleed as well. Review medications that can cause ototoxicity if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Adult Health—Ear

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 89). St. Louis: Saunders.

**ALTERNATE ITEM FORMAT:  
MULTIPLE RESPONSE****795. 1, 2, 3, 4**

**Rationale:** To administer eye medications, the nurse should wash hands and put gloves on. The client is instructed to tilt the head backward, open the eyes, and look up. The nurse pulls the lower lid down against the cheekbone and holds the bottle like a pencil with the tip downward. Holding the bottle, the nurse gently rests the wrist of the hand on the client's cheek and squeezes the bottle gently to allow the drop to fall into the conjunctival sac. The client is instructed to close the eyes gently and not to squeeze the eyes shut to prevent the loss of medication.

**Test-Taking Strategy:** Use guidelines related to standard precautions and visualize this procedure. This will assist in determining the correct interventions. If you are unfamiliar with the procedure for administering eye medications, review these guidelines.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

# UNIT XVI

## The Adult Client With a Neurological Disorder

### PYRAMID TERMS

**agnosia** The inability to recognize familiar objects or persons.

**apraxia** Called dyspraxia if the condition is mild; characterized by loss of ability to execute or carry out skilled movements or gestures, despite having the desire and physical ability to perform them.

**autonomic dysreflexia** Syndrome characterized by paroxysmal hypertension, bradycardia, excessive sweating, facial flushing, nasal congestion, pilomotor responses, and headache. The syndrome occurs with spinal lesions above T6 after the period of spinal shock is complete. Triggers include visceral stimulation from a distended bladder or impacted rectum. The syndrome is a neurological emergency and must be treated immediately to prevent a hypertensive stroke. It is also known as hyperreflexia.

**Babinski reflex** Dorsiflexion of the big toe with extension; elicited by firmly stroking the lateral aspect of the sole of the foot.

**Budzinski's sign** Involuntary flexion of the hip and knee when the neck is passively flexed; indicates meningeal irritation.

**decerebrate (extensor) posturing** Stiff extension of one or both arms and possibly the legs; indicates a brainstem lesion.

**decorticate (flexor) posturing** Flexure of one or both arms on the chest and possibly stiff extension of the legs; indicates damaged cortex.

**flaccid posturing** No motor response display in any extremity.

**Glasgow Coma Scale** A method of assessing a client's neurological condition. The scoring system is based on a scale of 1 to 15 points. A score of less than 8 indicates that coma is present.

**halo traction** Insertion of pins or screws into the client's skull and application of a circular fixation device and halo jacket or cast; used to immobilize the cervical spine.

**hemianopsia** Blindness in half the visual field.

**homonymous hemianopsia** Loss of half of the field of view on the same side in both eyes.

**increased intracranial pressure** Increased pressure within the skull caused by trauma, hemorrhage, growths or tumors, hydrocephalus, edema, or inflammation. Increased pressure can impede circulation to the brain and absorption of cerebrospinal fluid and can affect nerve cell functioning, leading to brainstem compression and death.

**Kernig's sign** Loss of the ability of a supine client to straighten the leg completely when it is fully flexed at the knee and hip; indicates meningeal irritation.

**nuchal rigidity** Stiff neck; flexion of the neck onto the chest causes intense pain.

**skull tongs** Tongs inserted into the outer aspect of the client's skull, just above the ears, with application of traction. Types include Gardner-Wells, Barton, and Crutchfield tongs.

**spinal shock** A sudden depression of reflex activity in the spinal cord below the level of injury (areflexia) that occurs within the first hour of injury and lasts days to months. The muscles become completely paralyzed and flaccid, and reflexes are absent; also known as neurogenic shock.

**Tensilon test** Test used to diagnose myasthenia gravis and to differentiate between myasthenic crisis and cholinergic crisis.

**unconscious client** A state of depressed cerebral functioning with unresponsiveness to sensory and motor function. Causes include head trauma, cerebral toxins, shock, hemorrhage, tumor, or infections.

**unilateral neglect** An inability to recognize a physical impairment on one side of the body. It occurs most commonly in clients who have had a right cerebral stroke; also known as neglect syndrome.

## PYRAMID TO SUCCESS

Pyramid Points related to neurological disorders focus on monitoring for increased intracranial pressure, assessing level of consciousness, positioning clients, head injuries, spinal cord injuries, spinal shock, autonomic dysreflexia, interventions during a seizure, the client with a stroke, Parkinson's disease, myasthenia gravis, and the Tensilon test. Altered body image and psychosocial issues that occur as a result of the neurological disorder are also a focus of the Pyramid to Success.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Acting as a client advocate
- Consulting with members of the health care team
- Ensuring that advance directives are in the client's medical record
- Establishing priorities
- Initiating referrals to appropriate services
- Maintaining asepsis with procedures and treatments
- Maintaining confidentiality
- Maintaining standard and other precautions
- Obtaining informed consent for invasive procedures
- Preventing accidents that can occur as a result of neurological deficits
- Upholding client rights

### Health Promotion and Maintenance

- Discussing expected and unexpected body image changes resulting from neurological deficits

- Performing neurological assessment using various techniques

- Preventing and detecting health problems associated with neurological deficits

- Providing home care instructions regarding care related to the neurological disorder

- Teaching about the importance of prescribed therapy

### Psychosocial Integrity

- Acknowledging end-of-life and grief and loss issues

- Assessing the ability to cope with feelings of isolation and loss of independence

- Considering the cultural, religious, and spiritual influences of the client when planning care

- Identifying sensory and perceptual alterations

- Identifying support systems and encouraging the use of community resources

- Mobilizing coping mechanisms

### Physiological Integrity

- Administering pharmacological therapy

- Maintaining nutrition

- Monitoring for alterations in body systems

- Monitoring for complications related to procedures

- Monitoring for fluid and electrolyte imbalances

- Providing assistive devices for mobility

- Providing emergency care

- Providing measures to promote comfort

- Promoting normal elimination patterns

- Promoting self-care measures

# Neurological System

## I. ANATOMY AND PHYSIOLOGY OF THE BRAIN AND SPINAL CORD

### A. Cerebrum

1. The cerebrum consists of the right and left hemispheres.
2. Each hemisphere receives sensory information from the opposite side of the body and controls the skeletal muscles of the opposite side.
3. The cerebrum governs sensory and motor activity and thought and learning.

### B. Cerebral cortex (Box 66-1)

1. The cerebral cortex is the outer gray layer; it is divided into five lobes.
2. It is responsible for the conscious activities of the cerebrum.

### C. Basal ganglia: Cell bodies in white matter that help the cerebral cortex produce smooth voluntary movements

### D. Diencephalon

1. Thalamus
  - a. Relays sensory impulses to the cortex
  - b. Provides a pain gate
  - c. Part of the reticular activating system
2. Hypothalamus
  - a. Regulates autonomic responses of the sympathetic and parasympathetic nervous systems
  - b. Regulates the stress response, sleep, appetite, body temperature, fluid balance, and emotions
  - c. Responsible for the production of hormones secreted by the pituitary gland and the hypothalamus

### E. Brainstem

1. Midbrain
  - a. Responsible for motor coordination
  - b. Contains the visual reflex and auditory relay centers
2. Pons: Contains the respiratory centers and regulates breathing
3. Medulla oblongata
  - a. Contains all afferent and efferent tracts and cardiac, respiratory, vomiting, and vasomotor centers
  - b. Controls heart rate, respiration, blood vessel diameter, sneezing, swallowing, vomiting, and coughing

### F. Cerebellum: Coordinates smooth muscle movement, posture, equilibrium, and muscle tone

### G. Spinal cord

1. Provides neuron and synapse networks to produce involuntary responses to sensory stimulation
2. Controls body movement and regulates visceral function
3. Carries sensory information to and motor information from the brain
4. Extends from the first cervical to the second lumbar vertebra
5. Protected by the meninges; cerebrospinal fluid, and adipose tissue
6. Horns
  - a. Inner column of gray matter; contains two anterior and two posterior horns
  - b. Posterior horns connect with afferent (sensory) nerve fibers.
  - c. Anterior horns contain efferent (motor) nerve fibers.
7. Nerve tracts
  - a. White matter contains the nerve tract.
  - b. Ascending tracts (sensory pathway)
  - c. Descending tract (motor pathway)

### H. Meninges

1. Dura mater is the tough and fibrous membrane.
2. Arachnoid membrane is the delicate membrane and contains cerebrospinal fluid.
3. Pia mater is the vascular membrane.
4. Subarachnoid space is formed by the arachnoid membrane and the pia mater.

### I. Cerebrospinal fluid (CSF)

1. Secreted in the ventricles; circulates in the subarachnoid space and through the ventricles to the subarachnoid layer of the meninges, where it is reabsorbed
2. Acts as a protective cushion; aids in the exchange of nutrients and wastes
3. Normal pressure is 50 to 175 mm H<sub>2</sub>O.
4. Normal volume is 125 to 150 mL.

### J. Ventricles

1. Four ventricles
2. The ventricles communicate between the subarachnoid spaces and produce and circulate cerebrospinal fluid.

**Box 66-1 Cerebral Cortex****Frontal Lobe**

Broca's area for speech

Morals, emotions, reasoning and judgment, concentration, and abstraction

**Parietal Lobe**

Interpretation of taste, pain, touch, temperature, and pressure

Spatial perception

**Temporal Lobe**

Auditory center

Wernicke's area for sensory and speech

**Occipital Lobe**

Visual area

**Limbic System**

Emotional and visceral patterns for survival

Learning and memory

- K. Blood supply**
1. Right and left internal carotid arteries
  2. Right and left vertebral arteries
  3. These arteries supply the brain via an anastomosis at the base of the brain called the circle of Willis.
- L. Neurotransmitters**
1. Acetylcholine
  2. Norepinephrine
  3. Dopamine
  4. Serotonin
  5. Amino acids
  6. Polypeptides
- M. Neurons**
1. The neuron consists of the cell body, axons, and dendrites.
  2. The cell body contains the nucleus.
  3. Neurons carrying impulses to the central nervous system (CNS) are called sensory neurons.
  4. Neurons carrying impulses away from the CNS are called motor neurons.
  5. Synapse is the chemical transmission of impulses from one neuron to another.
- N. Axons and dendrites**
1. The axon conducts impulses from the cell body.
  2. The dendrites receive stimuli from the body and transmit them to the axon.
  3. The neurons are protected and insulated by Schwann cells.
  4. The Schwann cell sheath is called the neurolemma.
  5. Neurons do not reproduce after the neonatal period.
  6. If an axon or dendrite is damaged, it will die and be replaced slowly only if the neurolemma is intact and the cell body has not died.

- O. Spinal nerves**
1. There are 31 pairs of spinal nerves.
  2. Mixed nerve fibers are formed by the joining of the anterior motor and posterior sensory roots.
  3. Posterior roots contain afferent (sensory) nerve fibers.
  4. Anterior roots contain efferent (motor) nerve fibers.
- P. Autonomic nervous system**
1. Sympathetic (adrenergic) fibers dilate pupils, increase heart rate and rhythm, contract blood vessels, and relax smooth muscles of the bronchi.
  2. Parasympathetic (cholinergic) fibers produce the opposite effect.

**II. DIAGNOSTIC TESTS****A. Skull and spinal radiography**

1. Description
  - a. Radiographs of the skull reveal the size and shape of the skull bones, suture separation in infants, fractures or bony defects, erosion, and calcification.
  - b. Spinal radiographs identify fractures, dislocation, compression, curvature, erosion, narrowed spinal cord, and degenerative processes.
2. Preprocedure interventions
  - a. Provide nursing support for the confused, combative, or ventilator-dependent client.
  - b. Maintain immobilization of the neck if a spinal fracture is suspected.
  - c. Remove metal items from body parts.
  - d. If the client has thick and heavy hair, this should be documented, because it could affect interpretation of the x-ray film.
3. Postprocedure intervention: Maintain immobilization until results are known.

 **Always check with the client about the possibility of pregnancy before any radiographic procedures are done.**

**B. Computed tomography (CT)**

1. Description
  - a. Computed tomography is a type of brain scanning that may or may not require injection of a dye.
  - b. It is used to detect intracranial bleeding, space-occupying lesions, cerebral edema, infarctions, hydrocephalus, cerebral atrophy, and shifts of brain structures.
2. Preprocedure interventions
  - a. Obtain an informed consent if a dye is used.
  - b. Assess for allergies to iodine, contrast dyes, or shellfish if a dye is used.
  - c. Instruct the client of the need to lie still and flat during the test.

- d. Instruct the client to hold his or her breath when requested.
- e. Initiate an intravenous line if prescribed.
- f. Remove objects from the head, such as wigs, barrettes, earrings, and hairpins.
- g. Assess for claustrophobia.
- h. Inform the client of possible mechanical noises as the scanning occurs.
- i. Inform the client that there may be a hot flushed sensation and a metallic taste in the mouth when the dye is injected.
- j. Note that some clients may be given the dye even if they report an allergy; they are treated with an antihistamine and corticosteroids before the injection to reduce the severity of a reaction.

 Assess the need to withhold metformin (Glucophage) if iodinated contrast dye is used for a diagnostic procedure because of the risk for metformin-induced lactic acidosis.

### 3. Postprocedure interventions

- a. Provide replacement fluids because diuresis from the dye is expected.
- b. Monitor for an allergic reaction to the dye.
- c. Assess dye injection site for bleeding or hematoma, and monitor the extremity for color, warmth, and the presence of distal pulses.

## C. Magnetic resonance imaging (MRI)

### 1. Description

- a. Magnetic resonance imaging is a noninvasive procedure that identifies tissues, tumors, and vascular abnormalities.
- b. It is similar to CT scanning but provides more detailed pictures.

### 2. Preprocedure interventions

- a. Remove all metal objects from the client.
- b. Determine whether the client has a pacemaker, implanted defibrillator, or other metal implants such as a hip prosthesis or vascular clips because these clients cannot have this test performed.
- c. Remove intravenous fluid pumps during the test.
- d. Provide precautions for the client who is attached to a pulse oximeter because it can cause a burn during testing if coiled around the body or a body part.
- e. Provide an assessment of the client with claustrophobia.
- f. Administer medication as prescribed for the client with claustrophobia.
- g. Determine whether a contrast agent is to be used and follow the prescription related to the administration of food, fluids, and medications.
- h. Instruct the client that he or she will need to remain still during the procedure.

 An MRI is contraindicated in a pregnant woman because the increase in amniotic fluid temperature that occurs during the procedure may be harmful to the fetus.

### 3. Postprocedure interventions

- a. Client may resume normal activities.
- b. Expect diuresis if a contrast agent is used.

## D. Lumbar puncture

### 1. Description

- a. Insertion of a spinal needle through the L3-L4 interspace into the lumbar subarachnoid space to obtain cerebrospinal fluid (CSF), measure CSF fluid or pressure, or instill air, dye, or medications
- b. The test is contraindicated in clients with **increased intracranial pressure** because the procedure will cause a rapid decrease in pressure in the CSF around the spinal cord, leading to brain herniation.

### 2. Preprocedure interventions

- a. Obtain an informed consent.
- b. Have the client empty the bladder.

### 3. Interventions during the procedure

- a. Position the client in a lateral recumbent position and have the client draw the knees up to the abdomen and the chin onto the chest; the prone position may be required for radiologically guided punctures.
- b. Assist with the collection of specimens (label the specimens in sequence).
- c. Maintain strict asepsis.

### 4. Postprocedure interventions

- a. Monitor vital signs and neurological signs to check for the presence of leakage of cerebrospinal fluid.
- b. Position the client flat as prescribed.
- c. Encourage fluids to replace CSF obtained from the specimen collection or from leakage.
- d. Monitor intake and output.

## E. Myelography

### 1. Description: Injection of dye or air into the subarachnoid space to detect abnormalities of the spinal cord and vertebrae

### 2. Preprocedure interventions

- a. Obtain an informed consent.
- b. Provide hydration for at least 12 hours before the test.
- c. Assess for allergies to contrast agents, iodine, or shellfish.
- d. If the client is taking a phenothiazine, withhold the medication because this medication lowers the seizure threshold.
- e. Premedicate for sedation as prescribed.

### 3. Postprocedure interventions

- a. Assess vital signs and neurological condition frequently as prescribed.

- b. Maintain bedrest as prescribed; the head position varies according to the dye used; the head is usually elevated if an oil-based or water-soluble contrast agent is used and usually positioned lower than the trunk if air contrast is used.
- c. Administer analgesics for headache or backache as prescribed.
- d. Encourage fluids to help excrete the contrast material.
- e. Monitor intake and output to ensure adequate fluid intake and to ensure an adequate urine output of at least 30 mL/hr.

#### F. Cerebral angiography

1. Description: Injection of a contrast material usually through the femoral artery (or another artery) into the carotid arteries to visualize the cerebral arteries and assess for lesions
2. Preprocedure interventions
  - a. Obtain an informed consent.
  - b. Assess the client for allergies to iodine and shellfish.
  - c. Assess for a medication history of anticoagulation therapy.
  - d. Encourage hydration for 2 days before the test.
  - e. Maintain the client on NPO status 4 to 6 hours before the test as prescribed.
  - f. Perform a neurological assessment, which will serve as a baseline for postprocedure assessments.
  - g. Mark the peripheral pulses.
  - h. Remove metal items from the hair.
  - i. Administer premedication as prescribed.
3. Postprocedure interventions
  - a. Monitor neurological status, vital signs, and neurovascular status of the affected extremity frequently until stable.
  - b. Monitor for swelling in the neck and for difficulty swallowing; notify the physician if these symptoms occur.
  - c. Maintain bed rest for 12 hours as prescribed.
  - d. Elevate the head of the bed 15 to 30 degrees only if prescribed.
  - e. Keep the bed flat if the femoral artery is used as prescribed.
  - f. Assess peripheral pulses.
  - g. Apply sandbags or another device to immobilize the limb and a pressure dressing to the injection site to decrease bleeding as prescribed.
  - h. Place ice on the puncture site as prescribed.
  - i. Encourage fluid intake.

#### G. Electroencephalography

1. Description: Graphic recording of the electrical activity of the superficial layers of the cerebral cortex

2. Preprocedure interventions
  - a. Wash the client's hair.
  - b. Inform the client that electrodes are attached to the head and that electricity does not enter the head.
  - c. Withhold stimulants such as coffee, tea, and caffeine beverages, antidepressants, tranquilizers, and possibly anticonvulsants for 24 to 48 hours before the test as prescribed.
  - d. Allow the client to have breakfast if prescribed.
  - e. Premedicate for sedation as prescribed.
3. Postprocedure interventions
  - a. Wash the client's hair.
  - b. Maintain side rails and safety precautions, if the client was sedated.

#### H. Caloric testing (oculovestibular reflex)

1. Description: Caloric testing provides information about the function of the vestibular portion of the eighth cranial nerve and aids in the diagnosis of cerebellar and brainstem lesions.
2. Procedure
  - a. Patency of the external auditory canal is confirmed.
  - b. The client is positioned supine with the head of the bed elevated 30 degrees.
  - c. Water that is warmer or cooler than body temperature is infused into the ear.
  - d. A normal response is the onset of vertigo and nystagmus (involuntary eye movements) within 20 to 30 seconds
  - e. Absent or disconjugate eye movements indicate brainstem damage.

### III. NEUROLOGICAL ASSESSMENT

(see Chapter 34 for additional information on neurological assessment)

#### A. Assessment of risk factors

1. Trauma
2. Hemorrhage
3. Tumors
4. Infection
5. Toxicity
6. Metabolic disorders
7. Hypoxic conditions
8. Hypertension
9. Cigarette smoking
10. Stress
11. Aging process
12. Chemicals, either ingestion or environmental exposure

#### B. Assessment of the cranial nerves (see Chapter 34)

#### C. Assessment of level of consciousness (LOC)

1. Assessment becomes increasingly invasive as the client is less responsive
  - a. Speak to the client (auditory)
  - b. Lightly touch the client (gentle tactile)

**Box 66-2 Assessment of Respirations****Cheyne-Stokes**

Rhythmic, with periods of apnea

Can indicate a metabolic dysfunction or dysfunction in the cerebral hemisphere or basal ganglia

**Neurogenic Hyperventilation**

Regular rapid and deep sustained respirations

Indicates a dysfunction in the low midbrain and middle pons

**Apneustic**

Irregular respirations, with pauses at the end of inspiration and expiration

Indicates a dysfunction in the middle or caudal pons

**Ataxic**

Totally irregular in rhythm and depth

Indicates a dysfunction in the medulla

**Cluster**

Clusters of breaths with irregularly spaced pauses

Indicates a dysfunction in the medulla and pons

- c. Painful stimuli (sternal rub, supraorbital pressure, trapezius squeeze)
2. Assess client behavior to determine level of consciousness, such as confusion, delirium, unconsciousness, stupor, or coma.

**!** Level of consciousness is the most sensitive indicator of neurological status.

**D.** Assessment of vital signs: Monitor for blood pressure or pulse changes, which may indicate **increased intracranial pressure (ICP)**.

**E.** Assessment of respirations (Box 66-2)

**F.** Assessment of temperature

1. An elevated temperature increases the metabolic rate of the brain.
2. An elevation in temperature may indicate a dysfunction of the hypothalamus or brainstem.
3. A slow rise in temperature may indicate infection.

**G.** Assessment of pupils (Fig. 66-1)

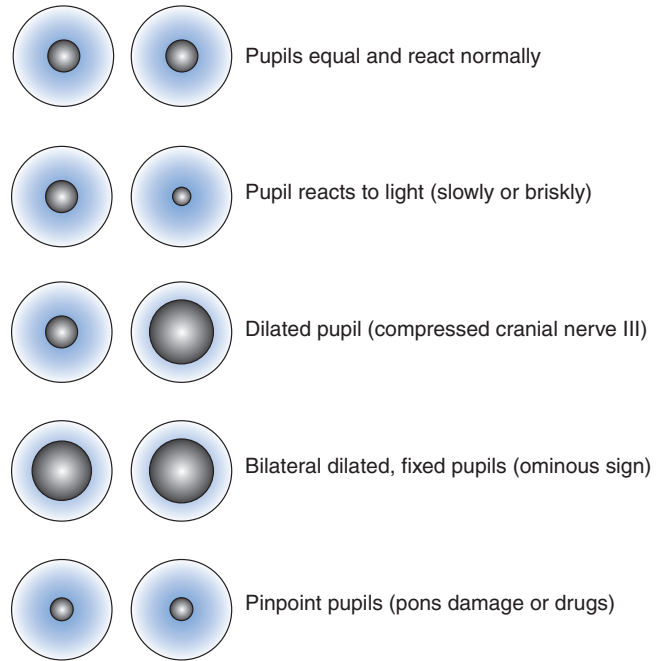

5. Unilateral pupil dilation indicates compression of the third cranial nerve.
6. Midposition fixed pupil indicates midbrain injury.
7. Pinpoint fixed pupil indicates pontine damage.

**H.** Assessment of motor function

1. Muscle tone, including strength and equality
2. Voluntary and involuntary movements
3. Purposeful and nonpurposeful movements

**I.** Assessment for posturing (Fig. 66-2)

1. Posturing indicates a deterioration of the condition.
2. Flexor (**decorticate posturing**)
  - a. Client flexes one or both arms on the chest and may extend the legs stiffly.
  - b. Flexor posturing indicates a nonfunctioning cortex.

**▲ FIGURE 66-1** Pupillary check for size and response. (From Lewis, S., Heitkemper, M., Dirksen, S., O'Brien, P., & Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

**▲ FIGURE 66-2** Posturing. **A**, Decorticate posturing. **B**, Decerebrate posturing. (From Ignatavicius, D., and Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

3. Extensor (**decerebrate posturing**)

- a. Client stiffly extends one or both arms and possibly the legs.
- b. Extensor posturing indicates a brainstem lesion.

4. **Flaccid posturing**: Client displays no motor response in any extremity.

**J.** Assessment of reflexes (Box 66-3)

**K.** Assessment of meningeal irritation (Box 66-4)

**Box 66-3 Assessment of Reflexes****Babinski Reflex**

Dorsiflexion of the big toe, with extension; elicited by firmly stroking the lateral aspect of the sole of the foot

**Corneal Reflex**

Loss of the blink reflex

Indicates a dysfunction of cranial nerve V

**Gag Reflex**

Loss of the gag reflex

Indicates a dysfunction of cranial nerves IX and X

**Box 66-4 Assessment of Meningeal Irritation****General Findings**

Irritability

Nuchal rigidity

Severe, unrelenting headaches

Generalized muscle aches and pains

Nausea and vomiting

Fever and chills

Tachycardia

Photophobia

Nystagmus

Abnormal pupil reaction and eye movement

**Brudzinski's Sign**

Involuntary flexion of the hip and knee when the neck is passively flexed; indicates meningeal irritation

**Kernig's Sign**

Loss of the ability of a supine client to straighten the leg completely when it is fully flexed at the knee and hip; indicates meningeal irritation

**Motor Response**

Hemiparesis, hemiplegia, and decreased muscle tone

Cranial nerve dysfunction, especially cranial nerves III, IV, VI, VII, and VIII

**Memory Changes**

Short attention span

Personality and behavioral changes

Bewilderment

-  L. Assessment of the autonomic system
  1. Sympathetic functions, adrenergic responses
    - a. Increased pulse and blood pressure
    - b. Dilated pupils
    - c. Decreased peristalsis
    - d. Increased perspiration
  2. Parasympathetic function, cholinergic responses
    - a. Decreased pulse and blood pressure
    - b. Constricted pupils
    - c. Increased salivation
    - d. Increased peristalsis

**Box 66-5 Glasgow Coma Scale****Score**

The highest possible score is 15 points.

**Motor Response Points**

Obeys a simple response = 6

Localizes painful stimuli = 5

Normal flexion (withdrawal) = 4

Abnormal flexion (decorticate posturing) = 3

Extensor response (decerebrate posturing) = 2

No motor response to pain = 1

**Verbal Response Points**

Oriented = 5

Confused conversation = 4

Inappropriate words = 3

Responds with incomprehensible sounds = 2

No verbal response = 1

**Eye-Opening Points**

Spontaneous = 4

In response to sound = 3

In response to pain = 2

No response, even to painful stimuli = 1

Modified from Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed.). St. Louis: Saunders.

e. Dilated blood vessels

f. Bladder contraction

M. Assessment of sensory function: Touch, pressure, pain

N. **Glasgow Coma Scale** (Box 66-5)

1. The scale is a method of assessing a client's neurological condition.
2. The scoring system is based on a scale of 1 to 15 points.
3. A score lower than 8 indicates that coma is present.

**IV. THE UNCONSCIOUS CLIENT**

A. Description

1. The **unconscious client** is in a state of depressed cerebral functioning with unresponsiveness to stimulation of sensory and motor function.
2. Some causes include head trauma, cerebral toxins, shock, hemorrhage, tumor, and infection.

B. Assessment

1. Unarousable
2. Primitive or no response to painful stimuli
3. Altered respirations
4. Decreased cranial nerve and reflex activity

C. Interventions (Box 66-6)

**V. INCREASED INTRACRANIAL PRESSURE (ICP)**

A. Description

1. **Increased ICP** may be caused by trauma, hemorrhage, growths or tumors, hydrocephalus, edema, or inflammation.

**Box 66-6 Care of the Unconscious Client**

Assess patency of the airway and keep an airway and emergency equipment at the bedside.  
 Monitor blood pressure, pulse, and heart sounds.  
 Assess respiratory and circulatory status.  
 Maintain a patent airway and ventilation because a high CO<sub>2</sub> level increases intracranial pressure.  
 Assess lung sounds for the accumulation of secretions.  
 Suction fluids from the airway as needed.  
 Assess neurological status, including level of consciousness, pupillary reactions, and motor and sensory function, using the Glasgow Coma Scale.  
 Place the client in a semi-Fowler's position.  
 Change position of the client every 2 hours, avoiding injury when turning.  
 Avoid Trendelenburg's position.  
 Use side rails unless contraindicated or according to agency protocol.  
 Assess for edema.  
 Monitor for dehydration.  
 Monitor intake and output and daily weight.  
 Maintain NPO status until consciousness returns.  
 Maintain nutrition as prescribed, and monitor fluid and electrolyte balance.  
 Check the gag and swallow reflex before resuming a diet, and begin the diet with ice chips and fluids when the client becomes alert.

Provide intravenous or enteral feedings as prescribed.  
 Assess bowel sounds.  
 Monitor elimination patterns.  
 Monitor for constipation, impaction, and paralytic ileus.  
 Maintain urinary output to prevent stasis, infection, and calculus formation.  
 Monitor the status of skin integrity.  
 Initiate measures to prevent skin breakdown.  
 Provide frequent mouth care.  
 Remove dentures and contact lenses.  
 Assess the eyes for the presence of a corneal reflex and irritation, and instill artificial tears or cover the eyes with eye patches.  
 Monitor drainage from the ears or nose for the presence of cerebrospinal fluid.  
 Assume that the unconscious client can hear.  
 Avoid restraints.  
 Do not leave the client unattended if unstable.  
 Initiate seizure precautions if necessary.  
 Provide range-of-motion exercises to prevent contractures.  
 Use a footboard or high-topped sneakers to prevent footdrop.  
 Use splints to prevent wrist deformities.  
 Initiate physical therapy as appropriate.

2. **Increased ICP** can impede circulation to the brain, impede the absorption of CSF, affect the functioning of nerve cells, and lead to brainstem compression and death.

**B. Assessment**

1. Altered level of consciousness, which is the most sensitive and earliest indication of increasing **ICP**
2. Headache
3. Abnormal respirations (see Box 66-2)
4. Rise in blood pressure with widening pulse pressure
5. Slowing of pulse
6. Elevated temperature
7. Vomiting
8. Pupil changes
9. Late signs of **increased ICP**, including increased systolic blood pressure, widened pulse pressure, and slowed heart rate
10. Other late signs include changes in motor function from weakness to hemiplegia, a positive **Babinski reflex**, **decorticate** or **decerebrate posturing**, and seizures.

**C. Interventions**

1. Monitor respiratory status and prevent hypoxia.
2. Avoid the administration of morphine sulfate to prevent the occurrence of hypoxia.
3. Maintain mechanical ventilation as prescribed; maintaining the PaCO<sub>2</sub> at 30 to 35 mm Hg will

result in vasoconstriction of the cerebral blood vessels, decreased blood flow, and therefore decreased ICP.

4. Maintain body temperature.
5. Prevent shivering, which can increase ICP.
6. Decrease environmental stimuli.
7. Monitor electrolyte levels and acid-base balance.
8. Monitor intake and output.
9. Limit fluid intake to 1200 mL/day.
10. Instruct the client to avoid straining activities, such as coughing and sneezing.
11. Instruct the client to avoid Valsalva's maneuver.

For the client with increased intracranial pressure, elevate the head of the bed 30 to 40 degrees, avoid the Trendelenburg position, and prevent flexion of the neck and hips.

**D. Medications (Box 66-7)**

**E. Surgical intervention:** Also see Chapter 36 for additional information on ventriculoperitoneal shunts (Box 66-8)

**VI. HYPERTHERMIA****A. Description**

1. Temperature higher than 105° F, which increases the cerebral metabolism and increases the risk of hypoxia

**Box 66-7 Medications for Increased Intracranial Pressure****Anticonvulsants**

Anticonvulsants may be given prophylactically to prevent seizures.

Seizures increase metabolic requirements and cerebral blood flow and volume, thus increasing intracranial pressure.

**Antipyretics and Muscle Relaxants**

Temperature reduction decreases metabolism, cerebral blood flow, and thus intracranial pressure.

Antipyretics prevent temperature elevations.

Muscle relaxants prevent shivering.

**Blood Pressure Medication**

Blood pressure medication may be required to maintain cerebral perfusion at a normal level.

Notify the physician if the blood pressure range is lower than 100 or higher than 150 mm Hg systolic.

**Corticosteroids**

Corticosteroids stabilize the cell membrane and reduce the leakiness in the blood-brain barrier.

Corticosteroids decrease cerebral edema.

A histamine blocker may be administered to counteract the excess gastric secretion that occurs with the corticosteroid.

Clients must be withdrawn slowly from corticosteroid therapy to reduce the risk of adrenal crisis.

**Intravenous Fluids**

Fluids are administered intravenously via an infusion pump to control the amount administered.

Hypertonic intravenous solutions are avoided because of the risk of promoting additional cerebral edema.

**Hyperosmotic Agent**

Mannitol (Osmitol) is a hyperosmotic agent that increases intravascular pressure by drawing fluid from the interstitial spaces and from the brain cells.

Monitor renal function.

Diuresis is expected.

**Box 66-8 Surgical Intervention for Chronic Increased Intracranial Pressure: Ventriculoperitoneal Shunt****Description**

A ventriculoperitoneal shunt diverts cerebrospinal fluid from the ventricles into the peritoneum.

**Postprocedure Interventions**

Position the client supine and turn from the back to the nonoperative side.

Monitor for signs of increasing intracranial pressure resulting from shunt failure.

Monitor for signs of infection.

2. Causes include infection, heat stroke, exposure to high environmental temperatures, and dysfunction of the thermoregulatory center

**B. Assessment**

1. Temperature higher than 105° F
2. Shivering
3. Nausea and vomiting

**C. Interventions**

1. Maintain a patent airway.
2. Initiate seizure precautions.
3. Monitor intake and output and assess the skin and mucous membranes for signs of dehydration.
4. Monitor lung sounds.
5. Monitor for dysrhythmias.
6. Assess peripheral pulses for systemic blood flow.
7. Induce normothermia with fluids, cool baths, fans, or a hypothermia blanket.

**D. Inducement of normothermia**

1. Prevent shivering, which will increase intracranial pressure and oxygen consumption.

2. Administer medications as prescribed to prevent shivering and to lower body temperature.
3. Monitor neurological status.
4. Monitor for infection and respiratory complications because hyperthermia may mask the signs of infection.
5. Monitor for cardiac dysrhythmias.
6. Monitor intake and output.
7. Prevent trauma to the skin and tissues.
8. Apply lotion to the skin frequently.
9. Inspect for frostbite if a hypothermia blanket is used.

**VII. HEAD INJURY****A. Description**

1. Head injury is trauma to the skull, resulting in mild to extensive damage to the brain.
2. Immediate complications include cerebral bleeding, hematomas, uncontrolled **increased ICP**, infections, and seizures.
3. Changes in personality or behavior, cranial nerve deficits, and any other residual deficits depend on the area of the brain damage and the extent of the damage.

**B. Types of head injuries (Box 66-9)**

1. Open
  - a. Scalp lacerations
  - b. Fractures in the skull
  - c. Interruption of the dura mater
2. Closed
  - a. Concussions
  - b. Contusions
  - c. Fractures

**Box 66-9 Types of Head Injuries****Concussion**

Concussion is a jarring of the brain within the skull, with no loss of consciousness.

**Contusion**

Contusion is a bruising type of injury to the brain tissue. Contusion may occur along with other neurological injuries, such as with subdural or extradural collections of blood.

**Skull Fractures**

Linear  
Depressed  
Compound  
Comminuted

**Epidural Hematoma**

The most serious type of hematoma, epidural hematoma forms rapidly and results from arterial bleeding.

Epidural hematoma forms between the dura and skull from a tear in the meningeal artery.

It is often associated with temporary loss of consciousness, followed by a lucid period, that rapidly progresses to coma.

Epidural hematoma is a surgical emergency.

**Subdural Hematoma**

Subdural hematoma forms slowly and results from a venous bleed.

Subdural hematoma occurs under the dura as a result of tears in the veins crossing the subdural space.

**Intracerebral Hemorrhage**

Multiple hemorrhages occur around a contused area.

**Subarachnoid Hemorrhage**

Bleeding occurs directly into the brain, ventricles, or subarachnoid space.

**C. Hematoma**

1. Description: Hematoma can occur as a result of a subarachnoid hemorrhage or an intracerebral hemorrhage.

2. Assessment

- a. Assessment findings depend on the injury.
- b. Clinical manifestations usually result from **increased ICP**.
- c. Changing neurological signs in the client
- d. Changes in level of consciousness
- e. Airway and breathing pattern changes
- f. Vital signs changes reflecting **increased ICP**
- g. Headache, nausea, and vomiting
- h. Visual disturbances, pupillary changes, and papilledema
- i. **Nuchal rigidity** (not tested until spinal cord injury is ruled out)
- j. CSF drainage from the ears or nose
- k. Weakness and paralysis
- l. Posturing
- m. Decreased sensation or absence of feeling
- n. Reflex activity changes
- o. Seizure activity

 CSF can be distinguished from other fluids by the presence of concentric rings (yellowish stain surrounded by bloody fluid) when the fluid is placed on a white sterile background, such as a gauze pad. CSF also tests positive for glucose when tested using a strip test.

3. Interventions

- a. Monitor respiratory status and maintain a patent airway because increased CO<sub>2</sub> levels increase cerebral edema.
- b. Monitor neurological status and vital signs, including temperature.

c. Monitor for **increased ICP**.

d. Maintain head elevation to reduce venous pressure.

e. Prevent neck flexion.

f. Initiate normothermia measures for increased temperature.

g. Assess cranial nerve function, reflexes, and motor and sensory function.

h. Initiate seizure precautions.

i. Monitor for pain and restlessness.

j. Morphine sulfate may be prescribed to decrease agitation and control restlessness caused by pain for the head injured client on a ventilator; administer with caution because it is a respiratory depressant and may increase ICP.

k. Monitor for drainage from the nose or ears because this fluid may be CSF.

l. Do not attempt to clean the nose, suction, or allow the client to blow his or her nose if drainage occurs.

m. Do not clean the ear if drainage is noted, but apply a loose, dry sterile dressing.

n. Check drainage for the presence of CSF.

o. Notify the physician if drainage from the ears or nose is noted and if the drainage tests positive for CSF.

p. Instruct the client to avoid coughing because this increases ICP.

q. Monitor for signs of infection.

r. Prevent complications of immobility.

s. Inform the client and family about the possible behavior changes that may occur, including those that are expected and those that need to be reported.

**D. Craniotomy**

1. Description

**Box 66-10 Nursing Care Following Craniotomy**

Monitor vital signs and neurological status every 30 to 60 minutes.

Monitor for increased intracranial pressure.

Monitor for decreased level of consciousness, motor weakness or paralysis, aphasia, visual changes, and personality changes.

Maintain mechanical ventilation and slight hyperventilation for the first 24 to 48 hours as prescribed to prevent increased intracranial pressure.

Assess the physician's prescription regarding client positioning.

Avoid extreme hip or neck flexion, and maintain the head in a midline neutral position.

Provide a quiet environment.

Monitor the head dressing frequently for signs of drainage.

Mark any area of drainage at least once each nursing shift for baseline comparison.

Monitor the Hemovac or Jackson-Pratt drain, which may be in place for 24 hours.

Maintain suction on the Hemovac or Jackson-Pratt drain.

Measure drainage from the Hemovac or Jackson-Pratt drain every 8 hours, and record the amount and color.

Notify the physician if drainage is more than the normal amount of 30 to 50 mL per shift.

Notify the physician immediately of excessive amounts of drainage or a saturated head dressing.

Record strict measurement of hourly intake and output.

Maintain fluid restriction at 1500 mL/day as prescribed.

Monitor electrolyte levels.

Monitor for dysrhythmias, which may occur as a result of fluid or electrolyte imbalance.

Apply ice packs or cool compresses as prescribed; expect periorbital edema and ecchymosis of one or both eyes, which is not an unusual occurrence.

Provide range-of-motion exercises every 8 hours.

Place antiembolism stockings on the client as prescribed.

Administer anticonvulsants, antacids, corticosteroids, and antibiotics as prescribed.

Administer analgesics such as codeine sulfate or acetaminophen (Tylenol) as prescribed for pain.

**Box 66-11 Client Positioning Following Craniotomy**

Positions prescribed following a craniotomy vary with the type of surgery and the specific postoperative physician's prescription.

Always check the physician's prescription regarding client positioning.

Incorrect positioning may cause serious and possibly fatal complications.

**Removal of a Bone Flap for Decompression**

To facilitate brain expansion, the client should be turned from the back to the nonoperative side, but not to the side operated on.

**Posterior Fossa Surgery**

To protect the operative site from pressure and minimize tension on the suture line, position the client on the side, with a pillow under the head for support and not on the back.

**Infratentorial Surgery**

Infratentorial surgery involves surgery below the tentorium of the brain.

The physician may prescribe a flat position without head elevation or may prescribe the head of the bed to be elevated at 30 to 45 degrees.

Do not elevate the head of the bed in the acute phase of care following surgery without a physician's prescription.

**Supratentorial Surgery**

Supratentorial surgery involves surgery above the tentorium of the brain.

The physician may prescribe the head of the bed to be elevated at 30 degrees to promote venous outflow through the jugular veins.

Do not lower the head of the bed in the acute phase of care following surgery without a physician's prescription.

- a. Surgical procedure that involves an incision through the cranium to remove accumulated blood or a tumor
  - b. Complications of the procedure include **increased ICP** from cerebral edema, hemorrhage, or obstruction of the normal flow of CSF.
  - c. Additional complications include hematomas, hypovolemic shock, hydrocephalus, respiratory and neurogenic complications, pulmonary edema, and wound infections.
  - d. Complications related to fluid and electrolyte imbalances include diabetes insipidus and inappropriate secretion of antidiuretic hormone.
2. Preoperative interventions
    - a. Explain the procedure to the client and family.
    - b. Ensure that an informed consent has been obtained.
    - c. Prepare to shave the client's head as prescribed (usually done in the operating room) and cover the head with an appropriate covering.
    - d. Stabilize the client before surgery.
  3. Postoperative interventions (Box 66-10)
  4. Postoperative positioning (Box 66-11)

**VIII. SPINAL CORD INJURY****A. Description**

1. Trauma to the spinal cord causes partial or complete disruption of the nerve tracts and neurons.

2. The injury can involve contusion, laceration, or compression of the cord.
3. Spinal cord edema develops; necrosis of the spinal cord can develop as a result of compromised capillary circulation and venous return.
4. Loss of motor function, sensation, reflex activity, and bowel and bladder control may result.
5. The most common causes include motor vehicle accidents, falls, sporting and industrial accidents, and gunshot or stab wounds.
6. Complications related to the injury include respiratory failure, **autonomic dysreflexia**, **spinal shock**, further cord damage, and death.

**B.** Most frequently involved vertebrae

1. Cervical—C5, C6, and C7
2. Thoracic—T12
3. Lumbar—L1

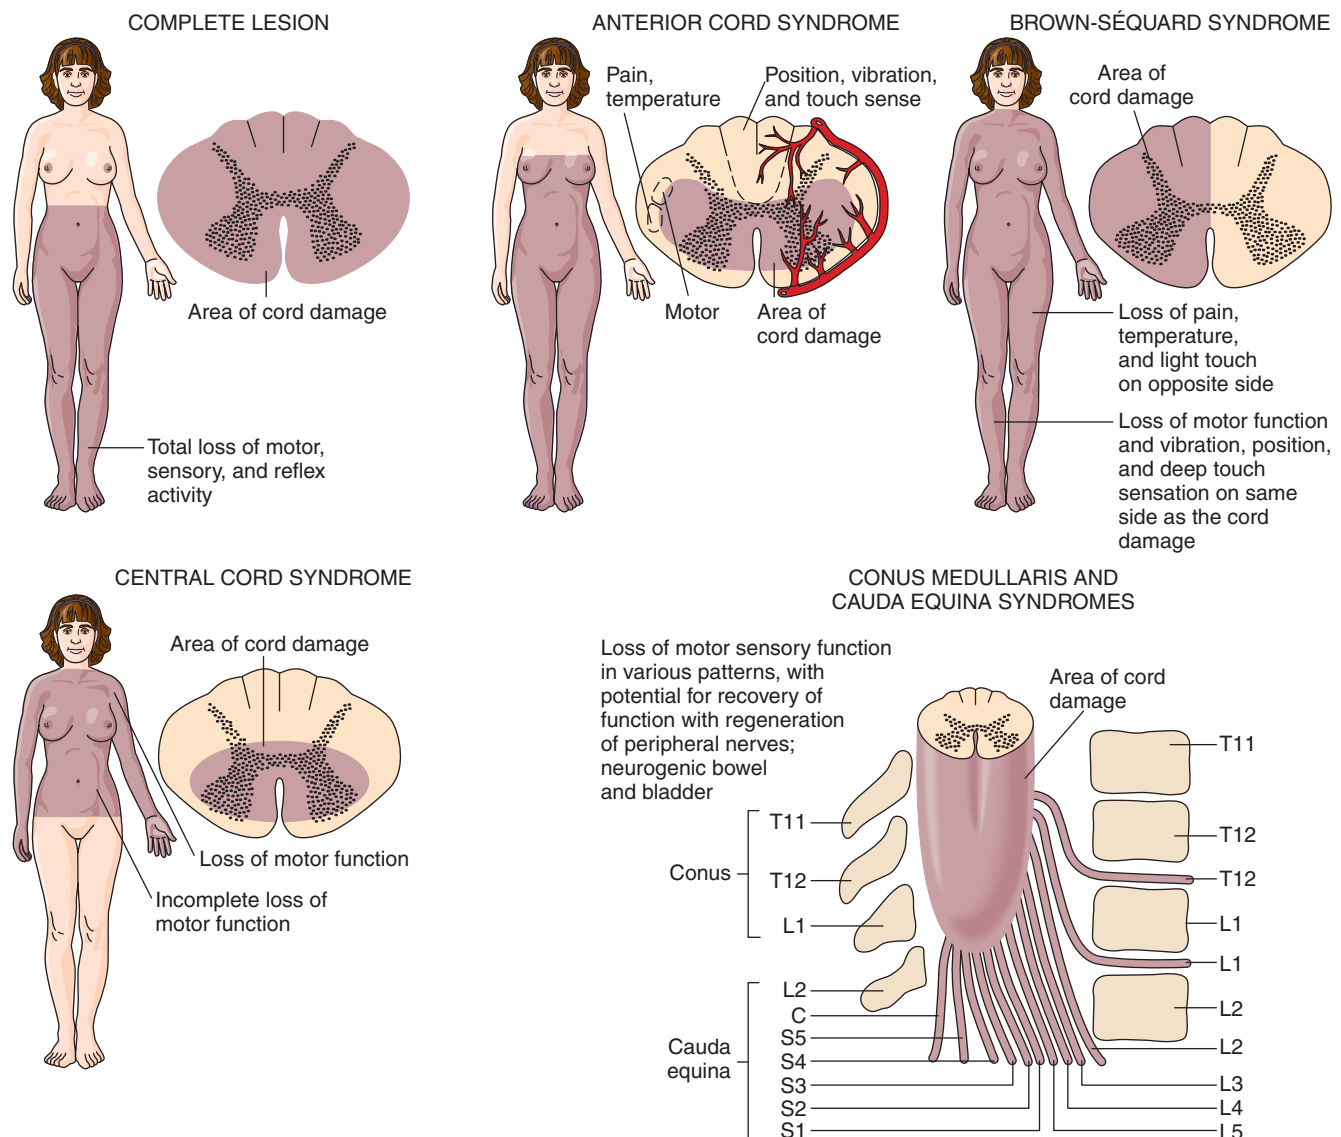

**C.** Transection of the cord

1. Complete transection of the cord: The spinal cord is severed completely, with total loss of sensation, movement, and reflex activity below the level of injury.
2. Partial transection of the cord
  - a. The spinal cord is damaged or severed partially.
  - b. The symptoms depend on the extent and location of the damage.
  - c. If the cord has not suffered irreparable damage, early treatment is needed to prevent partial damage from developing into total and permanent damage.

**D.** Spinal cord syndromes in incomplete injury (Fig. 66-3)

1. Central cord syndrome

- a. Central cord syndrome occurs from a lesion in the central portion of the spinal cord.

**▲ FIGURE 66-3** Common spinal cord syndromes. (From Ignatavicius, D., and Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

- b. Loss of motor function is more pronounced in the upper extremities, and varying degrees and patterns of sensation remain intact.
  - 2. Anterior cord syndrome
    - a. Anterior cord syndrome is caused by damage to the anterior portion of the gray and white matter of the spinal cord.
    - b. Motor function, pain, and temperature sensation are lost below the level of injury; however, the sensations of position, vibration, and touch remain intact.
  - 3. Posterior cord syndrome
    - a. Posterior cord syndrome is caused by damage to the posterior portion of the gray and white matter of the spinal cord.
    - b. Motor function remains intact, but the client experiences a loss of vibratory sense, crude touch, and position sensation.
  - 4. Brown-Séquard syndrome
    - a. Brown-Séquard syndrome results from penetrating injuries that cause hemisection of the spinal cord or injuries that affect half the cord.
    - b. Motor function, vibration, proprioception, and deep touch sensations are lost on the same side of the body (ipsilateral) as the lesion or cord damage.
    - c. On the opposite side of the body (contralateral) from the lesion or cord damage, the sensations of pain, temperature, and light touch are affected.
  - 5. Conus medullaris syndrome
    - a. Conus medullaris syndrome follows damage to the lumbar nerve roots and conus medullaris in the spinal cord.
    - b. Client experiences bowel and bladder areflexia and flaccid lower extremities.
    - c. If damage is limited to the upper sacral segments of the spinal cord, bulbospongiosus penile (erection) and micturition reflexes will remain.
  - 6. Cauda equina syndrome
    - a. Cauda equina syndrome occurs from injury to the lumbosacral nerve roots below the conus medullaris.
    - b. The client experiences areflexia of the bowel, bladder, and lower reflexes.
-  **E. Assessment of spinal cord injuries (Box 66-12)**
- 1. Dependent on the level of the cord injury
  - 2. Level of spinal cord injury: Lowest spinal cord segment with intact motor and sensory function
  - 3. Respiratory status changes
  - 4. Motor and sensory changes below the level of injury
  - 5. Total sensory loss and motor paralysis below the level of injury
  - 6. Loss of reflexes below the level of injury
- 7. Loss of bladder and bowel control
  - 8. Urinary retention and bladder distention
  - 9. Presence of sweat, which does not occur on paralyzed areas
- F. Cervical injuries** 
- 1. Injury at C2 to C3 is usually fatal.
  - 2. C4 is the major innervation to the diaphragm by the phrenic nerve.
  - 3. Involvement above C4 causes respiratory difficulty and paralysis of all four extremities.
  - 4. Client may have movement in the shoulder if the injury is at C5 through C8, and may also have decreased respiratory reserve.
- G. Thoracic level injuries** 
- 1. Loss of movement of the chest, trunk, bowel, bladder, and legs may occur, depending on the level of injury.
  - 2. Leg paralysis (paraplegia) may occur.
  - 3. **Autonomic dysreflexia** with lesions or injuries above T6 and in cervical lesions may occur.
  - 4. Visceral distention from a noxious stimuli such as a distended bladder or impacted rectum may cause reactions such as sweating, bradycardia, hypertension, nasal stuffiness, and goose flesh.
- H. Lumbar and sacral level injuries** 
- 1. Loss of movement and sensation of the lower extremities may occur.
  - 2. S2 and S3 center on micturition; therefore, below this level, the bladder will contract but not empty (neurogenic bladder).
  - 3. Injury above S2 in males allows them to have an erection, but they are unable to ejaculate because of sympathetic nerve damage.
  - 4. Injury between S2 and S4 damages the sympathetic and parasympathetic response, preventing erection or ejaculation.
- I. Emergency interventions** 
-  **Always suspect spinal cord injury when trauma occurs until this injury is ruled out. Immobilize the client on a spinal backboard with the head in a neutral position to prevent an incomplete injury from becoming complete.**
- 1. Emergency management is critical because improper movement can cause further damage and loss of neurological function.

### Box 66-12 Effects of Spinal Cord Injury

#### Tetraplegia (Quadriplegia)

Injury occurring between C1 and C8  
Paralysis involving all four extremities

#### Paraplegia

Injury occurring between T1 and L4  
Paralysis involving only the lower extremities

2. Assess the respiratory pattern and maintain a patent airway.
3. Prevent head flexion, rotation, or extension.
4. During immobilization, maintain traction and alignment on the head by placing hands on both sides of the head by the ears.
5. Maintain an extended position.
6. Logroll the client.
7. No part of the body should be twisted or turned, and the client is not allowed to assume a sitting position.
8. In the emergency department, a client who has sustained a cervical fracture should be placed immediately in skeletal traction via **skull tongs** or **halo traction** to immobilize the cervical spine and reduce the fracture and dislocation (Fig. 66-4).

#### J. Interventions during hospitalization

1. Respiratory system
  - a. Assess respiratory status because paralysis of the intercostal and abdominal muscles occurs with C4 injuries.
  - b. Monitor arterial blood gas levels and maintain mechanical ventilation if prescribed to prevent respiratory arrest, especially with cervical injuries.
  - c. Encourage deep breathing and the use of an incentive spirometer.
  - d. Monitor for signs of infection, particularly pneumonia.
2. Cardiovascular system
  - a. Monitor for cardiac dysrhythmias.
  - b. Assess for signs of hemorrhage or bleeding around the fracture site.
  - c. Assess for signs of shock, such as hypotension, tachycardia, and a weak and thready pulse.
3. Neuromuscular system
  - a. Assess neurological status.
  - b. Assess motor and sensory status to determine the level of injury.
  - c. Assess motor ability by testing the client's ability to squeeze hands, spread the fingers, move the toes, and turn the feet.
  - d. Assess absence of sensation, hyposensation, or hypersensation by pinching the skin or pricking it with a pin, starting at the shoulders and working down the extremities.
  - e. Monitor for signs of **autonomic dysreflexia** and **spinal shock**.
  - f. Immobilize the client to promote healing and prevent further injury.
  - g. Assess pain.
  - h. Initiate measures to reduce pain.
    - i. Administer analgesics as prescribed.
    - j. Monitor for complications of immobility.
  - k. Prepare the client for decompression laminectomy, spinal fusion, or insertion of instrumentation or rods if prescribed.
  - l. Collaborate with the physical therapist and occupational therapist to determine appropriate exercise techniques, assess the need for hand and wrist splints, and develop an appropriate plan to prevent footdrop.

▲ **FIGURE 66-4** Types of cervical spine traction. (From Ignatavicius, D., and Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

4. Gastrointestinal system
  - a. Assess abdomen for distention and hemorrhage.
  - b. Monitor bowel sounds and assess for paralytic ileus.
  - c. Prevent bowel retention.
  - d. Initiate a bowel control program as appropriate.
  - e. Maintain adequate nutrition and a high-fiber diet.
5. Renal system
  - a. Prevent urinary retention.
  - b. Initiate a bladder control program as appropriate.
  - c. Maintain fluid and electrolyte balance.
  - d. Maintain adequate fluid intake of 2000 mL/day.
  - e. Monitor for urinary tract infection and calculi.
6. Integumentary system
  - a. Assess skin integrity.
  - b. Turn the client every 2 hours.
7. Psychosocial integrity
  - a. Assess psychosocial status.
  - b. Encourage the client to express feelings of anger and depression.
  - c. Discuss the sexual concerns of the client.
  - d. Promote rehabilitation with self-care measures, setting realistic goals based on the client's potential functional level.
  - e. Encourage contact with appropriate community resources.

#### K. Spinal shock

1. Description
  - a. **Spinal shock** is also known as neurogenic shock.
  - b. A sudden depression of reflex activity in the spinal cord occurs below the level of injury (areflexia).
  - c. **Spinal shock** occurs within the first hour of injury and can last days to months.
  - d. The muscles become completely paralyzed and flaccid, and reflexes are absent.
  - e. **Spinal shock** ends when the reflexes are regained.
2. Assessment (Box 66-13)
3. Interventions
  - a. Monitor for signs of **spinal shock** following a spinal cord injury.
  - b. Monitor for hypotension and bradycardia.
  - c. Monitor for reflex activity.
  - d. Assess bowel sounds.
  - e. Monitor for bowel and urinary retention.
  - f. Provide supportive measures as prescribed, based on the presence of symptoms.
  - g. Monitor for the return of reflexes.

#### L. Autonomic dysreflexia

1. Description
  - a. **Autonomic dysreflexia** is also known as autonomic hyperreflexia.

- b. **Autonomic dysreflexia** generally occurs after the period of **spinal shock** is resolved and occurs with lesions or injuries above T6 and in cervical lesions.
- c. It is commonly caused by visceral distention from a distended bladder or impacted rectum.
- d. It is a neurological emergency and must be treated immediately to prevent a hypertensive stroke.

2. Assessment (see Box 66-13)

3. Interventions (see Priority Nursing Actions)

#### M. Cervical spine traction for cervical injuries (see Fig. 66-4)

1. Description

- a. Skeletal traction is used to stabilize fractures or dislocations of the cervical or upper thoracic spine.
- b. Two types of equipment used for cervical traction are skull (cervical) tongs and **halo traction** (halo fixation device).

2. **Skull tongs**

- a. **Skull tongs** are inserted into the outer aspect of the client's skull, and traction is applied.
- b. Weights are attached to the tongs, and the client is used as countertraction.
- c. Monitor the neurological status of the client.
- d. Determine the amount of weight prescribed to be added to the traction.
- e. Ensure that weights hang securely and freely at all times.
- f. Ensure that the ropes for the traction remain within the pulley.
- g. Maintain body alignment and maintain care of the client on a special bed (such as a RotoRest bed or Stryker or Foster frame) as prescribed.
- h. Turn the client every 2 hours.

### Box 66-13 Spinal Shock and Autonomic Dysreflexia

#### Spinal Shock

Flaccid paralysis

Loss of reflex activity below the level of the injury

Bradycardia

Paralytic ileus

Hypotension

#### Autonomic Dysreflexia

Sudden onset, severe throbbing headache

Severe hypertension

Flushing above the level of the injury

Pale extremities below the level of the injury

Nasal stuffiness

Nausea

Dilated pupils or blurred vision

Sweating

Piloerection (goose bumps)

Restlessness and a feeling of apprehension

- i. Assess insertion site of the tongs for infection.
  - j. Provide sterile pin site care as prescribed.
3. **Halo traction**
- a. **Halo traction** is a static traction device that consists of a headpiece with four pins, two anterior and two posterior, inserted into the client's skull.
  - b. The metal halo ring may be attached to a vest (jacket) or cast when the spine is stable, allowing increased client mobility.

### PRIORITY NURSING ACTIONS!

#### Actions to Take for a Spinal Cord Injury Client Who Develops Autonomic Dysreflexia

1. Raise the head of the bed.
2. Loosen tight clothing on the client.
3. Check for bladder distention or other noxious stimulus.
4. Administer an antihypertensive medication.
5. Document the occurrence, treatment, and response.

Autonomic dysreflexia is characterized by severe hypertension, bradycardia, severe headache, nasal stuffiness, and flushing. The cause is a noxious stimulus, most often a distended bladder or constipation. Autonomic dysreflexia is a neurological emergency and must be treated promptly to prevent a hypertensive stroke. Immediate nursing actions are to contact the physician and sit the client up in bed in a high Fowler's position and remove the noxious stimulus. The nurse would loosen any tight clothing and then check for bladder distention. If the client has a Foley catheter, the nurse would check for kinks in the tubing. The nurse also would check for a fecal impaction and disimpact the client, if necessary. The nurse assesses the environment to ensure that it is not too cool or too drafty and also monitors vital signs, particularly the blood pressure, every 15 minutes. Antihypertensive medication may be prescribed by the physician to minimize cerebral hypertension. Finally, the nurse documents the occurrence, treatment, and client response.

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 998). St. Louis: Saunders.

- c. Monitor the client's neurological status for changes in movement or decreased strength.
  - d. Never move or turn the client by holding or pulling on the **halo traction** device.
  - e. Assess for tightness of the jacket by ensuring that one finger can be placed under the jacket.
  - f. Assess skin integrity to ensure that the jacket or cast is not causing pressure.
  - g. Provide sterile pin site care as prescribed.
4. Client education for **halo traction** device (Box 66-14)
  5. Initiate interventions in support of the client's self image.
  6. Teach the client and family pin care, care of the vest, and signs and symptoms of infection to report to his or her health care provider.
- N. Interventions for thoracic, lumbar, and sacral injuries**
1. Bed rest
  2. Immobilization with a body cast if prescribed
  3. Assess for respiratory impairment and paralytic ileus, possible complications of the body cast.
  4. Use of a brace or corset when the client is out of bed
- O. Surgical interventions for thoracic, lumbar, and sacral injuries**
1. Decompressive laminectomy
    - a. Removal of one or more laminae
    - b. Allows for cord expansion from edema; performed if conventional methods fail to prevent neurological deterioration
  2. Spinal fusion
    - a. Spinal fusion is used for thoracic spinal injuries.
    - b. Bone is grafted between the vertebrae for support and to strengthen the back.
  3. Postoperative interventions
    - a. Monitor for respiratory impairment.
    - b. Monitor vital signs, motor function, sensation, and circulatory status in the lower extremities.
    - c. Encourage breathing exercises.

#### Box 66-14 Client Education for a Halo Fixation Device

Notify the physician if the halo vest (jacket) or ring bolts loosen.

Use fleece or foam inserts to relieve pressure points.

Keep the vest lining dry.

Clean the pin site daily.

Notify the physician if redness, swelling, drainage, open areas, pain, tenderness, or a clicking sound occurs from the pin site.

A sponge bath or tub bath is allowed; showers are prohibited.

Assess the skin under the vest daily for breakdown, using a flashlight.

Do not use any products other than shampoo on the hair.

When shampooing the hair, cover the vest with plastic.

When getting out of bed, roll onto the side and push on the mattress with the arms.

Never use the metal frame for turning or lifting.

Use a rolled towel or pillowcase between the back of the neck and bed or next to the cheek when lying on the side, and raise the head of the bed to increase sleep comfort.

Adapt clothing to fit over the halo device.

Eat foods high in protein and calcium to promote bone healing. Have the correct-sized wrench available at all times for an emergency (tape the wrench to the vest).

If cardiopulmonary resuscitation is required, the anterior portion of the vest will be loosened and the posterior portion will remain in place to provide stability.

- d. Assess for signs of fluid and electrolyte imbalances.
- e. Observe for complications of immobility.
- f. Keep the client in a flat position as prescribed.
- g. Provide cast care if the client is in a full body cast.
- h. Turn and reposition frequently by logrolling side to back to side, using turning sheets and pillows between the legs to maintain alignment.
- i. Administer pain medication as prescribed.
- j. Maintain on NPO status until the client is passing flatus.
- k. Monitor bowel sounds.
  - l. Provide the use of a fracture bedpan.
- m. Monitor intake and output.
- n. Maintain nutritional status.

#### P. Medications

1. Dexamethasone (Decadron)
  - a. Used for its anti-inflammatory and edema-reducing effects
  - b. May interfere with healing
2. Dextran: Plasma expander used to increase capillary blood flow within the spinal cord and to prevent or treat hypotension
3. Dantrolene (Dantrium), baclofen (Lioresal): These medications are used for clients with upper motor neuron injuries to control muscle spasticity.

### IX. CEREBRAL ANEURYSM

#### A. Description

1. Dilation of the walls of a weakened cerebral artery
2. Aneurysm can lead to rupture.

#### B. Assessment

1. Headache and pain
2. Irritability
3. Diplopia
4. Blurred vision
5. Tinnitus
6. Hemiparesis
7. **Nuchal rigidity**
8. Seizures

#### C. Interventions

1. Maintain a patent airway (suction only with a physician's prescription).
2. Administer oxygen as prescribed.
3. Monitor vital signs and for hypertension or dysrhythmias.
4. Avoid taking temperatures via the rectum.
5. Initiate aneurysm precautions (Box 66-15)

### X. SEIZURES

#### A. Description

1. Seizures are an abnormal, sudden, excessive discharge of electrical activity within the brain.

2. Epilepsy is a disorder characterized by chronic seizure activity and indicates brain or CNS irritation.
3. Causes include genetic factors, trauma, tumors, circulatory or metabolic disorders, toxicity, and infections.
4. Status epilepticus involves a rapid succession of epileptic spasms without intervals of consciousness; it is a potential complication that can occur with any type of seizure, and brain damage may result.

#### B. Types of seizures (Box 66-16)

1. Generalized seizures
2. Partial seizures

#### C. Assessment

1. Seizure history
2. Type of seizure
3. Occurrences before, during, and after the seizure
4. Prodromal signs, such as mood changes, irritability, and insomnia
5. Aura: Sensation that warns the client of the impending seizure
6. Loss of motor activity or bowel and bladder function or loss of consciousness during the seizure
7. Occurrences during the postictal state, such as headache, loss of consciousness, sleepiness, and impaired speech or thinking

#### Box 66-15 Aneurysm Precautions

Maintain the client on bed rest in a semi-Fowler's or a side-lying position.

Maintain a darkened room (subdued lighting and avoid direct, bright, artificial lights) without stimulation (a private room is optimal).

Provide a quiet environment (avoid activities or startling noises); a telephone in the room is not usually allowed.

Reading, watching television, and listening to music are permitted, provided that they do not overstimulate the client.

Limit visitors.

Maintain fluid restrictions.

Provide diet as prescribed; avoid stimulants in the diet.

Prevent any activities that initiate the Valsalva maneuver (straining at stool, coughing); provide stool softeners to prevent straining.

Administer care gently (such as the bath, back rub, range of motion).

Limit invasive procedures.

Maintain normothermia.

Prevent hypertension.

Provide sedation.

Provide pain control.

Administer prophylactic anticonvulsant medications.

Provide deep vein thrombosis (DVT) prophylaxis as prescribed.

**Box 66-16 Types of Seizures****Generalized Seizures****Tonic-Clonic**

Tonic-clonic seizures may begin with an aura.

The tonic phase involves the stiffening or rigidity of the muscles of the arms and legs and usually lasts 10 to 20 seconds, followed by loss of consciousness.

The clonic phase consists of hyperventilation and jerking of the extremities and usually lasts about 30 seconds.

Full recovery from the seizure may take several hours.

**Absence**

A brief seizure that lasts seconds, and the individual may or may not lose consciousness.

No loss or change in muscle tone occurs.

Seizures may occur several times during a day.

The victim appears to be daydreaming.

This type of seizure is more common in children.

**Myoclonic**

Myoclonic seizures present as a brief generalized jerking or stiffening of extremities.

The victim may fall to the ground from the seizure.

**Atonic or Akinetic (Drop Attacks)**

An atonic seizure is a sudden momentary loss of muscle tone.

The victim may fall to the ground as a result of the seizure.

**Partial Seizures****Simple Partial**

The simple partial seizure produces sensory symptoms accompanied by motor symptoms that are localized or confined to a specific area.

The client remains conscious and may report an aura.

**Complex Partial**

The complex partial seizure is a psychomotor seizure.

The area of the brain most usually involved is the temporal lobe.

The seizure is characterized by periods of altered behavior of which the client is not aware.

The client loses consciousness for a few seconds.

**D. Interventions**

 **If the client is having a seizure, maintain a patent airway. Do not force the jaws open or place anything in the client's mouth.**

1. Note the time and duration of the seizure.
2. Assess behavior at the onset of the seizure: If the client has experienced an aura, if a change in facial expression occurred, or if a sound or cry occurred from the client
3. If the client is standing or sitting, place the client on the floor and protect the head and body.
4. Support the ABCs (airway, breathing, and circulation).
5. Administer oxygen.
6. Prepare to suction secretions.
7. Turn the client to the side to allow secretions to drain while maintaining the airway.
8. Prevent injury during the seizure.
9. Remain with the client.
10. Do not restrain the client.
11. Loosen restrictive clothing.
12. Note the type, character, and progression of the movements during the seizure.
13. Monitor for incontinence.
14. Administer intravenous medications as prescribed to stop the seizure.
15. Document the characteristics of the seizure.
16. Provide privacy, if possible.
17. Monitor behavior following the seizure, such as the state of consciousness, motor ability, and speech ability.

18. Instruct the client about the importance of life-long medication and the need for follow-up determination of medication blood levels.
19. Instruct the client to avoid alcohol, excessive stress, fatigue, and strobe lights.
20. Encourage the client to contact available community resources, such as the Epilepsy Foundation of America.
21. Encourage the client to wear a Medic-Alert bracelet.

**XI. STROKE (BRAIN ATTACK)****A. Description**

1. A stroke or brain attack, formerly known as a cerebrovascular accident (CVA), is a sudden focal neurological deficit caused by cerebrovascular disease.
2. A stroke is a syndrome in which the cerebral circulation is interrupted, causing neurological deficits.
3. Cerebral anoxia lasting longer than 10 minutes causes cerebral infarction with irreversible change.
4. Cerebral edema and congestion cause further dysfunction.
5. Diagnosis is determined by a CT scan, electroencephalography, cerebral arteriography, and MRI.
6. Transient ischemic attack may be a warning sign of an impending stroke
7. The permanent disability cannot be determined until the cerebral edema subsides.
8. The order in which function may return is facial, swallowing, lower limb, speech, and arms.
9. Carotid endarterectomy is a surgical intervention used in stroke management; it is targeted at stroke prevention, especially in clients with symptomatic carotid stenosis.

**Right-brain damage**

(stroke on right side of the brain)

- Paralyzed left side: hemiplegia
- Left-sided neglect
- Spatial-perceptual deficits
- Tends to deny or minimize problems
- Rapid performance, short attention span
- Impulsive, safety problems
- Impaired judgment
- Impaired time concepts

**Left-brain damage**

(stroke on left side of the brain)

- Paralyzed right side: hemiplegia
- Impaired speech/language aphasias
- Impaired right/left discrimination
- Slow performance, cautious
- Aware of deficits: depression, anxiety
- Impaired comprehension related to language, math

**▲ FIGURE 66-5** Manifestations of right brain and left brain stroke. (From Lewis, S., Heitkemper, M., Dirksen, S., O'Brien, P., & Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

**B. Causes**

1. Thrombosis
2. Embolism
3. Hemorrhage from rupture of a vessel

**C. Risk factors**

1. Atherosclerosis
2. Hypertension
3. Anticoagulation therapy
4. Diabetes mellitus
5. Stress
6. Obesity
7. Oral contraceptives

**D. Assessment** (Fig. 66-5; Boxes 66-17 and 66-18)

**▲** A critical factor in the early intervention and treatment of stroke is the accurate identification of stroke manifestations and establishing the onset of the manifestations. Stroke screening scales may be used to quickly identify stroke manifestations.

1. Assessment findings depend on the area of the brain affected.
2. Lesions in the cerebral hemisphere result in manifestations on the contralateral side, which is the side of the body opposite the stroke.

**Box 66-17 Neurological Assessment in Stroke**

Changes in level of consciousness  
 Signs of increasing intracranial pressure  
 Assessment of cranial nerves V, VII, IX, X, and XII  
 Cranial nerve V: Difficulty with chewing  
 Cranial nerve VII: Facial paralysis or paresis  
 Cranial nerves IX and X: Dysphagia  
 Cranial nerve IX: Absent gag reflex  
 Cranial nerve XII: Impaired tongue movement

**Box 66-18 Assessment Findings in a Stroke (Brain Attack)****Agnosia**

The inability to recognize familiar objects or persons

**Apraxia**

Called dyspraxia if the condition is mild  
 Characterized by loss of ability to execute or carry out skilled movements or gestures, despite having the desire and physical ability to perform them

**Hemianopsia**

Blindness in half the visual field

**Homonymous Hemianopsia**

Loss of half of the field of view on the same side in both eyes.

**Neglect Syndrome (Unilateral Neglect)**

Client unaware of the existence of his or her paralyzed side

**Proprioception Alterations**

Altered position sense that places the client at increased risk of injury

*Pyramid Point:* With visual problems, the client must turn the head to scan the complete range of vision.

3. Airway patency is always a priority.
4. Pulse (may be slow and bounding)
5. Respirations (Cheyne-Stokes)
6. Blood pressure (hypertension)
7. Headache, nausea, and vomiting
8. Facial drooping
9. **Nuchal rigidity**
10. Visual changes
11. Ataxia
12. Dysarthria
13. Dysphagia
14. Speech changes
15. Decreased sensation to pressure, heat, and cold
16. Bowel and bladder dysfunctions
17. Paralysis

**E. Aphasia**

1. Expressive
  - a. Damage occurs in Broca's area of the frontal brain.

- b. The client understands what is said but is unable to communicate verbally.
- 2. Receptive
  - a. Injury involves Wernicke's area in the temporoparietal area.
  - b. The client is unable to understand the spoken and often the written word.
- 3. Global or mixed: Language dysfunction occurs in expression and reception.
- 4. Interventions for aphasia
  - a. Provide repetitive directions.
  - b. Break tasks down to one step at a time.
  - c. Repeat names of objects frequently used.
  - d. Allow time for the client to communicate.
  - e. Use a picture board, communication board, or computer technology.

-  **F. Interventions during the acute phase of stroke**
  - 1. Maintain a patent airway and administer oxygen as prescribed.
  - 2. Monitor vital signs.
  - 3. Usually a blood pressure of 150/100 mm Hg is maintained to ensure cerebral perfusion.
  - 4. Suction secretions as prescribed, but never suction nasally or for longer than 10 seconds to prevent **increased ICP**.
  - 5. Monitor for **increased ICP** because the client is most at risk during the first 72 hours following the stroke.
  - 6. Position the client on the side, with the head of bed elevated 15 to 30 degrees as prescribed.
  - 7. Monitor level of consciousness, pupillary response, motor and sensory response, cranial nerve function, and reflexes.
  - 8. Maintain a quiet environment.
  - 9. Insert a Foley catheter as prescribed.
  - 10. Administer intravenous fluids as prescribed.
  - 11. Maintain fluid and electrolyte balance.
  - 12. Prepare to administer anticoagulants, antiplatelets, diuretics, antihypertensives, and anticonvulsants as prescribed.
  - 13. Establish a form of communication.

-  **G. Interventions in the postacute phase of a stroke**
  - 1. Continue with interventions from the acute phase.
  - 2. Position the client 2 hours on the unaffected side and 20 minutes on the affected side.
  - 3. Position the client in the prone position if prescribed, for 30 minutes three times daily.
  - 4. Provide skin, mouth, and eye care.
  - 5. Perform passive range-of-motion exercises to prevent contractures.
  - 6. Place antiembolism stockings on the client; remove daily to check skin.
  - 7. Measure thighs and calves daily for an increase in size.
  - 8. Monitor the gag reflex and ability to swallow.
  - 9. Provide sips of fluids and slowly advance diet to foods that are easy to chew and swallow.

- 10. Provide soft and semisoft foods and flavored, cool or warm, thickened fluids rather than thin liquids because the stroke client can tolerate these types of food better; speech therapists may do swallow studies to recommend consistency of food and fluids.
- 11. When the client is eating, position the client sitting in a chair or sitting up in bed, with the head and neck positioned slightly forward and flexed.
- 12. Place food in the back of the mouth on the unaffected side to prevent trapping of food in the affected cheek.

- H. Interventions in the chronic phase of stroke** 
  - 1. Neglect syndrome
    - a. Client is unaware of the existence of his or her paralyzed side (**unilateral neglect**), which places the client at risk for injury.
    - b. Teach the client to touch and use both sides of the body.
  - 2. **Hemianopsia**
    - a. Client has blindness in half the visual field.
    - b. **Homonymous hemianopsia** is blindness in the same visual field of both eyes.
    - c. Encourage the client to turn the head to scan the complete range of vision; otherwise, he or she does not see half of the visual field.
  - 3. Approach the client from the unaffected side.
  - 4. Place the client's personal objects within the visual field.
  - 5. Provide eye care for visual deficits.
  - 6. Place a patch over the affected eye if the client has diplopia.
  - 7. Increase mobility as tolerated.
  - 8. Encourage fluid intake and a high-fiber diet.
  - 9. Administer stool softeners as prescribed.
  - 10. Encourage the client to express her or his feelings.
  - 11. Encourage independence in activities of daily living.
  - 12. Assess the need for assistive devices such as a cane, walker, splint, or braces.
  - 13. Teach transfer technique from bed to chair and from chair to bed.
  - 14. Provide gait training.
  - 15. Initiate physical and occupational therapy for assessment and the need for adaptive equipment or other supports for self-care and mobility.
  - 16. Refer client to a speech and language pathologist as prescribed.
  - 17. Encourage the client and family to contact available community resources.

## XII. MULTIPLE SCLEROSIS

- A. Description**
  - 1. Multiple sclerosis is a chronic, progressive, non-contagious, degenerative disease of the CNS characterized by demyelination of the neurons.

2. It usually occurs between the ages of 20 and 40 years and consists of periods of remissions and exacerbations.
3. The causes are unknown, but the disease is thought to be the result of an autoimmune response or viral infection.
4. Precipitating factors include pregnancy, fatigue, stress, infection, and trauma.
5. Electroencephalographic findings are abnormal.
6. Assessment of a lumbar puncture indicates an increased gamma globulin level, but the serum globulin level is normal.

#### B. Assessment

1. Fatigue and weakness
2. Ataxia and vertigo
3. Tremors and spasticity of the lower extremities
4. Parasthesias
5. Blurred vision, diplopia, and transient blindness
6. Nystagmus
7. Dysphasia
8. Decreased perception to pain, touch, and temperature
9. Bladder and bowel disturbances, including urgency, frequency, retention, and incontinence
10. Abnormal reflexes, including hyperreflexia, absent reflexes, and a positive **Babinski reflex**
11. Emotional changes such as apathy, euphoria, irritability, and depression
12. Memory changes and confusion

#### C. Interventions

1. Provide energy conservation measures during exacerbation.
2. Protect the client from injury by providing safety measures.
3. Place an eye patch on the eye for diplopia.
4. Monitor for potential complications such as urinary tract infections, calculi, pressure ulcers, respiratory tract infections, and contractures.
5. Promote regular elimination by bladder and bowel training.
6. Encourage independence.
7. Assist the client to establish a regular exercise and rest program.
8. Instruct the client to balance moderate activity with rest periods.
9. Assess the need for and provide assistive devices.
10. Initiate physical and speech therapy.
11. Instruct the client to avoid fatigue, stress, infection, overheating, and chilling.
12. Instruct the client to increase fluid intake and eat a balanced diet, including low-fat, high-fiber foods and foods high in potassium.
13. Instruct the client in safety measures related to sensory loss, such as regulating the temperature of bath water and avoiding heating pads.

14. Instruct the client in safety measures related to motor loss, such as avoiding the use of scatter rugs and using assistive devices.
15. Instruct the client in the self-administration of prescribed medications.
16. Provide information about the National Multiple Sclerosis Society.

### XIII. MYASTHENIA GRAVIS

#### A. Description

1. Myasthenia gravis is a neuromuscular disease characterized by considerable weakness and abnormal fatigue of the voluntary muscles.
2. A defect in the transmission of nerve impulses at the myoneural junction occurs.
3. Causes include insufficient secretion of acetylcholine, excessive secretion of cholinesterase, and unresponsiveness of the muscle fibers to acetylcholine.

#### B. Assessment

1. Weakness and fatigue
2. Difficulty chewing
3. Dysphagia
4. Ptosis
5. Diplopia
6. Weak, hoarse voice
7. Difficulty breathing
8. Diminished breath sounds
9. Respiratory paralysis and failure

#### C. Interventions

1. Monitor respiratory status and ability to cough and deep-breathe adequately.
2. Monitor for respiratory failure.
3. Maintain suctioning and emergency equipment at the bedside.
4. Monitor vital signs.
5. Monitor speech and swallowing abilities to prevent aspiration.
6. Encourage the client to sit up when eating.
7. Assess muscle status.
8. Instruct the client to conserve strength.
9. Plan short activities that coincide with times of maximal muscle strength.
10. Monitor for myasthenic and cholinergic crises.
11. Administer anticholinesterase medications as prescribed.
12. Instruct the client to avoid stress, infection, fatigue, and over-the-counter medications.
13. Instruct the client to wear a Medic-Alert bracelet.
14. Inform the client about services from the Myasthenia Gravis Foundation.

#### D. Anticholinesterase medications: Increase levels of acetylcholine at the myoneural junction (see Chapter 67)

#### E. Myasthenic crisis

1. Description
  - a. Myasthenic crisis is an acute exacerbation of the disease.

- b. The crisis is caused by a rapid, unrecognized progression of the disease, inadequate amount of medication, infection, fatigue, or stress.
2. Assessment
    - a. Increased pulse, respirations, and blood pressure
    - b. Dyspnea, anoxia, and cyanosis
    - c. Bowel and bladder incontinence
    - d. Decreased urine output
    - e. Absent cough and swallow reflex
  3. Interventions
    - a. Assess for signs of myasthenic crisis.
    - b. Increase anticholinesterase medication, as prescribed.

#### F. Cholinergic crisis

1. Description
  - a. Cholinergic crisis results in depolarization of the motor end plates.
  - b. The crisis is caused by overmedication with anticholinesterase.
2. Assessment
  - a. Abdominal cramps
  - b. Nausea, vomiting, and diarrhea
  - c. Blurred vision
  - d. Pallor
  - e. Facial muscle twitching
  - f. Hypotension
  - g. Pupillary miosis
3. Interventions
  - a. Hold anticholinesterase medication.
  - b. Prepare to administer the antidote, atropine sulfate, if prescribed.

#### G. Tensilon test

 **Have atropine sulfate available when performing the Tensilon test.**

1. Description
  - a. The **Tensilon test** is performed to diagnose myasthenia gravis and to differentiate between myasthenic crisis and cholinergic crisis.
  - b. The test places the client at risk for ventricular fibrillation and cardiac arrest; the nurse must be prepared for this possibility.
2. To diagnose myasthenia gravis
  - a. Edrophonium (Tensilon) injection is administered to the client.
  - b. Positive for myasthenia gravis: Client shows improvement in muscle strength after the administration of Tensilon.
  - c. Negative for myasthenia gravis: Client shows no improvement in muscle strength, and strength may even deteriorate after injection of Tensilon.
3. To differentiate crisis
  - a. Myasthenic crisis: Tensilon is administered and, if strength improves, the client needs more medication.

- b. Cholinergic crisis: Tensilon is administered and, if weakness is more severe, the client is overmedicated; administer atropine sulfate, the antidote, as prescribed.

#### XIV. PARKINSON'S DISEASE

##### A. Description

1. Parkinson's disease is a degenerative disease caused by the depletion of dopamine, which interferes with the inhibition of excitatory impulses, resulting in a dysfunction of the extrapyramidal system.
2. It is a slow, progressive disease that results in a crippling disability.
3. The debilitation can result in falls, self-care deficits, failure of body systems, and depression.
4. Mental deterioration occurs late in the disease.

##### B. Assessment

1. Bradykinesia, abnormal slowness of movement, and sluggishness of physical and mental responses
2. Akinesia
3. Monotonous speech
4. Handwriting that becomes progressively smaller
5. Tremors in hands and fingers at rest (pill rolling)
6. Tremors increasing when fatigued and decreasing with purposeful activity or sleep
7. Rigidity with jerky movements
8. Restlessness and pacing
9. Blank facial expression; mask-like facies
10. Drooling
11. Difficulty swallowing and speaking
12. Loss of coordination and balance
13. Shuffling steps, stooped position, and propulsive gait

##### C. Interventions

1. Assess neurological status.
2. Assess ability to swallow and chew.
3. Provide high-calorie, high-protein, high-fiber soft diet with small, frequent feedings.
4. Increase fluid intake to 2000 mL/day.
5. Monitor for constipation.
6. Promote independence along with safety measures.
7. Avoid rushing the client with activities.
8. Assist with ambulation and provide assistive devices.
9. Instruct the client to rock back and forth to initiate movement.
10. Instruct the client to wear low-heeled shoes.
11. Encourage the client to lift feet when walking and to avoid prolonged sitting.
12. Provide a firm mattress and position the client prone, without a pillow, to facilitate proper posture.
13. Instruct in proper posture by teaching the client to hold the hands behind the back to keep the spine and neck erect.

14. Promote physical therapy and rehabilitation.
15. Administer antiparkinsonian medications to increase the level of dopamine in the CNS.
16. Instruct the client to avoid foods high in vitamin B<sub>6</sub> because they block the effects of antiparkinsonian medications.
17. Instruct the client to avoid monoamine oxidase inhibitors because they will precipitate hypertensive crisis.
18. See Chapter 67 regarding medication to treat Parkinson's disease.

## XV. TRIGEMINAL NEURALGIA

### A. Description

1. Trigeminal neuralgia is a sensory disorder of the trigeminal (fifth cranial) nerve.
2. It results in severe, recurrent, sharp, facial pain along the trigeminal nerve.

### B. Assessment

1. Client has severe pain on the lips, gums, or nose, or across the cheeks.
2. Situations that stimulate symptoms include cold, washing the face, chewing, or food or fluids of extreme temperatures.

### C. Interventions

1. Instruct the client to avoid hot or cold foods and fluids.
2. Provide small feedings of liquid and soft foods.
3. Instruct the client to chew food on the unaffected side.
4. Administer medications as prescribed (see Chapter 67).

### D. Surgical interventions

1. Microvascular decompression: Surgical relocation of the artery that compresses the trigeminal nerve as it enters the pons may relieve pain without compromising facial sensation
2. Radiofrequency waveforms: Creates lesions that provides relief of pain without compromising touch or motor function
3. Rhizotomy: Resection of the root of the nerve to relieve pain.
4. Glycerol injection: Destroys the myelinated fibers of the trigeminal nerve (may take up to 3 weeks for pain relief to occur)

## XVI. BELL'S PALSY (FACIAL PARALYSIS)

### A. Description

1. Bell's palsy is caused by a lower motor neuron lesion of the seventh cranial nerve that may result from infection, trauma, hemorrhage, meningitis, or tumor.
2. It results in paralysis of one side of the face.
3. Recovery usually occurs in a few weeks, without residual effects.

### B. Assessment

1. Flaccid facial muscles
2. Inability to raise the eyebrows, frown, smile, close the eyelids, or puff out the cheeks
3. Upward movement of the eye when attempting to close the eyelid
4. Loss of taste

### C. Interventions

1. Encourage facial exercises to prevent the loss of muscle tone (a face sling may be prescribed to prevent stretching of weak muscles).
2. Protect the eyes from dryness and prevent injury.
3. Promote frequent oral care.
4. Instruct the client to chew on the unaffected side.

## XVII. GUILLAIN-BARRÉ SYNDROME

### A. Description

1. Guillain-Barré syndrome is an acute infectious neuronitis of the cranial and peripheral nerves.
2. The immune system overreacts to the infection and destroys the myelin sheath.
3. The syndrome usually is preceded by a mild upper respiratory infection or gastroenteritis.
4. The recovery is a slow process and can take years.

 The major concern in Guillain-Barré syndrome is difficulty breathing; monitor respiratory status closely.

### B. Assessment

1. Paresthesias
2. Pain and/or hypersensitivity such as with the weight of bed sheets or other items touching the body
3. Weakness of lower extremities
4. Gradual progressive weakness of the upper extremities and facial muscles
5. Possible progression to respiratory failure
6. Cardiac dysrhythmias
7. CSF that reveals an elevated protein level
8. Abnormal electroencephalogram

### C. Interventions

1. Care is directed toward the treatment of symptoms, including pain management.
2. Monitor respiratory status.
3. Provide respiratory treatments.
4. Prepare to initiate respiratory support.
5. Monitor cardiac status.
6. Assess for complications of immobility.
7. Provide the client and family with support.

## XVIII. AMYOTROPHIC LATERAL SCLEROSIS

### A. Description

1. Amyotrophic lateral sclerosis is also known as Lou Gehrig's disease.
2. It is a progressive degenerative disease involving the motor system.

3. The sensory and autonomic systems are not involved, and mental status changes do not result from the disease.
4. The cause of the disease may be related to an excess of glutamate, a chemical responsible for relaying messages between the motor neurons.
5. As the disease progresses, muscle weakness and atrophy develop until a flaccid tetraplegia develops.
6. Eventually, the respiratory muscles become affected, leading to respiratory compromise, pneumonia, and death.
7. No cure is known, and the treatment is symptomatic.

**B. Assessment**

1. Respiratory difficulty
2. Fatigue while talking
3. Muscle weakness and atrophy
4. Tongue atrophy
5. Dysphagia
6. Weakness of the hands and arms
7. Fasciculations of the face
8. Nasal quality of speech
9. Dysarthria

**C. Interventions**

1. Care is directed toward the treatment of symptoms.
2. Monitor respiratory status and institute measures to prevent aspiration.
3. Provide respiratory treatments.
4. Prepare to initiate respiratory support.
5. Assess for complications of immobility.
6. Address advance directives as appropriate.
7. Provide the client and family with support.

**XIX. ENCEPHALITIS****A. Description**

1. Encephalitis is an inflammation of the brain parenchyma and often of the meninges.
2. It affects the cerebrum, brainstem, and cerebellum.
3. It most often is caused by a viral agent, although bacteria, fungi, or parasites also may be involved.
4. Viral encephalitis is almost always preceded by a viral infection.

**B. Transmission**

1. Arboviruses can be transmitted to human beings through the bite of an infected mosquito or tick.
2. Echovirus, coxsackievirus, poliovirus, herpes zoster virus, and viruses that cause mumps and chickenpox are common enteroviruses associated with encephalitis.
3. Herpes simplex type 1 virus can cause viral encephalitis.
4. The organism that causes amebic meningoencephalitis can enter the nasal mucosa of persons swimming in warm fresh water—for example, in a pond or lake.

**C. Assessment**

1. Presence of cold sores, lesions, or ulcerations of the oral cavity
2. History of insect bites and swimming in fresh water
3. Exposure to infectious diseases
4. Travel to areas where the disease is prevalent
5. Fever
6. Nausea and vomiting
7. **Nuchal rigidity**
8. Changes in level of consciousness and mental status
9. Signs of **increased ICP**
10. Motor dysfunction and focal neurological deficits

**D. Interventions**

1. Monitor vital and neurological signs.
2. Assess level of consciousness using the **Glasgow Coma Scale**.
3. Assess for mental status changes and personality and behavior changes.
4. Assess for signs of **increased ICP**.
5. Assess for the presence of **nuchal rigidity** and a positive **Kernig's sign** or **Brudzinski's sign**, indicating meningeal irritation.
6. Assist the client to turn, cough, and deep-breathe frequently.
7. Elevate the head of the bed 30 to 45 degrees.
8. Assess for muscle and neurological deficits.
9. Administer acyclovir (Zovirax) as prescribed (usually is the medication of choice for herpes encephalitis).
10. Initiate rehabilitation as needed for motor dysfunction or neurological deficits.

**XX. WEST NILE VIRUS INFECTION****A. Description**

1. West Nile virus infection is a potentially serious illness that affects the CNS.
2. The virus is contracted primarily by the bite of an infected mosquito (mosquitoes become carriers when they feed on infected birds).
3. Symptoms typically develop between 3 and 14 days after being bitten by the infected mosquito.
4. Neurological effects can be permanent.

**B. Assessment**

1. Many individuals will not experience any symptoms.
2. Mild symptoms include fever, headache and body aches, nausea, vomiting, swollen glands, or a rash on the chest, stomach, or back.
3. Severe symptoms include a high fever, headache, neck stiffness, stupor, disorientation, tremors, muscle weakness, vision loss, numbness, paralysis, seizures, or coma.

- C. Interventions** are supportive; there is no specific treatment for the virus.

**D. Prevention**

1. Use insect repellents containing DEET (diethyltoluamide) when outdoors and wear long sleeves and pants and light-colored clothing.
2. Stay indoors at dusk and dawn when mosquitoes are most active.
3. Ensure that mosquito breeding sites are eliminated, such as standing water and water in bird baths, and keep wading pools empty and on their sides when not in use.

 **XXI. MENINGITIS****A. Description**

1. Meningitis is inflammation of the arachnoid and pia mater of the brain and spinal cord.
2. It is caused by bacterial and viral organisms, although fungal and protozoal meningitis also occur.
3. Predisposing factors include skull fractures, brain or spinal surgery, sinus or upper respiratory infections, the use of nasal sprays, and a compromised immune system.
4. Cerebrospinal fluid is analyzed to determine the diagnosis and type of meningitis.

- B. Transmission:** Transmission occurs in areas of high population density, crowded living areas such as college dormitories, and prisons.

 **Transmission of meningitis is by direct contact, including droplet spread.**

 **C. Assessment (see Box 66-4)**

1. Mild lethargy
2. Photophobia
3. Deterioration in the level of consciousness
4. Signs of meningeal irritation, such as **nuchal rigidity** and a positive **Kernig's sign** and **Budzinski's sign**
5. Red, macular rash with meningococcal meningitis
6. Abdominal and chest pain with viral meningitis

 **D. Interventions**

1. Monitor vital signs and neurological signs.
2. Assess for signs of **increased ICP**.
3. Initiate seizure precautions.
4. Monitor for seizure activity.
5. Monitor for signs of meningeal irritation.
6. Perform cranial nerve assessment.
7. Assess peripheral vascular status (septic emboli may block circulation).
8. Maintain isolation precautions as necessary with bacterial meningitis.
9. Maintain urine and stool precautions with viral meningitis.
10. Maintain respiratory isolation for the client with pneumococcal meningitis.
11. Elevate the head of the bed 30 degrees, and avoid neck flexion and extreme hip flexion.

12. Prevent stimulation and restrict visitors.
13. Administer analgesics as prescribed.
14. Administer antibiotics as prescribed.

**MORE QUESTIONS ON THE CD!****Practice Questions**

- 796.** The nurse is assessing the motor function of an unconscious client. The nurse would plan to use which of the following to test the client's peripheral response to pain?

1. Sternal rub
2. Nail bed pressure
3. Pressure on the orbital rim
4. Squeezing of the sternocleidomastoid muscle

- 797.** The nurse is caring for the client with increased intracranial pressure. The nurse would note which of the following trends in vital signs if the intracranial pressure is rising?

1. Increasing temperature, increasing pulse, increasing respirations, decreasing blood pressure
2. Increasing temperature, decreasing pulse, decreasing respirations, increasing blood pressure
3. Decreasing temperature, decreasing pulse, increasing respirations, decreasing blood pressure
4. Decreasing temperature, increasing pulse, decreasing respirations, increasing blood pressure

- 798.** The client recovering from a head injury is arousable and participating in care. The nurse determines that the client understands measures to prevent elevations in intracranial pressure if the nurse observes the client doing which of the following activities?

1. Blowing the nose
2. Isometric exercises
3. Coughing vigorously
4. Exhaling during repositioning

- 799.** The client has clear fluid leaking from the nose following a basilar skull fracture. The nurse assesses that this is cerebrospinal fluid if the fluid:

1. Is clear and tests negative for glucose
2. Is grossly bloody in appearance and has a pH of 6
3. Clumps together on the dressing and has a pH of 7
4. Separates into concentric rings and tests positive for glucose

- 800.** The client with a spinal cord injury is prone to experiencing autonomic dysreflexia. The nurse would avoid which of the following measures to minimize the risk of recurrence?

1. Strict adherence to a bowel retraining program
  2. Keeping the linen wrinkle-free under the client
  3. Preventing unnecessary pressure on the lower limbs
  4. Limiting bladder catheterization to once every 12 hours
- 801.** The nurse is evaluating the neurological signs of a client in spinal shock following spinal cord injury. Which of the following observations by the nurse indicates that spinal shock persists?
1. Hyperreflexia
  2. Positive reflexes
  3. Reflex emptying of the bladder
  4. Flaccid paralysis
- 802.** The nurse is caring for the client who begins to experience seizure activity while in bed. Which of the following actions by the nurse would be contraindicated?
1. Loosening restrictive clothing
  2. Restraining the client's limbs
  3. Removing the pillow and raising padded side rails
  4. Positioning the client to the side, if possible, with the head flexed forward
- 803.** The nurse is assigned to care for a client with complete right-sided hemiparesis. The nurse plans care knowing that in this condition:
1. The client has complete bilateral paralysis of the arms and legs.
  2. The client has weakness on the right side of the body, including the face and tongue.
  3. The client has lost the ability to move the right arm but is able to walk independently.
  4. The client has lost the ability to ambulate independently but is able to feed and bathe himself or herself without assistance.
- 804.** The nurse has instructed the family of a client with brain attack (stroke) who has homonymous hemianopsia about measures to help the client overcome the deficit. The nurse determines that the family understands the measures to use if they state that they will:
1. Place objects in the client's impaired field of vision.
  2. Discourage the client from wearing eyeglasses.
  3. Approach the client from the impaired field of vision.
  4. Remind the client to turn the head to scan the lost visual field.
- 805.** The nurse is assessing the adaptation of the client to changes in functional status after a brain attack (stroke). The nurse determines that the client is adapting most successfully if the client
1. Gets angry with family if they interrupt a task
  2. Experiences bouts of depression and irritability
  3. Has difficulty with using modified feeding utensils
  4. Consistently uses adaptive equipment in dressing self
- 806.** The nurse is teaching the client with myasthenia gravis about the prevention of myasthenic and cholinergic crises. The nurse tells the client that this is most effectively done by:
1. Eating large, well-balanced meals
  2. Doing muscle-strengthening exercises
  3. Doing all chores early in the day while less fatigued
  4. Taking medications on time to maintain therapeutic blood levels
- 807.** The nurse has given instructions to the client with Parkinson's disease about maintaining mobility. The nurse determines that the client understands the directions if the client states that he or she will:
1. Sit in soft, deep chairs.
  2. Exercise in the evening to combat fatigue.
  3. Rock back and forth to start movement with bradykinesia.
  4. Buy clothes with many buttons to maintain finger dexterity.
- 808.** The nurse has given suggestions to the client with trigeminal neuralgia about strategies to minimize episodes of pain. The nurse determines that the client needs reinforcement of information if the client makes which of the following statements?
1. "I will wash my face with cotton pads."
  2. "I'll have to start chewing on my unaffected side."
  3. "I'll try to eat my food either very warm or very cold."
  4. "I should rinse my mouth if toothbrushing is painful."
- 809.** The client is admitted to the hospital with a diagnosis of Guillain-Barré syndrome. The nurse inquires during the nursing admission interview if the client has a history of:
1. Seizures or trauma to the brain
  2. Meningitis during the last 5 years
  3. Back injury or trauma to the spinal cord
  4. Respiratory or gastrointestinal infection during the previous month
- 810.** The client with Guillain-Barré syndrome has ascending paralysis and is intubated and receiving mechanical ventilation. Which of the following strategies would the nurse incorporate in the plan of care to help the client cope with this illness?

1. Giving client full control over care decisions and restricting visitors
  2. Providing positive feedback and encouraging active range of motion
  3. Providing information, giving positive feedback, and encouraging relaxation
  4. Providing intravenously administered sedatives, reducing distractions, and limiting visitors
- 811.** The client has a neurological deficit involving the limbic system. Which assessment finding is specific to this type of deficit?
1. Is disoriented to person, place, and time
  2. Affect is flat, with periods of emotional lability
  3. Cannot recall what was eaten for breakfast today
  4. Demonstrates inability to add and subtract; does not know who is the president of the United States
- 812.** The nurse is admitting a client with Guillain-Barré syndrome to the nursing unit. The client has an ascending paralysis to the level of the waist. Knowing the complications of the disorder, the nurse brings which of the following essential items into the client's room?
1. Nebulizer and pulse oximeter
  2. Blood pressure cuff and flashlight
  3. Flashlight and incentive spirometer
  4. Electrocardiographic monitoring electrodes and intubation tray
- 813.** The nurse is evaluating the status of the client who had a craniotomy 3 days ago. The nurse would suspect that the client is developing meningitis as a complication of surgery if the client exhibits:
1. A negative Kernig sign
  2. Absence of nuchal rigidity
  3. A positive Brudzinski sign
  4. A Glasgow Coma Scale score of 15
- 814.** The nurse has completed discharge instructions for the client with application of a halo device. The nurse determines that the client needs further clarification of the instructions if the client states that he or she will:
1. Use a straw for drinking.
  2. Drive only during the daytime.
  3. Use caution because the device alters balance.
  4. Wash the skin daily under the lamb's wool liner of the vest.

### Alternate Item Format: Multiple Response

- 815.** The nurse is planning to institute seizure precautions for a client who is being admitted from the emergency department. Which of the following measures would the nurse include in planning for the client's safety? **Select all that apply.**
- 1. Padding the side rails of the bed
  - 2. Placing an airway at the bedside
  - 3. Placing the bed in the high position
  - 4. Placing oxygen and suction equipment at the bedside
  - 5. Putting a padded tongue blade at the head of the bed
  - 6. Having intravenous equipment ready for insertion of an intravenous catheter

## ANSWERS

### 796. 2

**Rationale:** Motor testing in the unconscious client can be done only by testing response to painful stimuli. Nail bed pressure tests a basic peripheral response. Cerebral responses to pain are tested using a sternal rub, placing upward pressure on the orbital rim, or squeezing the clavicle or sternocleidomastoid muscle.

**Test-Taking Strategy:** Note the strategic words *peripheral response*. The nail beds are the most distal of all the options and are therefore the most peripheral. Each of the other options may elicit a generalized response, but not a localized one. Review the process of testing peripheral response to pain if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult health—Neurological

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1797). St. Louis: Saunders.

### 797. 2

**Rationale:** A change in vital signs may be a late sign of increased intracranial pressure. Trends include increasing temperature and blood pressure and decreasing pulse and respirations. Respiratory irregularities also may arise.

**Test-Taking Strategy:** This question looks complex but can be answered logically. If you remember that the temperature rises, then you are able to eliminate options 3 and 4. If you know that the client becomes bradycardic, or know that the blood pressure rises, you are able to select the correct option. Review the signs of increased intracranial pressure if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Neurological

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1923). St. Louis: Saunders.

#### 798. 4

**Rationale:** Activities that increase intrathoracic and intra-abdominal pressures cause an indirect elevation of the intracranial pressure. Some of these activities include isometric exercises, Valsalva's maneuver, coughing, sneezing, and blowing the nose. Exhaling during activities such as repositioning or pulling up in bed, opens the glottis, which prevents intrathoracic pressure from rising.

**Test-Taking Strategy:** Use the process of elimination. Evaluate each option in terms of the tension it puts on the body. Doing so will help you eliminate each incorrect option systematically. Review the measures that will reduce or prevent increased intracranial pressure if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Neurological

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1946). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1064). St. Louis: Saunders.

#### 799. 4

**Rationale:** Leakage of cerebrospinal fluid (CSF) from the ears or nose may accompany basilar skull fracture. CSF can be distinguished from other body fluids because the drainage will separate into bloody and yellow concentric rings on dressing material, called a halo sign. The fluid also tests positive for glucose.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the characteristics of CSF. Recall that CSF contains glucose, whereas other secretions, such as mucus, do not. Knowing that CSF separates into rings also will help you answer this question. Review testing for CSF fluid if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Neurological

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1055). St. Louis: Saunders.

#### 800. 4

**Rationale:** The most frequent cause of autonomic dysreflexia is a distended bladder. Straight catheterization should be done every 4 to 6 hours, and Foley catheters should be checked frequently to prevent kinks in the tubing. Constipation and fecal impaction are other causes, so maintaining bowel regularity is important. Other causes include stimulation of the skin from tactile, thermal, or painful stimuli. The nurse administers care to minimize risk in these areas.

**Test-Taking Strategy:** Use the process of elimination. Remember that autonomic dysreflexia is caused by noxious

stimuli to the bowel, bladder, or skin. With this in mind, you can eliminate easily each of the incorrect options. Review the measures to minimize the risk of autonomic dysreflexia if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Neurological

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 772). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 998). St. Louis: Saunders.

#### 801. 4

**Rationale:** Resolution of spinal shock is occurring when there is return of reflexes (especially flexors to noxious cutaneous stimuli), a state of hyperreflexia rather than flaccidity, and reflex emptying of the bladder.

**Test-Taking Strategy:** Recall that spinal shock is characterized by the loss of movement of skeletal muscles, bowel or bladder wall, and depressed reflex action. Return of any of these indicates that spinal shock is beginning to resolve. Note that options 1, 2, and 3 are comparable or alike, indicating the presence of reflexes. Review signs of spinal shock if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Neurological

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1954). St. Louis: Saunders.

Copstead-Kirkhorn, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 1082). St. Louis: Mosby.

#### 802. 2

**Rationale:** Nursing actions during a seizure include providing for privacy, loosening restrictive clothing, removing the pillow and raising side rails in the bed, and placing the client on one side with the head flexed forward, if possible, to allow the tongue to fall forward and facilitate drainage. The limbs are never restrained because the strong muscle contractions could cause the client harm. If the client is not in bed when seizure activity begins, the nurse lowers the client to the floor, if possible, protects the head from injury, and moves furniture that may injure the client. Other aspects of care are as described for the client who is in bed.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *contraindicated*. Evaluate this question from the perspective of causing possible harm. No harm can come to the client from any of the options except for restraining the limbs. Remember, avoid restraints. Review care of a client during a seizure if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Neurological

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 959). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, and psychiatric nursing care plans* (2nd ed., pp. 325–326). St. Louis: Mosby.

### 803. 2

**Rationale:** Hemiparesis is a weakness of one side of the body that may occur after a stroke. Complete hemiparesis is weakness of the face and tongue, arm, and leg on one side. Complete bilateral paralysis does not occur in this condition. The client with right-sided hemiparesis has weakness of the right arm and leg and needs assistance with feeding, bathing, and ambulating.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *complete right-sided* and focus on the subject, hemiparesis. Recalling that hemiparesis indicates weakness and focusing on the strategic words will direct you to option 2. Review the description of hemiparesis and care of the client with hemiparesis if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Neurological

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1034). St. Louis: Saunders.

### 804. 4

**Rationale:** Homonymous hemianopsia is loss of half of the visual field. The client with homonymous hemianopsia should have objects placed in the intact field of vision, and the nurse also should approach the client from the intact side. The nurse instructs the client to scan the environment to overcome the visual deficit and does client teaching from within the intact field of vision. The nurse encourages the use of personal eyeglasses, if they are available.

**Test-Taking Strategy:** Use the process of elimination. Recalling the definition of homonymous hemianopsia will direct you easily to option 4. Review the concept of homonymous hemianopsia if you are unfamiliar with it.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Neurological

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1849). St. Louis: Saunders.

### 805. 4

**Rationale:** Clients are evaluated as coping successfully with lifestyle changes after a brain attack (stroke) if they make appropriate lifestyle alterations, use the assistance of others, and have appropriate social interactions. Options 1, 2, and 3 are not adaptive behaviors.

**Test-Taking Strategy:** Use the process of elimination, focusing on the strategic words *adapting most successfully*. Options 1 and 2 are behaviors that may be expected in the client with a brain attack (stroke), but they are not adaptive responses.

Instead, they are a result of the insult to the brain. Options 3 and 4 indicate that the client is trying to adapt, but option 4 has the best outcome. Review care of the client with a brain attack (stroke) if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Neurological

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1861–1862, 1866–1867). St. Louis: Saunders.

### 806. 4

**Rationale:** Clients with myasthenia gravis are taught to space out activities over the day to conserve energy and restore muscle strength. Taking medications correctly to maintain blood levels that are not too low or too high is important. Muscle-strengthening exercises are not helpful and can fatigue the client. Overeating is a cause of exacerbation of symptoms, as is exposure to heat, crowds, erratic sleep habits, and emotional stress.

**Test-Taking Strategy:** Use the process of elimination. Recalling that the common causes of myasthenic and cholinergic crises are undermedication and overmedication, respectively, will assist you in eliminating each of the incorrect options. No other option would prevent both of those complications. Review measures to prevent myasthenic and cholinergic crises if you are unfamiliar with them.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Neurological

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1916–1917). St. Louis: Saunders.

### 807. 3

**Rationale:** The client with Parkinson's disease should exercise in the morning when energy levels are highest. The client should avoid sitting in soft deep chairs because they are difficult to get up from. The client can rock back and forth to initiate movement. The client should buy clothes with Velcro fasteners and slide-locking buckles to support the ability to dress self.

**Test-Taking Strategy:** Use the process of elimination. Option 2 is not useful to clients with fatigue from any disorder, so eliminate this option first. Knowing that the client with Parkinson's has difficulty with movement and dexterity helps eliminate options 1 and 4 next. Review client teaching points with Parkinson's disease if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Neurological

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, and psychiatric nursing care plans* (2nd ed., p. 316). St. Louis: Mosby.

### 808. 3

**Rationale:** Facial pain can be minimized by using cotton pads to wash the face and using room temperature water. The client should chew on the unaffected side of the mouth,

eat a soft diet, and take in foods and beverages at room temperature. If toothbrushing triggers pain, an oral rinse after meals may be helpful instead.

**Test-Taking Strategy:** Use the process of elimination, and note the strategic words *needs reinforcement of information*. These words indicate a negative event query and ask you to select an option that is incorrect. Recall that the pain of trigeminal neuralgia is triggered by mechanical or thermal stimuli. Very hot or cold foods are likely to trigger the pain, not relieve it. Review client education points if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Neurological

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1025–1026). St. Louis: Saunders.

### 809. 4

**Rationale:** Guillain-Barré syndrome is a clinical syndrome of unknown origin that involves cranial and peripheral nerves. Many clients report a history of respiratory or gastrointestinal infection in the 1 to 4 weeks before the onset of neurological deficits. Occasionally, the syndrome can be triggered by vaccination or surgery.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the causes related to this disorder. Remember that a recent history of respiratory or gastrointestinal infection are predisposing factors. If you are unfamiliar with Guillain-Barré syndrome, review this disorder.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Neurological

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, and psychiatric nursing care plans* (2nd ed., p. 287). St. Louis: Mosby.

### 810. 3

**Rationale:** The client with Guillain-Barré syndrome experiences fear and anxiety from the ascending paralysis and sudden onset of the disorder. The nurse can alleviate these fears by providing accurate information about the client's condition, giving expert care and positive feedback to the client, and encouraging relaxation and distraction. The family can become involved with selected care activities and provide diversion for the client as well.

**Test-Taking Strategy:** Use the process of elimination. Option 1 should be eliminated first because it is not practical to think that the client would want full control over all care decisions. The client who is paralyzed cannot participate in active range of motion, which eliminates option 2. From the remaining options, option 3 is more beneficial in helping the client cope than option 4. Review care of the client with Guillain-Barré syndrome if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Caring

**Content Area:** Adult Health—Neurological

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1016). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, and psychiatric nursing care plans* (2nd ed., p. 290). St. Louis: Mosby.

### 811. 2

**Rationale:** The limbic system is responsible for feelings (affect) and emotions. Calculation ability and knowledge of current events relates to function of the frontal lobe. The cerebral hemispheres, with specific regional functions, control orientation. Recall of recent events is controlled by the hippocampus.

**Test-Taking Strategy:** Use the process of elimination. Recall that the limbic system is responsible for feelings and emotions to direct you to option 2. Review the function of the limbic system if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Neurological

**Reference:** Copstead, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 996). St. Louis: Mosby.

### 812. 4

**Rationale:** The client with Guillain-Barré syndrome is at risk for respiratory failure because of ascending paralysis. An intubation tray should be available for use. Another complication of this syndrome is cardiac dysrhythmias, which necessitates the use of electrocardiographic monitoring. Because the client is immobilized, the nurse should assess for deep vein thrombosis and pulmonary embolism routinely.

**Test-Taking Strategy:** Note the strategic word *essential*. With an ascending paralysis, the client is at risk for involvement of respiratory muscles and subsequent respiratory failure. Option 4 is the only option that includes an intubation tray, which would be needed if the client's status deteriorated to needing intubation and mechanical ventilation. This option most directly addresses airway. Review care of the client with Guillain-Barré syndrome if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Neurological

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1015). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, and psychiatric nursing care plans* (2nd ed., pp. 288–289). St. Louis: Mosby.

### 813. 3

**Rationale:** Signs of meningeal irritation compatible with meningitis include nuchal rigidity, a positive Brudzinski sign, and positive Kernig sign. Nuchal rigidity is characterized by a stiff neck and soreness, which is especially noticeable when the neck is flexed. Kernig's sign is positive when the client feels pain and spasm of the hamstring muscles when the leg

is fully flexed at the knee and hip. Brudzinski's sign is positive when the client flexes the hips and knees in response to the nurse gently flexing the head and neck onto the chest. A Glasgow Coma Scale score of 15 is a perfect score and indicates that the client is awake and alert, with no neurological deficits.

**Test-Taking Strategy:** Use the process of elimination, focusing on the client's diagnosis, meningitis. You can eliminate options 1, 2, and 4 because they are normal findings. Review the signs of meningitis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Neurological

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1835–1836). St. Louis: Saunders.

### 814. 2

**Rationale:** The halo device alters balance and can cause fatigue because of its weight. The client should cleanse the skin daily under the vest to protect the skin from ulceration and should use powder or lotions sparingly, or not at all. The liner should be changed if odor becomes a problem. The client should have food cut into small pieces to facilitate chewing and use a straw for drinking. Pin care is done as instructed. The client cannot drive at all because the device impairs the range of vision.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *needs further clarification*. These words indicate a negative event query and ask you to select an option that is incorrect. Visualize this device to answer correctly. The inability to turn the head without turning the torso would contraindicate driving. Review client education points related to a halo device if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Neurological

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 996). St. Louis: Saunders.

Perry, A., & Potter, P. (2010). *Clinical nursing skills and techniques* (7th ed., pp. 283–285). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 815. 1, 2, 4, 6

**Rationale:** Seizure precautions may vary from agency to agency, but they generally have some common features. Usually, an airway, oxygen, and suctioning equipment are kept available at the bedside. The side rails of the bed are padded, and the bed is kept in the lowest position. The client has an intravenous access in place to have a readily accessible route if anticonvulsant medications must be administered. The use of padded tongue blades is highly controversial, and they should not be kept at the bedside. Forcing a tongue blade into the mouth during a seizure more likely will harm the client who bites down during seizure activity. Risks include blocking the airway from improper placement, chipping the client's teeth, and subsequent risk of aspirating tooth fragments. If the client has an aura before the seizure, it may give the nurse enough time to place an oral airway before seizure activity begins.

**Test-Taking Strategy:** Use the process of elimination. Evaluate this question from the perspective of causing possible harm. No harm can come to the client from any of the options except for placing the bed in the high position and using a tongue blade. Review seizure precautions if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Neurological

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, and psychiatric nursing care plans* (2nd ed., p. 325). St. Louis: Mosby.

# Neurological Medications

## I. ANTIMYASTHENIC MEDICATIONS

### A. Description

1. Antimyasthenic, also called anticholinesterase, medications relieve muscle weakness associated with myasthenia gravis by blocking acetylcholine breakdown at the neuromuscular junction.
2. Antimyasthenic medications are used to treat or diagnose myasthenia gravis or to distinguish cholinergic crisis from myasthenic crisis.
3. Neostigmine bromide (Prostigmin), pyridostigmine (Mestinon), and ambenonium chloride (Mytelase) are used to control myasthenic symptoms.
4. Edrophonium chloride (Tensilon) is used to diagnose myasthenia gravis and to distinguish cholinergic crisis from myasthenic crisis.

### B. Medications (Box 67-1)

### C. Side effects: Cholinergic crisis (Box 67-2)

### D. Interventions

1. Assess neuromuscular status, including reflexes, muscle strength, and gait.
2. Monitor the client for signs and symptoms of medication overdose (cholinergic crisis) and underdose (myasthenic crisis).
3. Instruct the client to take medications on time to maintain therapeutic blood level, thus preventing weakness, because weakness can impair the client's ability to breathe and swallow.
4. Instruct the client to take the medication with a small amount of food to prevent gastrointestinal symptoms.
5. Instruct the client to eat 45 to 60 minutes after taking medications to decrease the risk for aspiration.
6. Instruct the client to wear a Medic-Alert bracelet.
7. Note that antimyasthenic therapy is lifelong therapy.
8. Evaluate for medication effectiveness, which is based on the improvement of neuromuscular symptoms or strength without cholinergic signs and symptoms.
9. When administering edrophonium chloride, have emergency resuscitation equipment on hand and atropine sulfate available for cholinergic crisis.

### E. Tensilon test

1. Edrophonium (Tensilon) is injected intravenously.
2. The **Tensilon test** can cause bronchospasm, laryngospasm, hypotension, bradycardia, and cardiac arrest.
3. Atropine sulfate is the antidote for overdose.
4. Diagnosis of myasthenia gravis: Most myasthenic clients will show a significant improvement in muscle tone within 30 to 60 seconds after injection, and the muscle improvement lasts 4 to 5 minutes.
5. The **Tensilon test** is used to diagnose cholinergic crisis (overdose with anticholinesterase) or myasthenic crisis (undermedication).
  - a. In cholinergic crisis, muscle tone does not improve after the administration of Tensilon, and muscle twitching may be noted around the eyes and face.
  - b. A Tensilon injection makes the client in cholinergic crisis temporarily worse (negative **Tensilon test**).
  - c. A Tensilon injection temporarily improves the condition when the client is in myasthenic crisis (positive **Tensilon test**).

## II. ANTIPARKINSONIAN MEDICATIONS

### A. Description

1. Antiparkinsonian medications restore the balance of the neurotransmitters acetylcholine and dopamine in the central nervous system (CNS), decreasing the signs and symptoms of Parkinson's disease to maximize the client's functional abilities.
2. These medications include the dopaminergics, which stimulate the dopamine receptors; the anticholinergics, which block the cholinergic receptors; and the catechol-O-methyltransferase inhibitors, which inhibit the metabolism of dopamine in the periphery.
3. Antiparkinsonian medications are also used for Parkinson's disease, in which dopamine-containing neurons in the basal ganglia are destroyed or deficient, which causes loss of fine motor control.

**Box 67-1 Anticholinergic Medications**

Ambenonium chloride (Mytelase)  
 Edrophonium chloride (Tensilon)  
 Neostigmine bromide (Prostigmin)  
 Pyridostigmine (Mestinon)

**Box 67-2 Signs of Cholinergic Crisis**

Abdominal cramps  
 Nausea, vomiting, and diarrhea  
 Pupillary miosis  
 Hypotension and dizziness  
 Increased bronchial secretions  
 Increased tearing and salivation  
 Increased perspiration  
 Bronchospasm, wheezing, and bradycardia

**Box 67-3 Medications to Treat Parkinson's Disease****Medications Affecting the Amount of Dopamine**

Amantadine (Symmetrel)  
 Bromocriptine (Parlodel)  
 Carbidopa; levodopa (Sinemet)  
 Levodopa (Larodopa, Dopar)  
 Pramipexole (Mirapex)  
 Ropinirole (Requip)  
 Selegiline hydrochloride (Carbex, Eldepryl)

**Anticholinergics**

Benzotropine mesylate (Cogentin)  
 Biperiden hydrochloride (Akineton)  
 Procyclidine hydrochloride (Kemadrin)  
 Trihexyphenidyl hydrochloride

**Catechol-O-Methyltransferase (COMT) Inhibitors**

Entacapone (Comtan)  
 Tolcapone (Tasmar)

**B. Dopaminergic medications****1. Description**

- Dopaminergic medications stimulate the dopamine receptors and increase the amount of dopamine available in the CNS or enhance neurotransmission of dopamine.
- Dopaminergic medications are contraindicated in clients with cardiac, renal, or psychiatric disorders.

**!** Levodopa taken with a monoamine oxidase inhibitor antidepressant can cause a hypertensive crisis.

**2. Medications (Box 67-3; Fig. 67-1)****3. Side effects**

- Dyskinesia
- Involuntary body movements
- Chest pain
- Nausea and vomiting
- Urinary retention
- Constipation
- Sleep disturbances, insomnia or periods of sedation
- Orthostatic hypotension and dizziness
- Confusion
- Mood changes, especially depression
- Hallucinations
- Dry mouth

**4. Interventions**

- Assess vital signs.
- Assess for risk of injury.
- Instruct the client to take the medication with food if nausea or vomiting occurs.
- Assess for signs and symptoms of parkinsonism such as rigidity, tremors, akinesia, and

**▲ FIGURE 67-1** Steps leading to alteration of central nervous system function by levodopa. To produce its beneficial effects in Parkinson's disease (PD), levodopa must be (1) transported across the blood-brain barrier; (2) taken up by dopaminergic nerve terminals in the striatum; (3) converted into dopamine (DA); (4) released into the synaptic space; and (5) bound to DA receptors on striatal GABAergic neurons, causing them to fire at a slower rate. Note that DA itself is unable to cross the blood-brain barrier, and hence cannot be used to treat PD. (From Lehne, R. [2010]. *Pharmacology for nursing care* [7th ed.]. St. Louis: Saunders.)

bradykinesia, a stooped forward posture, shuffling gait, and masked facies.

- Monitor for signs of dyskinesia.
- Instruct the client to report side effects and symptoms of dyskinesia.

- g. Monitor the client for improvement in signs and symptoms of parkinsonism without the development of side effects from the medications.
- h. Instruct the client to change positions slowly to minimize orthostatic hypotension.
- i. Instruct the client not to discontinue the medication abruptly.
- j. Instruct the client to avoid alcohol.
- k. Inform the client that urine or perspiration may be discolored and that this is harmless, but may stain the clothing.
- l. Advise the client with diabetes mellitus that glucose testing should not be done by urine testing because the results will not be reliable.
- m. Instruct the client taking carbidopa-levodopa (Sinemet) to divide the total daily prescribed protein intake among all meals of the day; high-protein diets interfere with medication availability to the CNS.
- n. When administering levodopa, instruct the client to avoid excessive vitamin B<sub>6</sub> intake to prevent medication reactions.

### C. Anticholinergic medications

1. Description
  - a. Anticholinergic medications block the cholinergic receptors in the CNS, thereby suppressing acetylcholine activity.
  - b. Anticholinergic medications reduce the tremors and drooling but have a minimal effect on the bradykinesia, rigidity, and balance abnormalities.
  - c. Anticholinergic medications are contraindicated in clients with glaucoma.
  - d. The client with chronic obstructive lung disease can develop dry, thick mucous secretions.
2. Medications (see Box 67-3)
3. Side effects
  - a. Blurred vision
  - b. Dryness of the nose, mouth, throat, and respiratory secretions
  - c. Increased pulse rate, palpitations, and dysrhythmias
  - d. Constipation
  - e. Urinary retention
  - f. Restlessness, confusion, depression, and hallucinations
  - g. Photophobia
4. Interventions
  - a. Monitor vital signs.
  - b. Assess for risk of injury.
  - c. Monitor the client for improvement in signs and symptoms.
  - d. Assess the client's bowel and urinary function and monitor for urinary retention, constipation, and paralytic ileus.
  - e. Monitor for involuntary movements.

- f. Encourage the client to avoid alcohol, smoking, caffeine, and aspirin to decrease gastric acidity.
- g. Instruct the client to consult with the physician before taking any nonprescription medications.
- h. Instruct the client to minimize dry mouth by increasing fluid intake and using ice chips, hard candy, or gum.
- i. Instruct the client to prevent constipation by increasing fluids and fiber in the diet.
- j. Instruct the client to use sunglasses in direct sunlight because of possible photophobia.
- k. Instruct the client to have routine eye examinations to assess intraocular pressure.

 If an anticholinergic medication is discontinued, the signs and symptoms of parkinsonism, such as rigidity, tremors, akinesia, bradykinesia, stooped forward posture, shuffling gait, and masked facies abruptly, may be intensified.

### III. ANTICONVULSANT MEDICATIONS

#### A. Description

1. Anticonvulsant medications are used to depress abnormal neuronal discharges and prevent the spread of seizures to adjacent neurons.
2. Anticonvulsant medications should be used with caution in clients taking anticoagulants, aspirin, sulfonamides, cimetidine (Tagamet), and antipsychotic drugs.
3. Absorption is decreased with the use of antacids, calcium preparations, and antineoplastic medications.

#### B. Interventions for clients on anticonvulsants

1. Initiate seizure precautions.
2. Monitor urinary output.
3. Monitor liver and renal function tests and medication blood serum levels (Table 67-1)
4. Monitor for signs of medication toxicity, which would include CNS depression, ataxia, nausea, vomiting, drowsiness, dizziness, restlessness, and visual disturbances.
5. If a seizure occurs, assess seizure activity, including location and duration.
6. Protect the client from hazards in the environment during a seizure.

#### C. Client education (Box 67-4)

#### D. Hydantoins (Box 67-5)

1. Hydantoins are used to treat partial and generalized tonic-clonic seizures.
2. Phenytoin (Dilantin) also is used to treat dysrhythmias.
3. Side effects
  - a. Gingival hyperplasia (reddened gums that bleed easily)
  - b. Slurred speech

**TABLE 67-1** Anticonvulsant Medications

| Medication               | Therapeutic Serum Range |
|--------------------------|-------------------------|
| Amobarbital (Amytal)     | 1-5 mcg/mL              |
| Carbamazepine (Tegretol) | 3-14 mcg/mL             |
| Clonazepam (Klonopin)    | 20-80 ng/mL             |
| Ethosuximide (Zarontin)  | 40-100 mcg/mL           |
| Ethotoin (Peganone)      | 10-50 mcg/mL            |
| Lorazepam (Ativan)       | 50-240 ng/mL            |
| Mephobarbital (Mebaral)  | 15-40 mcg/mL            |
| Phenobarbital (Luminal)  | 15-40 mcg/mL            |
| Phenytoin (Dilantin)     | 10-20 mcg/mL            |

**Box 67-4 Client Education: Anticonvulsants**

Take the prescribed medication in the prescribed dose and frequency.

Take anticonvulsants with food to decrease gastrointestinal irritation, but avoid milk and antacids, which impair absorption.

If taking liquid medication, shake well before ingesting. Do not discontinue the medications.

Avoid alcohol.

Avoid over-the-counter medications.

Wear a Medic-Alert bracelet.

Use caution when driving or performing activities that require alertness.

Maintain good oral hygiene and use a soft toothbrush.

Maintain preventive dental checkups.

Maintain follow-up health care visits with periodic blood studies related to determining toxicity.

Monitor serum glucose levels (diabetes mellitus).

Urine may be a harmless pink-red or red-brown in color.

Report symptoms of sore throat, bruising, and nosebleeds, which may indicate a blood dyscrasia.

Inform the physician if side effects occur, such as bleeding gums, nausea, vomiting, blurred vision, slurred speech, rash, or dizziness.

- c. Confusion
- d. Sedation and drowsiness
- e. Nausea and vomiting
- f. Blurred vision and nystagmus
- g. Headaches
- h. Blood dyscrasias: Decreased platelet count and decreased white blood cell count
- i. Elevated blood glucose level
- j. Alopecia or hirsutism
- k. Rash or pruritis

## 4. Interventions

- a. Oral tube feedings may interfere with the absorption of orally administered phenytoin and diminish the effectiveness of the

**Box 67-5 Hydantoins**

|                        |                      |
|------------------------|----------------------|
| Ethotoin (Peganone)    | Phenytoin (Dilantin) |
| Fosphenytoin (Cerebyx) |                      |

**Box 67-6 Barbiturates**

|                         |                         |
|-------------------------|-------------------------|
| Amobarbital (Amytal)    | Phenobarbital (Luminal) |
| Mephobarbital (Mebaral) |                         |

**Box 67-7 Benzodiazepines**

|                        |                    |
|------------------------|--------------------|
| Clonazepam (Klonopin)  | Diazepam (Valium)  |
| Clorazepate (Tranxene) | Lorazepam (Ativan) |

medication; therefore, feedings should be scheduled as far as possible from the time of phenytoin administration.

- b. Monitor therapeutic serum levels to assess for toxicity.
- c. Monitor for signs of toxicity.
- d. When administering phenytoin intravenously, dilute in normal saline because dextrose causes the medication to precipitate.
- e. When administering phenytoin intravenously, infuse no faster than 25 to 50 mg/min; otherwise, hypotension and cardiac dysrhythmias could occur.
- f. Assess for ataxia (staggering gait).
- g. Instruct the client to consult with the physician before taking other medications to ensure compatibility with anticonvulsants.

 **Phenytoin decreases the effectiveness of some birth control pills and can have teratogenic effects if taken during pregnancy.**

**E. Barbiturates (Box 67-6)**

- 1. Barbiturates are used for tonic-clonic seizures and acute episodes of seizures caused by status epilepticus.
- 2. Barbiturates also may be used as adjuncts to anesthesia.
- 3. Side effects
  - a. Sedation, ataxia, and dizziness during initial treatment
  - b. Mood changes
  - c. Hypotension
  - d. Respiratory depression
  - e. Tolerance to the medication

**F. Benzodiazepines (Box 67-7)**

- 1. Benzodiazepines are used to treat absence seizures.

2. Diazepam (Valium) and lorazepam (Ativan) are used to treat status epilepticus, anxiety, and skeletal muscle spasms.
3. Clorazepate (Tranxene) is used as adjunctive therapy for partial seizures.
4. Side effects
  - a. Sedation, drowsiness, dizziness, blurred vision
  - b. Administer at no more than 5 mg/min intravenously to prevent bradycardia.
  - c. Medication tolerance and drug dependency
  - d. Blood dyscrasias: Decreased platelet count and decreased white blood cell count
  - e. Hepatotoxicity

 **Flumazenil (Romazicon) reverses the effects of benzodiazepines. It should not be administered to clients with increased intracranial pressure or status epilepticus who were treated with benzodiazepines because these problems may recur with reversal.**

- G. Succinimides (Box 67-8)**
  1. Succinimides are used to treat absence seizures.
  2. Side effects
    - a. Anorexia, nausea, vomiting
    - b. Blood dyscrasias
- H. Oxazolidinediones (Box 67-9)**
  1. Oxazolidinediones are used for absence seizures.
  2. Side effects
    - a. Sedation, drowsiness, fatigue
    - b. Headache
    - c. Photophobia
    - d. Blood dyscrasias
- I. Valproates (Box 67-10)**
  1. Valproates are used to treat tonic-clonic, partial, and myoclonic seizures.
  2. Side effects
    - a. Transient nausea, vomiting, and indigestion
    - b. Sedation, drowsiness, and dizziness
    - c. Pancreatitis

#### Box 67-8 Succinimides

Ethosuximide (Zarontin)      Methsuximide (Celontin)

#### Box 67-9 Oxazolidinedione

Trimethadione (Troxidone)

#### Box 67-10 Valproates

Valproic acid (Depakene, Depacon)  
Divalproex sodium (Depakote ER)

- d. Blood dyscrasias: Decreased platelet count and decreased white blood cell count
  - e. Hepatotoxicity
- J. Iminostilbenes**
    1. Iminostilbenes are used to treat seizure disorders that have not responded to other anticonvulsants (Box 67-11).
    2. Iminostilbenes are used to treat trigeminal neuralgia.
    3. Side effects
      - a. Drowsiness
      - b. Dizziness
      - c. Nausea and vomiting, dry mouth
      - d. Constipation or diarrhea
      - e. Rash
      - f. Visual abnormalities
      - g. Blood dyscrasias, agranulocytosis
      - h. Headache

#### IV. CENTRAL NERVOUS SYSTEM STIMULANTS

- A. Description**
  1. Amphetamines and caffeine stimulate the cerebral cortex of the brain (Box 67-12).
  2. Amphetamines have a high potential for abuse.
  3. Analeptics and caffeine act on the brainstem and medulla to stimulate respiration.
  4. Anorexiant act on the cerebral cortex and hypothalamus to suppress appetite (Box 67-13).
  5. Central nervous system stimulants are used to treat narcolepsy and attention-deficit/hyperactivity disorders.

#### Box 67-11 Other Anticonvulsants

|                           |                               |
|---------------------------|-------------------------------|
| Carbamazepine (Tegretol)  | Pregabalin (Lyrica)           |
| Gabapentin (Neurontin)    | Tiagabine (Gabitril Filmtabs) |
| Lamotrigine (Lamictal)    | Topiramate (Topamax)          |
| Levetiracetam (Keppra)    | Zonisamide (Zonegran)         |
| Oxcarbazepine (Trileptal) | Vigabatrin (Sabril)           |

#### Box 67-12 Amphetamines

Amphetamine sulfate  
Amphetamine; dextroamphetamine (Adderall)  
Atomoxetine (Strattera)  
Methylphenidate hydrochloride (Ritalin, Concerta)

#### Box 67-13 Anorexiant

Benzphetamine hydrochloride (Didrex)  
Orlistat (Xenical)  
Phendimetrazine (Bontril, Melfiat-105)  
Phentermine hydrochloride (Adipex-P, Ionamin)  
Sibutramine (Meridia)

6. Central nervous system stimulants are used as adjunctive therapy for exogenous obesity.
7. Other central nervous system stimulants (Box 67-14)

**B. Side effects**

1. Irritability
2. Restlessness
3. Tremors
4. Insomnia
5. Heart palpitations
6. Tachycardia and dysrhythmias
7. Hypertension
8. Dry mouth
9. Anorexia and weight loss
10. Abdominal cramping
11. Diarrhea or constipation
12. Hepatic failure
13. Psychoses
14. Impotence
15. Dependence and tolerance

**C. Interventions**

1. Monitor vital signs.
2. Assess mental status.
3. Document the degree of inattention, impulsivity, hyperactivity, and periods of sleepiness.
4. Assess height, weight, and growth of the child.
5. Monitor complete blood count and white blood cell and platelet counts before and during therapy.
6. Monitor for side effects.
7. Monitor sleep patterns.
8. Monitor for withdrawal symptoms such as nausea, vomiting, weakness, and headache.
9. Instruct the client to take the medication before meals.
10. Instruct the client to avoid foods and beverages containing caffeine to prevent additional stimulation.
11. Instruct the client not to chew or crush long-acting forms of the medications.
12. Instruct the client to read labels on over-the-counter products because many contain caffeine.
13. Instruct the client to avoid alcohol.
14. Instruct the client not to discontinue the medication abruptly (can produce extreme fatigue and depression).
15. Instruct the client to take the last daily dose of the CNS stimulant at least 6 hours before bedtime to prevent insomnia.
16. Monitor for drug dependence and abuse with amphetamines.

17. If a child is taking a CNS stimulant, instruct the parents to notify the school nurse.
18. Monitor for calming effects of CNS stimulants within 3 to 4 weeks on children with attention-deficit/hyperactivity disorder.
19. Monitor growth in the child on long-term therapy with methylphenidate hydrochloride (Ritalin) or other medications to treat attention-deficit/hyperactivity disorder.

**V. NONOPIOID ANALGESICS****A. Nonsteroidal anti-inflammatory drugs (NSAIDs; Box 67-15)****1. Description**

- a. NSAIDs are aspirin and aspirin-like medications that inhibit the synthesis of prostaglandins.
- b. The medications act as an analgesic to relieve pain, antipyretic to reduce body temperature, and anticoagulant to inhibit platelet aggregation.
- c. NSAIDs are used to relieve inflammation and pain and to treat rheumatoid arthritis, bursitis, tendinitis, osteoarthritis, and acute gout.
- d. NSAIDs are contraindicated in clients with hypersensitivity or liver or renal disease.
- e. Clients taking anticoagulants should not take aspirin or NSAIDs.

**Box 67-15 Nonopioid Analgesics****Acetaminophen**

Acetaminophen (Tylenol)

**Aspirin**

Aspirin (acetylsalicylic acid; ASA, Aspergum, Bayer Aspirin, Ecotrin)

Aspirin (acetylsalicylic acid), buffered (Alka-Seltzer, Bufferin)

**Nonsteroidal Anti-Inflammatory Drugs**

Fenoprofen (Nalfon)

Ibuprofen (Motrin, Advil)

Naproxen (Anaprox, Naprosyn, Aleve, Naprelan)

Oxaprozin (Daypro)

**Cyclooxygenase-2 (COX-2) Inhibitor**

Celecoxib (Celebrex)

**Other Nonsteroidal Anti-Inflammatory Drugs**

Diclofenac (Voltaren)

Diflunisal (Dolobid)

Etodolac (Lodine)

Indomethacin (Indocin)

Ketorolac

Meclofenamate

Mefenamic acid (Ponstel)

Meloxicam (Mobic)

Piroxicam (Feldene)

Sulindac (Clinoril)

**Box 67-14 Other Central Nervous System Stimulants**

Doxapram (Dopram)

Theophylline

Theobromine

- f. Aspirin and an NSAID should not be taken together because aspirin decreases the blood level and the effectiveness of the NSAID and can increase the risk of bleeding.
- g. NSAIDs can increase the effects of warfarin (Coumadin), sulfonamides, cephalosporins, and phenytoin (Dilantin).
- h. Hypoglycemia can result if ibuprofen (Motrin) is taken with insulin or an oral hypoglycemic medication.
- i. A high risk of toxicity exists if ibuprofen is taken concurrently with calcium blockers.

 Adolescents and children with flu symptoms, viral illnesses, and varicella should not take aspirin because of the risk of Reye's syndrome.

## 2. Side effects (Box 67-16)

### 3. Interventions

- a. Assess client for allergies.
- b. Obtain a medication history on the client.
- c. Assess for history of gastric upset or bleeding or liver or renal disease.
- d. Assess the client for gastrointestinal upset during medication administration.
- e. Monitor for edema.
- f. Monitor the serum salicylate (aspirin) level when the client is taking high doses.
- g. Monitor for signs of bleeding such as tarry stools, bleeding gums, petechiae, ecchymosis, and purpura.
- h. Instruct the client to take the medication with water, milk, or food.
  - i. An enteric-coated or buffered form of aspirin can be taken to decrease gastric distress.
  - j. Instruct the client that enteric-coated tablets cannot be crushed or broken.
- k. Clients taking aspirin should sit upright for 20 to 30 minutes after taking the dose.
  - l. Advise the client to inform other health care professionals if they are taking high doses of aspirin.

- m. Note that aspirin should be discontinued 3 to 7 days before surgery to reduce the risk of bleeding.
- n. Instruct the client to avoid alcoholic beverages.

## B. Acetaminophen (Tylenol)

### 1. Description

- a. Acetaminophen inhibits prostaglandin synthesis.
- b. Acetaminophen is used to decrease pain and fever.

### 2. Side effects

- a. Anorexia, nausea, vomiting
- b. Rash
- c. Hypoglycemia
- d. Oliguria

### 3. Interventions

- a. Monitor vital signs.
- b. Assess client for history of liver and renal dysfunction, alcoholism, and malnutrition.
- c. Monitor for hepatic damage, which includes nausea, vomiting, diarrhea, and abdominal pain.
- d. Monitor liver enzyme test results.
- e. Instruct the client that self-medication should not be used longer than 10 days for an adult and 5 days for a child.
- f. Note that the antidote for acetaminophen is acetylcysteine (Mucomyst).
- g. Evaluate for the effectiveness of the medication.

 Acetaminophen is contraindicated in clients with hepatic or renal disease, alcoholism, and/or hypersensitivity.

## VI. OPIOID ANALGESICS

### A. Description

- 1. Opioid analgesics suppress pain impulses but can suppress respiration and coughing by acting on the respiratory and cough center in the medulla of the brainstem.
- 2. Opioid analgesics can produce euphoria and sedation and can cause physical dependence.

### Box 67-16 Side Effects of Aspirin and Nonsteroidal Anti-Inflammatory Drugs

#### Aspirin

Allergic reactions (anaphylaxis, laryngeal edema)  
 Bleeding (anemia, hemolysis, increased bleeding time)  
 Dizziness  
 Drowsiness  
 Flushing  
 Gastrointestinal symptoms (distress, heartburn, nausea, vomiting)  
 Headaches  
 Decreased renal function  
 Tinnitus  
 Visual changes

#### Nonsteroidal Anti-Inflammatory Drugs

Dysrhythmias  
 Blood dyscrasias  
 Cardiovascular thrombotic events  
 Dizziness  
 Gastric irritation  
 Hepatotoxicity  
 Hypotension  
 Pruritus  
 Decreased renal function  
 Sodium and water retention  
 Tinnitus

3. Opioid analgesics are used for relief of mild, moderate, or severe pain.

**B. Medications (Box 67-17)**

1. Codeine sulfate

a. Codeine sulfate also is an effective cough suppressant at low doses.

b. Codeine sulfate can cause constipation.

2. Hydromorphone hydrochloride (Dilaudid)

a. Hydromorphone can decrease respirations.

b. Hydromorphone can cause constipation.

3. Meperidine hydrochloride (Demerol)

a. Meperidine can cause hypotension, dizziness, urinary retention.

b. Meperidine may be used for acute pain and as a preoperative medication.

c. Meperidine may lead to **increased intracranial pressure (ICP)** in clients with head injuries.

d. Meperidine is contraindicated in clients with head injuries and **increased ICP**, respiratory disorders, hypotension, shock, and severe hepatic and renal disease and in clients taking monoamine oxidase inhibitors.

e. Meperidine should not be taken with alcohol or a sedative-hypnotic because it may increase the CNS depression.

f. Meperidine should be used cautiously in children and adults with a seizure disorder or a history of seizures because it decreases the seizure threshold.

4. Morphine sulfate

a. Morphine can cause respiratory depression, orthostatic hypotension, and constipation.

b. Morphine may cause nausea and vomiting because of increased vestibular sensitivity.

c. Morphine is used for acute pain caused by myocardial infarction or cancer, for dyspnea caused by pulmonary edema, for surgery, and as a preoperative medication.

d. Morphine is contraindicated in clients with severe respiratory disorders; head injuries;

**increased ICP**; severe renal, hepatic, or pulmonary disease; or seizure activity.

e. Morphine is used with caution in clients with blood loss or shock.

**!** Respiratory depression is the priority concern with morphine sulfate.

5. Oxycodone with aspirin (Percodan)

a. Percodan should not be taken by a client allergic to aspirin.

b. Percodan can cause gastric irritation and should be taken with food or plenty of liquids.

6. Propoxyphene hydrochloride (Darvon) and propoxyphene napsylate (Darvon-N)

a. Darvon compounds contain aspirin and should not be taken by a client allergic to aspirin.

b. Darvocet-N contains acetaminophen.

7. Nalbuphine hydrochloride (Nubain) is preferable for treating the pain of a myocardial infarction because it reduces the oxygen needs of the heart without reducing blood pressure.

8. Methadone hydrochloride (Dolophine)

a. Dilute doses of oral concentrate with at least 90 mL of water.

b. Dilute dispersible tablets in at least 120 mL of water, orange juice, or acidic fruit beverage.

c. Methadone is used as a replacement medication for opiate dependence and to facilitate withdrawal.

9. Hydrocodone (Hycodan) frequently is used for cough suppression.

**C. Interventions for opioid analgesics**

1. Monitor vital signs.

2. Assess the client thoroughly before administering pain medication.

3. Initiate nursing measures such as massage, distraction, deep breathing and relaxation exercises, the application of heat or cold as prescribed, and providing care and comfort before administering the opioid analgesic.

### Box 67-17 Opioid Analgesics

Acetaminophen/hydrocodone (Lortab)  
Buprenorphine hydrochloride (Buprenex)

Butorphanol tartrate (Stadol)

Codeine sulfate, codeine phosphate

Fentanyl (Duragesic, Sublimaze)

Hydrocodone (Hycodan)

Hydromorphone hydrochloride (Dilaudid)

Levorphanol tartrate (Levo-Dromoran)

Meperidine hydrochloride (Demerol)

Methadone hydrochloride (Dolophine, Methadose)

Morphine sulfate (Duramorph, MS Contin, Kadian, Oramorph SR)

Nalbuphine hydrochloride (Nubain)

Oxycodone (Roxicodone, OxyContin)

Oxycodone hydrochloride; acetaminophen (Percocet)

Oxycodone; aspirin (Percodan)

Oxymorphone hydrochloride (Numorphan)

Pentazocine (Talwin)

Propoxyphene napsylate (Darvon-N)

Remifentanyl (Ultiva)

Sufentanyl (Sufenta)

Tramadol (Ultram)

4. Administer medications 30 to 60 minutes before painful activities.
5. Monitor respiratory rate and, if the rate is less than 12 breaths/min in an adult, withhold the medication unless ventilatory support is being provided.
6. Monitor pulse and, if bradycardia develops, withhold the dose and notify the physician.
7. Monitor blood pressure for hypotension.
8. Auscultate breath sounds because opioid analgesics suppress the cough reflex.
9. Encourage activities such as turning, deep breathing, and incentive spirometry to prevent atelectasis and pneumonia.
10. Monitor level of consciousness.
11. Initiate safety precautions such as side rails, a night light, and supervised ambulation.
12. Monitor intake and output.
13. Assess for urinary retention.
14. Instruct the client to take oral doses with milk or a snack to reduce gastric irritation.
15. Instruct the client to avoid alcohol.
16. Instruct the client to avoid activities that require alertness.
17. Assess bowel function for constipation, abdominal distention, and decreased peristalsis.
18. Evaluate the effectiveness of medication.
19. Have an opioid antagonist, oxygen, and resuscitation equipment available.

#### D. Morphine sulfate

1. Side effects
  - a. Respiratory depression
  - b. Orthostatic hypotension
  - c. Urinary retention
  - d. Nausea and vomiting
  - e. Constipation
  - f. Sedation, confusion, and hallucinations
  - g. Cough suppression
  - h. Reduction in pupillary size
  - i. Miosis
2. Interventions
  - a. Have naloxone (Narcan) available for overdose.
  - b. Assess vital signs and level of consciousness.
  - c. Compare rate and depth of respirations to baseline.
  - d. Withhold the medication if the respiratory rate is less than 12 breaths/min; respirations of less than 10 breaths/min can indicate respiratory distress.
  - e. Monitor urinary output, which should be at least 30 mL/hr.
  - f. Monitor bowel sounds for decreased peristalsis because constipation can occur.
  - g. Monitor for pupil changes because pinpoint pupils can indicate morphine overdose.
  - h. Avoid alcohol or CNS depressants because they can cause respiratory depression.

### Box 67-18 Opioid Antagonists

Naloxone hydrochloride (Narcan)  
Naltrexone (ReVia)

- i. Instruct the client to report dizziness or difficulty breathing.
  - j. If taking sustained-release morphine, the client may need short-acting opioid doses for breakthrough pain.
  - k. To administer morphine intravenously, dilute in at least 5 mL of sterile water for injection and administer slowly over 4 to 5 minutes.
  - l. Explain to client and family about administration and the sick effects of the medication.
- E. Meperidine hydrochloride (Demerol)**
1. Side effects
    - a. Respiratory depression
    - b. Hypotension and dizziness
    - c. Tachycardia
    - d. Drowsiness and confusion
    - e. Constipation
    - f. Urinary retention
    - g. Nausea and vomiting
    - h. Seizures
    - i. Tremors
  2. Interventions
    - a. Monitor vital signs.
    - b. Monitor for respiratory depression and hypotension.
    - c. Have naloxone available for overdose.
    - d. Monitor for urinary retention.
    - e. Monitor bowel sounds and for constipation.
    - f. To administer meperidine intravenously, dilute in at least 5 mL of sterile water or normal saline for injection and administer the dose over 4 to 5 minutes.

### VII. OPIOID ANTAGONISTS

- A.** Opioid antagonists (Box 67-18) are used to treat respiratory depression from opioid overdose.
- B.** Interventions
1. Monitor blood pressure, pulse, and respiratory rate every 5 minutes initially, tapering to every 15 minutes, and then every 30 minutes until the client is stable.
  2. Place the client on a cardiac monitor and monitor cardiac rhythm.
  3. Auscultate breath sounds.
  4. Have resuscitation equipment available.
  5. Do not leave the client unattended.
  6. Monitor the client closely for several hours because when the effects of the antagonist wears off, the client may again display signs of opioid overdose.

**Box 67-19 Osmotic Diuretics**

Mannitol (Osmitrol)  
Urea (Ureaphil)

**VIII. OSMOTIC DIURETICS****A. Description**

1. Osmotic diuretics (Box 67-19) increase osmotic pressure of the glomerular filtrate, inhibiting reabsorption of water and electrolytes.
2. Osmotic diuretics are used for oliguria and to prevent renal failure, decrease intracranial pressure, and decrease ICP in clients with narrow-angle glaucoma.
3. Mannitol is used with chemotherapy to induce diuresis.

**B. Side effects**

1. Fluid and electrolyte imbalances
2. Pulmonary edema from the rapid shifts of fluid
3. Nausea and vomiting
4. Headache
5. Tachycardia from the rapid fluid loss
6. Hyponatremia and dehydration

**C. Interventions**

1. Monitor vital signs.
2. Monitor weight.
3. Monitor urine output.
4. Monitor electrolyte levels.
5. Monitor lungs and heart sounds for signs of pulmonary edema.
6. Monitor for signs of dehydration.
7. Monitor neurological status.
8. Monitor for increased intraocular pressure.
9. Assess for signs of decreasing ICP if appropriate.
10. Change the client's position slowly to prevent orthostatic hypotension.
11. Monitor for crystallization in the vial of mannitol before administering the medication; if crystallization is noted, do not administer the medication from that vial.

**MORE QUESTIONS ON THE CD!**
**Practice Questions**

- 816.** Carbidopa-levodopa (Sinemet) is prescribed for the client with Parkinson's disease. The nurse monitors the client for side effects of the medication. Which of the following would indicate that the client is experiencing a side effect?
1. Pruritus
  2. Tachycardia
  3. Hypertension
  4. Impaired voluntary movements
- 817.** The home health nurse visits a client who is taking phenytoin (Dilantin) for control of seizures. During the assessment, the nurse notes that the client is taking birth control pills. Which of the following information should the nurse include in the teaching plan?
1. Pregnancy should be avoided while taking phenytoin.
  2. The client may stop the medication if it is causing severe gastrointestinal effects.
  3. There is the potential of decreased effectiveness of birth control pills while taking phenytoin.
  4. There is the increased risk of thrombophlebitis while taking phenytoin and birth control pills together.
- 818.** The nurse is caring for a client in the emergency department diagnosed with Bell's palsy. The client has been taking acetaminophen (Tylenol), and acetaminophen overdose is suspected. The nurse anticipates that the antidote to be prescribed is:
1. Pentostatin (Nipent)
  2. Auranofin (Ridaura)
  3. Fludarabine (Fludara)
  4. Acetylcysteine (Mucomyst)
- 819.** The client with trigeminal neuralgia tells the nurse that acetaminophen (Tylenol) is taken daily for the relief of generalized discomfort. Which laboratory value would indicate toxicity associated with the medication?
1. Sodium level of 140 mEq/L
  2. Prothrombin time of 12 seconds
  3. Direct bilirubin level of 2 mg/dL
  4. Platelet count of 400,000/mm<sup>3</sup>
- 820.** The client is taking the prescribed dose of phenytoin (Dilantin) to control seizures. Results of a phenytoin blood level study reveal a level of 35 mcg/mL. Which of the following symptoms would be expected as a result of this laboratory result?
1. Hypotension
  2. Tachycardia
  3. Slurred speech
  4. No symptoms, because this is a normal therapeutic level
- 821.** The client arrives at the emergency department complaining of back spasms. The client states, "I have been taking two to three aspirin every 4 hours for the last week, and it hasn't helped my back." Aspirin intoxication is suspected, and the nurse assesses the client for which of the following?
1. Tinnitus
  2. Diarrhea

3. Constipation
4. Photosensitivity

**822.** A client with trigeminal neuralgia is being treated with carbamazepine (Tegretol), 400 mg orally daily. Which of the following indicates that the client is experiencing a side effect to the medication?

1. Uric acid level, 5 mg/dL
2. Sodium level, 140 mEq/L
3. Blood urea nitrogen level, 15 mg/dL
4. White blood cell count, 3000/mm<sup>3</sup>

**823.** The nurse is caring for a client with severe back pain. Codeine sulfate has been prescribed for the client. Which of the following does the nurse specifically include in the plan of care while the client is taking this medication?

1. Monitor fluid balance.
2. Monitor bowel activity.
3. Monitor peripheral pulses.
4. Monitor for hypertension.

**824.** The nurse has given medication instructions to the client receiving phenytoin (Dilantin). The nurse determines that the client has an adequate understanding if the client states that:

1. "Alcohol is not contraindicated while taking this medication."
2. "Good oral hygiene is needed, including brushing and flossing."

3. "The medication dose may be self-adjusted, depending on side effects."
4. "The morning dose of the medication should be taken before a serum drug level is drawn."

**825.** The client with myasthenia gravis has become increasingly weaker. The physician prepares to identify whether the client is reacting to an overdose of the medication (cholinergic crisis) or an increasing severity of the disease (myasthenic crisis). An injection of edrophonium (Tensilon) is administered. Which of the following would indicate that the client is in cholinergic crisis?

1. No change in the condition
2. Complaints of muscle spasms
3. An improvement of the weakness
4. A temporary worsening of the condition

### Alternate Item Format: Multiple Response

**826.** Meperidine hydrochloride (Demerol) has been prescribed for a client to treat pain. Select the side effects of this medication. **Select all that apply.**

- 1. Diarrhea
- 2. Tremors
- 3. Drowsiness
- 4. Hypotension
- 5. Urinary frequency
- 6. Increased respiratory rate

## ANSWERS

### 816. 4

**Rationale:** Dyskinesia and impaired voluntary movement may occur with high levodopa dosages. Nausea, anorexia, dizziness, orthostatic hypotension, bradycardia, and akinesia are frequent side effects of the medication.

**Test-Taking Strategy:** Use the process of elimination. Options 2 and 3 are comparable or alike and are cardiac-related options, so these options can be eliminated first. Next, focus on the client's diagnosis and select option 4 over option 1 because it is related neurologically. Review the side effects of levodopa if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (pp. 174–176). St. Louis: Saunders.

### 817. 3

**Rationale:** Phenytoin enhances the rate of estrogen metabolism, which can decrease the effectiveness of some birth

control pills. Options 1, 2, and 4 are inappropriate instructions.

**Test-Taking Strategy:** Use the process of elimination. Option 4 would cause anxiety in the client. A client should not be instructed to stop anticonvulsant medication, as indicated in option 2. Pregnancy does not need to be "avoided." Review medication interactions related to phenytoin if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., pp. 324, 329). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 225). St. Louis: Saunders.

### 818. 4

**Rationale:** The antidote for acetaminophen is acetylcysteine (Mucomyst). The normal therapeutic serum level of acetaminophen is 10 to 20 mcg/mL. A toxic level is higher than 50 mcg/mL, and levels higher than 200 mcg/mL could

indicate hepatotoxicity. Auranofin (Ridaura) is a gold preparation used to treat rheumatoid arthritis. Fludarabine (Fludara) and pentostatin (Nipent) are antineoplastic agents.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 3 first because they are comparable or alike (antineoplastic agents). Recalling that auranofin is used to treat rheumatoid arthritis will direct you to option 4. Review the antidote for acetaminophen if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 11). St. Louis: Saunders.

### 819. 3

**Rationale:** In adults, overdose of acetaminophen causes liver damage. Option 3 is an indicator of liver function and is the only option that indicates an abnormal laboratory value. The normal direct bilirubin level is 0 to 0.3 mg/dL. The normal platelet count is 150,000 to 400,000/mm<sup>3</sup>. The normal prothrombin time is 10 to 13 seconds. The normal sodium level is 135 to 145 mEq/L.

**Test-Taking Strategy:** Use the process of elimination. Knowledge that acetaminophen causes liver damage and knowledge of normal laboratory results will assist you in answering this question. Option 3 is the only abnormal value. Also, of all the options, the bilirubin level is the laboratory value most directly related to liver function. Review the effects of toxicity from acetaminophen and normal laboratory values if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 377). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 845). St. Louis: Saunders.

Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed., p. 148). St. Louis: Mosby.

### 820. 3

**Rationale:** The therapeutic phenytoin level is 10 to 20 mcg/mL. At a level higher than 20 mcg/mL, involuntary movements of the eyeballs (nystagmus) appears. At a level higher than 30 mcg/mL, ataxia and slurred speech occur.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the therapeutic phenytoin level. From this point, you must know the symptoms that would be noted in the client when the phenytoin level is 35 mcg/mL. Remember that ataxia and slurred speech occur with levels higher than 30 mcg/mL. Review therapeutic levels and associated symptoms if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 909). St. Louis: Saunders.

### 821. 1

**Rationale:** Mild intoxication with acetylsalicylic acid (aspirin) is called salicylism and is experienced commonly when the daily dosage is higher than 4 g. Tinnitus (ringing in the ears) is the most frequent effect noted with intoxication. Hyperventilation may occur because salicylate stimulates the respiratory center. Fever may result, because salicylate interferes with the metabolic pathways coupling oxygen consumption and heat production. Options 2, 3, and 4 are not associated specifically with toxicity.

**Test-Taking Strategy:** Use the process of elimination. Note that the question refers to aspirin intoxication. Options 2 and 3 relate to gastrointestinal symptoms, are comparable or alike, and are eliminated first. From the remaining options, you must know that tinnitus occurs. If you had difficulty with this question, review aspirin intoxication.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 89). St. Louis: Saunders.

### 822. 4

**Rationale:** Adverse effects of carbamazepine appear as blood dyscrasias, including aplastic anemia, agranulocytosis, thrombocytopenia, and leukopenia; cardiovascular disturbances; thrombophlebitis; dysrhythmias; and dermatological effects.

**Test-Taking Strategy:** Use the process of elimination. If you are familiar with normal laboratory values, you will note that the only option that indicates an abnormal value is option 4. Review the side effects related to this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**References:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 237). St. Louis: Saunders.

Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed., pp. 998–1000). St. Louis: Mosby.

### 823. 2

**Rationale:** While the client is taking codeine sulfate, the nurse would monitor vital signs and assess for hypotension. The nurse also should increase fluid intake, palpate the bladder for urinary retention, auscultate bowel sounds, and monitor the pattern of daily bowel activity and stool consistency. The nurse should monitor respiratory status and initiate deep-breathing and coughing exercises. Additionally, the nurse monitors the effectiveness of the pain medication.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic word *specifically* and recall that codeine sulfate can cause constipation. If you had difficulty with this question, review nursing measures related to the administration of codeine sulfate.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 267). St. Louis: Saunders.

#### 824. 2

**Rationale:** Typical anticonvulsant medication instructions include taking the prescribed daily dosage to keep the blood level of the drug constant and having a sample drawn for serum drug level before taking the morning dose. The client is taught not to stop the medication abruptly, avoid alcohol, check with the physician before taking over-the-counter medications, avoid activities in which alertness and coordination are required until medication effects are known, provide good oral hygiene, and obtain regular dental care. The client should also wear a Medic-Alert bracelet.

**Test-Taking Strategy:** Use the process of elimination. Using knowledge of general principles related to the medication administration will assist you in eliminating options 1 and 3. From the remaining options, recall that medications generally are not taken just before drawing therapeutic serum levels because the results would be artificially high. This leaves oral hygiene as the correct option because of the risk of gingival hyperplasia. Review client education related to phenytoin (Dilantin) if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult health—Neurological

**References:** Edmunds, M. (2010). *Introduction to clinical pharmacology* (6th ed., p. 257). St. Louis: Mosby.

Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 909). St. Louis: Saunders.

#### 825. 4

**Rationale:** An edrophonium injection makes the client in cholinergic crisis temporarily worse. An improvement in the weakness indicates myasthenia crisis.

**Test-Taking Strategy:** Use the process of elimination. Recalling that a cholinergic crisis indicates an overdose of medication, it seems reasonable that a worsening of the condition will occur when medication is administered. Review cholinergic crisis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1017, 1019). St. Louis: Saunders.

Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., pp. 345, 347). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 137–138). St. Louis: Saunders.

### ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

#### 826. 2, 3, 4

**Rationale:** Meperidine hydrochloride is an opioid analgesic. Side effects include respiratory depression, drowsiness, hypotension, constipation, urinary retention, nausea, vomiting, and tremors.

**Test-Taking Strategy:** Focus on the name of the medication. Recalling that this medication is an opioid analgesic and recalling the effects of an opioid analgesic will assist in identifying the side effects. Review the side effects of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 716). St. Louis: Saunders.

# UNIT XVII

## The Adult Client With a Musculoskeletal Disorder

### PYRAMID TERMS

**cast** Stiff dressing or casting, made of plaster of Paris or synthetic material, to stabilize a part or parts of the body until healing occurs.

**compartment syndrome** Condition in which pressure increases in a confined anatomical space, leading to decreased blood flow, ischemia, and dysfunction of these tissues. Initial ischemia with pain, pallor, paresthesia, muscle weakness, and loss of pulses may progress to necrosis and permanent muscle cell dysfunction.

**external fixation** Stabilization of a fracture by the use of an external frame, with multiple pins applied through the bone.

**fat embolism** Sudden dislodgment of a fat globule that is freed into the circulation, where it can lodge in a blood vessel and obstruct blood flow to tissue distal to the obstruction.

**internal fixation** Stabilization of a fracture that involves the application of screws, plates, pins, or nails to hold the fragments in alignment.

**reduction** Correction or realignment of a bone fracture or joint dislocation.

**traction** Exertion of a pulling force to a fractured bone or dislocated joint to establish and maintain correct alignment for healing and to decrease muscle spasms and pain.

include postoperative care following hip surgery or amputation and care of the client with rheumatoid arthritis or osteoporosis. Focus on the points related to the psychosocial effects as a result of the musculoskeletal disorder, such as unexpected body image changes, and the appropriate and available support services needed for the client.

### CLIENT NEEDS

#### Safe and Effective Care Environment

- Establishing priorities
- Handling hazardous and infectious materials safely
- Maintaining asepsis related to wounds
- Maintaining confidentiality regarding the disorder and plan of care
- Maintaining standard and other precautions
- Preventing accidents and injuries
- Providing a dietary consultation
- Providing informed consent for diagnostic treatments and surgical procedures
- Providing physical therapy and occupational therapy referrals
- Upholding client rights

#### Health Promotion and Maintenance

- Discussing expected body image changes
- Performing physical assessment related to the musculoskeletal system
- Promoting health related to diet and activity
- Preventing diseases that occur as a result of the aging process

### PYRAMID TO SUCCESS

The Pyramid to Success focuses on the emergency care for a client who sustains a fracture or other musculoskeletal injury, monitoring for complications related to fractures, and carrying out interventions if complications occur. Nursing care related to casts and traction is emphasized. Skill related to instructing the client in the use of an assistive device such as a cane, walker, or crutches is a Pyramid Point. Pyramid Points also

Providing home care instructions regarding care related to a musculoskeletal disorder  
Reinforcing the importance of prescribed therapy

### **Psychosocial Integrity**

Assessing available support systems and use of community resources  
Assessing the client's ability to cope with feelings of isolation and loss of independence  
Considering cultural, religious, and spiritual influences  
Discussing grief and loss related to mobility limitations and restrictions  
Discussing situational role changes as a result of the musculoskeletal disorder  
Identifying unexpected body image changes as a result of injury or disease

Identifying sensory and perceptual alterations  
Mobilizing coping mechanisms

### **Physiological Integrity**

Identifying complications of a fracture  
Identifying complications related to procedures or injuries  
Providing care related to casts and traction  
Promoting normal elimination patterns  
Promoting self-care measures  
Providing emergency care for a fracture or other injury  
Providing measures to promote comfort  
Teaching about the use of assistive devices for mobility such as canes, walkers, and crutches  
Teaching pharmacological therapy

# Musculoskeletal System

## I. ANATOMY AND PHYSIOLOGY

### A. Skeleton

1. Axial portion
  - a. Cranium
  - b. Vertebrae
  - c. Ribs
2. Appendicular portion
  - a. Limbs
  - b. Shoulders
  - c. Hips

### B. Types of bones (Box 68-1)

1. Spongy bone
  - a. Spongy bone is located in the ends of long bones and the center of flat and irregular bones.
  - b. Spongy bone can withstand forces applied in many directions.
2. Dense (compact) bone
  - a. Dense bone covers spongy bone.
  - b. Forms a cylinder around a central marrow cavity
  - c. Better able to withstand longitudinal forces than horizontal forces
3. Characteristics of the bones
  - a. Support and protect structures of the body
  - b. Provide attachments for muscles, tendons, and ligaments
  - c. Contain tissue in the central cavities, which aids in the formation of blood cells
  - d. Assist in regulating calcium and phosphate concentrations
4. Bone growth
  - a. The length of bone growth results from the ossification of the epiphyseal cartilage at the ends of bones; bone growth stops between the ages of 18 and 25 years.
  - b. The width of bone growth results from the activity of osteoblasts; it occurs throughout life but slows down with aging.

**!** As aging occurs, bone resorption accelerates, decreasing bone mass and predisposing the client to injury.

### C. Types of joints (Table 68-1)

1. Characteristics of joints
  - a. Allow movement between bones
  - b. Formed where two bones join
  - c. Surfaces are covered with cartilage.
  - d. Enclosed in a capsule (synovial joints)
  - e. Contain a cavity filled with synovial fluid (synovial joints)
  - f. Ligaments hold the bone and joint in the correct position.
  - g. Articulation is the meeting point of two or more bones.
2. Synovial fluid
  - a. Found in the synovial joint capsule
  - b. Formed by the synovial membrane, which lines the joint capsule
  - c. Lubricates the cartilage
  - d. Provides a cushion against shocks

### D. Muscles

1. Characteristics of muscles
  - a. Made up of bundles of muscle fibers
  - b. Provide the force to move bones
  - c. Assist in maintaining posture
  - d. Assist with heat production
2. Process of contraction and relaxation
  - a. Muscle contraction and relaxation require large amounts of adenosine triphosphate.
  - b. Contraction also requires calcium, which functions as a catalyst.
  - c. Acetylcholine released by the motor end plate of the motor neuron initiates an action potential.
  - d. Acetylcholine is then destroyed by acetylcholinesterase.
  - e. Calcium is required to contract muscle fibers and acts as a catalyst for the enzyme needed for the sliding together action of actin and myosin.
  - f. Following contraction, adenosine triphosphate transports calcium out to allow actin and myosin to separate and allow the muscle to relax.

### 3. Skeletal muscles

**Box 68-1 Types of Bones**

|       |           |
|-------|-----------|
| Long  | Flat      |
| Short | Irregular |

**TABLE 68-1** Types of Joints

| Type           | Description  |
|----------------|--|
| Amphiarthrosis | Cartilaginous joint<br>Slightly movable                            |
| Condyloid      | Freely movable<br>Allows frictionless, painless movement           |
| Diarthrosis    | Synovial joint<br>Ball-and-socket joint                            |
| Synarthrosis   | Fibrous or fixed joint<br>No movement associated with these joints |

- a. Skeletal muscles are attached to two bones and cross at least one joint.
- b. The point of origin is the point of attachment that does not move.
- c. The point of insertion is the point of attachment that moves when the muscle contracts.
- d. Skeletal muscles act in groups.
- e. Prime movers contract to produce movement.
- f. Antagonists relax.
- g. Synergists contract to stabilize body movement.
- h. Nerves activate and control the muscles.

**E. Bone healing**

1. Description: Bone union or healing is the process that occurs after the integrity of a bone is interrupted.
2. Three stages
  - a. The fracture causes soft tissue edema and bleeding because of the vascularity of the bone; this blood solidifies into a hematoma over 48 to 72 hours.
  - b. The postinjury blood supply is interrupted, leading to ischemia and necrosis of the bone around the injury site.
  - c. Dead cells promote migration of osteoblasts and fibroblasts to the area and healing starts with the formation of fibrocartilage.
  - d. Bone union begins as a callus forms with vascular and cellular proliferation surrounding the fracture site; this loose fibrous tissue, or callus, changes into bone over the next 3 to 6 months.
  - e. Remodeling occurs as the excess bone tissue of the callus resorbs as time passes and weight-bearing activities are gradually increased; the time required for complete healing varies and is related to factors such as age, bone type, trauma severity, infection, and blood supply.

**Box 68-2 Risk Factors Associated With Musculoskeletal Disorders**

|                      |                       |
|----------------------|-----------------------|
| Autoimmune disorders | Metabolic disorders   |
| Calcium deficiency   | Neoplastic disorders  |
| Falls                | Obesity               |
| Hyperuricemia        | Postmenopausal states |
| Infection            | Trauma and injury     |
| Medications          |                       |

**II. RISK FACTORS ASSOCIATED WITH MUSCULOSKELETAL DISORDERS (Box 68-2)****III. DIAGNOSTIC TESTS****A. Radiography**

1. Description: Radiography is a commonly used procedure to diagnose disorders of the musculoskeletal system.
2. Interventions
  - a. Handle injured areas carefully and support extremities above and below the joint.
  - b. Administer analgesics as prescribed before the procedure, particularly if the client is in pain.
  - c. Remove any radiopaque objects, such as jewelry.
  - d. Ask the client if she is pregnant; may be contraindicated in pregnancy.
  - e. Shield client's testes, ovaries, or pregnant abdomen.
  - f. The client must lie still during a radiographic (x-ray) procedure.
  - g. Inform the client that exposure to radiation is minimal and not dangerous.
  - h. The health care provider is to wear a lead apron if staying in the room with the client.

**B. Arthrocentesis**

1. Description: Arthrocentesis is used to diagnose joint inflammation and infection.
  - a. Arthrocentesis involves aspirating synovial fluid, blood, or pus via a needle inserted into a joint cavity.
  - b. Medication, such as corticosteroids, may be instilled into the joint if necessary to alleviate inflammation.
2. Interventions
  - a. Obtain an informed consent.
  - b. Apply an elastic compression bandage post-procedure as prescribed.
  - c. Use ice to decrease pain and swelling.
  - d. Pain may worsen after aspirating fluid from the joint; analgesics may be prescribed.
  - e. Pain can continue up to 2 days after administration of corticosteroids into a joint.
  - f. Instruct the client to rest the joint for 8 to 24 hours postprocedure.

-  g. Instruct the client to notify the physician if a fever or swelling of the joint occurs.
- C. Arthrography**
1. Description: Arthrography is used in unexplained joint pain or inflammation to diagnose trauma to the joint capsule or ligaments.
    - a. Arthrography is a radiographic examination of the soft tissues of the joint structures.
    - b. A local anesthetic is used for the procedure.
    - c. A contrast medium or air is injected into the joint cavity, and the joint is moved through range of motion as a series of x-rays are taken.
  2. Interventions
    - a. Instruct the client to fast from food and fluids for 8 hours before the procedure as prescribed.
    -  b. Assess the client for allergies to iodine or shellfish before the procedure.
    - c. Obtain an informed consent.
    - d. Inform the client of the need to remain as still as possible, except when asked to reposition.
    - e. Minimize the use of the joint for 12 hours after the procedure.
    -  f. Instruct the client that the joint may be edematous and tender for 1 to 2 days after the procedure and may be treated with ice packs and analgesics as prescribed.
    - g. Instruct the client that if edema and tenderness last longer than 2 days, the physician should be notified.
    - h. If knee arthrography was performed, an elastic compression wrap over the knee may be prescribed for 3 to 4 days and ice applied to decrease pain and swelling.
    - i. If air has been used for injection, crepitus may be felt in the joint for up to 2 days.
- D. Arthroscopy**
1. Description: Arthroscopy is used to diagnose and treat acute and chronic disorders of the joint.
    - a. Arthroscopy provides an endoscopic examination of various joints.
    - b. Articular cartilage abnormalities can be assessed, loose bodies removed, and the cartilage trimmed.
    - c. A biopsy may be performed during the procedure.
  2. Interventions
    - a. Instruct the client to fast for 8 to 12 hours before the procedure.
    - b. Obtain an informed consent.
    - c. Administer pain medication as prescribed postprocedure.
    -  d. Assess the neurovascular status of the affected extremity.
    - e. An elastic compression bandage should be worn postprocedure for 2 to 4 days as prescribed.
- f. Instruct the client that walking without weight bearing usually is permitted after sensation returns but to limit activity for 1 to 4 days as prescribed following the procedure.
  - g. Instruct the client to elevate the extremity as often as possible for 2 days following the procedure and to place ice on the site to minimize swelling.
  - h. Reinforce instructions regarding the use of crutches, which may be used for 5 to 7 days postprocedure for walking.
  - i. Advise the client to notify the physician if fever or increased knee pain occurs or if edema continues for more than 3 days postprocedure. 
- E. Bone mineral density measurements**
1. Dual-energy x-ray absorptiometry
    - a. Dual-energy x-ray absorptiometry measures the bone mass of the spine, wrist and hip bones, and total body.
    - b. Radiation exposure is minimal.
    - c. Dual-energy x-ray absorptiometry is used to diagnosis metabolic bone disease and to monitor changes in bone density with treatment.
    - d. Inform the client that the procedure is painless.
    - e. All metallic objects are removed before the test. 
  2. Quantitative ultrasound
    - a. Quantitative ultrasound evaluates strength, density, and elasticity of various bones, using ultrasound rather than radiation.
    - b. Inform the client that the procedure is painless.
- F. Bone scan**
1. Description: A bone scan is used to identify, evaluate, and stage bone cancer before and after treatment; it is also used to detect fractures.
    - a. Radioisotope is injected intravenously and will collect in areas that indicate abnormal bone metabolism and some fractures, if they exist.
    - b. The isotope is excreted in the urine and feces within 48 hours and is not harmful to others.
  2. Interventions
    - a. Food and fluids may be withheld, before the procedure.
    - b. Obtain an informed consent.
    - c. Remove all jewelry and metal objects.
    - d. Following the injection of the radioisotope, the client must drink 32 oz of water (if not contraindicated) to promote renal filtering of the excess isotope.
    - e. From 1 to 3 hours after the injection, have the client void to clear excess isotope from the bladder before the scanning procedure is completed.

- f. Inform the client of the need to lie supine during the procedure and that the procedure is not painful.
- g. Monitor the injection site for redness and swelling.
- h. Encourage oral fluid intake following the procedure.

 **No special precautions are required after a bone scan because a minimal amount of radioactivity exists in the radioisotope used for the procedure.**

#### G. Bone or muscle biopsy

1. Description: Biopsy may be done during surgery or through aspiration or punch or needle biopsy.
2. Interventions
  - a. Obtain an informed consent.
  - b. Monitor for bleeding, swelling, hematoma, or severe pain.
  - c. Elevate the site for 24 hours following the procedure to reduce edema.
  - d. Apply ice packs as prescribed following the procedure to prevent the development of a hematoma and decrease site discomfort.
  - e. Monitor for signs of infection following the procedure.
  - f. Inform the client that mild to moderate discomfort is normal following the procedure.

#### H. Electromyography (EMG)

1. Description: EMG is used to evaluate muscle weakness.
  - a. Electromyography measures electrical potential associated with skeletal muscle contractions.
  - b. Needles are inserted into the muscle, and recordings of muscular electrical activity are traced on recording paper through an oscilloscope.

#### 2. Interventions

- a. Obtain an informed consent.
- b. Instruct the client that the needle insertion is uncomfortable.
- c. Instruct the client not to take any stimulants or sedatives for 24 hours before the procedure.
- d. Inform the client that slight bruising may occur at the needle insertion sites.
- e. Mild analgesics can be used for the pain.

#### I. Myelography

1. Description: Myelography requires injection of dye or air into the subarachnoid space followed by radiography to detect abnormalities of the spinal cord and vertebrae.
2. Preprocedure interventions
  - a. Obtain an informed consent.
  - b. Provide hydration for at least 12 hours before the test.
  - c. Assess client for allergies to iodine or seafood (shellfish).

- d. Premedicate for sedation as prescribed.

#### 3. Postprocedure interventions

- a. Obtain vital signs and perform neurological assessment frequently as prescribed.
- b. Maintain bedrest as prescribed. The head position varies according to the dye used; the head is usually elevated if an oil-based or water-soluble contrast agent is used and is usually positioned lower than the trunk if air contrast is used.
- c. Encourage fluids and monitor intake and output to validate dye excretion.
- d. If air contrast is used, keep the head lower than the trunk, as prescribed by the physician.

## IV. INJURIES

### A. Strains

1. Strains are an excessive stretching of a muscle or tendon.
2. Management involves cold and heat applications, exercise with activity limitations, anti-inflammatory medications, and muscle relaxants.
3. Surgical repair may be required for a severe strain (ruptured muscle or tendon).

### B. Sprains

1. Sprains are an excessive stretching of a ligament, usually caused by a twisting motion, such as in a fall or stepping onto an uneven surface.
2. Sprains are characterized by pain and swelling.
3. Management involves rest, ice, a compression bandage, and elevation to reduce swelling and provide joint support.
4. Casting may be required for moderate sprains to allow the tear to heal.
5. Surgery may be necessary for severe ligament damage.

### C. Rotator cuff injuries

1. The musculotendinous or rotator cuff of the shoulder can sustain a tear, usually as a result of trauma.
2. Injury is characterized by shoulder pain and the inability to maintain abduction of the arm at the shoulder (drop arm test).
3. Management involves nonsteroidal anti-inflammatory drugs (NSAIDs), physical therapy, sling support, and ice-heat applications.
4. Surgery may be required if medical management is unsuccessful or a complete tear is present.

## V. FRACTURES

- ### A. Description: A fracture is a break in the continuity of the bone caused by trauma, twisting as a result of muscle spasm or indirect loss of leverage, or bone decalcification and disease that result in osteopenia.

### B. Types of fractures (Box 68-3)

### C. Assessment of a fracture of an extremity

**Box 68-3 Types of Fractures**

**Closed or simple:** Skin over the fractured area remains intact.

**Comminuted:** The bone is splintered or crushed, creating numerous fragments.

**Complete:** The bone is separated completely by a break into two parts.

**Compression:** A fractured bone is compressed by other bone.

**Depressed:** Bone fragments are driven inward.

**Greenstick:** One side of the bone is broken and the other is bent; these fractures occur most commonly in children.

**Impacted:** A part of the fractured bone is driven into another bone.

**Incomplete:** Fracture line does not extend through the full transverse width of the bone.

**Oblique:** The fracture line runs at an angle across the axis of the bone.

**Open or compound:** The bone is exposed to air through a break in the skin, and soft tissue injury and infection are common.

**Pathological:** The fracture results from weakening of the bone structure by pathological processes such as neoplasia or osteomalacia; also called spontaneous fracture.

**Spiral:** The break partially encircles bone.

**Transverse:** The bone is fractured straight across.

**Box 68-4 Interventions for a Fracture**

Reduction  
Fixation

Traction  
Cast

1. Pain or tenderness over the involved area
2. Decrease or loss of muscular strength or function
3. Obvious deformity of affected area
4. Crepitation, erythema, edema, or bruising
5. Muscle spasm and neurovascular impairment

- D. Initial care of a fracture of an extremity**
1. Immobilize affected extremity with cast or splint.
  2. Assess neurovascular status of the extremity.
  3. Interventions for a fracture (Box 68-4)

**⚠** If a compound (open) fracture exists, splint the extremity and cover the wound with a sterile dressing.

- E. Reduction** restores the bone to proper alignment.
1. Closed **reduction** is a nonsurgical intervention performed by manual manipulation.
    - a. Closed **reduction** may be performed under local or general anesthesia.
    - b. A **cast** may be applied following **reduction**.
  2. Open **reduction** involves a surgical intervention; the fracture may be treated with **internal fixation** devices.
- F. Fixation**
1. **Internal fixation** follows an open **reduction** (Fig. 68-1).
    - a. **Internal fixation** involves the application of screws, plates, pins, or intramedullary rods to hold the fragments in alignment.
    - b. **Internal fixation** may involve the removal of damaged bone and replacement with a prosthesis.
    - c. **Internal fixation** provides immediate bone strength.
  2. **External fixation** is the use of an external frame to stabilize a fracture by attaching skeletal pins

**▲ FIGURE 68-1** A compression hip screw used for open reduction with internal fixation. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

through bone fragments to a rigid external support (Fig. 68-2)

- a. **External fixation** provides more freedom of movement than with **traction**.
  - b. Monitor pin stability and provide pin care to decrease infection risks.
  - c. Risk of infection exists with both fixation methods.
  - d. **External fixation** is commonly used when massive tissue trauma is present.
- G. Traction** (Fig. 68-3)
1. Description
    - a. **Traction** is the exertion of a pulling force applied in two directions to reduce and immobilize a fracture.
    - b. **Traction** provides proper bone alignment and reduces muscle spasms.

**▲ FIGURE 68-2** External fixators. **A**, Mini-Hoffman system in use on hand. **B**, Hoffman II on the tibia (standard system). (From Lewis, S., Heitkemper, M., Dirksen, S., O'Brien, P., & Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

**▲ FIGURE 68-3** Types of traction. **A**, Buck's traction. **B**, Russell's traction. **C**, Head halter traction. **D**, Pelvic traction. **E**, Balanced suspension traction. (From Lewis, S., Heitkemper, M., Dirksen, S., O'Brien, P., & Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

▲ **FIGURE 68-4** Balanced suspension with a Thomas splint and Pearson attachment. The apparatus can be used alone or, as in this case, with skeletal traction. (From Monahan, F., Sands, J., Neighbors, M., Marek, J., & Green, C. [2007]. *Phipps' medical-surgical nursing: Health and illness perspectives* [8th ed.]. St. Louis: Mosby.)

## 2. Interventions

- Maintain proper body alignment.
- Ensure that the weights hang freely and do not touch the floor.
- Do not remove or lift the weights without a physician's prescription.
- Ensure that pulleys are not obstructed and that ropes in the pulleys move freely.
- Place knots in the ropes to prevent slipping.
- Check the ropes for fraying.

## H. Skeletal traction (Fig. 68-4)

### 1. Description

- Traction** is applied mechanically to the bone with pins, wires, or tongs.
- Typical weight for skeletal **traction** is 25 to 40 lb.

### 2. Interventions

- Monitor color, motion, and sensation of the affected extremity.
- Monitor the insertion sites for redness, swelling, drainage, or increased pain.
- Provide insertion site care as prescribed.

### 3. Cervical tongs and a halo fixation device. See Chapter 66 regarding care of the client with these types of devices.

## I. Skin traction (Box 68-5)

- Description:** Skin **traction** is applied by using elastic bandages or adhesive, foam boot, or sling.
- Cervical skin **traction** relieves muscle spasms and compression in the upper extremities and neck (see Fig. 68-3).
  - Cervical skin **traction** uses a head halter and chin pad to attach the **traction**.
  - Use powder to protect the ears from friction rub.
  - Position the client with the head of the bed elevated 30 to 40 degrees, and attach the weights to a pulley system over the head of the bed.

## Box 68-5 Types of Skin Traction

|                   |                    |
|-------------------|--------------------|
| Buck's traction   | Pelvic traction    |
| Cervical traction | Russell's traction |

- Buck's (extension) skin **traction** is used to alleviate muscle spasms and immobilize a lower limb by maintaining a straight pull on the limb with the use of weights (see Fig. 68-3).

### a. A boot appliance is applied to attach to the **traction**.

### b. The weights are attached to a pulley; allow the weights to hang freely over the edge of bed.

### c. Not more than 8 to 10 lb of weight should be applied.

### d. Elevate the foot of the bed to provide the **traction**.

- Russell's skin (sling) **traction**. See Fig 68-3 and Chapter 44 regarding this type of **traction**.

- Pelvic skin **traction** is used to relieve low back, hip, or leg pain or to reduce muscle spasm (see Fig. 68-3).

### a. Apply the **traction** belt snugly over the pelvis and iliac crest and attach to the weights.

### b. Use measures as prescribed to prevent the client from slipping down in bed.

## J. Balanced suspension traction (see Fig. 68-3)

### 1. Description

### a. Balanced suspension **traction** is used with skin or skeletal **traction**.

### b. Used to approximate fractures of the femur, tibia, or fibula

### c. Balanced suspension **traction** is produced by a counterforce other than client.

### 2. Interventions

- Position the client in a low Fowler's position on either the side or the back.

- b. Maintain a 20-degree angle from the thigh to the bed.
- c. Protect the skin from breakdown.
- d. Provide pin care if pins are used with the skeletal **traction**.
- e. Clean the pin sites with sterile normal saline and hydrogen peroxide or povidone-iodine (Betadine) as prescribed or per agency policy.

#### K. Dunlop's **traction**

1. Description: Horizontal **traction** is used to align fractures of the humerus; vertical **traction** maintains the forearm in proper alignment.
2. Interventions: Nursing care is similar to that for Buck's skin **traction**.

#### L. **Casts**

1. Description: Plaster or fiberglass **casts** are used to immobilize bones and joints into correct alignment after a fracture or injury.
2. Interventions
  - a. Keep the **cast** and extremity elevated.
  - b. Allow a wet plaster **cast** 24 to 72 hours to dry (synthetic **casts** dry in 20 minutes).
  - c. Handle a wet plaster **cast** with the palms of the hands until dry.
  - d. Turn the extremity every 1 to 2 hours, unless contraindicated, to allow air circulation and promote drying of the **cast**.
  - e. A hair dryer can be used on a cool setting to dry a plaster **cast** (heat cannot be used on a plaster **cast** because the **cast** heats up and burns the skin).
  - f. Prepare for bivalving or cutting the **cast** if circulatory impairment occurs.
  - g. Pad the **cast** or apply moleskin to the edges to protect the client's skin; maintain smooth edges around the **cast** to prevent crumbling of the **cast** material.
  - h. Monitor for signs of infection such as increased temperature, hot spots on the **cast**, foul odor, or changes in pain.
  - i. If an open draining area exists on the affected extremity, the physician will make a cutout portion of the **cast** known as a window.
  - j. Instruct the client not to stick objects inside the **cast**.
  - k. Teach the client to keep the **cast** clean and dry.
  - l. Instruct the client in isometric exercises to prevent muscle atrophy.

 **Monitor a casted extremity for circulatory impairment such as pain, swelling, discoloration, tingling, numbness, coolness, or diminished pulse. Notify the physician immediately if circulatory compromise occurs.**

## VI. COMPLICATIONS OF FRACTURES (Box 68-6)

### A. **Fat embolism**

1. Description: A **fat embolism** originates in the bone marrow and occurs after a fracture when a fat globule is released into the bloodstream.

- a. Clients with long bone fractures are at the greatest risk for the development of a **fat embolism**.
  - b. **Fat embolism** can occur within the first 48 to 72 hours following the injury.
2. Assessment: Findings often suggest pulmonary embolism.
    - a. Restlessness, hypoxemia, or mental status changes
    - b. Tachycardia and hypotension
    - c. Dyspnea and tachypnea
    - d. Petechial rash over the upper chest and neck; these may fade quickly.
  3. Interventions (see Priority Nursing Actions)

### Box 68-6 Complications of Fractures

Avascular necrosis  
 Compartment syndrome  
 Fat embolism  
 Infection and osteomyelitis  
 Pulmonary embolism

### PRIORITY NURSING ACTIONS!

#### Actions to Take if the Client Develops a Fat Embolism

1. Notify the physician.
2. Administer oxygen .
3. Administer intravenous fluids.
4. Monitor vital signs and respiratory status.
5. Prepare for intubation and mechanical ventilation if necessary.
6. Document the event, actions taken, and the client's response.

A fat embolism originates in the bone marrow and occurs after a fracture when a fat globule is released into the bloodstream. Fat embolism can occur within the first 48 to 72 hours following the injury and clients with long bone fractures are at the greatest risk for the development of a fat embolism. Findings are similar to those noted with pulmonary embolism and include restlessness, hypoxemia, mental status changes, dyspnea, tachypnea, tachycardia, and hypotension. Additionally, a petechial rash may present over the upper chest and neck. The physician is notified immediately while initiating emergency care. The client is maintained on bedrest and is repositioned only as necessary and gently. Oxygen is administered and IV hydration is administered to prevent hypovolemic shock. Vital signs and respiratory status are monitored closely and the client is prepared for intubation and mechanical ventilation if necessary. Corticosteroids may also be prescribed for the client. The nurse then documents the event, actions taken, and the client's response.

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1182). St. Louis: Saunders.

-  **B. Compartment syndrome**
1. Description
    - a. Tough fascia surrounds muscle groups, forming compartments from which arteries, veins, and nerves enter and exit at opposite ends.
    - b. **Compartment syndrome** occurs when pressure increases within one or more compartments, leading to decreased blood flow, tissue ischemia, and neurovascular impairment.
    - c. Within 4 to 6 hours after the onset of **compartment syndrome**, neurovascular damage is irreversible if not treated.
  2. Assessment
    - a. Unrelieved or increased pain in the limb
    - b. Tissue that is distal to the involved area becomes pale, dusky, or edematous.
    - c. Pain with passive movement
    - d. Loss of sensation (paresthesia)
    - e. Pulselessness (a late sign)
  3. Interventions
    - a. Notify the physician immediately and prepare to assist physician.
    - b. If severe, assist the physician with fasciotomy to relieve pressure and restore tissue perfusion.
    - c. Loosen tight dressings or bivalve restrictive **cast** as prescribed.
- C. Infection and osteomyelitis**
1. Description: Infection and osteomyelitis (inflammatory response in bone tissue) can be caused by the introduction of organisms into bones leading to localized bone infection.
  2. Assessment
    - a. Tachycardia and fever (usually above 101° F).
    - b. Erythema and pain in the area surrounding the infection
    - c. Leukocytosis and elevated erythrocyte sedimentation rate (ESR)
  3. Interventions
    - a. Notify the physician.
    - b. Prepare to initiate aggressive, long-term intravenous antibiotic therapy.
    - c. Administer hyperbaric oxygen therapy to promote healing.
    - d. Surgery is performed for resistant osteomyelitis with sequestrectomy and/or bone grafts.
- D. Avascular necrosis**
1. Description: Avascular necrosis occurs when a fracture interrupts the blood supply to a section of bone, leading to bone death.
  2. Assessment
    - a. Pain
    - b. Decreased sensation
  3. Interventions
    - a. Notify the physician if pain or numbness occurs.
    - b. Prepare the client for removal of necrotic tissue because it serves as a focus for infection.
- E. Pulmonary embolism**
1. Description: Pulmonary embolism is caused by the movement of foreign particles (blood clot, fat, or air) into the pulmonary circulation.
  2. Assessment
    - a. Restlessness and apprehension
    - b. Sudden onset of dyspnea and chest pain
    - c. Cough, hemoptysis, hypoxemia, or crackles
  3. Interventions
    - a. Notify the physician if signs of emboli are present.
    - b. Administer oxygen and other prescriptions; IV anticoagulant therapy may be prescribed.
- VII. CRUTCH WALKING**
- A. Description**
1. An accurate measurement of the client for crutches is important because an incorrect measurement could damage the brachial plexus.
  2. The distance between the axillae and the arm pieces on the crutches should be two to three fingerwidths in the axilla space.
  3. The elbows should be slightly flexed, 20 to 30 degrees, when the client is walking.
  4. When ambulating with the client, stand on the affected side.
  5. Instruct the client never to rest the axillae on the axillary bars.
  6. Instruct the client to look up and outward when ambulating and to place the crutches 6 to 10 inches diagonally in front of the foot.
  7. Instruct the client to stop ambulation if numbness or tingling in the hands or arms occurs.
- B. Crutch gaits (Table 68-2)**
- C. Assisting the client with crutches to sit and stand**
1. Place the unaffected leg against the front of the chair.
  2. Move the crutches to the affected side, and grasp the arm of the chair with the hand on the unaffected side.
  3. Flex the knee of the unaffected leg to lower self into the chair while placing the affected leg straight out in front.
  4. Reverse the steps to move from a sitting to standing position.
- D. Going up and down stairs**
1. Up the stairs
    - a. The client moves the unaffected leg up first.
    - b. The client moves the affected leg and the crutches up.
  2. Down the stairs
    - a. The client moves the crutches and the affected leg down.
    - b. The client moves the unaffected leg down.
- VIII. CANES AND WALKERS**
- A. Description:** Canes and walkers are made of a lightweight material with a rubber tip at the bottom.
- B. Interventions**

**TABLE 68-2** Crutch Gaits

| Type of Gait       | Use  | Procedure   |
|--------------------|--|---|
| Two-point gait     | Used with partial weight-bearing limitations and with bilateral lower extremity prostheses                                   | The crutch on the affected side and the unaffected foot are advanced at the same time.  |
| Three-point gait   | Used for partial weight-bearing or no weight-bearing on the affected leg; requires that the client have strength and balance | Both crutches and the foot of the affected extremity are advanced together, followed by the foot of the unaffected extremity.                             |
| Four-point gait    | Used if weight-bearing is allowed and one foot can be placed in front of the other   | The right crutch is advanced, then the left foot, then the left crutch, and then the right foot.  |
| Swing-to gait      | Used when there is adequate muscle power and balance in the arms and legs  | Both crutches are advanced together, then both legs are lifted and placed down on a spot behind the crutches. The feet and crutches form a tripod.        |
| Swing-through gait | Used when there is adequate muscle power and balance in the arms and legs.   | Both crutches are advanced together; then both legs are lifted through and beyond the crutches and placed down again at a point in front of the crutches. |

Modified from Linton, A. (2007). *Introduction to medical-surgical nursing* (4th ed.). St. Louis: Saunders.

- Stand at the affected side of the client when ambulating; use of a gait or transfer belt may be necessary.
- The handle should be at the level of the client's greater trochanter.
- The client's elbow should be flexed at a 15- to 30-degree angle.
- Instruct the client to hold the cane 4 to 6 inches to the side of the foot.
- Instruct the client to hold the cane in the hand on the unaffected side so that the cane and weaker leg can work together with each step.
- Instruct the client to move the cane at the same time as the affected leg.
- Instruct the client to inspect the rubber tips regularly for worn places.

#### C. Hemicanes or quadripod canes

- Hemicanes or quadripod canes are used for clients who have the use of only one upper extremity.
- Hemicanes provide more security than a quadripod cane; however, both types provide more security than a single-tipped cane.
- Position the cane at the client's unaffected side, with the straight, nonangled side adjacent to the body.
- Position the cane 6 inches from client's side, with the hand grip level with the greater trochanter.

#### D. Walker

- Stand adjacent to the client on the affected side.
- Instruct the client to put all four points of the walker flat on the floor before putting weight on the hand pieces.
- Instruct the client to move the walker forward, followed by the affected or weaker foot and then the unaffected foot.

 Safety is the priority concern when the client uses an assistive device such as a cane, walker, or crutches. Be sure that the client demonstrates correct use of the device.

## IX. FRACTURED HIP

### A. Types

- Intracapsular (femoral head is broken within the joint capsule).
  - Femoral head and neck receive decreased blood supply and heal slowly.
  - Skin traction is applied preoperatively to reduce fracture and immobilize bone.
  - Treatment includes a total hip replacement or open **reduction internal fixation** (ORIF) with femoral head replacement (Fig. 68-5).
  - To prevent hip displacement postoperatively, avoid extreme hip flexion.
- Extracapsular (fracture is outside the joint capsule) 
  - Fracture can occur at the greater trochanter or can be an intertrochanteric fracture.
  - Preoperative treatment includes balanced suspension or skin **traction** to relieve muscle spasms and reduce pain.
  - Surgical treatment includes open **reduction internal fixation** with nail plate, screws, pins, or wires

### B. Postoperative interventions

- Maintain leg and hip in proper alignment and prevent internal or external rotation; avoid extreme hip flexion.
- Turn client to the unaffected side and only to affected side as prescribed by physician.
- Elevate the head of the bed 30 to 45 degrees for meals only.

▲ **FIGURE 68-5** Moore prosthesis, used for hip fractures. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders. Courtesy of Smith & Nephew, Orthopaedics Division, Memphis, TN.)

4. Assist the client to ambulate as prescribed by the physician.
5. Avoid weight bearing on the affected leg as prescribed; instruct the client in the use of a walker to avoid weight bearing.
6. Weight bearing is often restricted after an ORIF and may not be restricted after total hip arthroplasty (THA); always refer to the physician's prescriptions.
7. Keep the operative leg extended, supported, and elevated when getting the client out of bed.
8. Avoid hip flexion greater than 90 degrees and avoid low chairs when out of bed.
9. Monitor for wound infection or hemorrhage.
10. Neurovascular assessment of affected extremity: Check color, pulses, capillary refill, movement, and sensation.
11. Maintain the compression of the Hemovac or Jackson-Pratt drain to facilitate wound drainage.
12. Monitor and record drainage amount, which decreases consistently about 80 mL every 8 hours until 48 hours postoperatively.
13. Carry out postoperative blood salvage to collect, filter, and reinfuse salvaged blood into the client.
14. Use antiembolism stockings or sequential compression stockings; encourage the client to flex and extend the feet to reduce the risk of deep vein thrombosis (DVT).
15. Instruct the client to avoid crossing the legs and activities that require bending over.
16. Physical therapy will be instituted postoperatively with progressive ambulation as prescribed by the physician.

## X. TOTAL KNEE REPLACEMENT

- A.** Description: Total knee replacement is the implantation of a device to substitute for the femoral condyles and tibial joint surfaces.
- B.** Postoperative interventions
  1. Monitor surgical incision for drainage and infection.
  2. Begin continuous passive motion 24 to 48 hours postoperatively as prescribed to exercise the knee and provide moderate flexion and extension.
  3. Administer analgesics before continuous passive motion to decrease pain.
  4. Prepare the client for out of bed activities as prescribed; have the client avoid leg dangling.
  5. Avoid weight bearing and instruct the client in the use of the prescribed assistive device, such as a walker.
  6. Postoperative blood salvage may be prescribed to collect, filter, and reinfuse salvaged blood into client.

## XI. JOINT DISLOCATION AND SUBLUXATION

- A.** Dislocation: Injury of the ligaments surrounding a joint, which leads to displacement or separating of the articular surfaces of the joint
- B.** Subluxation: Incomplete displacement of joint surfaces when forces disrupt the soft tissue that surrounds the joints
- C.** Assessment
  1. Asymmetry of the contour of affected body parts
  2. Pain, tenderness, dysfunction, and swelling
  3. Complications include neurovascular compromise, avascular necrosis, and open joint injuries.
  4. X-rays are taken to determine joint shifting.
- D.** Interventions
  1. Focus of treatment includes pain relief, joint support, and joint protection.
  2. Immediate treatment is done to reduce the dislocation and realign the dislocated joint.
  3. Open or closed **reduction** is done with a post-procedural joint immobilization.
  4. Intravenous conscious sedation, local, or general anesthesia is used during joint manipulation.
  5. Initial activity restriction is followed by gentle range-of-motion activities and a gradual return of activities to normal levels while supporting the affected joint.
  6. A weakened joint is prone to recurrent dislocation and may require extended activity restriction.

## XII. HERNIATION: INTERVERTEBRAL DISK

- A.** Description: The nucleus of the disk protrudes into the annulus, causing nerve compression.
- B.** Cervical disk herniation occurs at the C5 to C6 and C6 to C7 interspaces.

1. Cervical disk herniation causes pain radiation to shoulders, arms, hands, scapulae, and pectoral muscles.
  2. Motor and sensory deficits can include paresthesia, numbness, and weakness of the upper extremities.
  3. Interventions
    - a. Conservative management is used unless the client develops signs of neurological deterioration.
    - b. Bed rest is prescribed to decrease pressure, inflammation, and pain.
    - c. Immobilize the cervical area with cervical collar or brace.
    - d. Apply heat to reduce muscle spasms and apply ice to reduce inflammation and swelling.
    - e. Maintain head and spine alignment.
    - f. Instruct the client in the use of analgesics, sedatives, anti-inflammatory agents, and corticosteroids as prescribed.
    - g. Prepare the client for a corticosteroid injection into the epidural space if prescribed.
    - h. Assist and instruct the client in the use of a cervical collar or cervical **traction** as prescribed.
  4. Cervical collar is used for cervical disk herniation.
    - a. A cervical collar limits neck movement and holds the head in a neutral or slightly flexed position.
    - b. The cervical collar may be worn intermittently or 24 hours daily.
    - c. Inspect the skin under the collar for irritation.
    - d. When prescribed and after pain decreases, exercises are prescribed to strengthen the muscles.
  5. Client education related to cervical disk conditions
    - a. Avoid flexing, extending, and rotating neck.
    - b. Avoid the prone position and maintain neck, spine, and hips in a neutral position while sleeping.
    - c. Minimize long periods of sitting.
    - d. Instruct the client regarding medications such as analgesics, sedatives, anti-inflammatory agents, and corticosteroids.
- C.** Lumbar disk herniation most often occurs at the L4 to L5 or L5 to S1 interspace.
1. Herniation produces muscle weakness, sensory deficits, and diminished tendon reflexes.
  2. The client experiences pain and muscle spasms in the lower back, with radiation of the pain into one hip and down the leg (sciatica).
  3. Pain is relieved by bed rest and aggravated by movement, lifting, straining, and coughing.
  4. Interventions
    - a. Conservative management is indicated unless neurological deterioration or bowel and bladder dysfunction occurs.
    - b. Apply heat to decrease muscle spasms and apply ice to decrease inflammation and swelling.

### Box 68-7 Types of Disk Surgery

*Discectomy:* Removal of herniated disk tissue and related matter

*Discectomy with fusion:* Fusion of vertebrae with bone graft  
*Laminectomy:* Excision of part of the vertebrae (lamina) to remove the disk

*Laminotomy:* Division of the lamina of a vertebra

- c. Instruct the client to sleep on the side, with the knees and hips flexed, and place a pillow between the legs.
  - d. Apply pelvic **traction** as prescribed to relieve muscle spasms and decrease pain.
  - e. Begin progressive ambulation as inflammation, edema, and pain subside.
5. Client education related to lumbar disk conditions
- a. Instruct the client in the use of prescribed medications such as analgesics, muscle relaxants, anti-inflammatory agents, or corticosteroids.
  - b. Instruct the client about application techniques for corsets or braces to maintain immobilization and proper spine alignment.
  - c. Instruct the client in correct posture while sitting, standing, walking, and working.
  - d. Instruct the client in the correct technique to use when lifting objects such as bending the knees, maintaining a straight back, and avoiding lifting objects above the elbow level.
  - e. Instruct in weight control program as prescribed.
  - f. Instruct the client in an exercise program to strengthen back and abdominal muscles as prescribed.
- D.** Disk surgery is used when spinal cord compression is suspected or client's symptoms do not respond to conservative treatment (Box 68-7).
1. Preoperative interventions
    - a. Routine preoperative instructions are provided.
    - b. Instruct the client about logrolling and range-of-motion exercises.
  2. Postoperative interventions: Cervical disk
    - a. Monitor for respiratory difficulty from inflammation or hematoma.
    - b. Encourage coughing, deep breathing, and early ambulation as prescribed.
    - c. Monitor for hoarseness and inability to cough effectively because this may indicate laryngeal nerve damage.
    - d. Use throat sprays or lozenges for sore throat, avoiding anesthetic lozenges that may numb the throat and increase choking risks.
    - e. Monitor the surgical wound for infection, swelling, redness, drainage, or pain.
    - f. Provide a soft diet if the client complains of dysphagia.
    - g. Monitor for sudden return of radicular pain, which may indicate cervical spine instability.

3. Postoperative interventions: Lumbar disk
  - a. Monitor for wound hemorrhage.
  - b. Monitor lower extremities for sensation, movement, color, temperature, and paresthesia.
  - c. Monitor for urinary retention, paralytic ileus, and constipation, which can result from decreased movement, opioid administration, or spinal cord compression.
  - d. Prevent constipation by encouraging a high-fiber diet, increased fluid intake, and stool softeners as prescribed.
  - e. Administer opioids and sedatives as prescribed to relieve pain and anxiety.
  - f. Assist and instruct the client to use a prescribed back brace or corset with cotton underwear to prevent skin irritation.
4. Postoperative lumbar disk positioning concerns
  - a. In the immediate postoperative period, the client may be expected to lie supine or have other activity restrictions, depending on the specific surgical intervention.
  - b. Instruct the client to avoid spinal flexion or twisting and that the spine should be kept aligned.
  - c. Instruct the client to minimize sitting, which may place a strain on the surgical site.
  - d. When the client is lying supine, place a pillow under the neck and slightly flex the knees.
  - e. Avoid extreme hip flexion when lying on side

**!** Following disk surgery, instruct the client in correct logrolling techniques for turning and repositioning and for getting out of bed.

### XIII. AMPUTATION OF A LOWER EXTREMITY

- A. Description: Amputation (Fig. 68-6) is the surgical removal of a limb or part of the limb.
- B. Postoperative interventions
  1. Monitor vital signs.
  2. Monitor for infection and hemorrhage.
  3. Mark bleeding and drainage on the dressing if it occurs.
  4. Keep a tourniquet at the bedside if prescribed.
  5. Observe for and prevent contractures, which can result from prolonged residual limb elevation.
  6. Monitor for signs of infection, necrosis, and neuroma.
  7. Evaluate for phantom limb sensation and pain; explain sensation and pain to the client, and medicate the client as prescribed.
  8. First 24 hours: Elevate the foot of the bed to reduce edema; then keep the bed flat to prevent hip flexion contractures, if prescribed by the physician.
  9. After 24 to 48 hours postoperatively, position the client prone to stretch the muscles and prevent hip flexion contractures, if prescribed.

**▲ FIGURE 68-6** Common levels of lower extremity amputation. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

10. To prevent hip flexion contractures, do not elevate the residual limb on a pillow.
  11. Maintain surgical application of dressing, elastic compression wrap, or elastic stump (residual limb) shrinker as prescribed to reduce swelling, minimize pain, and mold the residual limb in preparation for prosthesis.
  12. As prescribed, wash the residual limb with mild soap and water and dry completely.
  13. Massage the skin toward the suture line to mobilize scar and prevent its adherence to underlying bone.
  14. Prepare for the prosthesis and instruct the client in progressive resistive techniques by gently pushing the residual limb against pillows and progressing to firmer surfaces.
  15. Encourage verbalization regarding loss of the body part, and assist the client to identify coping mechanisms to deal with the loss.
- C. Interventions for below-knee amputation
    1. Prevent edema.
    2. Do not allow the residual limb to hang over the edge of the bed.
    3. Discourage long periods of sitting to lessen complications of knee flexion.
  - D. Interventions for above-knee amputation
    1. Prevent internal or external rotation of the limb.
    2. Place a sandbag, rolled towel, or trochanter roll along the outside of the thigh to prevent external rotation.

**E. Rehabilitation**

1. Instruct the client in the use of a mobility aid such as crutches or a walker.
2. Prepare the residual limb for a prosthesis.
3. Prepare the client for fitting of the residual limb for a prosthesis.
4. Instruct the client in exercises to maintain range of motion and upper body strengthening.
5. Provide psychosocial support to the client.

**XIV. RHEUMATOID ARTHRITIS****A. Description**

1. Rheumatoid arthritis is a chronic systemic inflammatory disease (immune complex disorder); the cause may be related to a combination of environmental and genetic factors.
2. Rheumatoid arthritis leads to destruction of connective tissue and synovial membrane within the joints.
3. Rheumatoid arthritis weakens the joint, leading to dislocation and permanent deformity of the joint.
4. Pannus forms at the junction of synovial tissue and articular cartilage and projects into the joint cavity, causing necrosis.
5. Exacerbations of disease manifestations occur during periods of physical or emotional stress and fatigue.
6. Vasculitis can impede blood flow, leading to organ or organ system malfunction and failure caused by tissue ischemia.

**B. Assessment**

1. Inflammation, tenderness, and stiffness of the joints
2. Moderate to severe pain with morning stiffness lasting longer than 30 minutes
3. Joint deformities, muscle atrophy, and decreased range of motion in affected joints
4. Spongy, soft feeling in the joints
5. Low-grade temperature, fatigue, and weakness
6. Anorexia, weight loss, and anemia
7. Elevated ESR and positive rheumatoid factor
8. Radiographic study showing joint deterioration
9. Synovial tissue biopsy reveals inflammation

**C. Rheumatoid factor**

1. Blood test used to assist in diagnosing rheumatoid arthritis
2. Values
  - a. Nonreactive: 0 to 39 international units (IU)/mL
  - b. Weakly reactive: 40 to 79 IU/mL
  - c. Reactive: Higher than 80 IU/mL

**D. Medications:** Combination of pharmacological therapies includes nonsteroidal anti-inflammatory drugs (NSAIDs), disease-modifying antirheumatic drugs (DMARDs), and glucocorticoids

**E. Physical mobility**

1. Preserve joint function.
2. Provide range-of-motion exercises to maintain joint motion and muscle strengthening.

**Box 68-8 Client Education for Rheumatoid Arthritis and Degenerative Joint Disease**

Assist the client to identify and correct safety hazards in the home.

Instruct the client in the correct use of assistive or adaptive devices.

Instruct the client in energy conservation measures.

Review the prescribed exercise program.

Instruct the client to sit in a chair with a high straight back.

Instruct the client to use only a small pillow when lying down.

Instruct the client in measures to protect the joints.

Instruct the client regarding the prescribed medications.

Stress the importance of follow-up visits with the health care provider.

3. Balance rest and activity.

4. Splints may be used during acute inflammation to prevent deformity.

5. Prevent flexion contractures.

6. Apply heat or cold therapy as prescribed to joints.

7. Apply paraffin baths and massage as prescribed.

8. Encourage consistency with exercise program.

9. Use joint-protecting devices.

10. Avoid weight bearing on inflamed joints.

**F. Self-care (Box 68-8)**

1. Assess the need for assistive devices such as raised toilet seats, self-rising chairs, wheelchairs, and scooters to facilitate mobility.

2. Work with an occupational therapist or health care provider to obtain assistive or adaptive devices.

3. Instruct the client in alternative strategies for providing activities of daily living.

**G. Fatigue**

1. Identify factors that may contribute to fatigue.

2. Monitor for signs of anemia and administer iron, folic acid, and vitamins as prescribed.

3. Monitor for medication-related blood loss by testing the stool for occult blood.

4. Instruct the client in measures to conserve energy, such as pacing activities and obtaining assistance when possible.

**H. Disturbed body image**

1. Assess the client's reaction to the body change.

2. Encourage the client to verbalize feelings.

3. Assist the client with self-care activities and grooming.

4. Encourage the client to wear street clothes.

**I. Surgical interventions**

1. Synovectomy: Surgical removal of the synovia to help maintain joint function

2. Arthrodesis: Bony fusion of a joint to regain some mobility

3. Joint replacement (arthroplasty): Surgical replacement of diseased joints with artificial joints; performed to restore motion to a joint

and function to the muscles, ligaments, and other soft tissue structures that control a joint

## XV. OSTEOARTHRITIS (DEGENERATIVE JOINT DISEASE)

### A. Description

1. Osteoarthritis is marked by progressive deterioration of the articular cartilage.
2. Osteoarthritis causes bone buildup and the loss of articular cartilage in peripheral and axial joints.
3. Osteoarthritis affects the weight-bearing joints and joints that receive the greatest stress, such as the hips, knees, lower vertebral column, and hands.
4. The cause of primary osteoarthritis is not known. Risk factors include trauma, aging, obesity, genetic changes, and smoking.

### B. Assessment

1. Client experiences joint pain that diminishes after rest and intensifies after activity, noted early in the disease process.
2. As the disease progresses, pain occurs with slight motion or even at rest.
3. Symptoms are aggravated by temperature change and climate humidity.
4. Presence of Heberden's nodes or Bouchard's nodes
5. Joint swelling (may be minimal), crepitus, and limited range of motion
6. Difficulty getting up after prolonged sitting
7. Skeletal muscle disuse atrophy
8. Inability to perform activities of daily living
9. Compression of the spine as manifested by radiating pain, stiffness, and muscle spasms in one or both extremities

### C. Pain

1. Administer NSAIDs, muscle relaxants, and other medications as prescribed.
2. Prepare the client for corticosteroid injections into joints as prescribed.
3. Position joints in function position and avoid flexion of knees and hips.
4. Immobilize the affected joint with a splint or brace until inflammation subsides.
5. Avoid large pillows under the head or knees.
6. Provide a bed or foot cradle to keep linen off of feet.
7. Instruct the client in the importance of moist heat, hot packs or compresses, and paraffin dips as prescribed.
8. Apply cold applications as prescribed when the joint is acutely inflamed.
9. Encourage adequate rest, recommending 10 hours of sleep at night and a 1- to 2-hour nap in the afternoon.

### D. Nutrition

1. Encourage a well-balanced diet.
2. Maintain weight within normal range to decrease stress on the joints.

### E. Physical mobility

1. Instruct the client to balance activity with rest and to participate in an exercise program that limits stressing affected joints.
2. Instruct the client that exercises should be active rather than passive and to stop exercise if pain occurs.
3. Instruct the client to limit exercise when joint inflammation is severe.

### F. Surgical management

1. Osteotomy: The bone is resected to correct joint deformity, promote realignment, and reduce joint stress.
2. Total joint replacement or arthroplasty
  - a. Total joint replacement is performed when all measures of pain relief have failed.
  - b. Hips and knees are replaced most commonly.
  - c. Total joint replacement is contraindicated in the presence of infection, advanced osteoporosis, or severe joint inflammation.

## XVI. OSTEOPOROSIS

### A. Description

1. Osteoporosis is a metabolic disease characterized by bone demineralization, with loss of calcium and phosphorus salts leading to fragile bones and the subsequent risk for fractures.
2. Bone resorption accelerates as bone formation slows.
3. Osteoporosis occurs most commonly in the wrist, hip, and vertebral column.
4. Osteoporosis can occur postmenopausally or as a result of a metabolic disorder or calcium deficiency.
5. Client may be asymptomatic until the bones become fragile and a minor injury or movement causes a fracture.
6. Primary osteoporosis
  - a. Most often occurs in postmenopausal women; occurs in men with low testosterone levels
  - b. Risk factors include decreased calcium intake, deficient estrogen, and sedentary lifestyle.
7. Secondary osteoporosis
  - a. Causes include prolonged therapy with corticosteroids, thyroid-reducing medications, aluminum-containing antacids, or anticonvulsants.
  - b. Associated with immobility, alcoholism, malnutrition, or malabsorption
8. Risk factors (Box 68-9)

### B. Assessment

1. Possibly asymptomatic
2. Back pain occurs after lifting, bending, or stooping.
3. Back pain that increases with palpation
4. Pelvic or hip pain, especially with weight bearing

**Box 68-9 Risk Factors for Osteoporosis**

Cigarette smoking  
 Early menopause  
 Excessive use of alcohol  
 Family history  
 Female gender  
 Increasing age  
 Insufficient intake of calcium  
 Sedentary lifestyle  
 Thin, small frame  
 White (European descent) or Asian race

5. Problems with balance
6. Decline in height from vertebral compression
7. Kyphosis of the dorsal spine, also known as “dowager’s hump”
8. Degeneration of lower thorax and lumbar vertebrae on radiographic studies

 The client with osteoporosis is at risk for pathological fractures.

**C. Interventions**

1. Assess risk for and prevent injury in client’s personal environment.
  - a. Assist client to identify and correct hazards in his or her environment.
  - b. Position household items and furniture to ensure an unobstructed walkway.
  - c. Use side rails to prevent falls.
  - d. Instruct in use of assistive devices such as a cane or walker.
  - e. Encourage the use of a firm mattress.
2. Provide personal care to client to reduce injuries.
  - a. Move the client gently when turning and repositioning.
  - b. Assist with ambulation if client is unsteady.
  - c. Provide gentle range-of-motion exercises.
  - d. Apply a back brace as prescribed during an acute phase to immobilize the spine and provide spinal column support.
3. Provide client instructions to promote optimal level of health and function.
  - a. Instruct the client in the use of good body mechanics.
  - b. Instruct the client in exercises to strengthen abdominal and back muscles to improve posture and provide support for the spine.
  - c. Instruct the client to avoid activities that can cause vertebral compression.
  - d. Instruct the client to eat a diet high in protein, calcium, vitamins C and D, and iron.
  - e. Instruct the client to avoid alcohol and coffee.
  - f. Instruct the client to maintain an adequate fluid intake to prevent renal calculi.

4. Administer medications as prescribed to promote bone strength and decrease pain.

**XVII. GOUT****A. Description**

1. Gout is a systemic disease in which urate crystals deposit in joints and other body tissues.
2. Gout results from abnormal amounts of uric acid in the body.
3. Primary gout results from a disorder of purine metabolism.
4. Secondary gout involves excessive uric acid in the blood caused by another disease.

**B. Phases**

1. Asymptomatic: Client has no symptoms but serum uric acid level is elevated.
2. Acute: Client has excruciating pain and inflammation of one or more small joints, especially the great toe.
3. Intermittent: Client has intermittent periods without symptoms between acute attacks.
4. Chronic: Results from repeated episodes of acute gout
  - a. Chronic gout results in deposits of urate crystals under the skin.
  - b. Chronic gout results in deposits of urate crystals within major organs, such as the kidneys, leading to organ dysfunction.

**C. Assessment**

1. Swelling and inflammation of the joints, leading to excruciating pain
2. Tophi: Hard, irregularly shaped nodules in the skin containing chalky deposits of sodium urate
3. Low-grade fever, malaise, and headache
4. Pruritis from urate crystals in the skin
5. Presence of renal stones from elevated uric acid levels

**D. Interventions**

1. Provide a low-purine diet as prescribed, avoiding foods such as organ meats, wines, and aged cheese.
2. Encourage a high fluid intake of 2000 mL/day to prevent stone formation.
3. Encourage weight reduction diet if required.
4. Instruct the client to avoid alcohol and starvation diets because they may precipitate a gout attack.
5. Increase urinary pH (above 6) by eating alkaline ash foods (see Chapter 62).
6. Provide bed rest during the acute attacks with the affected extremity elevated.
7. Monitor joint range-of-motion ability and appearance of joints.
8. Position the joint in mild flexion during acute attack.
9. Protect the affected joint from excessive movement or direct contact with sheets or blankets.

10. Provide heat or cold for local treatments to affected joint as prescribed.
11. Administer medications such as analgesics, anti-inflammatory, and uricosuric agents as prescribed.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 827.** A nurse is conducting health screening for osteoporosis. Which of the following clients is at greatest risk of developing this disorder?
1. A 25-year-old woman who jogs
  2. A 36-year-old man who has asthma
  3. A 70-year-old man who consumes excess alcohol
  4. A sedentary 65-year-old woman who smokes cigarettes
- 828.** A nurse has given instructions to a client returning home after knee arthroscopy. The nurse determines that the client understands the instructions if the client states that he or she will:
1. Resume regular exercise the following day.
  2. Stay off the leg entirely for the rest of the day.
  3. Report fever or site inflammation to the physician.
  4. Refrain from eating food for the remainder of the day.
- 829.** A nurse is one of several persons who witness a vehicle hit a pedestrian at fairly low speed on a small street. The victim is dazed and tries to get up. The leg appears fractured. The nurse would plan to:
1. Try to reduce the fracture manually.
  2. Assist the victim to get up and walk to the sidewalk.
  3. Leave the victim for a few moments to call an ambulance.
  4. Stay with the victim and encourage the person to remain still.
- 830.** A client with a hip fracture asks the nurse why Buck's (extension) traction is being applied before surgery. The nurse's response is based on the understanding that Buck's (extension) traction primarily:
1. Allows bony healing to begin before surgery
  2. Provides rigid immobilization of the fracture site
  3. Lengthens the fractured leg to prevent severing of blood vessels
  4. Provides comfort by reducing muscle spasms and provides fracture immobilization
- 831.** A nurse is evaluating the pin sites of a client in skeletal traction. The nurse would be least concerned with which of the following findings?
1. Inflammation
  2. Serous drainage
  3. Pain at a pin site
  4. Purulent drainage
- 832.** A nurse is assessing the casted extremity of a client. The nurse would assess for which of the following signs and symptoms indicative of infection?
1. Dependent edema
  2. Diminished distal pulse
  3. Presence of a "hot spot" on the cast
  4. Coolness and pallor of the extremity
- 833.** A client has sustained a closed fracture and has just had a cast applied to the affected arm. The client is complaining of intense pain. The nurse elevates the limb, applies an ice bag, and administers an analgesic, with little relief. The nurse interprets that this pain may be caused by:
1. Infection under the cast
  2. The anxiety of the client
  3. Impaired tissue perfusion
  4. The recent occurrence of the fracture
- 834.** A nurse is admitting a client with multiple trauma to the nursing unit. The client has a leg fracture and had a plaster cast applied. In positioning the casted leg, the nurse should:
1. Keep the leg in a level position.
  2. Elevate the leg for 3 hours and put it flat for 1 hour.
  3. Keep the leg level for 3 hours and elevate it for 1 hour.
  4. Elevate the leg on pillows continuously for 24 to 48 hours.
- 835.** A client is being discharged to home after application of a plaster leg cast. The nurse determines that the client understands proper care of the cast if the client states that he or she should:
1. Avoid getting the cast wet.
  2. Cover the casted leg with warm blankets.
  3. Use the fingertips to lift and move the leg.
  4. Use a padded coat hanger end to scratch under the cast.
- 836.** A client being measured for crutches asks the nurse why the crutches cannot rest up underneath the arm for extra support. The nurse's response is based on the understanding that this could most likely result in:
1. A fall and further injury
  2. Injury to the brachial plexus nerves
  3. Skin breakdown in the area of the axilla
  4. Impaired range of motion while the client ambulates

- 837.** A nurse has given a client instructions about crutch safety. The nurse determines that the client needs reinforcement of information if the client states:
1. That he or she will not use someone else's crutches
  2. That crutch tips will not slip even when wet
  3. The need to have spare crutches and tips available
  4. That crutch tips should be inspected periodically for wear
- 838.** A nurse is caring for a client being treated for fat embolus after multiple fractures. Which of the following data would the nurse evaluate as the most favorable indication of resolution of the fat embolus?
1. Minimal dyspnea
  2. Clear mentation
  3. Oxygen saturation of 85%
  4. Arterial oxygen level of 78 mm Hg
- 839.** A nurse has conducted teaching with a client in an arm cast about the signs and symptoms of compartment syndrome. The nurse determines that the client understands the information if the client states that he or she should report which of the following early symptoms of compartment syndrome?
1. Cold, bluish-colored fingers
  2. Pain that is out of proportion to the type of injury or condition
  3. Pain that increases when the arm is dependent
  4. Numbness and tingling in the fingers
- 840.** A client with diabetes mellitus has had a right below-knee amputation. The nurse would assess specifically for which of the following signs because of the history of diabetes?
1. Hemorrhage
  2. Edema of the stump
  3. Slight redness of the incision
  4. Separation of the wound edges
- 841.** A nurse is caring for a client who had an above-knee amputation 2 days ago. The residual limb was wrapped with an elastic compression bandage, which has come off. The nurse immediately:
1. Calls the physician
  2. Applies ice to the site
  3. Rewraps the stump with an elastic compression bandage
  4. Applies a dry sterile dressing and elevates it on one pillow
- 842.** A client is complaining of low back pain that radiates down the left posterior thigh. The nurse further assesses the client to see if the pain is worsened or aggravated by:
1. Bed rest
  2. Bending or lifting
  3. Ibuprofen (Motrin)
  4. Application of heat
- 843.** A nurse is caring for a client who has had spinal fusion, with insertion of hardware. The nurse would be concerned especially with which of the following assessment findings?
1. Temperature of 101.6° F orally
  2. Complaints of discomfort during repositioning
  3. Old bloody drainage outlined on the surgical dressing
  4. Discomfort during coughing and deep-breathing exercises
- 844.** A nurse is caring for a client with a diagnosis of gout. Which of the following laboratory values would the nurse expect to note in the client?
1. Calcium level of 9.0 mg/dL
  2. Uric acid level of 8.6 mg/dL
  3. Potassium level of 4.1 mEq/L
  4. Phosphorus level of 3.1 mg/dL

### Alternate Item Format: Multiple Response

- 845.** A nurse is preparing a list of cast care instructions for a client who just had a plaster cast applied to his right forearm. Select all instructions that the nurse would include on the list.
- 1. Keep the cast and extremity elevated.
  - 2. The cast needs to be kept clean and dry.
  - 3. Allow the wet cast 24 to 72 hours to dry.
  - 4. Tingling and numbness in the extremity are expected.
  - 5. Use a hair dryer set on a warm to hot setting to dry the cast.
  - 6. Use a soft padded object that will fit under the cast to scratch the skin under the cast.

## ANSWERS

### 827. 4

**Rationale:** Risk factors for osteoporosis include female gender, postmenopausal, advanced age, low-calcium diet, excessive alcohol intake, being sedentary, and smoking cigarettes.

Long-term use of corticosteroids, anticonvulsants, and/or furosemide (Lasix) also increase the risk.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 1 first. The 25-year-old woman who jogs (exercises using the long bones) has negligible risk. The 36-year-old man

with asthma is eliminated next because his only risk factor might be long-term corticosteroid use to treat the asthma. Of the two remaining options, the 65-year-old woman has higher risk (age, gender, postmenopausal, sedentary, smoking) than the 70-year-old man (age, alcohol consumption). Review the risk factors associated with osteoporosis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1153). St. Louis: Saunders.

### 828. 3

**Rationale:** After arthroscopy, the client usually can walk carefully on the leg once sensation has returned. The client is instructed to avoid strenuous exercise for at least a few days. The client may resume the usual diet. Signs and symptoms of infection should be reported to the physician.

**Test-Taking Strategy:** Use the process of elimination. Recalling the general client teaching points related to surgical procedures will direct you to option 3. Review client teaching points following arthroscopy if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, and psychiatric nursing care plans* (2nd ed., p. 528). St. Louis: Mosby.

### 829. 4

**Rationale:** With a suspected fracture, the victim is not moved unless it is dangerous to remain in that spot. The nurse should remain with the victim and have someone else call for emergency help. A fracture is not reduced at the scene. Before the victim is moved, the site of fracture is immobilized to prevent further injury.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 2 first because either of these options could result in further injury to the victim. Of the remaining options, the more prudent action would be for the nurse to remain with the victim and have someone else call for emergency assistance. Review care of the victim with a fracture if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1186). St. Louis: Saunders.

### 830. 4

**Rationale:** Buck's (extension) traction is a type of skin traction often applied after hip fracture before the fracture is reduced in surgery. Traction reduces muscle spasms and helps immobilize the fracture. Traction does not lengthen the leg

for the purpose of preventing blood vessel severance. Traction also does not allow for bony healing to begin.

**Test-Taking Strategy:** Use the process of elimination. Focus on the client's diagnosis, hip fracture. Read each option carefully. Noting the words *provides fracture immobilization* will direct you to option 4. Review the purpose of Buck's (extension) traction if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1189). St. Louis: Saunders.

### 831. 2

**Rationale:** A small amount of serous oozing is expected at pin insertion sites. Signs of infection such as inflammation, purulent drainage, and pain at the pin site are not expected findings and should be reported to the physician.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *least concerned*. Options 1 and 4 seem to indicate an infectious problem and are eliminated first. From the remaining options, note that the complaint of pain is at "a pin site." Also, because serous drainage is an expected finding, select option 2. Review expected findings in the client with skeletal traction if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1191). St. Louis: Saunders.

### 832. 3

**Rationale:** Signs and symptoms of infection under a casted area include odor or purulent drainage from the cast or the presence of "hot spots," which are areas of the cast that are warmer than others. The physician should be notified if any of these occur. Signs of impaired circulation in the distal limb include coolness and pallor of the skin, diminished arterial pulse, and edema.

**Test-Taking Strategy:** Use the process of elimination. Answer this question and think about what you would expect to note with infection—redness, swelling, heat, and purulent drainage. With this in mind, you can eliminate options 2 and 4 easily. From the remaining options, remember that "dependent edema" is not necessarily indicative of infection. Swelling would be continuous. The hot spot on the cast could signify infection underneath that area and is the correct answer to the question. Review signs of infection in an extremity with a cast if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1189). St. Louis: Saunders.

**833. 3**

**Rationale:** Most pain associated with fractures can be minimized with rest, elevation, application of cold, and administration of analgesics. Pain that is not relieved by these measures should be reported to the physician because the pain unrelieved by medications and other measures may indicate neurovascular compromise. Because this is a new closed fracture and cast, infection would not have had time to set in.

**Test-Taking Strategy:** Use the process of elimination. Focus on the subject, intense pain. Use of the ABCs—airway, breathing, and circulation—will direct you to option 3. Review care of the client with a fracture and new cast if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Musculoskeletal

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1184–1185). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, and psychiatric nursing care plans* (2nd ed., pp. 516–517). St. Louis: Mosby.

**834. 4**

**Rationale:** A casted extremity is elevated continuously for the first 24 to 48 hours to minimize swelling and promote venous drainage. Options 1, 2, and 3 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Recalling that edema is a concern and knowledge of the effects of gravity on edema will direct you to option 4. Review care of the client with a new cast if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1188–1189). St. Louis: Saunders.

**835. 1**

**Rationale:** A plaster cast must remain dry to keep its strength. The cast should be handled with the palms of the hands, not the fingertips, until fully dry. Air should circulate freely around the cast to help it dry; the cast also gives off heat as it dries. The client should never scratch under the cast; the client may use a hair dryer on the cool setting to relieve an itch.

**Test-Taking Strategy:** Use the process of elimination. Knowing that a wet cast can be dented with the fingertips, causing pressure underneath, helps eliminate option 3 first. Knowing that the cast needs to dry helps eliminate option 2 next. Option 4 is dangerous to skin integrity and is also eliminated. Remember that plaster casts, once they have dried after application, should not become wet. Review care of the client with a cast if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., pp. 518–519). St. Louis: Mosby.

**836. 2**

**Rationale:** Crutches are measured so that the tops are two to three fingerwidths from the axillae. This ensures that the client's axillae are not resting on the crutch or bearing the weight of the crutch, which could result in injury to the nerves of the brachial plexus.

**Test-Taking Strategy:** Note the strategic words *most likely*. Recalling the risk associated with brachial nerve plexus injury will direct you to option 2. Review the complications associated with the use of crutches if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1193). St. Louis: Saunders.

**837. 2**

**Rationale:** Crutch tips should remain dry. Water could cause the client to slip by decreasing the surface friction of the rubber tip on the floor. If crutch tips get wet, the client should dry them with a cloth or paper towel. The client should use only crutches measured for the client. The tips should be inspected for wear, and spare crutches and tips should be available if needed.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *needs reinforcement of information*. These words indicate a negative event query and ask you to select an option that is incorrect. Remember that crutch tips can slip when they get wet, posing a possible threat to the unsuspecting client. Review client teaching points related to safety and the use of crutches if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 803). St. Louis: Mosby.

**838. 2**

**Rationale:** An altered mental state is an early indication of fat emboli; therefore, clear mentation is a good indicator that a fat embolus is resolving. Eupnea, not minimal dyspnea, is a normal sign. Arterial oxygen levels should be 80 to 100 mm Hg. Oxygen saturation should be higher than 95%.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *most favorable indication*. Knowing that the arterial oxygen and oxygen saturation levels are below normal helps eliminate options 3 and 4. Dyspnea, even at a minimal level, is not normal, so eliminate option 1. Review the expected outcomes in a client being treated for fat embolism if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Musculoskeletal

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1182–1183). St. Louis: Saunders.

Monahan, F., Sands, J., Marek, J., Neighbors, M., & Green, C. (2007). *Phipps' Medical-surgical nursing: Health and illness perspectives* (8th ed., p. 1538). St. Louis: Mosby.

#### 839. 4

**Rationale:** The earliest symptom of compartment syndrome is paresthesia (numbness and tingling in the fingers). Other symptoms include pain unrelieved by opioids, pain that increases with limb elevation, and pallor and coolness to the distal limb. Cyanosis is a late sign.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic word *early*. Knowing that compartment syndrome is characterized by insufficient circulation and ischemia caused by pressure will direct you to option 4. Review the early signs of compartment syndrome if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1181). St. Louis: Saunders.

#### 840. 4

**Rationale:** Clients with diabetes mellitus are more prone to wound infection and delayed wound healing because of the disease. Postoperative stump edema and hemorrhage are complications in the immediate postoperative period that apply to any client with an amputation. Slight redness of the incision is considered normal, as long as it is dry and intact.

**Test-Taking Strategy:** Use the process of elimination. Recalling that diabetes mellitus increases the client's chances of developing infection and delayed wound healing will direct you to option 4. Review the complications associated with an amputation in the client with diabetes mellitus if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1101, 1320–1321). St. Louis: Saunders.

#### 841. 3

**Rationale:** If the client with an amputation has a cast or elastic compression bandage that slips off, the nurse must wrap the stump immediately with another elastic compression bandage. Otherwise, excessive edema will form rapidly, which could cause a significant delay in rehabilitation. If the client had a cast that slipped off, the nurse would have to call the physician so that a new one could be applied. Elevation on one pillow is not going to impede the development of edema greatly once compression is released. Ice would be of limited value in controlling edema from this cause. If the physician

were called, the prescription likely would be to reapply the compression dressing anyway.

**Test-Taking Strategy:** Use the process of elimination. Recalling that excessive edema can form rapidly will direct you to option 3. Review care of the client after amputation if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, and psychiatric nursing care plans* (2nd ed., pp. 512–513). St. Louis: Mosby.

#### 842. 2

**Rationale:** Low back pain that radiates into one leg (sciatica) is consistent with herniated lumbar disk. The nurse assesses the client to see whether the pain is aggravated by events that increase intraspinal pressure, such as bending, lifting, sneezing, and coughing, or by lifting the leg straight up while supine (straight leg-raising test).

**Test-Taking Strategy:** Use the process of elimination. Recall that bed rest, heat (or sometimes ice), and nonsteroidal anti-inflammatory drugs usually relieve back pain, whereas bending, lifting, and straining aggravate it. Review the causes of back pain and the factors that alleviate or aggravate pain if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 984–985). St. Louis: Saunders.

#### 843. 1

**Rationale:** The nursing assessment conducted after spinal surgery is similar to that done after other surgical procedures. For this specific type of surgery, the nurse assesses the neurovascular status of the lower extremities, watches for signs and symptoms of infection, and inspects the surgical site for evidence of cerebrospinal fluid leakage (drainage is clear and tests positive for glucose). A mild temperature is expected after insertion of hardware, but a temperature of 101.6° F should be reported.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *concerned especially*. Thus, you are looking for the option that has the greatest deviation from normal. Options 2 and 4 are expected after surgery and, although the nurse tries to minimize discomfort, the client is likely to have some discomfort, even with proper analgesic use. The words *old* and *outlined* in option 3 indicate that this is not a new occurrence. This leaves the temperature of 101.6° F, which is excessive and should be reported. Review the signs of complications following this surgical procedure if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 987). St. Louis: Saunders.

**844. 2**

**Rationale:** In addition to the presence of clinical manifestations, gout is diagnosed by the presence of persistent hyperuricemia, with a uric acid level higher than 8 mg/dL; a normal value ranges from 2.5 to 8 mg/dL. Options 1, 3, and 4 indicate normal laboratory values. Additionally, the presence of uric acid in an aspirated sample of synovial fluid confirms the diagnosis.

**Test-Taking Strategy:** Use the process of elimination and knowledge of normal laboratory values. Recalling that increased uric acid levels occur in gout and noting that option 2 is the only abnormal value will assist you in answering the question. Review the manifestations of gout and the normal uric acid level if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 353). St. Louis: Saunders.

### ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

**845. 1, 2, 3**

**Rationale:** A plaster cast takes 24 to 72 hours to dry (synthetic casts dry in 20 minutes). The cast and extremity should

be elevated to reduce edema if prescribed. A wet cast is handled with the palms of the hand until it is dry, and the extremity is turned (unless contraindicated) so that all sides of the wet cast will dry. A cool setting on the hair dryer can be used to dry a plaster cast (heat cannot be used on a plaster cast because the cast heats up and burns the skin). The cast needs to be kept clean and dry, and the client is instructed not to stick anything under the cast because of the risk of breaking skin integrity. The client is instructed to monitor the extremity for circulatory impairment, such as pain, swelling, discoloration, tingling, numbness, coolness, or diminished pulse. The physician is notified immediately if circulatory impairment occurs.

**Test-Taking Strategy:** Focus on the subject, a plaster cast. Recalling that edema occurs following a fracture and recalling the complications associated with a cast will assist you in answering the question. Review cast care instructions if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1184). St. Louis: Saunders.

# Musculoskeletal Medications

## I. SKELETAL MUSCLE RELAXANTS

### A. Description

1. Skeletal muscle relaxants (Box 69-1) act directly on the neuromuscular junction or act indirectly on the central nervous system (CNS).
2. Centrally acting muscle relaxants depress neuron activity in the spinal cord or brain.
3. Peripherally acting muscle relaxants act directly on the skeletal muscles, interfering with calcium release from muscle tubules and thus preventing the fibers from contracting.
4. Skeletal muscle relaxants are used to prevent or relieve muscle spasms and treat spasticity associated with spinal cord disease or lesions, acute painful musculoskeletal conditions, and chronic debilitating disorders such as multiple sclerosis, brain attacks (stroke), or cerebral palsy.
5. Skeletal muscle relaxants are contraindicated in clients with severe liver, renal, or heart disease; these medications are often metabolized in the liver or excreted by the kidneys.
6. Skeletal muscle relaxants should not be taken with CNS depressants, such as barbiturates, opioids, alcohol, sedatives, hypnotics, or tricyclic antidepressants, unless specifically prescribed.

### B. Side effects

1. Dizziness and hypotension
2. Drowsiness and muscle weakness
3. Dry mouth
4. Gastrointestinal upset
5. Photosensitivity
6. Liver toxicity

### C. Interventions

1. Obtain a medical history.
2. Monitor vital signs.
3. Monitor for CNS side effects.
4. Assess for risk of injury.
5. Assess involved joints and muscles for pain and mobility.
6. Monitor renal function studies.
7. Instruct the client to take the medication with food to decrease gastrointestinal upset.

8. Instruct the client to report side effects.
9. Instruct the client to avoid alcohol and CNS depressants.
10. Instruct the client to avoid activities requiring alertness, such as driving or operating equipment.

 **Monitor liver function tests when a client is taking a skeletal muscle relaxant because hepatotoxicity can occur.**

### D. Nursing considerations

1. Baclofen (Lioresal)
  - a. Baclofen causes CNS effects such as drowsiness, dizziness, weakness, and fatigue and nausea, constipation, and urinary retention.
  - b. Administer with caution in the client with renal or hepatic dysfunction or a seizure disorder.
  - c. Baclofen can be administered by the physician through intrathecal infusion using an implantable pump or direct intrathecal administration over 1 minute.
  - d. Instruct the client with an implantable pump to maintain medication refill appointments to prevent the pump from emptying and experiencing sudden withdrawal symptoms, which could be life-threatening.
2. Carisoprodol (Soma)
  - a. Advise the client to take the medication with food to prevent gastrointestinal upset.
  - b. Instruct the client to report any rash or hypersensitivity to the physician.
3. Chlorzoxazone (Paraflex, Parafon Forte, Remular-S)
  - a. Monitor the client for hypersensitivity reactions such as urticaria, redness or itching, and possibly angioedema.
  - b. Chlorzoxazone may cause malaise and may cause the urine to turn orange or red.
  - c. Can cause hepatitis and hepatic necrosis.
4. Cyclobenzaprine (Flexeril)
  - a. Cyclobenzaprine is contraindicated in clients who have received monoamine oxidase

**Box 69-1 Skeletal Muscle Relaxants**

Baclofen (Lioresal)  
 Carisoprodol (Soma)  
 Chlorzoxazone (Paraflex, Parafon Forte, Remular-S)  
 Cyclobenzaprine (Flexeril)  
 Dantrolene (Dantrium)  
 Diazepam (Valium)  
 Metaxalone (Skelaxin)  
 Methocarbamol (Robaxin)  
 Orphenadine (Norflex)  
 Tizanidine (Zanaflex)

inhibitors (MAOIs) within 14 days of initiation of cyclobenzaprine therapy and in clients with cardiac disorders.

- b. Cyclobenzaprine has significant anticholinergic (atropine-like) effects and should be used with caution in clients with a history of urinary retention, angle-closure glaucoma, or increased intraocular pressure.
- c. Cyclobenzaprine should be used only for short-term therapy (2 to 3 weeks).
5. Dantrolene (Dantrium)
  - a. Dantrolene acts directly on skeletal muscles to relieve spasticity.
  - b. Liver damage is the most serious adverse effect.
  - c. Liver function values should be monitored before the initiation of treatment and during treatment.
  - d. Dantrolene can cause gastrointestinal bleeding, urinary frequency, impotence, photosensitivity, rash, and muscle weakness.
  - e. Instruct the client to wear protective clothing when in the sun.
  - f. Instruct the client to notify the physician if rash, bloody or tarry stools, or yellow discoloration of the skin or eyes occurs.
6. Diazepam (Valium)
  - a. Acts on the CNS to suppress spasticity; does not affect skeletal muscle directly
  - b. Sedation is a common side effect.
7. Methocarbamol (Robaxin)
  - a. The parenteral form is contraindicated in clients with renal impairment.
  - b. The parenteral form can cause hypotension, bradycardia, anaphylaxis, and seizures, especially when the medication is given too rapidly.
  - c. Monitor site for extravasation, which can result in thrombophlebitis and tissue sloughing.
  - d. Methocarbamol may cause the urine to turn brown, black, or green.
  - e. Inform the client to notify the physician if blurred vision, nasal congestion, urticaria, or rash occurs.
8. Tizanidine (Zanaflex) and metaxalone (Skelaxin): Can cause liver damage

**Box 69-2 Antigout Medications**

|                        |                           |
|------------------------|---------------------------|
| Allopurinol (Zyloprim) | Probenecid                |
| Colchicine             | Sulfinpyrazone (Anturane) |

9. Orphenadrine (Norflex) has significant anticholinergic (atropine-like) effects and should be used with caution in clients with a history of urinary retention, angle-closure glaucoma, or increased intraocular pressure.

 Safety is a primary concern when the client is taking a skeletal muscle relaxant because these medications cause drowsiness.

**II. ANTIGOUT MEDICATIONS****A. Description**

1. Antigout medications (Box 69-2) reduce uric acid production and increase uric acid excretion (uricosuric) to prevent or relieve gout or to manage hyperuricemia.
2. Nonsteroidal anti-inflammatory drugs (NSAIDs) are used for their anti-inflammatory effects and to relieve pain during an acute gouty attack (see Chapter 67 for information on NSAIDs).
3. Glucocorticoids may be prescribed to reduce inflammation during an acute gout attack (see Chapter 55 for information on glucocorticoids).
4. Antigout medications should be used cautiously in clients with gastrointestinal, renal, cardiac, or hepatic disease.

**B. Side effects**

1. Headaches
2. Nausea, vomiting, and diarrhea
3. Blood dyscrasias, such as bone marrow depression
4. Flushed skin and rash
5. Uric acid kidney stones
6. Sore gums
7. Metallic taste

**C. Interventions**

1. Assess serum uric acid levels.
2. Monitor intake and output.
3. Maintain a fluid intake of at least 2000 to 3000 mL/day to prevent kidney stones.
4. Monitor complete blood cell count and renal and liver function studies.
5. Instruct the client to avoid alcohol and caffeine because these products can increase uric acid levels.
6. Encourage the client to comply with therapy to prevent elevated uric acid levels, which can trigger a gout attack.
7. Instruct the client to avoid foods high in purine as prescribed, such as wine, alcohol, organ meats, sardines, salmon, scallops, and gravy.

- 8. Instruct the client to take the medication with food to decrease gastric irritation.
- 9. Instruct the client to report side effects to the physician.
- 10. Caution the client not to take aspirin with these medications because this could trigger a gout attack.

#### D. Nursing considerations

1. Allopurinol (Zyloprim)
  - a. Can increase the effect of warfarin (Coumadin) and oral hypoglycemic agents
  - b. Instruct the client not to take large doses of vitamin C while taking allopurinol because kidney stones may occur.
  - c. Hypersensitivity syndrome (rare) can occur, characterized by rash, fever, eosinophilia, and liver and kidney alterations (medication is withheld and the physician is notified).
  - d. Advise the client to minimize exposure to sunlight and have an annual eye examination because visual changes can occur from prolonged use of allopurinol.
2. Colchicine
  - a. Used with caution in older clients, debilitated clients, and clients with cardiac, renal, and/or gastrointestinal disease.
  - b. If gastrointestinal symptoms occur (nausea, vomiting, diarrhea, and abdominal pain), the medication is withheld and the physician is notified.
3. Probenecid
  - a. Mild gastrointestinal effects can occur and can be reduced by taking the medication with food.
  - b. Aspirin and other salicylates interfere with the uricosuric action of the medication.
4. Sulfapyrazone (Anturane)
  - a. Contraindicated in clients with active ulcer disease; used with caution in clients with a history of ulcer disease
  - b. Salicylates counteract the uricosuric action of the medication.
  - c. Inhibits hepatic metabolism of tolbutamide (Orinase), causing hypoglycemia, and warfarin, causing bleeding tendencies.

 The concurrent use of antigout medications and aspirin causes elevated uric acid levels; the client should be instructed to take acetaminophen (Tylenol) if prescribed rather than aspirin.

### III. ANTIARTHRITIC MEDICATIONS (Box 69-3)

#### A. Description (Fig. 69-1)

1. Rheumatoid arthritis occurs as inflammation progresses into the synovia, cartilage and bone; if this inflammation is not controlled, it will lead to joint destruction, thus affecting client mobility and comfort.

#### Box 69-3 Antiarthritic Medications

Anakinra (Kineret)  
 Adalimumab (Humira)  
 Auranofin (Ridaura)  
 Aurothioglucose (Solganal)  
 Azathioprine (Imuran)  
 Cyclosporine (Neoral)  
 Etanercept (Enbrel)  
 Gold sodium thiomalate (Aurolate, Myochrysine)  
 Leflunomide (Arava)  
 Methotrexate (Rheumatrex, Trexall)  
 Penicillamine (Cuprimine)  
 Infliximab (Remicade)  
 Sulfasalazine (Azulfidine)

2. The focus of treatment is early diagnosis and aggressive treatment in order to preserve joint function.
3. Medication therapy includes NSAIDs, glucocorticoids, and disease-modifying antirheumatic drugs (DMARDs).
4. Gold salts: Use of gold salts has decreased, but their purpose is to reduce the progression of joint damage caused by arthritic processes. Gold toxicity, characterized by pruritis, rash, metallic taste, stomatitis, and diarrhea, can occur; if toxicity occurs, dimercaprol (BAL in oil) may be prescribed to enhance gold excretion.

#### B. DMARDs

1. Description
  - a. DMARDs are effective antirheumatic medications that are used to slow the degenerative effects of the disorder.
  - b. DMARDs are usually prescribed secondary to NSAIDs but are often the first choice in the treatment of severe arthritis.
2. Common side effects of DMARDs include injection site inflammation and pain, ecchymosis, and edema, pancytopenia and infection, fatigue, headache, nausea, vomiting, and flu-like symptoms, and allergic response.
3. Interventions
  - a. Instruct the client to monitor for signs of infection and report signs to the physician.
  - b. Monitor the injection site for signs of irritation, pain, inflammation, and swelling.
  - c. Instruct the client to consult with the physician before receiving live vaccines and to avoid exposure to infections.
  - d. Inform the client about the importance of laboratory tests for neutrophil counts, white blood cell counts, and platelet counts before initiation of treatment and during treatment.
4. Anakinra (Kineret): Injection site reactions are common (pruritus, erythema, rash, pain).

**▲ Figure 69-1** Progressive joint degeneration in rheumatoid arthritis. **A**, Healthy joint. **B**, Inflammation of synovial membrane. **C**, Onset of pannus formation and cartilage erosion. **D**, Pannus formation progresses and cartilage deteriorates further. **E**, Complete destruction of joint cavity, together with fusion of articulating bones. (From Lehne, R. [2010]. *Pharmacology for nursing care* [7th ed.]. St. Louis: Saunders.)

5. Adalimumab (Humira)
  - a. Injection site reactions are common.
  - b. Has been associated with neurological injury (numbness, tingling, dizziness, visual disturbances, weakness in the legs)
6. Auranofin (Ridaura): Oral gold preparation (not commonly used)
7. Gold sodium thiomalate (Aurolate, Myochrysin), aurothioglucose (Solganal): Intramuscular gold preparations (not commonly used)
8. Azathioprine (Imuran): Immunosuppressive and anti-inflammatory actions; toxic effects include hepatitis and blood dyscrasias.
9. Cyclosporine (Neoral): Immunosuppressive actions; can cause nephrotoxicity
10. Etanercept (Enbrel)
  - a. Injection site reactions are common.
  - b. Poses a risk for heart failure; has been associated with central nervous system demyelinating disorders and hematological disorders
11. Hydroxychloroquine sulfate (Plaquenil): Associated with retinal damage; inform the client to contact the physician if visual disturbances occur.
12. Leflunomide (Arava): Side effects include diarrhea, respiratory infection, reversible alopecia, rash, and nausea; is hepatotoxic.
13. Methotrexate (Rheumatrex, Trexall): Can cause hepatic fibrosis, bone marrow suppression, gastrointestinal ulceration, and pneumonitis
14. Penicillamine (Cuprimine): Can cause bone marrow suppression and autoimmune disorders
15. Infliximab (Remicade): Can cause infusion reactions (fever, chills, pruritus, urticaria, chest pain); is hepatotoxic
16. Sulfasalazine (Azulfidine): Can cause gastrointestinal and dermatological reactions, bone marrow suppression, hepatitis

- D.** Glucocorticoids may be prescribed for their anti-inflammatory effects (see Chapter 55 for information on glucocorticoids).

#### IV. MEDICATIONS TO PREVENT AND TREAT OSTEOPOROSIS

##### A. Description

1. Osteoporosis is characterized by decreased bone mass and increased bone fragility
2. Calcium and vitamin D supplementation can reduce the risk of osteoporosis; calcium maximizes bone growth early in life and maintains bone integrity later in life, and vitamin D ensures calcium absorption (see Chapter 55 for information on calcium and vitamin D supplements).
3. Treatment is aimed at reducing the occurrence of fractures by maintaining or increasing bone strength.
4. Medications that decrease bone resorption (anti-resorptive) and medications that promote bone formation are used.
5. Antiresorptive medications include raloxifene (Evista), calcitonin, and bisphosphonates.
6. Teriparatide (Forteo) promotes bone growth.

##### B. Interventions

1. Salmon calcitonin (Miacalcin)
  - a. Calcitonin is secreted by the thyroid gland and inhibits osteoclastic bone resorption.
  - b. Instruct the client how to administer the intranasal or subcutaneous form, depending on the route prescribed.
  - c. Intranasal route: Examine the nares for irritation; alternate nostrils for doses.
  - d. When calcitonin is taken, it is important to monitor for hypocalcemia.
2. Bisphosphonates (Box 69-4)
  - a. Bisphosphonates inhibit osteoclast-mediated bone resorption, thereby increasing total bone mass.

- C.** NSAIDs may be prescribed for their anti-inflammatory and analgesic effects (see Chapter 67 for information on NSAIDs).

### Box 69-4 Medications to Prevent or Treat Osteoporosis

|                                |                       |
|--------------------------------|-----------------------|
| Calcium and vitamin D          | Ibandronate (Boniva)  |
| Alendronate (Fosamax)          | Raloxifene (Evista)   |
| Calcitonin, salmon (Miacalcin) | Risedronate (Actonel) |
|                                | Teriparatide (Forteo) |

- b. Bisphosphonates include alendronate (Fosamax), risedronate (Evista), and ibandronate (Boniva).
- c. Contraindicated for clients with esophageal disorders that can impede swallowing and for clients who cannot sit or stand for at least 30 minutes (60 minutes with ibandronate)
- d. After taking the medication, the client is instructed to postpone ingesting anything for at least 30 minutes (60 minutes with ibandronate).
- e. Adverse effects include esophagitis, muscle pain, and ocular problems; the client is instructed to contact the physician if adverse effects occur.

 Because of the risk of esophagitis, bisphosphonates must be administered in the morning before eating or drinking with a full glass of water; the client must then remain sitting or standing for at least 30 minutes (60 minutes with ibandronate).

- 3. Raloxifene (Evista)
  - a. Antiresorptive medication (nonbisphosphonate)
  - b. Contraindicated in clients who have a history of venous thrombotic events
  - c. Needs to be discontinued 72 hours prior to prolonged immobilization periods (such as with periods of extended bed rest).
  - d. Instruct the client to avoid extended periods of restricted activity (such as when traveling).
- 4. Teriparatide (Forteo)
  - a. Teriparatide stimulates new bone formation, thus increasing bone mass.
  - b. Teriparatide is a portion of the human parathyroid hormone and works by increasing the action of osteoblasts.
  - c. Reserved for clients at high risk for fractures
  - d. Has been associated with the development of bone cancer

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 846.** The client has been on treatment for rheumatoid arthritis for 3 weeks. During the administration of etanercept (Enbrel), it is most important for the nurse to assess:
1. The injection site for itching and edema
  2. The white blood cell counts and platelet counts
  3. Whether the client is experiencing fatigue and joint pain
  4. A metallic taste in the mouth, with a loss of appetite
- 847.** Allopurinol (Zyloprim) is prescribed for a client and the nurse provides medication instructions to the client. The nurse instructs the client:
1. To drink 3000 mL of fluid a day
  2. To take the medication on an empty stomach
  3. That the effect of the medication will occur immediately
  4. That if swelling of the lips occurs, this is a normal expected response
- 848.** Colchicine is prescribed for a client with a diagnosis of gout. The nurse reviews the client's record, knowing that this medication would be used with caution in which of the following disorders?
1. Myxedema
  2. Renal failure
  3. Hypothyroidism
  4. Diabetes mellitus
- 849.** Alendronate (Fosamax) is prescribed for a client with osteoporosis. The nurse instructs the client to:
1. Take the medication at bedtime.
  2. Take the medication in the morning with breakfast.
  3. Lie down for 30 minutes after taking the medication.
  4. Take the medication with a full glass of water after rising in the morning.
- 850.** A nurse is providing discharge instructions to a client receiving baclofen (Lioresal). Which of the following would be included in the teaching plan?
1. Restrict fluid intake.
  2. Avoid the use of alcohol.
  3. Notify the physician if fatigue occurs.
  4. Stop the medication if diarrhea occurs.
- 851.** A nurse is analyzing the laboratory studies on a client receiving dantrolene sodium (Dantrium). Which of the following laboratory tests would identify an adverse effect associated with the administration of this medication?
1. Creatinine level determination
  2. Platelet count determination
  3. Blood urea nitrogen level determination
  4. Liver function tests

- 852.** Cyclobenzaprine hydrochloride (Flexeril) is prescribed for a client for muscle spasms. The nurse is reviewing the client's record. Which of the following disorders, if noted in the record, would indicate a need to contact the physician about the administration of this medication?
1. Glaucoma
  2. Emphysema
  3. Hypothyroidism
  4. Diabetes mellitus
- 853.** A nurse is administering an intravenous dose of methocarbamol (Robaxin) to a client with multiple sclerosis. For which of the following adverse effects would the nurse monitor?
1. Tachycardia
  2. Rapid pulse
  3. Bradycardia
  4. Hypertension

## ANSWERS

### 846. 2

**Rationale:** Infection and pancytopenia are side effects of etanercept (Enbrel). Laboratory studies are performed prior to and during medication treatment. The appearance of abnormal white blood cell counts and abnormal platelet counts can alert the nurse to a potentially life-threatening infection. Injection site itching is a common occurrence following administration. A metallic taste with loss of appetite are not common signs of side effects of this medication.

**Test-Taking Strategy:** Use the process of elimination. Option 4 can be eliminated, because this is not a common side effect. In early treatment, residual fatigue and joint pain may still be apparent. Option 2 monitors for a hematological disorder, which could indicate a reason for discontinuing this medication and should be reported. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**References:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 440). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 343). St. Louis: Saunders.

### 847. 1

**Rationale:** Clients taking allopurinol are encouraged to drink 3000 mL of fluid a day. A full therapeutic effect may take 1 week or longer. Allopurinol is to be given with, or immediately after, meals or milk. A client who develops a rash, irritation of the eyes, or swelling of the lips or mouth should contact the physician because this may indicate hypersensitivity.

**Test-Taking Strategy:** Use the process of elimination. Option 4 can be eliminated easily because it indicates hypersensitivity, which is not a normal expected response. From the remaining options, recalling that this medication is used to

## Alternate Item Format: Multiple Response

- 854.** In monitoring a client's response to disease-modifying antirheumatic drugs (DMARDs), which assessment findings would the nurse consider acceptable responses? **Select all that apply.**
- 1. Symptom control during periods of emotional stress
  - 2. Normal white blood cell, platelet, and neutrophil counts
  - 3. Radiological findings that show no progression of joint degeneration
  - 4. An increased range of motion in the affected joints 3 months into therapy
  - 5. Inflammation and irritation at the injection site 3 days after the injection is given
  - 6. A low-grade temperature on rising in the morning that remains throughout the day

treat gout will direct you to option 1. If you had difficulty with this question, review the client instructions related to allopurinol.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**References:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 35). St. Louis: Saunders.

Skidmore-Roth, L. (2010). *Mosby's nursing drug reference* (23rd ed., p. 108). St. Louis: Mosby.

### 848. 2

**Rationale:** Colchicine is used with caution in older clients, debilitated clients, and clients with cardiac, renal, or gastrointestinal disease. The disorders in options 1, 3, and 4 are not concerns with administration of this medication.

**Test-Taking Strategy:** Use the process of elimination. Note that options 1, 3, and 4 are endocrine-related disorders. Option 2, the correct option, is different from the others. Review the cautions associated with this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 865). St. Louis: Saunders.

### 849. 4

**Rationale:** Precautions need to be taken with the administration of alendronate to prevent gastrointestinal side effects (especially esophageal irritation) and to increase absorption of the medication. The medication needs to be taken with a full glass of water after rising in the morning. The client should not eat or drink anything for 30 minutes following administration and should not lie down after taking the medication.

**Test-Taking Strategy:** Knowledge regarding the administration of alendronate is needed to answer this question. Recalling that this medication can cause esophageal irritation will direct you to option 4. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 30). St. Louis: Saunders.

### 850. 2

**Rationale:** Baclofen is a skeletal muscle relaxant. The client should be cautioned against the use of alcohol and other central nervous system depressants because baclofen potentiates the depressant activity of these agents. Constipation rather than diarrhea is an adverse effect. Restriction of fluids is not necessary, but the client should be warned that urinary retention can occur. Fatigue is related to a CNS effect that is most intense during the early phase of therapy and diminishes with continued medication use. The client does not need to notify the physician about fatigue.

**Test-Taking Strategy:** Use the process of elimination. Recalling that baclofen is a skeletal muscle relaxant will direct you easily to option 2. If you were unsure of the correct option, use general principles related to medication administration. Alcohol should be avoided with the use of medications. Review client teaching points related to this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 241). St. Louis: Saunders.

### 851. 4

**Rationale:** Dose-related liver damage is the most serious adverse effect of dantrolene. To reduce the risk of liver damage, liver function tests should be performed before treatment and throughout the treatment interval. Dantrolene is administered in the lowest effective dosage for the shortest time necessary.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 3 because these tests assess kidney function and are comparable or alike. From the remaining options, you must recall that this medication affects liver function. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (pp. 298–300). St. Louis: Saunders.

### 852. 1

**Rationale:** Because cyclobenzaprine (Flexeril) has anticholinergic effects, it should be used with caution in clients with a history of urinary retention, glaucoma, and increased

intraocular pressure. Cyclobenzaprine should be used only for a short term (2 to 3 weeks).

**Test-Taking Strategy:** Use the process of elimination. Recalling that this medication has anticholinergic effects will direct you to option 1. If you are unfamiliar with this medication and the contraindications associated with its administration, review this content.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 284). St. Louis: Saunders.

### 853. 3

**Rationale:** Intravenous administration of methocarbamol can cause hypotension and bradycardia. The nurse needs to monitor for these side effects. Options 1, 2, and 4 are not a concern with administration of this medication.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 2 first because they are comparable or alike. Knowledge about the specific side effects related to the intravenous use of this medication will direct you to option 3. Remember that hypotension and bradycardia can occur with intravenous administration of methocarbamol. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**References:** Edmunds, M. (2010). *Introduction to clinical pharmacology* (6th ed., pp. 383, 385). St. Louis: Mosby.

Skidmore-Roth; L. (2010). *Mosby's nursing drug reference* (23rd ed., pp. 699–700). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 854. 1, 2, 3, 4

**Rationale:** Because emotional stress frequently exacerbates the symptoms of rheumatoid arthritis, the absence of symptoms is a positive finding. DMARDs are given to slow the progression of joint degeneration. In addition, the improvement in the range of motion after 3 months of therapy with normal blood work is a positive finding. Temperature elevation and inflammation and irritation at the medication injection site could indicate signs of infection.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject, acceptable responses to therapy. Recalling that signs of an infection can indicate an unexpected finding will assist in eliminating options 5 and 6. Review the expected effects of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 863). St. Louis: Saunders.

# UNIT XVIII

## The Adult Client With an Immune Disorder

### PYRAMID TERMS

**acquired immunity** Immunity received passively from the mother's antibodies, animal serum, or antibodies produced in response to a disease. Immunization produces active acquired immunity.

**allergy** An abnormal, individual response to certain substances that normally do not trigger such an exaggerated reaction.

**cellular response** A delayed response against slowly developing bacterial infections; also called delayed hypersensitivity.

**humoral response** An immediate response that provides protection against acute, rapidly developing bacterial and viral infections.

**immunodeficiency** The absence or inadequate production of immune bodies.

**innate immunity** Immunity present at birth.

**Kaposi's sarcoma** Skin lesions that occur in individuals with a compromised immune system.

**Lyme disease** An infection acquired from a tick bite. Ticks live in wooded areas and survive by attaching to a host.

### PYRAMID TO SUCCESS

Pyramid Points focus on the effects of and complications associated with an immune deficiency. Specific focus relates to the nursing care related to the disorder, the impact of the treatment or disorder, and client adaptation. Acquired immunodeficiency syndrome is a pyramid focus, along with protecting the client from infection and preventing the transmission of infection to other individuals. Psychosocial issues relate to social isolation and the body image disturbances that can occur as a result of the immune disorder.

### CLIENT NEEDS

#### Safe and Effective Care Environment

- Acting as an advocate related to the client's decisions
- Addressing advance directives
- Consulting with members of the health care team
- Establishing priorities
- Handling hazardous and infectious materials safely
- Implementing standard and other precautions
- Maintaining asepsis
- Maintaining confidentiality regarding diagnosis
- Obtaining informed consent for treatments and procedures
- Preventing infection
- Upholding client rights

#### Health Promotion and Maintenance

- Ensuring that the client receives recommended immunizations
- Implementing health screening measures
- Monitoring for expected body image changes
- Preventing disease related to infection
- Providing health promotion programs
- Respecting client lifestyle choices

#### Psychosocial Integrity

- Assisting in mobilizing appropriate support and resource systems
- Assisting the client and family to cope
- Assisting the client to cope, adapt, and solve problems during illness or stressful events
- Considering religious, spiritual, and cultural preferences

Discussing grief and loss related to death and the dying process  
Promoting a positive environment to maintain optimal quality of life

### **Physiological Integrity**

Managing pain  
Managing medical emergencies

Monitoring for the expected and unexpected responses to treatments  
Promoting nutrition  
Protecting the client from infection  
Providing basic care and comfort  
Reviewing diagnostic test and laboratory test results

# Immune Disorders

## I. FUNCTIONS OF THE IMMUNE SYSTEM

- A. The immune system provides protection against invasion by microorganisms from outside the body.
- B. The immune system protects the body from internal threats and maintains the internal environment by removing dead or damaged cells.

## II. IMMUNE RESPONSE

-  A. T lymphocytes and B lymphocytes
  1. Lymphocytes migrate to lymphoid tissue where they remain dormant until they need to form sensitized lymphocytes for cellular immunity or antibodies for humoral immunity.
  2. Some B lymphocytes lie dormant until a specific antigen enters the body, at which time they greatly increase in number and are available for defense.
  3. Types of T lymphocytes include helper/inducer, suppressor, and cytotoxic/cytolytic.
  4. T and B lymphocytes are necessary for a normal immune response.
-  B. Humoral response
  1. **Humoral response** is immediate.
  2. This type of response provides protection against acute, rapidly developing bacterial and viral infections.
- C. **Cellular response**
  1. **Cellular response** is delayed; this is also called delayed hypersensitivity.
  2. This type of response is active against slowly developing bacterial infections and is involved in autoimmune responses, some allergic reactions, and rejection of foreign cells.

## III. IMMUNITY

- A. Natural immunity
  1. Natural immunity is also called native or **innate immunity**.
  2. It is present at birth and includes biochemical, physical, and mechanical barriers of defense, as well as the inflammatory response.

## B. **Acquired immunity**

1. Acquired or adaptive immunity is received passively from the mother's antibodies, animal serum, or antibodies produced in response to a disease.
2. Immunization produces active **acquired immunity**.

## IV. IMMUNIZATIONS (See Chapter 48 for information about immunizations.)

## V. LABORATORY STUDIES

- A. Antinuclear antibody (ANA) titer determination
  1. The ANA titer determination is a blood test used for the differential diagnosis of rheumatic diseases and for the detection of antinucleoprotein factors and patterns associated with certain autoimmune diseases.
  2. The test is positive at a titer of 1:20 or 1:40, depending on the laboratory.
  3. A positive result does not necessarily confirm a disease.
  4. The ANA titer is positive in most individuals diagnosed with systemic lupus erythematosus (SLE).
  5. An ANA titer result can be false positive in a small proportion of the normal population.
-  B. Anti-dsDNA antibody test
  1. The anti-dsDNA (double-stranded DNA) antibody test is a blood test done specifically to identify or differentiate DNA antibodies found in SLE.
  2. The test supports a diagnosis, monitors disease activity and response to therapy, and establishes a prognosis for SLE.
  3. Values
    - a. Negative: Lower than 70 units by enzyme-linked immunosorbent assay (ELISA)
    - b. Borderline: 70 to 200 units
    - c. Positive: Higher than 200 units
- C. See Chapter 11 for testing related to acquired **immunodeficiency syndrome (AIDS)**.

| Test Results  | Interpretation                              |
|---|---|
|  | Negative—Wheal less than 0.5 cm in diameter |
|  | Positive—Wheal 0.5 cm in diameter (1+)      |
|  | Positive—Wheal 1.0 cm in diameter (2+)      |
|  | Positive—Wheal 1.5 cm in diameter (3+)      |
|  | Positive—Wheal 2.0 cm in diameter (4+)      |

▲ **FIGURE 70-1** Interpretation of intradermal test results based on the size of the wheal after 15 to 30 minutes. (From Monahan, F., Sands, J., Neighbors, M., et al. [2007]. *Phipps' medical-surgical nursing: Health and illness perspectives* [8th ed.]. St. Louis: Mosby.)

#### D. Skin testing

##### 1. Description

- The administration of an allergen to the surface of the skin or into the dermis
- Administered by patch, scratch, or intradermal techniques

##### 2. Preprocedure interventions

- Discontinue systemic corticosteroids or antihistamine therapy 5 days before the test as prescribed.
- Obtain informed consent.

##### 3. Postprocedure interventions

- Record the site, date, and time of the test.
- Record the date and time for follow-up site reading.
- Have client remain in waiting room or office for at least 30 minutes after the injection to monitor for adverse effects.
- Inspect the site for erythema, papules, vesicles, edema, and wheal (Fig. 70-1).
- Measure flare along with the wheal and document the size and other findings.
- Provide the client with a list of potential allergens, if identified.

▲ **!** Have resuscitation equipment available if skin testing is performed because the allergen may induce an anaphylactic reaction.

## VI. IMMUNODEFICIENCY

### A. Description

- Immunodeficiency** is the absence or inadequate production of immune bodies.

- The disorder can be congenital (primary) or acquired (secondary).
- Treatment depends on the inadequacy of immune bodies and its primary cause.

### B. Assessment

- Factors that decrease immune function
- Frequent infections
- Nutritional status
- Medication history, such as use of corticosteroids for long periods
- History of alcohol or drug abuse

### C. Interventions

- Protect the client from infection.
- Promote a balanced diet with adequate nutrition.
- Use strict aseptic technique for all procedures.
- Provide psychosocial care regarding lifestyle changes and role changes.
- Instruct the client in measures to prevent infection.
- Instruct the client to wear a Medic-Alert bracelet.

▲ **!** The priority concern for a client with immunodeficiency is infection.

## VII. HYPERSENSITIVITY AND ALLERGY

### A. Description

- An **allergy** is an abnormal, individual response to certain substances that normally do not trigger such an exaggerated reaction.
- In some types of allergies, a reaction occurs on a second and subsequent contact with the allergen.
- Skin testing may be done to determine the allergen.
- Types of hypersensitivity reactions (Table 70-1)

### B. Assessment

- History of exposure to allergens
- Itching, tearing, and burning of eyes and skin
- Rashes
- Nose twitching, nasal stuffiness

### C. Interventions

- Identification of the specific allergen
- Management of the symptoms with antihistamines, anti-inflammatory agents, or corticosteroids
- Ointments, creams, wet compresses, and soothing baths for local reactions
- Desensitization programs may be recommended.

## VIII. ANAPHYLAXIS

### A. Description

- Anaphylaxis is a serious and immediate hypersensitivity reaction that releases histamine from the damaged cells.
- Anaphylaxis can be systemic or cutaneous (localized).

### B. Assessment (Fig. 70-2)

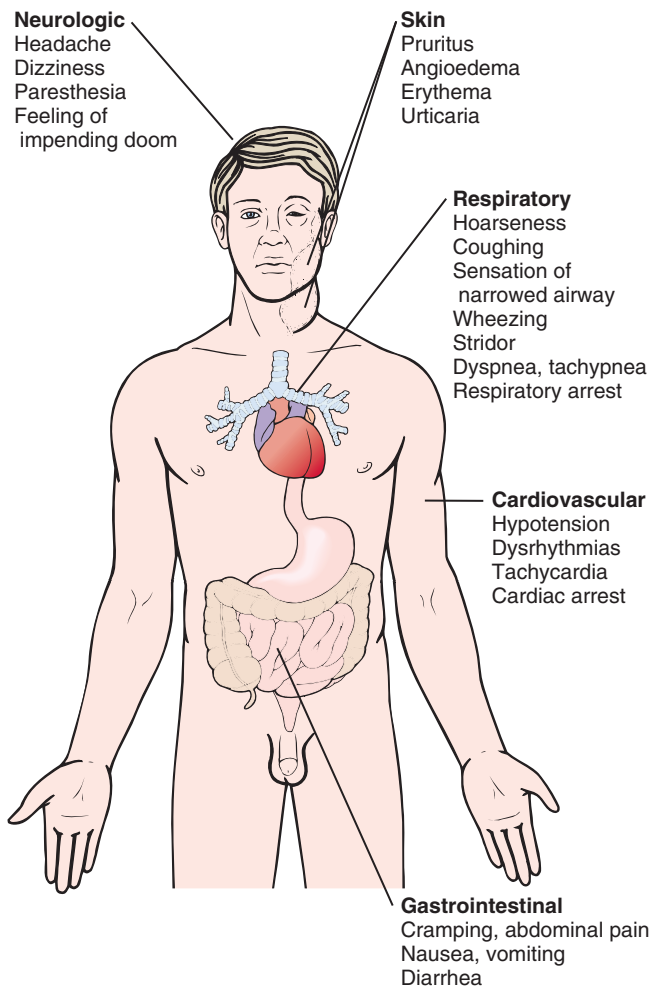

### C. Interventions (see Priority Nursing Actions)

**TABLE 70-1** Types of Hypersensitivity Reactions

| Type                       | Causative Component        | Pathological Process  | Reaction  |
|----------------------------|----------------------------|---|---|
| I: Immediate, anaphylactic | IgE                        | Mast cell degranulation<br>↓<br>Histamine and leukotriene release | Anaphylaxis<br>Atopic diseases<br>Skin reactions  |
| II: Cytolytic, cytotoxic   | IgG<br>IgM<br>Complement   | Complement fixation<br>↓<br>Cell lysis                            | ABO incompatibility<br>Drug-induced hemolytic anemia  |
| III: Immune complex        | Antigen-antibody complexes | Deposition in vessels and tissue walls<br>↓<br>Inflammation       | Arthus reaction<br>Serum sickness<br>Systemic lupus erythematosus<br>Acute glomerulonephritis |
| IV: Cell-mediated, delayed | Sensitized T cells         | Lymphokine release  | Tuberculosis<br>Contact dermatitis<br>Transplant rejection                                    |

Ig, Immunoglobulin.

From Black, J., & Hawks, J., (2005). *Medical-surgical nursing: Clinical management for positive outcomes* (7th ed.). St. Louis: Saunders.

**▲ FIGURE 70-2** Clinical manifestations of a systemic anaphylactic reaction. (From Lewis, S., Heitkemper, M., Dirksen, S., O'Brien, P., & Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

### PRIORITY NURSING ACTIONS!

#### Actions to Take if a Client Develops Anaphylaxis

1. Quickly assess respiratory status and maintain a patent airway.
2. Call the physician or Rapid Response Team.
3. Administer oxygen.
4. Start an IV line and infuse normal saline.
5. Prepare to administer diphenhydramine (Benadryl) and epinephrine (adrenalin).
6. Document the event, actions taken, and the client's response.

If the client experiences an anaphylactic reaction, the immediate action would be to assess the respiratory status quickly and maintain a patent airway. The physician or Rapid Response Team is called. In the meantime, the nurse stays with the client and monitors the client's vital signs and for signs of shock. An IV device is inserted if one is not already in place and normal saline is infused. The nurse then prepares for the administration of diphenhydramine and epinephrine and other medications as prescribed. The head of the bed is elevated if the client's blood pressure is normal. The client's feet and legs may be raised. The nurse documents the event, actions taken, and the client's response.

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes*. (8th ed., pp. 2167-2168). St. Louis: Saunders.

## IX. LATEX ALLERGY

### A. Description

1. Latex **allergy** is a hypersensitivity to latex.
2. The source of the allergic reaction is thought to be the proteins in the natural rubber latex or

### Box 70-1 Products That May Contain Natural Rubber Latex

Ace bandages (brown)  
 Adhesive or elastic bandages  
 Ambu bag  
 Balloons  
 Blood pressure cuff (tubing and bladder)  
 Catheter leg bag straps  
 Catheters  
 Condoms  
 Diaphragms  
 Elastic pressure stockings  
 Electrocardiographic pads  
 Feminine hygiene pads  
 Gloves  
 Intravenous catheters, tubing, and rubber injection ports  
 Nasogastric tubes  
 Pads for crutches  
 Prepackaged enema kits  
 Rubber stoppers on medication vials  
 Stethoscopes  
 Syringes

Note: Health care agencies use as many nonlatex products as possible and have nonlatex supplies available for clients with a latex allergy.

the various chemicals used in the manufacturing process of latex gloves.

3. Symptoms of the **allergy** can range from mild contact dermatitis to moderately severe symptoms of rhinitis, conjunctivitis, urticaria, and bronchospasm to severe life-threatening anaphylaxis.

#### B. Common routes of exposure (Box 70-1)

1. Cutaneous: Natural latex gloves and latex balloons
2. Percutaneous and parenteral: Intravenous lines and catheters; hemodialysis equipment
3. Mucosal: Use of latex condoms, catheters, airways, and nipples
4. Aerosol: Aerosolization of powder from latex gloves can occur when gloves are dispensed from the box or when gloves are removed from the hands.

#### C. At-risk individuals

1. Health care workers
2. Individuals who work in the rubber industry
3. Individuals having multiple surgeries
4. Individuals with spina bifida
5. Individuals who wear gloves frequently, such as food handlers, hairdressers, and auto mechanics
6. Individuals allergic to kiwis, bananas, pineapples, tropical fruits, grapes, avocados, potatoes, hazelnuts, and water chestnuts

#### D. Assessment

1. Anaphylaxis or type I hypersensitivity is a response to natural rubber latex (Fig. 70-3; see Fig. 70-2).
2. A delayed type IV hypersensitivity reaction can occur; symptoms of contact dermatitis include

▲ **FIGURE 70-3** Steps in a type I allergic reaction. (From Lewis, S., Heitkemper, M., Dirksen, S., O'Brien, P., & Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

pruritus, edema, erythema, vesicles, papules, and crusting and thickening of the skin and can occur within 6 to 48 hours following exposure.

#### E. Interventions (Box 70-2)

### X. AUTOIMMUNE DISEASE

#### A. Description

1. Body is unable to recognize its own cells as a part of itself.
2. Autoimmune disease can affect collagenous tissue.

#### B. Systemic lupus erythematosus (SLE)

##### 1. Description

- a. Chronic, progressive, systemic inflammatory disease that can cause major organs and systems to fail

### Box 70-2 Interventions for the Client With a Latex Allergy

Ask the client about a known allergy to latex when performing the initial assessment.

Identify risk factors for a latex allergy in the client.

Use nonlatex gloves and all latex-safe supplies.

Keep a latex-safe supply cart near the client's room.

Apply a cloth barrier to the client's arm under a blood pressure cuff.

Use latex-free syringes, medication containers (glass ampules), and latex-safe intravenous equipment.

Instruct the client to wear a Medic-Alert bracelet.

Instruct the client about the importance of informing health care providers and local and paramedic ambulance companies about the allergy.

- b. Connective tissue and fibrin deposits collect in blood vessels on collagen fibers and on organs.
- c. The deposits lead to necrosis and inflammation in blood vessels, lymph nodes, gastrointestinal tract, and pleura.
- d. No cure for the disease is known but remissions are frequently experienced by clients who manage their care well.

#### 2. Causes

- a. The cause of SLE is unknown, but is believed to be a defect in immunological mechanisms, with a genetic origin.
- b. Precipitating factors include medications, stress, genetic factors, sunlight or ultraviolet light, and pregnancy.
- c. Discoid lupus erythematosus is possible with some medications but totally disappears after the medication is stopped; the only manifestation is the skin rash that occurs in lupus.

#### 3. Assessment

- a. Assess for precipitating factors.
- b. Erythema butterfly or rash of the face (malar)
- c. Dry, scaly, raised rash on the face or upper body
- d. Fever
- e. Weakness, malaise, and fatigue
- f. Anorexia
- g. Weight loss
- h. Photosensitivity
- i. Joint pain
- j. Erythema of the palms
- k. Anemia
- l. Positive antinuclear antibody (ANA) test and lupus erythematosus (LE) preparation
- m. Elevated erythrocyte sedimentation rate (ESR) and C-reactive protein level

#### 4. Interventions

- a. Monitor skin integrity and provide frequent oral care.

- b. Instruct the client to clean the skin with a mild soap, avoiding harsh and perfume substances.
- c. Assist with the use of ointments and creams for the rash as prescribed.
- d. Identify factors contributing to fatigue.
- e. Administer iron, folic acid, or vitamin supplements as prescribed if anemia occurs.
- f. Provide a high-vitamin and high-iron diet.
- g. Provide a high-protein diet if there is no evidence of kidney disease.
- h. Instruct in measures to conserve energy, such as pacing activities and balancing rest with exercise.
- i. Administer topical or systemic corticosteroids, salicylates, and nonsteroidal anti-inflammatory drugs as prescribed for pain and inflammation.
- j. Administer medications to decrease the inflammatory response as prescribed.
- k. Instruct the client to avoid exposure to sunlight and ultraviolet light.
- l. Monitor for proteinuria and red cell casts in the urine.
- m. Monitor for bruising, bleeding, and injury.
- n. Assist with plasmapheresis as prescribed to remove autoantibodies and immune complexes from the blood before organ damage occurs.
- o. Monitor for signs of organ involvement such as pleuritis, nephritis, pericarditis, coronary artery disease, hypertension, neuritis, anemia, and peritonitis.
- p. Note that lupus nephritis occurs early in the disease process.
- q. Provide supportive therapy as major organs become affected.
- r. Provide emotional support and encourage the client to verbalize feelings.
- s. Provide information regarding support groups and encourage the use of community resources.

 For the client with SLE, monitor the blood urea nitrogen and creatinine levels frequently for signs of renal impairment.

### C. Scleroderma (systemic sclerosis)

#### 1. Description

- a. Scleroderma is a chronic connective tissue disease similar to SLE that is characterized by inflammation, fibrosis, and sclerosis.
- b. This disorder affects the connective tissue throughout the body.
- c. It causes fibrotic changes involving the skin, synovial membranes, esophagus, heart, lungs, kidneys, and gastrointestinal tract.

- d. Treatment is directed toward forcing the disease into remission and slowing its progress.
- 2. Assessment
  - a. Pain
  - b. Stiffness and muscle weakness
  - c. Pitting edema of the hands and fingers that progresses to the rest of the body
  - d. Taut and shiny skin that is free from wrinkles
  - e. Skin tissue is tight, hard, and thick, loses its elasticity, and adheres to underlying structures.
  - f. Dysphagia
  - g. Decreased range of motion
  - h. Joint contractures
  - i. Inability to perform activities of daily living
- 3. Interventions
  - a. Encourage activity as tolerated.
  - b. Maintain a constant room temperature.
  - c. Provide small frequent meals, eliminating foods that stimulate gastric secretions, such as spicy foods, caffeine, and alcohol.
  - d. Advise the client to sit up for 1 to 2 hours after meals if there is esophageal involvement.
  - e. Provide supportive therapy as the major organs become affected.
  - f. Administer corticosteroids as prescribed for inflammation.
  - g. Provide emotional support and encourage the use of resources as necessary.
- D. Polyarteritis nodosa**
  - 1. Description
    - a. Polyarteritis nodosa is a collagen disease; it is a form of systemic vasculitis that causes inflammation of the arteries in visceral organs, brain, and skin.
    - b. Treatment is similar to the treatment for SLE.
    - c. Polyarteritis nodosa affects middle-aged men.
    - d. The cause is unknown and the prognosis is poor.
    - e. Renal disorders and cardiac involvement are the most frequent causes of death.
  - 2. Assessment
    - a. Malaise and weakness
    - b. Low-grade fever
    - c. Severe abdominal pain
    - d. Bloody diarrhea
    - e. Weight loss
    - f. Elevated ESR
  - 3. Interventions
    - a. Provide supportive care as required.
    - b. Provide a well-balanced diet.
    - c. Administer corticosteroids and analgesics to control pain and inflammation.
    - d. Provide emotional support and encourage the client to verbalize feelings.
    - e. Initiate support services for the client.
- E. Pemphigus**

- 1. Description
  - a. Pemphigus is a rare autoimmune disease that occurs predominantly between middle and old age.
  - b. The cause is unknown, and the disorder is potentially fatal.
  - c. Treatment is aimed at suppressing the immune response that causes blister formation.
- 2. Assessment
  - a. Lesions appear as fragile, flaccid bullae.
  - b. Partial-thickness lesions bleed, weep, and form crusts when bullae are disrupted.
  - c. Debilitation, malaise, and pain
  - d. Chewing and swallowing difficulties
  - e. Nikolsky's sign: Separation of the epidermis caused by rubbing the skin
  - f. Leukocytosis, eosinophilia, foul-smelling discharge from skin
- 3. Interventions
  - a. Provide supportive care.
  - b. Provide oral hygiene and increase fluid intake.
  - c. Soothe oral lesions.
  - d. Assist with oatmeal or potassium permanganate baths, or other soothing baths, as prescribed for relief of symptoms.
  - e. Administer topical or systemic antibiotics as prescribed for secondary infections.
  - f. Administer corticosteroids and cytotoxic agents as prescribed to bring about remission.

## XI. GOODPASTURE'S SYNDROME

- A. Description**
  - 1. Goodpasture's syndrome is an autoimmune disorder; autoantibodies are made against the glomerular basement membrane and alveolar basement membrane.
  - 2. Goodpasture's syndrome is most common in males and young adults who smoke; the exact cause is unknown.
  - 3. The lungs and the kidneys are affected primarily, and the disorder usually is not diagnosed until significant pulmonary or renal involvement occurs.
- B. Assessment**
  - 1. Clinical manifestations indicating pulmonary and renal involvement
  - 2. Shortness of breath
  - 3. Hemoptysis
  - 4. Decreased urine output
  - 5. Edema and weight gain
  - 6. Hypertension and tachycardia
- C. Interventions**
  - 1. Focus on suppressing the autoimmune response with medications such as corticosteroids and plasmapheresis (filtration of the plasma to remove some proteins) to remove the autoantibodies.

2. Provide supportive therapy for pulmonary and renal involvement.

## XII. LYME DISEASE

### A. Description

1. **Lyme disease** is an infection caused by the spirochete *Borrelia burgdorferi*, acquired from a tick bite (ticks live in wooded areas and survive by attaching to a host).
2. Infection with the spirochete stimulates inflammatory cytokines and autoimmune mechanisms.

### B. Assessment (Box 70-3; Fig. 70-4)

**!** The typical ring-shaped rash of Lyme disease does not occur in all clients. Many clients never develop a rash. Additionally, if a rash does occur, it can occur anywhere on the body, not only at the site of the bite.

### C. Interventions

1. Gently remove the tick with tweezers, wash the skin with antiseptic, and dispose of the tick by flushing it down the toilet; the tick may also be placed in a sealed jar so that the health care provider can inspect it and determine its type.
2. Perform a blood test 4 to 6 weeks after a bite to detect the presence of the disease (testing before this time is not reliable).
3. Instruct the client in the administration of antibiotics as prescribed; these are initiated immediately (even before the blood testing results are known).
4. Instruct the client to avoid areas that contain ticks, such as wooded grassy areas, especially in the summer months.
5. Instruct the client to wear long-sleeved tops, long pants, closed shoes, and hats while outside.

### Box 70-3 Assessment and Stages of Lyme Disease

#### First Stage

Symptoms can occur several days to months following the bite.

A small red pimple develops that may spread into a ring-shaped rash; it may occur anywhere on the body.

Rash may be large or small, or may not occur at all.

Flu-like symptoms occur, such as headaches, stiff neck, muscle aches, and fatigue.

#### Second Stage

This stage occurs several weeks following the bite.

Joint pain occurs.

Neurological complications occur.

Cardiac complications occur.

#### Third Stage

Large joints become involved.

Arthritis progresses.

6. Instruct the client to spray the body with tick repellent before going outside.
7. Instruct the client to examine the body when returning inside for the presence of ticks.

## XIII. IMMUNODEFICIENCY SYNDROMES

### A. Acquired immunodeficiency syndrome (AIDS)

1. AIDS is a viral disease caused by human **immunodeficiency virus** (HIV), which destroys T cells, thereby increasing susceptibility to infection and malignancy (Fig. 70-5).
2. The syndrome is manifested clinically by opportunistic infection and unusual neoplasms.
3. AIDS is considered a chronic illness.
4. The disease has a long incubation period, sometimes 10 years or longer.
5. Manifestations may not appear until late in the infection.

### B. Diagnosis and monitoring the client with AIDS

1. See Chapter 11 for diagnostic tests.
2. Refer to Box 70-4 for tests used to evaluate the progression of HIV infection.

### C. High-risk groups

1. Heterosexual or homosexual contact with high-risk individuals
2. Intravenous drug abusers
3. Persons receiving blood products
4. Health care workers
5. Babies born to infected mothers

### D. Assessment

1. Malaise, fever, anorexia, weight loss, influenza-like symptoms
2. Lymphadenopathy for at least 3 months
3. Leukopenia
4. Diarrhea
5. Fatigue
6. Night sweats
7. Presence of opportunistic infections
8. Protozoal infections (*Pneumocystis jiroveci* pneumonia, major source of mortality)

**▲ FIGURE 70-4** Erythema migrans of Lyme disease. (From Swartz, M. [2010]. *Textbook of physical diagnosis: History and examination* [6th ed.]. St. Louis: Saunders.)

9. Neoplasms (**Kaposi's sarcoma**, purplish-red lesions of internal organs and skin, B-cell non-Hodgkin's lymphoma, cervical cancer)
10. Fungal infections (candidiasis, histoplasmosis)
11. Viral infections (cytomegalovirus, herpes simplex)
12. Bacterial infections

- E. Interventions**
1. Provide respiratory support.
  2. Administer oxygen and respiratory treatments as prescribed.
  3. Provide psychosocial support as needed.
  4. Maintain fluid and electrolyte balance.
  5. Monitor for signs of infection.
  6. Prevent the spread of infection.
  7. Initiate standard and other necessary precautions.
  8. Provide comfort as necessary.
  9. Provide meticulous skin care.
  10. Provide adequate nutritional support as prescribed.
  11. See Chapters 25 and 47 for additional information on AIDS.

▲ **FIGURE 70-5** The life cycle of HIV. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

**Box 70-4 Tests Used to Evaluate Progression of Human Immunodeficiency Virus (HIV) Infection**

**Complete Blood Cell Count**

White blood cell (WBC) count normal to decreased  
 Lymphopenia (<30% of the normal number of WBCs)  
 Thrombocytopenia (decreased platelet count)

**Lymphocyte Screen**

Reduced CD4+/CD8+ T-cell ratio  
 CD4+ (helper) lymphocytes decreased  
 CD8+ lymphocytes increased

**Quantitative Immunoglobulin**

Immunoglobulin G (IgG) level increased  
 IgA level frequently increased

**Chemistry Panel**

Lactate dehydrogenase level increased (all fractions)  
 Serum albumin level decreased

Total protein increased  
 Cholesterol level decreased  
 AST and ALT levels elevated

**Anergy Panel**

Nonreactive (anergic) or poorly reactive to infectious agents or environmental materials (e.g., pokeweed, phytohemagglutinin mitogens and antigens, mumps, *Candida*)

**Hepatitis B Surface Antigen Testing**

To detect the presence of hepatitis B

**Blood Cultures**

To detect septicemia

**Chest Radiography**

To detect *Pneumocystis jiroveci* infection or tuberculosis

AST, Aspartate aminotransferase; ALT, alanine aminotransferase.

From Copstead-Kirkhorn, L., & Banasik, J. (2009). *Pathophysiology* (4th ed.). St. Louis: Mosby.

**F. Kaposi's sarcoma**

1. Description: Skin lesions that occur primarily in individuals with a compromised immune system
2. Assessment
  - a. **Kaposi's sarcoma** is a slow-growing tumor that appears as raised, oblong, purplish, reddish-brown lesions; may be tender or nontender.
  - b. Organ involvement includes the lymph nodes, airways or lungs, or any part of the gastrointestinal tract from the mouth to anus.
3. Interventions
  - a. Maintain standard precautions.
  - b. Provide protective isolation if the immune system is depressed.
  - c. Prepare the client for radiation therapy or chemotherapy as prescribed.
  - d. Administer immunotherapy, as prescribed, to stabilize the immune system.

**XIV. POST-TRANSPLANTATION IMMUNODEFICIENCY****A. Description**

1. Secondary **immunodeficiency** is immunosuppression caused by therapeutic agents.
2. The client must take immunosuppressive agents for the rest of his or her life post-transplantation to decrease rejection of the transplanted organ or tissue.

**B. Diagnosis and monitoring of post-transplantation clients**

1. Check renal and hepatic function.
2. Monitor the complete cell count with differential to determine signs of infection.
3. Assess all body secretions periodically for blood.

**C. High-risk clients**

1. Clients with a history of malignancy or premalignancy have an increased susceptibility to malignancy if immunosuppressed.
2. Clients with recent infection or exposure to tuberculosis, herpes zoster, or chickenpox have a high risk for severe generalized disease when on immunosuppressive agents.

**D. Assessment**

1. Assess for signs of opportunistic infections.
2. Assess nutritional status.
3. Assess for signs of rejection (signs will depend on the organ or tissue transplant).

**E. Interventions**

1. Strict aseptic technique is necessary.
2. Provide teaching regarding asepsis and the signs of infection and rejection.
3. Provide psychosocial support as needed.
4. Provide client teaching about immunosuppressants.

**MORE QUESTIONS ON THE CD!****Practice Questions**

- 855.** The nurse prepares to give a bath and change the bed linens of a client with cutaneous Kaposi's sarcoma lesions. The lesions are open and draining a scant amount of serous fluid. Which of the following would the nurse incorporate into the plan during the bathing of this client?
1. Wearing gloves
  2. Wearing a gown and gloves
  3. Wearing a gown, gloves, and a mask
  4. Wear a gown and gloves to change the bed linens and gloves only for the bath
- 856.** A client is suspected of having systemic lupus erythematosus. The nurse monitors the client, knowing that which of the following is one of the initial characteristic signs of systemic lupus erythematosus?
1. Weight gain
  2. Subnormal temperature
  3. Elevated red blood cell count
  4. Rash on the face across the bridge of the nose and on the cheeks
- 857.** The nurse provides home care instructions to a client with systemic lupus erythematosus and tells the client about methods to manage fatigue. Which statement by the client indicates a need for further instructions?
1. "I should take hot baths because they are relaxing."
  2. "I should sit whenever possible to conserve my energy."
  3. "I should avoid long periods of rest because it causes joint stiffness."
  4. "I should do some exercises, such as walking, when I am not fatigued."
- 858.** A client with pemphigus is being seen in the clinic regularly. The nurse plans care based on which of the following descriptions of this condition?
1. The presence of tiny red vesicles
  2. An autoimmune disease that causes blistering in the epidermis
  3. The presence of skin vesicles found along the nerve caused by a virus
  4. The presence of red, raised papules and large plaques covered by silvery scales
- 859.** The nurse is assisting in planning care for a client with a diagnosis of immunodeficiency. The nurse

would incorporate which of the following as a priority in the plan of care?

1. Protecting the client from infection
  2. Providing emotional support to decrease fear
  3. Encouraging discussion about lifestyle changes
  4. Identifying factors that decreased the immune function
- 860.** A client calls the nurse in the emergency department and tells the nurse that he was just stung by a bumble bee while gardening. The client is afraid of a severe reaction because the client's neighbor experienced such a reaction just 1 week ago. The appropriate nursing action is to:
1. Advise the client to soak the site in hydrogen peroxide.
  2. Ask the client if he ever sustained a bee sting in the past.
  3. Tell the client to call an ambulance for transport to the emergency department.
  4. Tell the client not to worry about the sting unless difficulty with breathing occurs.
- 861.** The community health nurse is conducting a research study and is identifying clients in the community at risk for latex allergy. Which client population is at most risk for developing this type of allergy?
1. Hairdressers
  2. The homeless
  3. Children in day care centers
  4. Individuals living in a group home
- 862.** The home care nurse is performing an assessment on a client who has been diagnosed with an allergy to latex. In determining the client's risk factors associated with the allergy, the nurse questions the client about an allergy to which food item?
1. Eggs
  2. Milk
  3. Yogurt
  4. Bananas
- 863.** The camp nurse prepares to instruct a group of children about Lyme disease. Which of the following information would the nurse include in the instructions?
1. Lyme disease is caused by a tick carried by deer.
  2. Lyme disease is caused by contamination from cat feces.
  3. Lyme disease can be contagious through skin contact with an infected individual.
  4. Lyme disease can be caused by the inhalation of spores from bird droppings.
- 864.** The client is diagnosed with stage I Lyme disease. The nurse assesses the client for which characteristic of this stage?
1. Arthralgias
  2. Flu-like symptoms
  3. Enlarged and inflamed joints
  4. Signs of neurological disorders
- 865.** A female client arrives at the health care clinic and tells the nurse that she was just bitten by a tick and would like to be tested for Lyme disease. The client tells the nurse that she removed the tick and flushed it down the toilet. Which of the following nursing actions is most appropriate?
1. Refer the client for a blood test immediately.
  2. Inform the client that there is no test available for Lyme disease.
  3. Tell the client that testing is not necessary unless arthralgia develops.
  4. Instruct the client to return in 4 to 6 weeks to be tested because testing before this time is not reliable.
- 866.** A Cub Scout leader, who is a nurse preparing a group of Cub Scouts for an overnight camping trip, instructs the scouts about the methods to prevent Lyme disease. Which statement by one of the Cub Scouts indicates a need for further instructions?
1. "I need to bring a hat to wear during the trip."
  2. "I should wear long-sleeved tops and long pants."
  3. "I should not use insect repellents because it will attract the ticks."
  4. "I need to wear closed shoes and socks that can be pulled up over my pants."
- 867.** The client with acquired immunodeficiency syndrome is diagnosed with cutaneous Kaposi's sarcoma. Based on this diagnosis, the nurse understands that this has been confirmed by which of the following?
1. Swelling in the genital area
  2. Swelling in the lower extremities
  3. Punch biopsy of the cutaneous lesions
  4. Appearance of reddish-blue lesions noted on the skin
- 868.** Which of the following individuals is least likely at risk for the development of Kaposi's sarcoma?
1. A kidney transplant client
  2. A male with a history of same-gender partners
  3. A client receiving antineoplastic medications
  4. An individual working in an environment in which he or she is exposed to asbestos

### Alternate Item Format: Multiple Response

**869.** Select the interventions that would apply in the care of a client at high risk for an allergic response to a latex allergy. **Select all that apply.**

- 1. Use nonlatex gloves.
- 2. Use medications from glass ampules.
- 3. Place the client in a private room only.

- 4. Avoid the use of medication vials that have rubber stoppers.
- 5. Keep a latex-safe supply cart available in the client's area.
- 6. Use a blood pressure cuff from an electronic device only to measure the blood pressure.

## ANSWERS

### 855. 2

**Rationale:** Gowns and gloves are required if the nurse anticipates contact with soiled items such as those with wound drainage or is caring for a client who is incontinent with diarrhea or a client who has an ileostomy or colostomy. Masks are not required unless droplet or airborne precautions are necessary. Regardless of the amount of wound drainage, a gown and gloves must be worn.

**Test-Taking Strategy:** Use the process of elimination and think about the method of transmission of infection when answering a question of this type. Read the question, noting the task that is presented; in this case, it is bathing and changing linens. Eliminate option 3 because the method of transmission is not respiratory. Eliminate options 1 and 4 because neither provide adequate protection based on the method of transmission. If you had difficulty with this question, review standard and transmission-based precautions.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Immune

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 655). St. Louis: Mosby.

### 856. 4

**Rationale:** Skin lesions or rash on the face across the bridge of the nose and on the cheeks is an initial characteristic sign of systemic lupus erythematosus (SLE). Fever and weight loss may also occur. Anemia is most likely to occur later in SLE.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *characteristic signs*. Recalling the characteristic butterfly rash associated with SLE will direct you to option 4. If you are unfamiliar with this disorder, review this content.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Immune

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 348–349). St. Louis: Saunders.

### 857. 1

**Rationale:** To help reduce fatigue in the client with systemic lupus erythematosus, the nurse should instruct the client to sit whenever possible, avoid hot baths (because they exacerbate fatigue), schedule moderate low-impact exercises when not fatigued, and maintain a balanced diet. The client is

instructed to avoid long periods of rest because it promotes joint stiffness.

**Test-Taking Strategy:** Note the strategic words *need for further instructions*. These words indicate a negative event query and the need to select the incorrect client statement. Also, focus on the subject, fatigue. By the process of elimination, you should be directed easily to option 1 as the action that would exacerbate fatigue. If you had difficulty with this question, review measures to prevent fatigue in a client with systemic lupus erythematosus.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Immune

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 2071). St. Louis: Saunders.

### 858. 2

**Rationale:** Pemphigus is an autoimmune disease that causes blistering in the epidermis. The client has large flaccid blisters (bullae). Because the blisters are in the epidermis, they have a thin covering of skin and break easily, leaving large denuded areas of skin. On initial examination, clients may have crusting areas instead of intact blisters. Option 1 describes eczema, option 3 describes herpes zoster, and option 4 describes psoriasis.

**Test-Taking Strategy:** Use the process of elimination. Recalling that pemphigus vulgaris is an autoimmune disorder will direct you easily to option 2. If you had difficulty with this question, review the characteristics of this disorder.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Immune

**Reference:** Copstead, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 1235). St. Louis: Mosby.

### 859. 1

**Rationale:** The client with immunodeficiency has inadequate or absence of immune bodies and is at risk for infection. The priority nursing intervention would be to protect the client from infection. Options 2, 3, and 4 may be components of care but are not the priority.

**Test-Taking Strategy:** Use Maslow's Hierarchy of Needs theory to answer the question. Remember that physiological needs are the priority. This will direct you to option 1. Review the care of a client with immunodeficiency if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Immune

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, and psychiatric nursing care plans* (2nd ed., pp. 15–16). St. Louis: Mosby.

### 860. 2

**Rationale:** In some types of allergies, a reaction occurs only on second and subsequent contacts with the allergen. The appropriate action, therefore, would be to ask the client if he ever experienced a bee sting in the past. Option 1 is not appropriate advice. Option 3 is unnecessary. The client should not be told “not to worry.”

**Test-Taking Strategy:** Use the steps of the nursing process to answer the question. Option 2 is the only option that addresses assessment. Review information related to allergic reactions if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Immune

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 149–150). St. Louis: Saunders.

### 861. 1

**Rationale:** Individuals at risk for developing a latex allergy include health care workers, individuals who work in the rubber industry or those who have had multiple surgeries, have spina bifida, wear gloves frequently, such as food handlers, hairdressers, and auto mechanics, or are allergic to kiwis, bananas, pineapples, tropical fruits, grapes, avocados, potatoes, hazelnuts, or water chestnuts.

**Test-Taking Strategy:** Focus on the subject, a latex allergy. Recalling the cause and the source of the allergic reaction will direct you easily to option 1. Review the cause of this type of allergy and the individuals at risk if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Immune

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 445). St. Louis: Saunders.

Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 197). St. Louis: Mosby.

### 862. 4

**Rationale:** Individuals who are allergic to kiwis, bananas, pineapples, tropical fruits, grapes, avocados, potatoes, hazelnuts, or water chestnuts are at risk for developing a latex allergy. This is thought to be the result of a possible cross-reaction between the food and the latex allergen. Options 1, 2, and 3 are unrelated to latex allergy.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the food items related to a latex allergy. Eliminate options 1, 2, and 3 because they are comparable or alike and relate to dairy products. Review the food items associated with a risk for latex allergy if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Immune

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 394, 445). St. Louis: Saunders.

### 863. 1

**Rationale:** Lyme disease is a multisystem infection that results from a bite by a tick carried by several species of deer. Persons bitten by the *Ixodes scapularis* or *I. pacificus* tick can become infected with the spirochete *Borrelia burgdorferi*. Lyme disease cannot be transmitted from one person to another. Histoplasmosis is caused by the inhalation of spores from bat or bird droppings. Toxoplasmosis is caused by the ingestion of cysts from contaminated cat feces.

**Test-Taking Strategy:** Use the process of elimination. Recalling that this disease is caused by a tick bite will assist in eliminating the incorrect options. If you had difficulty with this question, review the cause of Lyme disease.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Immune

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 356). St. Louis: Saunders.

### 864. 2

**Rationale:** A characteristic of stage I Lyme disease is the development of a rash within 2 to 30 days of infection, generally at the site of the tick bite, but it can be anywhere on the body. However, many individuals may not develop the rash. The rash develops into a concentric ring, giving it a bull’s-eye appearance. The lesion enlarges up to 50 to 60 cm, and smaller lesions develop farther away from the original tick bite. In stage I, most infected persons develop flu-like symptoms that last 7 to 10 days; these symptoms may recur later. Neurological deficits occur in stage II. Arthralgias and joint enlargements are most likely to occur in stage III.

**Test-Taking Strategy:** Use the process of elimination and eliminate options 1 and 3 first because they are comparable or alike. Next, note that the question asks for the characteristic of stage I. From the remaining two options, select the least serious one because the subject of the question relates to stage I. Expect neurological disorders to occur with progression of the disease. If you had difficulty with this question, review the stages of Lyme disease.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Immune

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 356). St. Louis: Saunders.

### 865. 4

**Rationale:** A blood test is available to detect Lyme disease; however, the test is not reliable if performed before 4 to 6 weeks following the tick bite. Antibody formation takes place in the following manner. Immunoglobulin M is detected 3 to

4 weeks after Lyme disease onset, peaks at 6 to 8 weeks, and then gradually disappears; immunoglobulin G is detected 2 to 3 months after infection and may remain elevated for years. Options 1, 2, and 3 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 1 first. The word *immediately* should indicate that this is potentially an incorrect option. A blood test is available; therefore, eliminate option 2. Eliminate option 3 because treatment should begin before the arthralgia develops. If you had difficulty with this question, review the method of diagnosing Lyme disease.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Immune

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 356). St. Louis: Saunders.

### 866. 3

**Rationale:** In the prevention of Lyme disease, individuals need to be instructed to use an insect repellent on the skin and clothes when in an area where ticks are likely to be found. Long-sleeved tops and long pants, closed shoes, and a hat or cap should be worn. If possible, heavily wooded areas or areas with thick underbrush should be avoided. Socks can be pulled up and over the pant legs to the prevent ticks from entering under clothing.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *need for further instructions*. These words indicate a negative event query and ask you to select an option that is incorrect. Note that option 3 uses the words *should not*. Reading carefully will assist in directing you to this option. If you had difficulty with this question, review the measures to prevent contact with ticks.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Immune

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 356). St. Louis: Saunders.

### 867. 3

**Rationale:** Kaposi's sarcoma lesions begin as red, dark blue, or purple macules on the lower legs that change into plaques. These large plaques ulcerate or open and drain. The lesions spread by metastasis through the upper body and then to the face and oral mucosa. They can move to the lymphatic system, lungs, and gastrointestinal tract. Late disease results in swelling and pain in the lower extremities, penis, scrotum, or face. Diagnosis is made by punch biopsy of cutaneous lesions and biopsy of pulmonary and gastrointestinal lesions.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 2 first because these symptoms occur late in the development of Kaposi's sarcoma. From the remaining options, note the strategic word *confirmed*. This strategic word will assist in directing you to the option that will confirm the diagnosis, the biopsy of the lesions. Review diagnostic measures for Kaposi's sarcoma if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Immune

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 372). St. Louis: Saunders.

### 868. 4

**Rationale:** Kaposi's sarcoma is a vascular malignancy that presents as a skin disorder and is a common AIDS indicator. Malignancy is seen most frequently in men with a history of same-gender partners. Although the cause of Kaposi's sarcoma is not known, it is considered to be caused by an alteration or failure in the immune system. The renal transplant recipient and the client receiving antineoplastic medications are at risk for immunosuppression. Exposure to asbestos is not related to the development of Kaposi's sarcoma.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *least likely at risk*. Option 2 can be eliminated easily. Note that options 1 and 3 are comparable or alike. These clients are at risk for immunosuppression. With this in mind, these options can be eliminated. If you had difficulty with this question, review the risk factors associated with Kaposi's sarcoma.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Immune

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 2107–2108). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 869. 1, 2, 4, 5

**Rationale:** If a client is allergic to latex and is at high risk for an allergic response, the nurse would use nonlatex gloves and latex-safe supplies, and would keep a latex-safe supply cart available in the client's area. Any supplies or materials that contain latex would be avoided. These include blood pressure cuffs and medication vials with rubber stoppers that require puncture with a needle. It is not necessary to place the client in a private room.

**Test-Taking Strategy:** Focus on the subject, that the client is at high risk for an allergic response to latex. Recalling that items that contain rubber are likely to contain latex will direct you to the correct interventions. Also, noting the close-ended word *only* in options 3 and 6 will assist in eliminating these options. Review care of the client with a latex allergy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Immune

# Immunological Medications

## I. HUMAN IMMUNODEFICIENCY VIRUS (HIV) AND ACQUIRED IMMUNODEFICIENCY SYNDROME (AIDS)

-  **A.** Medications include nucleoside-nucleotide reverse transcriptase inhibitors, non-nucleoside reverse transcriptase inhibitors, protease inhibitors, and fusion inhibitors (Box 71-1; Fig. 71-1).
- B.** Nucleoside-nucleotide reverse transcriptase inhibitors and non-nucleoside reverse transcriptase inhibitors work by inhibiting the activity of reverse transcriptase.
- C.** Protease inhibitors work by interfering with the activity of the enzyme protease.
- D.** Fusion inhibitors work by inhibiting the binding of human **immunodeficiency** virus to cells.
-  **E.** Standard treatment consists of using three or four medications in regimens known as highly active antiretroviral therapy (HAART); this therapy is not curative but can delay or reverse loss of immune function, preserve health, and prolong life.
- F.** Other medications include those that are used to treat complications or opportunistic infections that develop (see Box 71-1).
-  **G.** Nucleoside-nucleotide reverse transcriptase inhibitors (NRTIs)
  1. Abacavir (Ziagen): Can cause nausea; monitor for hypersensitivity reaction, including fever, nausea, vomiting, diarrhea, lethargy, malaise, sore throat, shortness of breath, cough, and rash.
  2. Abacavir; lamivudine (Epzicom): In addition to the effects that can occur from abacavir and lamivudine, hypersensitivity reactions, lactic acidosis, and severe hepatomegaly can occur.
  3. Didanosine (Videx): Can cause nausea, diarrhea, peripheral neuropathy, hepatotoxicity, and pancreatitis
  4. Emtricitabine (Emtriva): Can cause headache, diarrhea, nausea, rash, hyperpigmentation of the palms and soles, lactic acidosis, and severe hepatomegaly
  5. Emtricitabine; tenofovir (Truvada): In addition to the effects that can occur from emtricitabine and tenofovir, lactic acidosis and severe hepatomegaly can occur.
- 6. Lamivudine (Epivir): Causes nausea and nasal congestion
- 7. Lamivudine; zidovudine (Combivir): Can cause anemia and neutropenia and lactic acidosis with hepatomegaly
- 8. Lamivudine; zidovudine; abacavir (Trizivir): In addition to the effects that can occur from lamivudine, zidovudine, and abacavir, hypersensitivity reactions, anemia, neutropenia, lactic acidosis, and severe hepatomegaly can occur.
- 9. Stavudine (d4t, Zerit): Can cause peripheral neuropathy and pancreatitis
- 10. Tenofovir (Viread): Can cause nausea and vomiting
- 11. Zalcitabine (ddC, Hivid) Can cause oral ulcers, peripheral neuropathy, hepatotoxicity, and pancreatitis
- 12. Zidovudine (Retrovir, azidothymidine, AZT, ZDV): Can cause nausea, vomiting, anemia, leukopenia, myopathy, fatigue, and headache
- H.** Non-nucleoside reverse transcriptase inhibitors (NNRTIs) 
  1. Delavirdine (Rescriptor): Can cause rash, liver function changes, and pruritis
  2. Efavirenz (Sustiva): Can cause rash, dizziness, confusion, difficulty concentrating, dreams, and encephalopathy
  3. Etravirine (Intelence): Can cause rash, gastrointestinal disturbances, headache, hypertension, and peripheral neuropathy
  4. Nevirapine (Viramune): Can cause rash, Stevens-Johnson syndrome, hepatitis, and increased transaminase levels
- I.** Protease inhibitors (PIs) 
  1. Amprenavir; vitamin E (Agenerase)
    - a. Can cause nausea, vomiting, headache, altered taste sensations, perioral paresthesia, rashes, and increased results of liver function studies
    - b. Oral solution contains an alcohol that can interact with metronidazole (Flagyl); can cause feelings of inebriation.
  2. Atazanavir (Reyataz): Can cause nausea, headache, infection, vomiting, diarrhea, drowsiness,

**Box 71-1 Medications for HIV and AIDS****Nucleoside-Nucleotide Reverse Transcriptase Inhibitors (NRTIs)**

Abacavir (Ziagen)  
 Abacavir; lamivudine (Epzicom)  
 Didanosine (Videx)  
 Emtricitabine (Emtriva)  
 Emtricitabine; tenofovir (Truvada)  
 Emtricitabine; tenofovir; efavirenz (Atripla)  
 Lamivudine (EpiVir)  
 Lamivudine; zidovudine (Combivir)  
 Lamivudine; zidovudine; abacavir (Trizivir)  
 Stavudine (d4t, Zerit)  
 Tenofovir (Viread)  
 Zalcitabine (ddC, Hivid)  
 Zidovudine (Retrovir, azidothymidine, AZT, ZDV)

**Non-Nucleoside Reverse Transcriptase Inhibitors (NNRTIs)**

Delavirdine (Rescriptor)  
 Efavirenz (Sustiva)  
 Etravirine (Intelence)  
 Nevirapine (Viramune)

**Protease Inhibitors (PIs)**

Amprenavir; vitamin E (Agenerase)  
 Atazanavir (Reyataz)  
 Darunavir (Prezista)  
 Fosamprenavir (Lexiva)  
 Indinavir (Crixivan)  
 Lopinavir; ritonavir (Kaletra)  
 Nelfinavir (Viracept)

Ritonavir (Norvir)  
 Saquinavir (Invirase)  
 Tipranavir (Aptivus)

**Integrase Inhibitor**

Raltegravir (Isentress)

**Fusion Inhibitor**

Enfuvirtide (Fuzeon)

**CCR5 Antagonist**

Maraviroc (Selzentry)

**Anti-Inflammatory Medication**

Sulfasalazine (Azulfidine)

**Anti-Infective Medications**

Atovaquone (Mepron)  
 Metronidazole (Flagyl)  
 Pentamidine isethionate (Pentam 300)  
 Sulfamethoxazole; trimethoprim (Bactrim)

**Antifungal Medications**

Amphotericin B (Fungizone)  
 Fluconazole (Diflucan)  
 Ketoconazole (Nizoral)

**Antiviral Medications**

Acyclovir (Zovirax)  
 Foscarnet (Foscavir)  
 Ganciclovir (Cytovene)

insomnia, fever, hyperglycemia, hyperlipidemia, and increased bleeding in clients with hemophilia

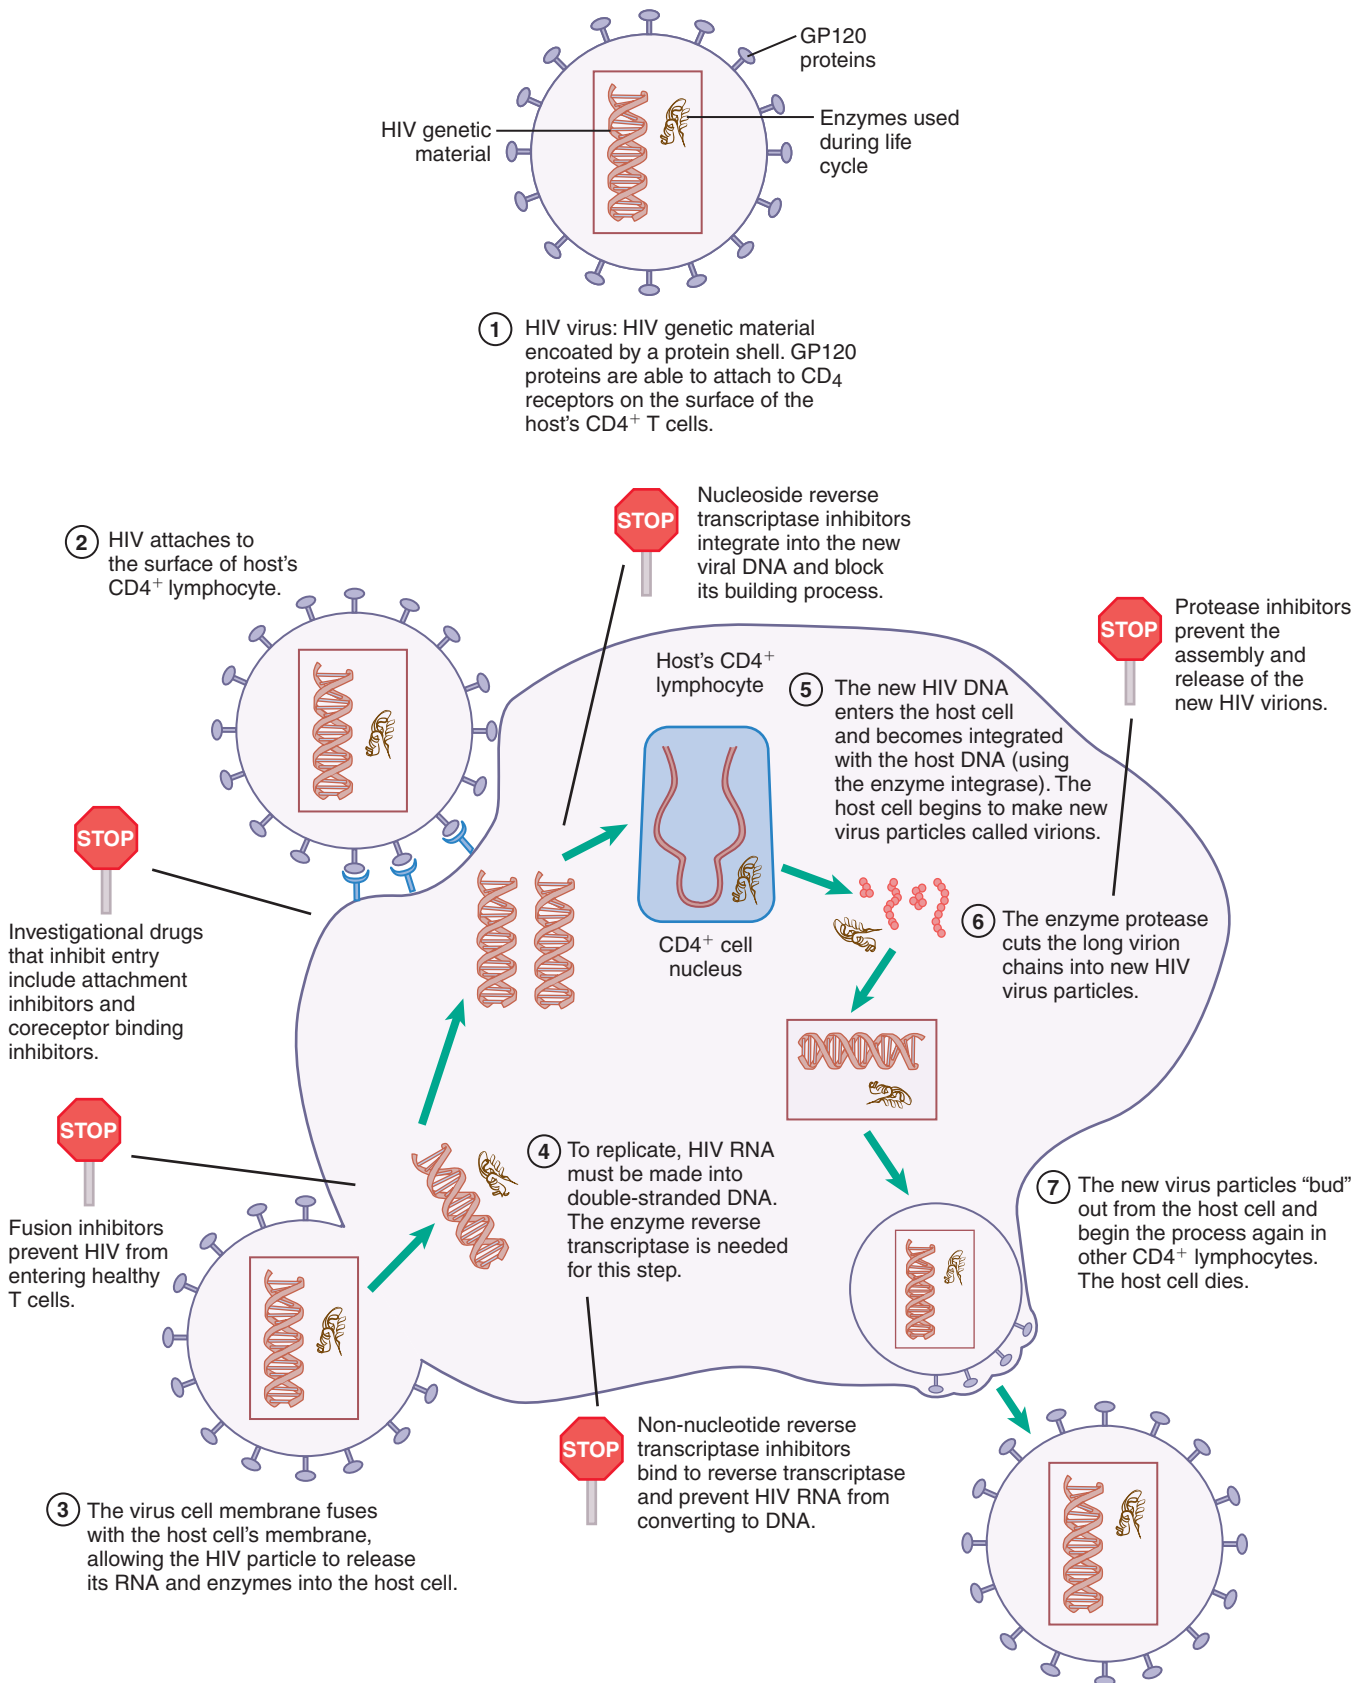

3. Fosamprenavir (Lexiva): Similar to amprenavir; can cause nausea, vomiting, headache, altered taste sensations, perioral paresthesia, rashes, and altered liver function
4. Indinavir (Crixivan): Can cause nausea, diarrhea, hyperbilirubinemia, nephritis, and kidney stones
5. Lopinavir-ritonavir combination (Kaletra): Can cause nausea, diarrhea, altered taste sensations, circumoral paresthesia, and hepatitis
6. Nelfinavir (Viracept): Can cause nausea, flatulence, and diarrhea
7. Ritonavir (Norvir): Can cause nausea, vomiting, diarrhea, altered taste sensations, circumoral paresthesia, hepatitis, and increased triglyceride levels
8. Saquinavir (Invirase): Can cause nausea, diarrhea, photosensitivity, and headache
9. Tipranavir (Aptivus): Hepatotoxicity (liver damage); can also cause nausea, vomiting, diarrhea, headache, and fatigue
- J. Integrase inhibitor: Raltegravir (Isentress)
  1. Stops HIV replication and is used in combination with other antiretroviral medications

2. Common side effects include nausea, diarrhea, fatigue, headache, and itching.

- K. Chemokine receptor 5 (CCR5) antagonist: Maraviroc (Selzentry)
  1. Binds with CCR5 and blocks viral entry
  2. Most common side effects are cough, dizziness, pyrexia, rash, abdominal pain, musculoskeletal symptoms, and upper respiratory tract infections; liver injury, and cardiovascular events have occurred in some clients.
- L. Fusion inhibitor: Enfuvirtide (Fuzeon) can cause skin irritation at injection site, fatigue, nausea, insomnia, and peripheral neuropathy.
- M. Anti-infective and anti-inflammatory medications: Used to treat opportunistic infections such as *Pneumocystis jiroveci* pneumonia; *Toxoplasma* encephalitis is treated with sulfamethoxazole-trimethoprim (Bactrim; see Box 71-1)
- N. Antifungal medications: Used to treat candidiasis, cryptococcal meningitis (see Box 71-1)
- O. Antiviral medications: Used to treat cytomegalovirus retinitis, herpes simplex, varicella-zoster virus (see Box 71-1)

 The client with HIV or AIDS is at high risk for the development of opportunistic infections.

**▲ FIGURE 71-1** Steps in the life cycle of the human immunodeficiency virus (HIV), with correlation to medications. (From Black, J., & Hawks, J., [2009]. *Medical-surgical nursing: Clinical management for positive outcomes* [8th ed.]. St. Louis: Saunders.)

**II. IMMUNOSUPPRESSANTS** (Box 71-2; Fig. 71-2)

- A.** Description: Immunosuppressants are used for transplant recipients to prevent organ or tissue rejection and to treat autoimmune disorders such as systemic lupus erythematosus.
- B.** Cyclosporine (Sandimmune, Gengraf, Neoral)
  - 1. Used for prevention of rejection following allogenic organ transplantation
  - 2. Usually administered with a glucocorticoid and another immunosuppressant
  - 3. The most common adverse effects are nephrotoxicity, infection, hypertension, and hirsutism.
- C.** Tacrolimus (Prograf)
  - 1. Used for prevention of rejection following liver or kidney transplantation
  - 2. Adverse effects include nephrotoxicity, neurotoxicity, gastrointestinal effects, hypertension, hyperkalemia, hyperglycemia, hirsutism, and gum hyperplasia.
- D.** Azathioprine (Imuran)
  - 1. Generally used with renal transplant recipients
  - 2. Can cause neutropenia and thrombocytopenia
- E.** Cyclophosphamide (Cytoxan, Neosar)
  - 1. Used for its immunosuppressant action to treat autoimmune disorders
  - 2. Can cause neutropenia and hemorrhagic cystitis
- F.** Methotrexate (Rheumatrex, Trexall)
  - 1. Used for its immunosuppressant action to treat autoimmune disorders
  - 2. Can cause hepatic fibrosis and cirrhosis, bone marrow suppression, ulcerative stomatitis, and renal damage
- G.** Mycophenolate mofetil (CellCept) and mycophenolic acid (Myfortic)
  - 1. Used to prevent rejection following kidney, heart, and liver transplantation
  - 2. Can cause diarrhea, vomiting, neutropenia, sepsis; increased risk of infection and malignancies, especially lymphomas
- H.** Basiliximab (Simulect); daclizumab (Zenapax)
  - 1. Used to prevent rejection following kidney transplantation
  - 2. Can cause severe acute hypersensitivity reactions, including anaphylaxis
- I.** Lymphocyte immune globulin, antithymocyte globulin (equine)
  - 1. Used to prevent rejection following kidney, heart, liver, and bone marrow transplantation
  - 2. Side effects include fever, chills, leukopenia, and skin reactions.
  - 3. Can cause anaphylactoid reactions

- 1. Used to prevent rejection following kidney, heart, and liver transplantation
- 2. Can cause diarrhea, vomiting, neutropenia, sepsis; increased risk of infection and malignancies, especially lymphomas
- 3. Can cause anaphylactoid reactions

**Box 71-2 Immunosuppressants**

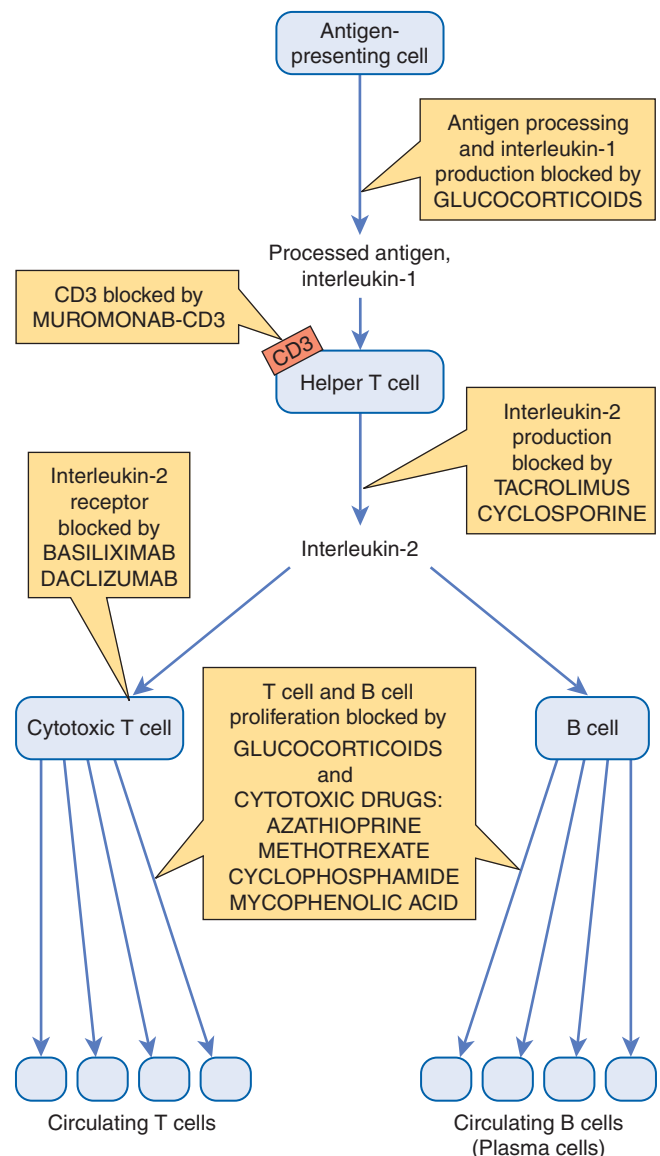

**Calcineurin Inhibitors**  
 Cyclosporine (Sandimmune, Gengraf, Neoral)  
 Tacrolimus (Prograf)

**Cytotoxic Medications**  
 Azathioprine (Imuran)  
 Cyclophosphamide (Cytoxan, Neosar)  
 Methotrexate (Rheumatrex, Trexall)  
 Mycophenolate mofetil (CellCept)  
 Mycophenolic acid (Myfortic)

**Antibodies**  
 Basiliximab (Simulect)  
 Daclizumab (Zenapax)  
 Lymphocyte immune globulin, antithymocyte globulin (equine)  
 Muromonab-CD3 (Orthoclone OKT3)  
 Rh<sub>o</sub>(D) immune globulin (RhoGAM)

**Other**  
 Sirolimus (Rapamune)

**Glucocorticoids**  
 See Chapter 55.

**▲ FIGURE 71-2** Sites of action of immunosuppressant drugs. (From Lehne, R. [2010]. *Pharmacology for nursing care* [7th ed.]. St. Louis: Saunders.)

- J. Muromonab-CD3 (Orthoclone OKT3)
  1. Used to prevent rejection following kidney, heart, and liver transplantation
  2. Side effects include fever, chills, dyspnea, chest pain, nausea, and vomiting.
  3. Can cause anaphylactoid reactions
-  K. Rh<sub>o</sub>(D) immune globulin (RhoGAM; see Chapter 31)
- L. Sirolimus (Rapamune)
  1. Used to prevent renal transplant rejection
  2. Increases the risk of infection; raises cholesterol and triglyceride levels; can cause renal injury

3. Other side effects include rash, acne, anemia, thrombocytopenia, joint pain, diarrhea, and hypokalemia.

 Monitor the client taking an immunosuppressant closely for signs of infection.

### III. IMMUNIZATIONS (see Chapter 48)

### IV. ANTIBIOTICS (Box 71-3)

- A. Inhibit the growth of bacteria

## Box 71-3 Antibiotics

### Aminoglycosides

Amikacin (Amikin)  
Gentamicin (Garamycin)  
Kanamycin (Kantrex)  
Neomycin (Neo-Fradin)  
Streptomycin  
Tobramycin (Nebcin)

### Cephalosporins

Cefaclor (Ceclor)  
Cefadroxil (Duricef)  
Cefazolin (Ancef, Kefzol)  
Cefdinir (Omnicef)  
Cefditoren (Spectracef)  
Cefepime (Maxipime)  
Cefotaxime (Claforan)  
Cefotetan (Cefotan)  
Cefoxitin (Mefoxin)  
Cefpodoxime (Vantin)  
Cefprozil (Cefzil)  
Ceftazidime (Ceptaz, Fortaz, Tazicef)  
Ceftibuten (Cedax)  
Ceftizoxime (Cefizox)  
Ceftriaxone (Rocephin)  
Cefuroxime (Ceftin)  
Cephalexin (Keflex)  
Loracarbef (Lorabid)

### Fluoroquinolones

Ciprofloxacin (Cipro)  
Gatifloxacin (Tequin)  
Gemifloxacin (Factive)  
Levofloxacin (Levaquin)  
Lomefloxacin (Maxaquin)  
Moxifloxacin (Avelox)  
Norfloxacin (Noroxin)  
Ofloxacin (Floxin)  
Trovaflaxacin (Trovan)

### Macrolides

Azithromycin (Zithromax)  
Clarithromycin (Biaxin)  
Dirithromycin (Dynabac)  
Erythromycin

### Lincosamides

Clindamycin (Cleocin)  
Lincomycin (Lincocin)

### Monobactam

Aztreonam (Azactam)

### Penicillins

Amoxicillin (Amoxil)  
Ampicillin (Principen)  
Carbenicillin (Geocillin)  
Penicillin G (Bicillin L-A, Permapen, Pfizerpen, Wycillin)  
Penicillin V (Veetids)  
Piperacillin  
Ticarcillin (Ticar)

### Penicillinase-Resistant Penicillins

Dicloxacillin  
Nafcillin  
Oxacillin

### Sulfonamides

Sulfamethoxazole  
Sulfadiazine  
Sulfasalazine  
Sulfisoxazole  
Trimethoprim; sulfamethoxazole (TMP-SMZ; Bactrim, Cotrim, Septra)

### Tetracyclines

Demeclocycline (Declomycin)  
Doxycycline (Vibramycin)  
Minocycline (Minocin)  
Oxytetracycline (Terramycin)  
Tetracycline (Sumycin)

### Antimycobacterials

Antituberculosis agents (see Chapter 59)  
Leprostatics: Clofazimine (Lamprene) and dapsone

### Antifungal Medications

Amphotericin B (Fungizone)  
Fluconazole (Diflucan)  
Ketoconazole (Nizoral)

### Antiviral Medications

Acyclovir (Zovirax)  
Foscarnet (Foscavir)  
Ganciclovir (Cytovene)

- B.** Include medication classifications of aminoglycosides, cephalosporins, fluoroquinolones, macrolides, lincosamides, monobactams, penicillins and penicillinase-resistant penicillins, sulfonamides, tetracyclines, antimycobacterials, and others (see Box 71-3)
- C.** Adverse effects (Table 71-1)
- D.** Nursing considerations
1. Assess for allergies.
  2. Monitor appropriate laboratory values before therapy as appropriate and during therapy to assess for adverse effects.
  3. Monitor for adverse effects and report to physician if any occur.
  4. Determine appropriate method of administration and provide instructions to the client.
  5. Monitor intake and output.
  6. Encourage fluid intake (unless contraindicated).
  7. Initiate safety precautions because of possible central nervous system effects.
  8. Teach client about the medication and how to take the medication; emphasize the importance of completing the full prescribed course.

**TABLE 71-1** Antibiotics and their Adverse Effects

| Classification                                      | Adverse Effects   |
|---|---|
| Aminoglycosides                                     | Ototoxicity<br>Confusion, disorientation<br>Renal toxicity<br>Gastrointestinal irritation<br>Palpitations, blood pressure changes<br>Hypersensitivity reactions   |
| Cephalosporins                                      | Gastrointestinal disturbances<br>Pseudomembranous colitis<br>Headache, dizziness, lethargy, paresthesias<br>Nephrotoxicity<br>Superinfections   |
| Fluoroquinolones                                    | Headache, dizziness, insomnia, depression<br>Gastrointestinal effects<br>Bone marrow depression<br>Fever, rash, photosensitivity  |
| Macrolides  | Gastrointestinal effects<br>Pseudomembranous colitis<br>Confusion, abnormal thinking<br>Superinfections<br>Hypersensitivity reactions   |
| Lincosamides  | Gastrointestinal effects<br>Pseudomembranous colitis<br>Bone marrow depression  |
| Monobactams   | Gastrointestinal effects<br>Hepatotoxicity<br>Allergic reactions  |
| Penicillins and penicillinase-resistant penicillins | Gastrointestinal effects, including sore mouth and furry tongue<br>Superinfections<br>Hypersensitivity reactions, including anaphylaxis   |
| Sulfonamides  | Gastrointestinal effects<br>Hepatotoxicity<br>Nephrotoxicity<br>Bone marrow depression<br>Dermatological effects, including hypersensitivity and photosensitivity<br>Headache, dizziness, vertigo, ataxia, depression, seizures |
| Tetracyclines                                       | Gastrointestinal effects<br>Hepatotoxicity<br>Teeth (staining) and bone damage<br>Superinfections<br>Dermatological reactions, including rash and photosensitivity<br>Hypersensitivity reactions                                |
| Antimycobacterials, leprostatics                    | Gastrointestinal effects<br>Neuritis, dizziness, headache, malaise, drowsiness, hallucinations  |

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 870.** The client with acquired immunodeficiency syndrome and *Pneumocystis jiroveci* infection has been receiving pentamidine (Pentam 300). The client develops a temperature of 101° F. The nurse does further monitoring of the client, knowing that this sign would most likely indicate:
1. That the dose of the medication is too low
  2. That the client is experiencing toxic effects of the medication
  3. That the client has developed inadequacy of thermoregulation
  4. That the client has developed another infection caused by leukopenic effects of the medication
- 871.** Saquinavir (Invirase) is prescribed for the client who is seropositive for human immunodeficiency virus. The nurse provides medication instructions and tells the client to:
1. Avoid sun exposure.
  2. Eat low-calorie foods.
  3. Eat foods that are low in fat.
  4. Take the medication on an empty stomach.
- 872.** The client who is human immunodeficiency virus seropositive has been taking stavudine (d4t, Zerit). The nurse monitors which of the following most closely while the client is taking this medication?
1. Gait
  2. Appetite
  3. Level of consciousness
  4. Gastrointestinal function
- 873.** The client with acquired immunodeficiency syndrome has begun therapy with zidovudine (Retrovir, azidothymidine, AZT, ZDV). The nurse carefully monitors which of the following laboratory results during treatment with this medication?
1. Blood culture
  2. Blood glucose level
  3. Complete blood count
  4. Blood urea nitrogen level
- 874.** The nurse is reviewing the results of serum laboratory studies drawn on a client with acquired immunodeficiency syndrome who is receiving didanosine (Videx). The nurse interprets that the client may have the medication discontinued
- by the physician if which of the following significantly elevated results is noted?
1. Serum protein level
  2. Blood glucose level
  3. Serum amylase level
  4. Serum creatinine level
- 875.** The nurse is caring for a post-renal transplantation client taking cyclosporine (Sandimmune, Gengraf, Neoral). The nurse notes an increase in one of the client's vital signs and the client is complaining of a headache. What is the vital sign that is most likely increased?
1. Pulse
  2. Respirations
  3. Blood pressure
  4. Pulse oximetry
- 876.** Amikacin (Amikin) is prescribed for a client with a bacterial infection. The nurse instructs the client to contact the physician immediately if which of the following occurs?
1. Nausea
  2. Lethargy
  3. Hearing loss
  4. Muscle aches
- 877.** The nurse is assigned to care for a client with cytomegalovirus retinitis and acquired immunodeficiency syndrome who is receiving foscarnet (Foscavir), an antiviral. The nurse checks the latest results of which of the following laboratory studies while the client is taking this medication?
1. CD4 cell count
  2. Serum albumin level
  3. Serum creatinine level
  4. Lymphocyte count

### Alternate Item Format: Multiple Response

- 878.** Ketoconazole (Nizoral) is prescribed for a client with a diagnosis of candidiasis. Select the interventions that the nurse includes when administering this medication. **Select all that apply.**
- 1. Restrict fluid intake.
  - 2. Instruct the client to avoid alcohol.
  - 3. Monitor liver function studies.
  - 4. Administer the medication with an antacid.
  - 5. Instruct the client to avoid exposure to the sun.
  - 6. Administer the medication on an empty stomach.

## ANSWERS

### 870. 4

**Rationale:** Frequent side effects of this medication include leukopenia, thrombocytopenia, and anemia. The client

should be monitored routinely for signs and symptoms of infection. Options 1, 2, and 3 are inaccurate interpretations.

**Test-Taking Strategy:** Use the process of elimination, focusing on the strategic words *develops a temperature*. Note the relationship between these strategic words and option 4. Review

the side effects of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Adult Health—Immune

**References:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 897). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 1161). St. Louis: Saunders.

### 871. 1

**Rationale:** Saquinavir is an antiretroviral (protease inhibitor) used with other antiretroviral medications to manage human immunodeficiency virus infection. Saquinavir is administered with meals and is best absorbed if the client consumes high-calorie, high-fat meals. Saquinavir can cause photosensitivity, and the nurse should instruct the client to avoid sun exposure.

**Test-Taking Strategy:** Use the process of elimination. Options 2 and 3 can be eliminated first, knowing that these dietary measures likely would not be prescribed for this client. From the remaining options, you must know that this medication can cause photosensitivity. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Immune

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 1023). St. Louis: Saunders.

### 872. 1

**Rationale:** Stavudine (d4t, Zerit) is an antiretroviral used to manage human immunodeficiency virus infection in clients who do not respond to or who cannot tolerate conventional therapy. The medication can cause peripheral neuropathy, and the nurse should monitor the client's gait closely and ask the client about paresthesia. Options 2, 3, and 4 are unrelated to this medication.

**Test-Taking Strategy:** Focus on the name of the medication. Recalling that this medication causes peripheral neuropathy will direct you to option 1. If you are not familiar with this medication and the important assessment measures, review this content.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Immune

**References:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 1060). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 1094, 1127). St. Louis: Saunders.

### 873. 3

**Rationale:** Common side effects of zidovudine are leukopenia and anemia. The nurse monitors the complete blood count results for these changes. Options 1, 2, and 4 are unrelated to the use of this medication.

**Test-Taking Strategy:** Focus on the name of the medication. Recalling that zidovudine causes leukopenia will direct you

to option 3. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Immune

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 1205). St. Louis: Saunders.

### 874. 3

**Rationale:** Didanosine (Videx) can cause pancreatitis. A serum amylase level that is increased to 1.5 to 2 times normal may signify pancreatitis in the client with acquired immunodeficiency syndrome and is potentially fatal. The medication may have to be discontinued. The medication is also hepatotoxic and can result in liver failure.

**Test-Taking Strategy:** Focus on the name of the medication. Recalling that this medication can cause damage to the pancreas and is hepatotoxic will direct you to the correct option. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Immune

**References:** Edmunds, M. (2010). *Introduction to clinical pharmacology* (6th ed., p. 195). St. Louis: Mosby.

Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 343). St. Louis: Saunders.

### 875. 3

**Rationale:** Hypertension can occur in a client taking cyclosporine (Sandimmune, Gengraf, Neoral) and, because this client is also complaining of a headache, the blood pressure is the vital sign to be monitored most closely. Other adverse effects include infection, nephrotoxicity, and hirsutism. Options 1, 2, and 4 are unrelated to the use of this medication.

**Test-Taking Strategy:** Focus on the name of the medication and recall that this medication can cause hypertension. Review the adverse effects of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Immune

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 815). St. Louis: Saunders.

### 876. 3

**Rationale:** Amikacin (Amikin) is an aminoglycoside. Adverse effects of aminoglycosides include ototoxicity (hearing problems) confusion, disorientation, gastrointestinal irritation, palpitations, blood pressure changes, nephrotoxicity, and hypersensitivity. The nurse instructs the client to report hearing loss to the physician immediately. Lethargy and muscle aches are not associated with the use of this medication. It is not necessary to contact the physician immediately if nausea occurs. If nausea persists or results in vomiting, the physician should be notified.

**Test-Taking Strategy:** Note the strategic words *contact the physician immediately*. Recalling that this medication is an

aminoglycoside (most aminoglycoside medication names end in *-cin*) and that aminoglycosides are ototoxic will direct you to the correct option. Review the adverse effects of aminoglycosides if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Immune

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 1024). St. Louis: Saunders.

### 877. 3

**Rationale:** Foscarnet (Foscavir) is toxic to the kidneys. The serum creatinine level is monitored before therapy, two or three times per week during induction therapy, and at least weekly during maintenance therapy. Foscarnet also may cause decreased levels of calcium, magnesium, phosphorus, and potassium. Thus, these levels also are measured with the same frequency.

**Test-Taking Strategy:** Use the process of elimination. Recalling that this medication is nephrotoxic will direct you easily to option 3. Review this medication if you are unfamiliar with it.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Immune

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 504). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 878. 2, 3, 5

**Rationale:** Ketoconazole (Nizoral) is an antifungal medication. It is administered with food (not on an empty stomach) and antacids are avoided for 2 hours after taking the medication to ensure absorption. The medication is hepatotoxic and the nurse monitors liver function. The client is instructed to avoid exposure to the sun because the medication increases photosensitivity. The client is also instructed to avoid alcohol. There is no reason for the client to restrict fluid intake. In fact, this could be harmful to the client.

**Test-Taking Strategy:** Use general medication guidelines to assist in selecting the correct interventions. Also, remember that this medication is administered with food and that it is hepatotoxic. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Immune

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 1061). St. Louis: Saunders.

# UNIT XIX

## The Adult Client With a Mental Health Disorder

### PYRAMID TERMS

**abuse** Act of misuse, deceit, or exploitation; the wrong or improper use or action toward another individual that results in injury, damage, maltreatment, or corruption.

**addiction** State of dependence or compulsive use. In relation to drug dependence, addiction incorporates the concepts of loss of control with respect to the use of a drug, taking the drug despite related problems and complications, and a tendency to relapse.

**coping mechanism** Method used to decrease anxiety. The use of a coping mechanism can be conscious, unconscious, constructive, destructive, task-oriented in relation to direct problem solving, or defense-oriented and regulating in response to protect oneself.

**crisis** Temporary state of disequilibrium in which an individual's usual coping mechanisms or problem-solving methods fail. Crisis can result in personality growth or personality disorganization.

**defense mechanism** Coping mechanism used in an effort to protect the individual from feelings of anxiety. As anxiety increases and becomes overwhelming, the individual copes by using defense mechanisms to protect the ego and decrease anxiety.

**milieu** Physical and social environment in which an individual lives. Milieu therapy focuses on positive physical and social environmental manipulation to produce positive change.

**restraints (security devices)** Physical restraints include any manual method or mechanical device, material, or equipment that inhibits free movement. Chemical restraints include the administration of medications for the specific purpose of inhibiting a specific behavior or movement.

**seclusion** Placing a client alone in a specially designed room that protects the client and allows for close supervision. Seclusion is the last selected measure in a process to maximize safety to the client and others.

**suicide** The ultimate act of self-destruction in which an individual purposefully ends his or her own life.

**suicide attempt** Any willful, self-inflicted, or life-threatening attempt by an individual that has not led to death.

### PYRAMID TO SUCCESS

The Pyramid to Success focuses on the therapeutic nurse-client relationship, client rights, hospital admission procedures, the ethical and legal issues related to the care of a client with a mental health disorder, grief and loss, and end-of-life care. Pyramid Points also focus on the use of restraints (security devices), seclusion, and electroconvulsive therapy. Care to a client with an addiction, such as an eating disorder or drug or alcohol disorder is another focus area. Additional areas of focus include anxiety, depression, suicide, abuse and neglect, violence, rape crisis interventions, posttraumatic stress disorders, obsessive-compulsive disorders, schizophrenia, and bipolar disorders. Pyramid Points address the use of medications prescribed for a client with a mental health disorder, particularly lithium carbonate (Lithobid) and the benzodiazepines.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Ensuring client advocacy
- Implementing legal responsibilities related to reporting incidences of abuse, neglect, or violence
- Maintaining confidentiality
- Obtaining informed consent related to treatments, such as restraints (security devices), seclusion, and electroconvulsive therapy
- Providing psychiatric consultations and referrals
- Providing safety to the client and others
- Upholding client rights
- Using restraints (security devices) and seclusion appropriately and safely

### Health Promotion and Maintenance

- Identifying individual lifestyle choices
- Performing psychosocial assessment techniques
- Providing health promotion programs related to addictions
- Identifying community resources for the client

### Psychosocial Integrity

- Assessing for abuse and neglect situations
- Assessing for chemical dependency
- Assessing for domestic violence
- Addressing grief and loss issues

- Providing end-of-life care
- Caring for the client who has been sexually abused or raped
- Considering religious, cultural, and spiritual influences on health
- Developing a therapeutic nurse-client relationship
- Identifying appropriate counseling techniques
- Identifying coping mechanisms
- Identifying support systems
- Implementing behavioral interventions
- Providing crisis intervention
- Providing a therapeutic milieu
- Teaching stress-management techniques

### Physiological Integrity

- Administering medications as prescribed
- Assessing for abusive and self-destructive behavior
- Monitoring elimination patterns
- Monitoring for alterations in body systems related to addictions
- Monitoring for expected and untoward effects of medications
- Monitoring for potential complications related to medications and treatments, such as electroconvulsive therapy
- Monitoring laboratory values related to medication therapy
- Monitoring rest and sleep patterns
- Providing adequate nutrition
- Providing personal hygiene measures

# Foundations of Psychiatric Mental Health Nursing

## I. NURSE-CLIENT RELATIONSHIP

### A. Principles

1. Genuineness, respect, and empathic understanding are characteristics important to the development of a therapeutic nurse-client relationship.
2. The client should be cared for in a holistic manner.
3. The nurse considers the client's cultural beliefs and values in assessing the client's response to the nurse-client relationship and his or her adaptation to stressors.
4. Appropriate limits and boundaries define and facilitate a therapeutic nurse-client relationship.
5. Honest and open communication are important for the development of trust, an underpinning of the therapeutic nurse-client relationship.
6. The nurse uses therapeutic communication techniques to encourage the client to express thoughts and feelings as they address identified problem areas.
7. The nurse respects the client's confidentiality and limits discussion of the client to members of the treatment team.
8. The goal of the nurse-client relationship is to assist the client to develop problem-solving abilities and **coping mechanisms**.

 The nurse needs to consider the religious and spiritual practices of the client and whether these practices may give the client hope, comfort, and support while healing.

### B. Phases of a therapeutic nurse-client relationship

1. Preinteraction phase
  - a. The preinteraction phase begins before the nurse's first contact with the client.
  - b. The nurse's task in the preinteraction phase is to focus on his or her own preconceived ideas, stereotypes, biases, and values that may impinge on the nurse-client relationship.
2. Orientation or introductory phase
  - a. Acceptance, trust, and boundaries are established.
  - b. Expectations and the time frame of the relationship are identified (establishing a contract).

- c. Client-centered goals are defined.
- d. Termination and separation of the relationship are discussed in anticipation of the time-limited nature of the relationship.

### 3. Working phase

- a. Exploring, focusing on, and evaluating the client's concerns and problems occurs; an attitude of acceptance and active listening assists the client to express thoughts and feelings.
- b. Encouraging independence in the client facilitates recovery and leads to readiness for termination.

### 4. Termination or separation phase

- a. Prepare the client for termination and separation on initial contact.
- b. Evaluate progress and achievement of goals.
- c. Identify responses related to termination and separation, such as anger, distancing from the relationship, a return of symptoms, and dependency.
- d. Encourage the client to express feelings about termination.
- e. Identify the client's strengths and anticipated needs for follow-up care.
- f. Refer the client to community resources and other support systems.

## II. THERAPEUTIC COMMUNICATION PROCESS

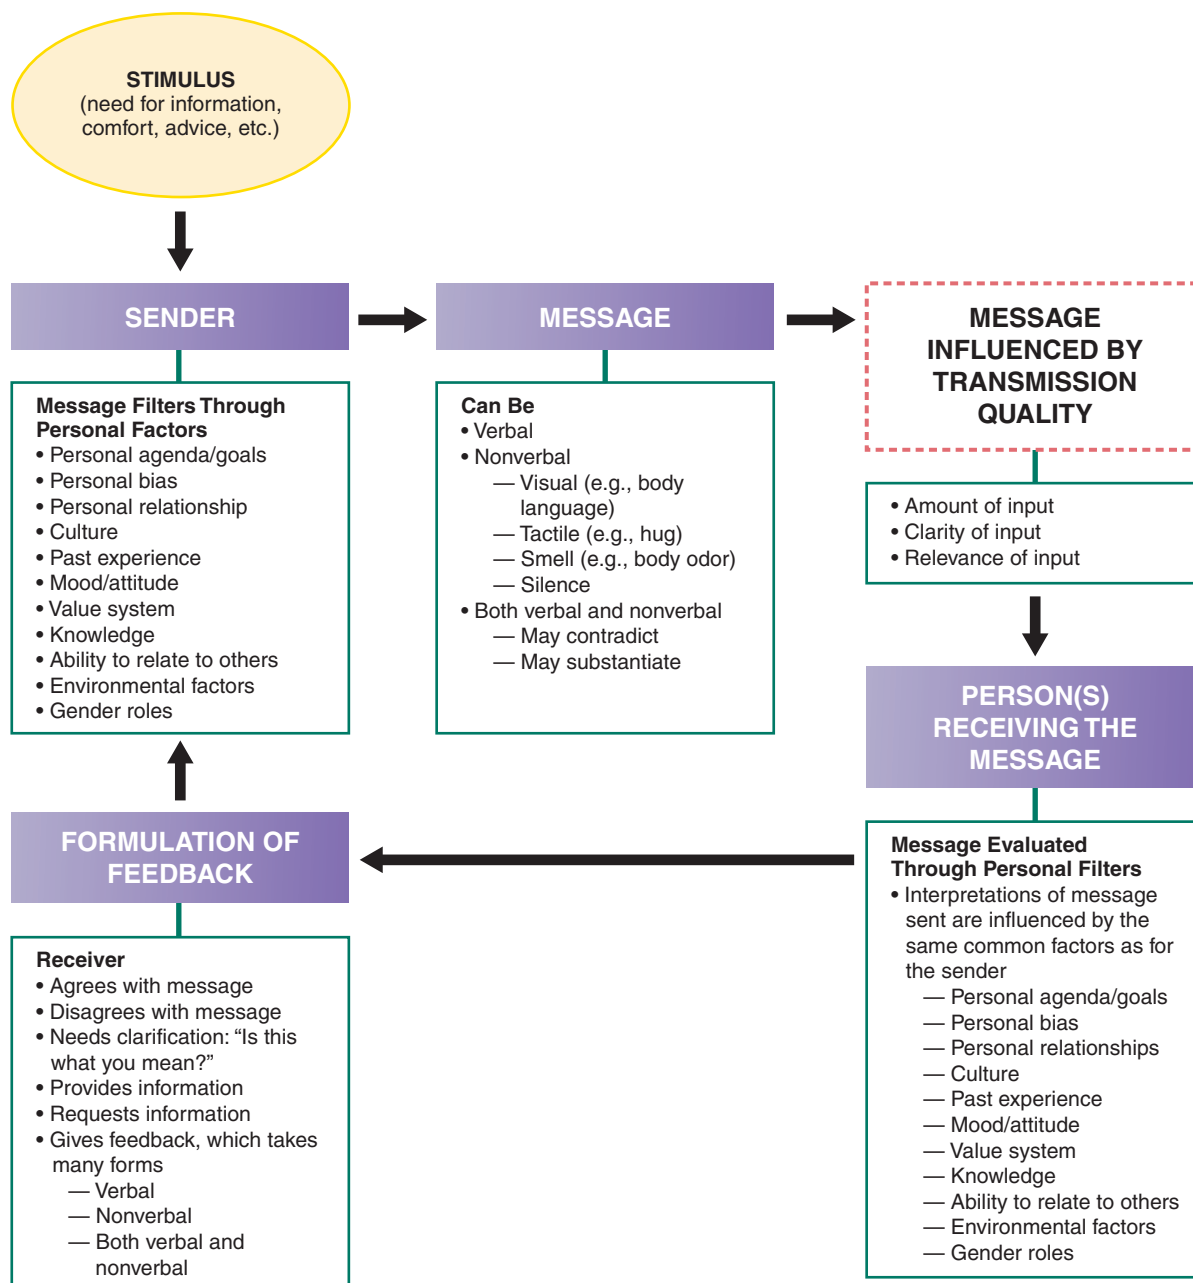

### A. Principles

1. Communication includes verbal and nonverbal expression (Fig. 72-1).
2. Successful communication includes appropriateness, efficiency, flexibility, and feedback.
3. Anxiety in the nurse or client impedes communication.
4. Communication needs to be goal-directed within a professional framework.

### B. Therapeutic and nontherapeutic communication techniques (Box 72-1)

## III. MENTAL HEALTH

- ### A. Mental health is a lifelong process of successful adaptation to changing internal and external environments.

▲ **FIGURE 72-1** Operational definition of communication. (Varcarolis, E., Carson, V., & Shoemaker, N. [2010]. *Foundations of psychiatric mental health nursing* [6th ed.]. St. Louis: Saunders.)

### Box 72-1 Therapeutic and Nontherapeutic Communication Techniques

#### Therapeutic Techniques

- Clarifying and validating
- Encouraging formulation of a plan of action
- Focusing and refocusing
- Listening
- Maintaining neutral responses
- Maintaining silence
- Providing acknowledgment and feedback
- Providing information and presenting reality
- Providing nonverbal encouragement
- Reflecting
- Restating
- Sharing perceptions

- Summarizing
- Using broad openings and open-ended questions

#### Nontherapeutic Techniques

- Asking the client "Why?"
- Being defensive or challenging the client
- Changing the subject
- Giving advice or approval or disapproval
- Making stereotypical comments
- Making value judgments
- Placing the client's feelings on hold
- Providing false reassurance

- B.** A mentally healthy individual is *in contact with reality*, can relate to people and situations in their environment, and resolve conflicts within a problem-solving framework.
-  **C.** A mentally healthy individual has psychobiological resilience.

#### IV. PSYCHIATRIC-MENTAL HEALTH ILLNESS

- A.** Description
1. Psychiatric illness is the loss of the ability to respond to the internal and external environment in ways that are in harmony with oneself or the expectations of society.
  2. Psychiatric illness is characterized by thought or behavior patterns that impair functioning and cause distress.
- B.** Personality characteristics
1. Self-concept is distorted.
  2. Perception of strengths and weaknesses is unrealistic.
  3. Thoughts and perceptions may not be reality-based.
  4. The ability to find meaning and purpose in life may be impaired.
  5. Life direction and productivity may be disturbed.
  6. Meeting one's own needs may be problematic.
  7. Excessive reliance or preoccupation on the thoughts, opinions, and actions of self or others may be present.
- C.** Adaptations to stress
1. The individual's sense of self-control may be affected.
  2. Perception of the environment may be distorted.
  3. **Coping mechanisms** may not exist or may be ineffective.
- D.** Interpersonal relationships
1. Interpersonal relationships may be minimally existent or may be negatively affected.
  2. The ability to enjoy sustained intimacy in relationships is impaired.

#### V. COPING AND DEFENSE MECHANISMS

- A.** **Coping mechanisms**
1. Coping involves any effort to decrease anxiety.
  2. **Coping mechanisms** can be constructive or destructive, task-oriented in relation to direct problem solving, or defense-oriented and regulating the response to protect oneself.
- B.** **Defense mechanisms**
1. As anxiety increases, the individual copes by using **defense mechanisms**.
  2. A **defense mechanism** is a **coping mechanism** used in an effort to protect the individual from feelings of anxiety; as anxiety increases and becomes overwhelming, the individual copes by using **defense mechanisms** to protect the ego and decrease anxiety (Box 72-2).

 **Coping mechanisms and defense mechanisms are used by the client to decrease anxiety.**

- C.** Interventions
1. Assist the client to identify the source of anxiety and to explore methods to reduce anxiety.
  2. Assess the client's use of **defense mechanisms**.
  3. Facilitate appropriate use of **defense mechanisms**.
  4. Determine whether the **defense mechanisms** used by the client are effective for him or her or create additional distress.
  5. Avoid criticizing the client's behavior and the use of **defense mechanisms**.

#### VI. DIAGNOSTIC AND STATISTICAL MANUAL OF MENTAL HEALTH DISORDERS

- A.** The *Diagnostic and Statistical Manual of Mental Health Disorders*, published by the American Psychiatric Association, provides guidelines for health care personnel for identifying and categorizing mental illness.
- B.** The manual is a system used in clinical, research, and educational settings, in which diagnostic criteria are included for each mental health disorder.
- C.** The manual addresses culturally diverse populations and illness that may be associated with a particular culture.
- D.** The guidelines in the manual assist the health care team to plan and evaluate the treatment plan. 

#### VII. TYPES OF MENTAL HEALTH ADMISSIONS AND DISCHARGES

- A.** Voluntary admission
1. The client (or the client's guardian) seeks admission for care.
  2. The voluntary client is free to sign out of the hospital with physician notification and prescription.
  3. Detaining a voluntary client against her or his will is termed *false imprisonment*.
  4. The client retains full civil rights (Box 72-3). 
- B.** Right to confidentiality
1. A client has a right to confidentiality of his or her medical information; the Health Insurance Portability and Accountability Act (HIPAA) of 1996 ensures client confidentiality with regard to the release and electronic transmission of data.
  2. Information sometimes must be released in life-threatening situations without the client's consent.
  3. In the event of a specific threat against an identified individual, the health care professional has a legal obligation to warn the intended victim of a client's threats of harm.

 **Except in an emergency situation, client information can be released only with the client's informed consent, which specifies the information that can be released and the time frame for which the release is valid.** 

- C.** Involuntary admission
1. Involuntary admission may be necessary when a person is mentally ill, is a danger to self or

**Box 72-2 Types of Defense Mechanisms**

|                     |   |                    |   |
|---------------------|---|--------------------|---|
| Compensation        | Putting forth extra effort to achieve in areas where one has a real or imagined deficiency  | Projection         | Transferring one's internal feelings, thoughts, and unacceptable ideas and traits to someone else   |
| Conversion          | Expression of emotional conflicts through physical symptoms   | Rationalization    | Attempt to make unacceptable feelings and behaviors acceptable by justifying the behavior   |
| Denial              | Disowning consciously intolerable thoughts and impulses   | Reaction formation | Developing conscious attitudes and behaviors and acting out behaviors opposite to what one really feels   |
| Displacement        | Feelings toward one person are directed to another who is less threatening, satisfying an impulse with a substitute object  | Regression         | Returning to an earlier developmental stage to express an impulse to deal with reality  |
| Dissociation        | Blocking of an anxiety-provoking event or period of time from the conscious mind  | Repression         | Unconscious process in which the client blocks undesirable and unacceptable thoughts from conscious expression  |
| Fantasy             | Gratification by imaginary achievements and wishful thinking  | Sublimation        | Replacement of an unacceptable need, attitude, or emotion with one more socially acceptable   |
| Fixation            | Never advancing to the next level of emotional development and organization; persistence in later life of interests and behavior patterns appropriate to an earlier age | Substitution       | Replacement of a valued unacceptable object with an object more acceptable to the ego   |
| Identification      | Unconscious attempt to change oneself to resemble an admired person   | Suppression        | Conscious, deliberate forgetting of unacceptable or painful thoughts, ideas, and feelings   |
| Insulation          | Withdrawing into passivity and becoming inaccessible so as to avoid further threatening situations  | Symbolization      | Conscious use of an idea or object to represent another actual event or object; often, the meaning is unclear because the symbol may be representative of something unconscious |
| Intellectualization | Excessive reasoning to avoid feelings; the thinking is disconnected from feelings, and situations are dealt with at a cognitive level                                   | Undoing            | Engaging in behavior considered to be the opposite of a previous unacceptable behavior, thought, or feeling   |
| Introjection        | Type of identification in which the individual incorporates the traits or values of another into himself or herself   |                    |   |
| Isolation           | Response in which a person blocks feelings associated with an unpleasant experience   |                    |   |

**Box 72-3 Client Rights**

- Right to accessible health care
- Right to coordination and continuity of health care
- Right to courteous and individualized health care
- Right to information about the qualifications, names, and titles of personnel delivering care
- Right to refuse observation by individuals not directly involved in care
- Right to privacy and confidentiality
- Right to informed consent
- Right to treatment and to refuse treatment
- Right to treatment in the least restrictive setting
- Right not to be subjected to unnecessary restraints
- Right to habeas corpus; may request a hearing at any time to be released from the hospital
- Right to information about diagnosis, prognosis, and treatment
- Right to information on the charges of service
- Right to communicate with people outside the hospital through written correspondence, telephone, and personal visits
- Right to keep clothing and personal effects
- Right to be employed
- Right to religious freedom
- Right to execute wills
- Right to retain licenses, privileges, or permits established by the law, such as a driver's or professional license

others, or is in need of psychiatric treatment or physical care.

2. Involuntary admission occurs when a person is admitted or detained involuntarily for mental health treatment because of actual or imminent danger to self or others.
3. A client who is admitted involuntarily retains his or her right for informed consent.
4. The client retains the right to refuse treatments, including medications, unless a separate and specific treatment order is obtained from the court.
5. The client loses the right to refuse treatment when he or she poses an immediate danger to self or others, requiring immediate action by the health care team.
6. An order from a judge is required for involuntary admissions except in the case of emergency, which allows time to obtain the necessary order from a judge; in the case of all involuntary admissions, legal counsel must be provided for the client.
7. A court hearing is held by a judge within a specified time period for a client admitted involuntarily; the specific time period varies by state.
8. In most states, a client can institute a court hearing to seek an expedient judicial discharge (a writ of habeas corpus).
9. At the court hearing, a determination is made as to whether the client may be released from the hospital or detained for further treatment and evaluation or committed to a mental health facility for an undetermined period.
10. A client has the right to treatment in the least restrictive treatment environment; if treatment objectives can be achieved by court-ordered treatment to an outpatient facility as opposed to an inpatient facility, the client has the right to be treated in the outpatient setting.
11. A client is considered legally competent unless he or she has been declared incompetent through a legal hearing separate from the involuntary commitment hearing.
12. In the course of providing nursing care and carrying out medical prescriptions, if the nurse believes that a client lacks competency to make informed decisions, action should be initiated to determine whether a legal guardian needs to be appointed by the court.

**D. Release from the hospital**

1. Description
  - a. A client may be released voluntarily, against medical advice, or with conditions (conditional release).
  - b. A client who has sought voluntary admission has the right to demand and receive release.
2. Voluntary release
  - a. In the absence of an act of self-harm or danger to others, a voluntary client should never be detained.

- b. If a voluntary client wishes to be discharged from treatment, but is considered potentially dangerous to self or others, the physician can order the client to be detained while legal proceedings for involuntary status are sought.
  - c. Some states provide for conditional release of involuntarily hospitalized clients; this enables the treating physician to prescribe continued treatment on an outpatient basis as opposed to discharging the client to follow-up on his or her own initiative.
  - d. Conditional release usually involves outpatient treatment for a specified period to determine the client's compliance with medication protocol, ability to meet basic needs, and ability to reintegrate into the community.
  - e. An involuntary client who is released conditionally may be reinstitutionalized while the commitment is still in effect without commencement of formal admission procedures.
3. Discharge planning and follow-up care
    - a. Discharge (unconditional release) is the termination of the client-institution relationship.
    - b. This release may be ordered by the psychiatrist, court, or administration for involuntarily admitted clients and may be requested by voluntary clients at any time.
    - c. In most states, the client can institute a court hearing to seek an expedient judicial discharge (writ of habeas corpus).
    - d. Discharge planning and follow-up care are important for the continued well-being of the client with a mental health disorder.
    - e. Aftercare case managers are used to facilitate the client's adaptation back into the community and to provide early referral if the treatment plan is unsuccessful.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 879.** A client with a diagnosis of major depression who has attempted suicide says to a nurse, "I should have died. I've always been a failure. Nothing ever goes right for me." The therapeutic response to the client is:
1. "I don't see you as a failure."
  2. "You have everything to live for."
  3. "Feeling like this is all part of being ill."
  4. "You've been feeling like a failure for a while?"
- 880.** A community health nurse visits a client at home. The client states, "I haven't slept at all the last couple of nights." Which response by the nurse illustrates a therapeutic communication technique for this client?

1. "Go on."
  2. "Sleeping?"
  3. "You're having difficulty sleeping?"
  4. "Sometimes, I have trouble sleeping too."
- 881.** A client admitted to the mental health unit is experiencing disturbed thought processes and believes that the food is being poisoned. Which communication technique would a nurse plan to use to encourage the client to eat?
1. Using open-ended questions and silence
  2. Focusing on self-disclosure regarding food preferences
  3. List possible reasons in the care plan that the client may not want to eat
  4. Offering opinions about the necessity of adequate nutrition
- 882.** A client is admitted to a mental health unit for treatment of psychotic behavior. The client is at the locked exit door and is shouting, "Let me out. There's nothing wrong with me. I don't belong here." A nurse analyzes this behavior as:
1. Denial
  2. Projection
  3. Regression
  4. Rationalization
- 883.** A client says to a nurse, "I'm going to die, and I wish my family would stop hoping for a cure! I get so angry when they carry on like this. After all, I'm the one who's dying." The therapeutic response by the nurse is:
1. "Have you shared your feelings with your family?"
  2. "I think we should talk more about your anger with your family."
  3. "You're feeling angry that your family continues to hope for you to be cured?"
  4. "Well, it sounds like you're being pretty pessimistic. After all, years ago, people died of pneumonia."
- 884.** A nurse employed in a mental health unit is assigned to care for a client admitted to the unit 2 days ago. On review of the client's record, the nurse notes that the admission was a voluntary admission. Based on this type of admission, the nurse anticipates which of the following?
1. The client will resist treatment measures.
  2. The client will be angry and will refuse care.
  3. The client's family will resist treatment measures.
  4. The client will participate in the planning of the care and treatment plan.
- 885.** A nurse enters a client's room, and the client is demanding release from the hospital. The nurse reviews the client's record and notes that the client was admitted 2 days ago for treatment of an anxiety disorder and that the admission was a voluntary admission. Which of the following actions would the nurse take?
1. Contact the physician.
  2. Call the client's family.
  3. Persuade the client to stay a few more days.
  4. Tell the client that discharge is not possible at this time.
- 886.** A client has been admitted to the mental health unit. On admission assessment, a nurse notes that the client was admitted by involuntary status. Based on this type of admission, the nurse would most likely expect that the client:
1. Presents a harm to self
  2. Requested the admission
  3. Consented to the admission
  4. Provided written application to the facility for admission
- 887.** A nurse is preparing a client for the termination phase of the nurse-client relationship. The nurse prepares to implement which nursing task appropriate for this phase?
1. Planning short-term goals
  2. Making appropriate referrals
  3. Developing realistic solutions
  4. Identifying expected outcomes
- 888.** A nurse is providing care to a client admitted to the hospital with a diagnosis of acute anxiety disorder. The client says to the nurse, "I have a secret that I want to tell you. You won't tell anyone about it, will you?" The appropriate nursing response would be which of the following?
1. "No, I won't tell anyone."
  2. "I cannot promise to keep a secret."
  3. "If you tell me the secret, I will tell it to your doctor."
  4. "If you tell me the secret, I will need to document it in your record."
- 889.** A nurse employed in a mental health clinic is greeted by a neighbor in a local grocery store. The neighbor says to the nurse, "How is Carol doing? She is my best friend and is seen at your clinic every week." The appropriate nursing response is which of the following?
1. "I cannot discuss any client situation with you."
  2. "If you want to know about Carol, you need to ask her yourself."
  3. "I'm not supposed to discuss this, but because you are my neighbor, I can tell you that she is doing great!"

4. "I'm not supposed to discuss this, but because you are my neighbor, I can tell you that she really has some problems!"
- 890.** A client was admitted involuntarily to the mental health unit because of episodes of extremely violent behavior. The client is demanding to be discharged from the hospital, and a nurse does not allow the client to leave. Which of the following represents the legal ramifications associated with the nurse's behavior?
1. The nurse will be charged with assault.
  2. The nurse will be charged with slander.
  3. The nurse will be charged with imprisonment.
  4. No charge will be made against the nurse because the nurse's actions are reasonable.
- 891.** A nurse is working with a client who has sought counseling after trying to rescue a neighbor involved in a house fire. Despite the client's efforts, the neighbor died. Which action does the nurse engage in with the client during the working phase of the nurse-client relationship?
1. Exploring the client's ability to function
  2. Exploring the client's potential for self-harm
  3. Inquiring about the client's perception or appraisal of the neighbor's death
  4. Inquiring about and examining the client's feelings that may block adaptive coping
- 892.** A client who has just been sexually assaulted is calm and quiet. A nurse analyzes this behavior as indicating which defense mechanism?
1. Denial
  2. Projection
  3. Rationalization
  4. Intellectualization
- 893.** Unresolved feelings related to loss most likely may be recognized during which phase of the therapeutic nurse-client relationship?
1. Working
  2. Trusting
  3. Orientation
  4. Termination

### Alternate Item Format: Multiple Response

- 894.** A nurse in the mental health unit reviews therapeutic and nontherapeutic communication techniques with a nursing student. Which of the following are therapeutic communication techniques? **Select all that apply.**
- 1. Restating
  - 2. Listening
  - 3. Asking the client, "Why?"
  - 4. Maintaining neutral responses
  - 5. Giving advice or approval or disapproval
  - 6. Providing acknowledgment and feedback

## ANSWERS

### 879. 4

**Rationale:** Responding to the feelings expressed by a client is an effective therapeutic communication technique. The correct option is an example of the use of restating. Options 1, 2, and 3 block communication because they minimize the client's experience and do not facilitate exploration of the client's expressed feelings.

**Test-Taking Strategy:** Use the process of elimination and knowledge of therapeutic communication techniques to direct you to the option that directly addresses the client's feelings and concerns. Also, option 4 is the only option stated in the form of a question and is open-ended; it will encourage the verbalization of feelings. Review therapeutic communication techniques if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 27–31, 316). St. Louis: Mosby.

### 880. 3

**Rationale:** Option 3 uses the therapeutic communication technique of restatement. Although restatement is a technique that has a prompting component to it, it repeats the client's major theme, which assists the nurse to obtain a more

specific perception of the problem from the client. Options 1, 2, and 4 are not therapeutic responses.

**Test-Taking Strategy:** Use the process of elimination. Option 1 is a general lead and allows the client to direct the discussion. Option 2 uses reflection, which simply repeats a client's words to prompt further discussion. Option 4 focuses on the nurse's problem. Option 3 will provide the perception of the problem from the client's perspective. Review therapeutic communication techniques if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Mental Health

**References:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., p. 417). St. Louis: Mosby.

Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 27–31). St. Louis: Mosby.

### 881. 1

**Rationale:** Open-ended questions and silence are strategies used to encourage clients to discuss their problems. Options 3 and 4 are not helpful to the client because they do not encourage the client to express feelings. The nurse should not offer opinions and should encourage the client to identify the reasons for the behavior. Option 2 is not a client-centered intervention.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 3 and 4 first because they do not support client expression of feelings. Eliminate option 2 next because it is not a client-centered response. Focusing on the client's feelings will direct you to option 1. Review therapeutic communication techniques if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 27–31). St. Louis: Mosby.

### 882. 1

**Rationale:** Denial is refusal to admit to a painful reality, which is treated as if it does not exist. In projection, a person unconsciously rejects emotionally unacceptable features and attributes them to other persons, objects, or situations. In regression, the client returns to an earlier, more comforting, although less mature, way of behaving. Rationalization is justifying illogical or unreasonable ideas, actions, or feelings by developing acceptable explanations that satisfy the teller and the listener.

**Test-Taking Strategy:** Use the process of elimination. The strategic words in the question that should direct you to the correct option are “*There’s nothing wrong with me.*” Select the option that recognizes the client’s attempt to avoid looking at the reality of the situation. If you had difficulty with this question, review defense mechanisms.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Mental Health

**Reference:** Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (pp. 136, 311). St. Louis: Saunders.

### 883. 3

**Rationale:** Restating is a therapeutic communication technique in which the nurse repeats what the client says to show understanding and to review what was said. Option 3 uses the therapeutic technique of restating. In option 1, the nurse is attempting to assess the client’s ability to discuss feelings openly with family members. In option 2, the nurse attempts to use focusing, but the attempt to discuss central issues is premature. In option 4, the nurse makes a judgment and is nontherapeutic in the one-to-one relationship.

**Test-Taking Strategy:** Use therapeutic communication techniques to answer the question. Option 3 is the only option that identifies the use of a therapeutic technique and focuses on the client’s feelings. Review these techniques if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 27, 32). St. Louis: Mosby.

### 884. 4

**Rationale:** Generally, the client seeks voluntary admission. A voluntary admission permits a client to make a written

application for admission. If the client seeks voluntary admission, the most likely expectation is that the client will participate in the treatment program. Options 1, 2, and 3 are not characteristics of this type of admission.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *voluntary admission*. This should direct you to option 4. Additionally, options 1, 2, and 3 are comparable or alike. Review the various types of hospital admission processes if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Mental Health

**Reference:** Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 520). St. Louis: Saunders.

### 885. 1

**Rationale:** Generally, the client seeks voluntary admission. Voluntary clients have the right to demand and obtain release. If the client is a minor, the release may be contingent on the consent of a parent or guardian. The nurse needs to be familiar with the state and facility policies and procedures. Many states require that the client submit a written release notice to the facility staff members, who re-evaluate the client’s condition for possible conversion to involuntary status if necessary, according to criteria established by laws. The best nursing action is to contact the physician.

**Test-Taking Strategy:** Use the process of elimination. Noting the type of hospital admission will assist in eliminating option 4. To “persuade” a client to stay in the hospital is inappropriate. Option 2 should be eliminated simply based on the subjects of client rights and confidentiality. Review the various types of hospital admission and discharge processes if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Ethical/Legal

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 124, 126). St. Louis: Mosby.

### 886. 1

**Rationale:** Involuntary admission is made without the client’s consent. Involuntary admission is necessary when a person is a danger to self or others or is in need of psychiatric treatment. Options 2, 3, and 4 describe the process of voluntary admission.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *involuntary status*. This should direct you easily to option 1. Also, note that options 2, 3, and 4 are comparable or alike. Review the process of involuntary admission if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Mental Health

**References:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 124). St. Louis: Mosby.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (pp. 520–521). St. Louis: Saunders.

**887. 2**

**Rationale:** Tasks of the termination phase include evaluating client performance, evaluating achievement of expected outcomes, evaluating future needs, making appropriate referrals, and dealing with the common behaviors associated with termination. Options 1, 3, and 4 identify the tasks of the working phase of the relationship.

**Test-Taking Strategy:** Use the process of elimination. Noting the strategic words *termination phase* should direct you easily to option 2. If you are unfamiliar with the appropriate tasks of the phases of the nurse-client relationship, review this content.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 21–22). St. Louis: Mosby.

**888. 2**

**Rationale:** The nurse should never promise to keep a secret. Secrets are appropriate in a social relationship, but not in a therapeutic one. The nurse needs to be honest with the client and tell the client that a promise cannot be made to keep the secret. Options 1, 3, and 4 are inappropriate responses.

**Test-Taking Strategy:** Use the process of elimination. Option 1 can be eliminated easily because it is inappropriate. Options 3 and 4 are not only inappropriate, but are also threatening and may block further communication. Review therapeutic communication techniques and the nurse-client relationship if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Leadership and Management—Ethical/Legal

**References:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., pp. 26–27). St. Louis: Mosby.

Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 27–31, 275). St. Louis: Mosby.

**889. 1**

**Rationale:** A nurse is required to maintain confidentiality regarding the client and the client's care. Confidentiality is basic to the therapeutic relationship and is a client's right. The most appropriate response to the neighbor is option 1. Option 2 is a blunt statement and does not acknowledge the issue that the nurse cannot reveal if the named person is or was a client. Options 3 and 4 identify statements that do not maintain client confidentiality. Option 1 is the most direct and correct.

**Test-Taking Strategy:** Focus on the subject of the question, maintaining confidentiality. This should assist you easily in eliminating options 3 and 4. From the remaining options, select option 1 over option 2 because it is the most direct and correct. Option 2 is a blunt and rude statement. Review confidentiality issues if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Ethical/Legal

**Reference:** Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (pp. 524–525). St. Louis: Saunders.

**890. 4**

**Rationale:** False imprisonment is an act with the intent to confine a person to a specific area. A nurse can be charged with false imprisonment if the nurse prohibits a client from leaving the hospital if the client has been admitted voluntarily and if no agency or legal policies exist for detaining the client. If the client has been admitted involuntarily or had agreed to an evaluation before discharge, the nurse's actions are reasonable.

**Test-Taking Strategy:** Noting the strategic words *admitted involuntarily* will assist you in eliminating option 3 and direct you to option 4. Options 1 and 2 are unrelated to the subject of the question and can be eliminated easily. Review the subjects related to false imprisonment and hospital admission if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership and Management—Ethical/Legal

**Reference:** Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 528). St. Louis: Saunders.

**891. 4**

**Rationale:** The client must first deal with feelings and negative responses before the client can work through the meaning of the crisis. Option 4 pertains directly to the client's feelings. Options 1 and 2 do not directly address the client's feelings. Option 3 does not directly focus on the clients's feelings..

**Test-Taking Strategy:** Focus on the subject of the question, the working phase of the nurse-client relationship. Think about the interventions that occur in this phase. Using the process of elimination, focus on this subject and on the option that focuses on the feelings of the client. This will direct you to option 4. Review the phases of the nurse-client relationship if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Caring

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 190–191). St. Louis: Mosby.

**892. 1**

**Rationale:** Denial is refusal to admit to a painful reality and may be a response by a victim of sexual abuse. Projection is transferring one's internal feelings, thoughts, and unacceptable ideas and traits to someone else. Rationalization is justifying the unacceptable attributes about oneself. Intellectualization is the excessive use of abstract thinking or generalizations to decrease painful thinking.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *calm* and *quiet*. These behaviors indicate denial in a sexually abused victim. If you had difficulty with this question, review content related to the sexually abused victim and defense mechanisms.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Mental Health

**References:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 722). St. Louis: Mosby.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (pp. 136, 311). St. Louis: Saunders.

### 893. 4

**Rationale:** In the termination phase, the relationship comes to a close. Ending treatment sometimes may be traumatic for clients who have come to value the relationship and the help. Because loss is an issue, any unresolved feelings related to loss may resurface during this phase. Options 1, 2, and 3 are incorrect.

**Test-Taking Strategy:** Note the strategic words *unresolved*, *loss*, and *recognized* in the question. Considering the phases of the therapeutic nurse-client relationship will direct you to option 4. Review these phases and the nursing implications if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Caring

**Content Area:** Mental Health

**References:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 560). St. Louis: Mosby.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (pp. 113–114). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 894. 1, 2, 4, 6

**Rationale:** Therapeutic communication techniques include listening, maintaining silence, maintaining neutral responses, using broad openings and open-ended questions, focusing and refocusing, restating, clarifying and validating, sharing perceptions, reflecting, providing acknowledgment and feedback, giving information, presenting reality, encouraging formulation of a plan of action, providing nonverbal encouragement, and summarizing.

**Test-Taking Strategy:** Focus on the subject, therapeutic communication techniques. This will assist you in selecting the correct answers. Review therapeutic and nontherapeutic techniques if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 27–31). St. Louis: Mosby.

# Models of Care

## I. MILIEU THERAPY

### A. Description

1. The **milieu** refers to the physical and social environment in which an individual is receiving treatment.
2. **Milieu** therapy uses a safe environment to meet the individual client's treatment needs.
3. Safety is the most important priority in managing the **milieu**.
4. **Milieu** therapy is staffed by persons educated to provide support, understanding, and individual attention; all encounters with the client have the goal of being "therapeutic."
5. All members of the treatment team contribute to the planning and functioning of the **milieu**; the team generally includes a registered nurse, social worker, exercise therapist, recreational therapist, psychologist, psychiatrist, occupational therapist, and clinical nurse specialist or nurse practitioner.
6. All members of the treatment team are viewed as significant and valuable to the client's successful treatment outcomes.

### B. Focus of **milieu** therapy

1. The physical and social environment is used to effect a positive change directed toward accomplishing the client's treatment goals.
2. Community meetings, activity groups, social skills groups, and physical exercise programs are used to accomplish treatment goals.
3. One-to-one relationships with staff are used to examine client behaviors, feelings, and interactions within the context of the therapeutic group activities.

 The focus of milieu therapy is to empower the client through involvement in setting his or her own goals and to develop purposeful relationships with the staff to assist in meeting these goals.

## II. INTERPERSONAL PSYCHOTHERAPY

### A. Description

1. A treatment modality that uses a therapeutic relationship to modify the client's feelings, attitudes, and behaviors

2. Therapeutic communication forms the foundation of the therapist-client relationship.

### B. Focus of interpersonal psychotherapy

1. To establish a contract, clarify roles, and work within an agreed-on time frame to help meet the client's goals
2. The therapist-client relationship is used as a way for the client to examine other relationships in his or her life.

### C. Levels of psychotherapy (Box 73-1)

1. Supportive therapy
  - a. Allows the client to express feelings, explore alternatives, and make decisions in a safe, caring environment
  - b. May be needed briefly or over a period of years
  - c. No plan exists to introduce new methods of coping; instead, the therapist reinforces the client's existing **coping mechanisms**.
2. Re-educative therapy
  - a. Involves learning new ways of perceiving and behaving
  - b. The client explores alternatives in a planned, systematic way; this requires a longer period of therapy than supportive therapy.
  - c. The client enters into a contract that specifies desired changes of behavior.
  - d. Techniques may include short-term psychotherapy, reality therapy, cognitive restructuring, behavior modification, and development of coping skills
3. Reconstructive therapy
  - a. Psychotherapy or psychoanalysis is used to make major changes in the client's life.
  - b. Several years of therapy may be required, and focus is on all aspects of the client's life.
  - c. Emotional and cognitive restructuring of self takes place.
  - d. Positive outcomes include a greater understanding of self and others, more emotional freedom, and the development of potential abilities.

## III. BEHAVIOR THERAPY

- A. Treatment approach that uses the principles of Skinnerian (operant conditioning) or Pavlovian

**Box 73-1 Levels of Psychotherapy**

- Supportive therapy
- Re-educative therapy
- Reconstructive therapy

▲ **FIGURE 73-1** Respondent versus operant conditioning. (From Varcarolis, E., Carson, V., & Shoemaker, N. [2010]. *Foundations of psychiatric mental health nursing* [6th ed.]. St. Louis: Saunders.)

(classical conditioning) behavior theory to bring about behavioral change

- B.** The belief is that most behaviors are learned.
- C.** Operant conditioning refers to the manipulation of selected reinforcers to elicit and strengthen desired behavioral responses; the reinforcer refers to the consequence of the behavior, which is defined as anything that increases the occurrence of a behavior (Fig. 73-1).
- D.** In classical conditioning (respondent conditioning), the individual responds to a stimulus, but is basically a passive agent (see Fig. 73-1).
- E.** Desensitization is a form of behavior therapy whereby exposure to increasing increments of a feared stimulus is paired with increasing levels of relaxation, which helps reduce the intensity of fear to a more tolerable level.
- F.** Aversion therapy is a form of behavior therapy whereby negative reinforcement is used to change behavior; a stimulus *attractive* to the client is paired with an *unpleasant* event in hopes of endowing the stimulus with negative properties and dissuading the behavior.
- G.** Modeling is behavioral therapy whereby the therapist acts as a role model for specific identified behaviors so that the client learns through imitation.

**IV. COGNITIVE THERAPY**

- A.** An active, directive, time-limited, structured approach used to treat a variety of disorders, including anxiety, depression, and phobias
- B.** It is based on the principle that how individuals feel and behave is determined by how they think about the world and their place in it; their cognitions are based on the attitudes or assumptions developed from previous experiences.
- C.** Therapeutic techniques are designed to identify, reality-test, and correct distorted conceptualizations

**Box 73-2 Stages of Group Development**

- Initial stage
- Working stage
- Termination stage

and the dysfunctional beliefs underlying these cognitions.

- D.** The therapist helps the individual change the way he or she thinks, relieving symptoms.

**V. GROUP DEVELOPMENT AND GROUP THERAPY**

- A.** Description: Group therapy involves a therapist and, ideally, five to eight members working on his or her individual goals within the context of a group, which presumably increases the opportunity for feedback and support.

- B.** Stages of group development (Box 73-2)

1. Initial stage
    - a. During this stage, group development involves superficial rather than open and trusting communication.
    - b. Members become acquainted with each other and search for similarities between themselves and other group members.
    - c. Members may be unclear about the purpose or goals of the group.
    - d. Group norms, roles, and responsibilities are established.
  2. Working stage
    - a. During this stage, the real work of the group is accomplished.
    - b. Members are familiar with each other, the group leader, and the group roles and feel free to address and attempt to solve their problems.
    - c. Conflict and cooperation surface during the group's work as the members learn to work with each other.
  3. Termination stage
    - a. Members' feelings are explored regarding their accomplishments and the impending termination of the group.
    - b. The termination stage provides an opportunity for members to learn to deal more realistically and comfortably with this normal part of human experience.
- C.** Group therapy models (*Note:* These models apply to individual or group psychotherapy.)
    1. Psychoanalytical group psychotherapy
      - a. The therapist holds a main position.
      - b. Each client in the group has a relationship with the therapist.
      - c. Communication is focused on three levels—unconscious, semiconscious, and conscious information.

2. Transactional analysis
  - a. The three ego states of the individual are examined.
  - b. The goal is for individuals in the group to communicate from the proper ego states for the situation and responses of others, lessening conflict and promoting mature relationships.
3. Rational emotive therapy is a type of cognitive therapy in which the therapist focuses on how irrational beliefs and thoughts contribute to psychological distress.
4. Rogerian therapy
  - a. The therapist's goal is to help the members express their feelings toward one another during group sessions.
  - b. The therapist's role is one of encouraging the expression of feelings, clarifying these feelings with clients, and accepting clients and their feelings nonjudgmentally.
5. Gestalt therapy
  - a. Emphasis is on the "here and now."
  - b. Emphasizes self-expression, self-exploration, and self-awareness in the present
  - c. The client and therapist focus on everyday problems and try to solve them.
  - d. The individual becomes aware of the total self and the surrounding environment.
  - e. Awareness of the problem renders the client capable of change.
  - f. The therapist's role is to help the members express their feelings and grow from their experiences.
6. Interpersonal group therapy: Promotes the individual's comfort with others in the group, which then transfers to other relationships
7. Self-help or support groups (Box 73-3)

 Support groups are based on the premise that individuals who have experienced a problem are able to help others who have a similar problem.

## VI. FAMILY THERAPY

1. Family therapy is a specific intervention mode based on the premise that the member with the presenting symptoms signals the presence of problems in the entire family; this premise also assumes that a change in one member will bring about changes in other members.
2. The therapist works to assist family members to identify and express their thoughts and feelings; define family roles and rules; try new, more productive styles of relating; and restore strength to the family.

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 895.** A nurse employed in a mental health unit of a hospital is the leader of a group psychotherapy session. The nurse's role in the termination stage of group development is to:
1. Encourage problem solving.
  2. Encourage accomplishment of the group's work.
  3. Acknowledge the contributions of each group member.
  4. Encourage members to become acquainted with one another.
- 896.** All treatment team members are seen as equally important in helping clients meet their treatment goals. This type of therapy approach is:
1. Milieu therapy
  2. Interpersonal therapy
  3. Behavior modification
  4. Rational emotive therapy
- 897.** An 18-year-old woman is admitted to an inpatient mental health unit with the diagnosis of anorexia nervosa. A cognitive behavioral approach is used as part of her treatment plan. A nurse understands that the purpose of this approach is to:
1. Provide a supportive environment.
  2. Examine intrapsychic conflicts and past issues.
  3. Emphasize social interaction with clients who withdraw.
  4. Help the client identify and examine dysfunctional thoughts and beliefs.
- 898.** A client with major depression is considering cognitive therapy. The client asks a nurse, "How does this treatment work?" The nurse tells the client that:

### Box 73-3 Self-Help and Support Groups

- Adult Children of Alcoholics
- Al-Anon
- Alcoholics Anonymous
- Co-Dependents Anonymous
- Gamblers Anonymous
- Narcotics Anonymous
- Overeaters Anonymous
- Parents Without Partners
- Bereavement groups
- Cancer support groups
- Groups to help deal with unexpected body image changes, such as mastectomy or colostomy
- Mental illness support groups
- Recovery groups, such as for individuals who have experienced trauma
- Smoking cessation groups

1. "This type of treatment will help you relax and develop new coping skills."
  2. "This type of treatment helps you confront your fears by gradually exposing you to them."
  3. "This type of treatment helps you examine how your past life has contributed to your problems."
  4. "This type of treatment helps you examine how your thoughts and feelings contribute to your difficulties."
- 899.** A client is preparing to attend a Gambler's Anonymous meeting for the first time. The prototype used by this group is the 12-step program developed by Alcoholics Anonymous. A nurse tells the client that the first step in the 12-step program is which of the following?
1. Admitting to having a problem
  2. Substituting other activities for gambling
  3. Stating that the gambling will be stopped
  4. Discontinuing relationships with friends who are gamblers
- 900.** A client asks a nurse about milieu therapy. The nurse responds, knowing that the primary focus of milieu therapy can best be described as which of the following?
1. A form of behavior modification therapy
  2. A cognitive approach to changing behavior
  3. A living, learning, or working environment
  4. A behavioral approach to changing behavior
- 901.** A nurse is caring for a client with a phobia who is being treated for the condition. The client is introduced to short periods of exposure to the phobic object while in a relaxed state. The nurse understands that this form of behavior modification can best be described as:
1. Milieu therapy
  2. Aversion therapy
  3. Self-control therapy
  4. Systematic desensitization
- 902.** A client with an eating disorder is planning to attend group meetings with Overeaters Anonymous, and a nurse describes this group to the client. The nurse determines that the client needs additional information if the client states which of the following about this self-help group?
1. "The leader is a nurse or psychiatrist."
  2. "The members provide support to each other."
  3. "People who have a similar problem are able to help others."
  4. "It is designed to serve people who have a common problem."
- 903.** A nurse is conducting a group therapy session, and a client with a manic disorder is monopolizing the group. The appropriate nursing action is which of the following?
1. Ask the client to leave.
  2. Refer the client to another group.
  3. Tell the client to stop monopolizing.
  4. Thank the client for the contribution and tell him or her to allow others a chance to contribute.

### Alternate Item Format: Multiple Response

- 904.** Select the characteristics of the termination stage of group development. **Select all that apply.**
- 1. The group evaluates the experience.
  - 2. The real work of the group is accomplished.
  - 3. Group interaction involves superficial conversation.
  - 4. Group members become acquainted with each other.
  - 5. Some structuring of group norms, roles, and responsibilities takes place.
  - 6. The group explores members' feelings about the group and the impending separation.

## ANSWERS

### 895. 3

**Rationale:** In the termination stage, the group leader's task is to acknowledge the contributions of each member and the experience of the group as a whole. In this stage, the group members prepare for separation and assist each other to prepare for the future. Options 1 and 2 identify the tasks of the working stage. Option 4 identifies the orientation stage.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 2 first because they are comparable or alike. From the remaining options, note the relationship

between the words *termination stage* in the question and option 3. Review the stages of group development if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**References:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 601). St. Louis: Mosby.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (pp. 113–114). St. Louis: Saunders.

**896. 1**

**Rationale:** All treatment team members are viewed as significant and valuable to the client's successful treatment outcomes in milieu therapy. Behavior modification is based on rewards and punishment. Rational emotive therapy deals with the correction of distorted thinking. Interpersonal therapy is based on a one-to-one or group therapy approach in which the therapist-client relationship is often used as a way for the client to examine other relationships in his or her life.

**Test-Taking Strategy:** Focus on the subject. Note the relationship between the words *helping clients to meet their treatment goals* and option 1. Review the types of therapy noted in the options if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**References:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., p. 521). St. Louis: Mosby.

Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 157). St. Louis: Mosby.

**897. 4**

**Rationale:** Cognitive behavioral therapy is used to help the client identify and examine dysfunctional thoughts and to identify and examine values and beliefs that maintain these thoughts. Options 1, 2, and 3 are incorrect.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *cognitive behavioral*. Focusing on these words will direct you to option 4. If you are unfamiliar with this type of therapy and its purpose, review this content.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Mental Health

**References:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., pp. 517–518). St. Louis: Mosby.

Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 474). St. Louis: Mosby.

**898. 4**

**Rationale:** Cognitive therapy frequently is used for clients with depression. This type of therapy is based on exploring the client's subjective experience. Cognitive therapy includes examining the client's thoughts and feelings about situations and how these thoughts and feelings contribute to and perpetuate the client's difficulties and mood.

**Test-Taking Strategy:** Focusing on the word *cognitive* will assist you in selecting the correct option. Look for a similar word used in the question and repeated in one of the options. Note the relationship of the word *cognitive* in the question and *thoughts* in option 4. Review this form of therapy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 305, 562–563). St. Louis: Mosby.

**899. 1**

**Rationale:** The first step in the 12-step program is to admit that a problem exists. Options 3 and 4 are unrealistic as a first step in the process to recovery. Although option 2 may be a strategy, it is not the first step.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *first step* in the question. This will assist in directing you to option 1. If you are unfamiliar with the 12-step program, review this content.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**References:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 416, 450). St. Louis: Mosby.

Varcariolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (pp. 353–354). St. Louis: Saunders.

**900. 3**

**Rationale:** Milieu therapy, or "therapeutic community," has as its focus a living, learning, or working environment. Such therapy may be based on numerous therapeutic modalities ranging from structured behavioral therapy to spontaneous, humanistically oriented approaches. Although milieu may include behavioral approaches, option 3 describes its primary focus.

**Test-Taking Strategy:** Use the process of elimination. Note that options 1, 2, and 4 are comparable or alike and that option 3 identifies a comprehensive description. Review milieu therapy if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 157). St. Louis: Mosby.

**901. 4**

**Rationale:** Systematic desensitization is a form of therapy used when the client is introduced to short periods of exposure to the phobic object while in a relaxed state. Exposure is gradually increased until the anxiety about or fear of the object or situation has ceased. Options 1, 2, and 3 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Focus on the strategic words *introduced to short periods of exposure*. This will direct you to the correct option. If you had difficulty with this question, review systematic desensitization.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**References:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., p. 180). St. Louis: Mosby.

Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 567). St. Louis: Mosby.

**902. 1**

**Rationale:** The sponsor of a self-help group is an experienced member of the group. A nurse or psychiatrist may be asked by

the group to serve as a resource, but would not be the leader of the group. Options 2, 3, and 4 are characteristics of a self-help group.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject, self-help group. Note the strategic words *needs additional information* in the question. Note that options 2, 3, and 4 are comparable or alike. This will direct you easily to option 1, the correct option. Review the characteristics of a self-help group if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 602). St. Louis: Mosby.

### 903. 4

**Rationale:** If a client is monopolizing the group, the nurse must be direct and decisive. The best action is to thank the client and suggest that the client stop talking and try listening to others. Although option 3 may be a direct response, option 4 is a more specific and direct statement. Options 1 and 2 are inappropriate.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 2 first because they are comparable or alike. Use therapeutic communication techniques to assist in directing you to option 4. If you had difficulty with this question, review therapeutic communication techniques for the client with a manic disorder.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 27–31, 287, 521, 602). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 904. 1, 6

**Rationale:** The stages of group development include the initial stage, the working stage, and the termination stage. During the initial stage, the group members become acquainted with each other, and some structuring of group norms, roles, and responsibilities takes place. During the initial stage, group interaction involves superficial conversation. During the working stage, the real work of the group is accomplished. During the termination stage, the group evaluates the experience and explores members' feelings about the group and the impending separation.

**Test-Taking Strategy:** Focus on the subject, the termination stage. Reading each item presented and recalling the stages of group development will assist you in answering this question. Review these stages if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Mental Health

**Reference:** Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (pp. 113–114). St. Louis: Saunders.

# Mental Health Disorders

## I. ANXIETY

### A. Description

1. Anxiety is a normal response to stress.
2. It is a subjective experience that includes feelings of apprehension, uneasiness, uncertainty, or dread.
3. Anxiety occurs as a result of a threat that may be misperceived or misinterpreted or of a threat to identity or self-esteem.
4. Anxiety may result when values are threatened or preceding new experiences.

### B. Types of anxiety

1. Normal: A healthy type of anxiety
2. Acute: Precipitated by imminent loss or change that threatens one's sense of security
3. Chronic: Anxiety that persists as a characteristic response to daily activities

### C. Levels of anxiety

1. Mild
  - a. Mild anxiety is associated with the tension of everyday life.
  - b. The individual is alert.
  - c. The perceptual field is increased.
  - d. Mild anxiety can be motivating, produce growth, enhance creativity, and increase learning.
2. Moderate
  - a. The focus is on immediate concerns.
  - b. Moderate anxiety narrows the perceptual field.
  - c. Selective inattentiveness occurs.
  - d. Learning and problem solving still occur.
3. Severe
  - a. Severe anxiety is a feeling that something bad is about to happen.
  - b. A significant narrowing in the perceptual field occurs.
  - c. Focus is on minute or scattered details.
  - d. All behavior is aimed at relieving the anxiety.
  - e. Learning and problem solving are impossible.
  - f. The individual needs direction to focus.
4. Panic
  - a. Panic is associated with dread and terror and a sense of impending doom.

b. The personality is disorganized.

c. The individual is unable to communicate or function effectively.

d. Increased motor activity occurs.

e. Loss of rational thoughts with distorted perception occurs.

f. Inability to concentrate occurs.

g. If prolonged, panic can lead to exhaustion and death.

D. Interventions: General nursing measures (see Priority Nursing Actions)

## PRIORITY NURSING ACTIONS!

### Actions to Take for a Client Experiencing Anxiety

1. Provide a calm environment, decrease environmental stimuli, and stay with the client.
2. Ask the client to identify what and how he or she feels.
3. Encourage the client to describe and discuss his or her feelings.
4. Help the client to identify the causes of the feelings if he or she is having difficulty doing so.
5. Listen to the client for expressions of helplessness and hopelessness.
6. Document the event, significant information, actions taken and follow-up actions, and the client's response.  
If a client experiences anxiety, immediate actions are to provide a calm environment, decrease environmental stimuli, and stay with the client. Excess stimulation would escalate the anxiety. Next, asking the client to identify what and how he or she feels and helping the client to identify the causes of the feelings help to increase the client's awareness of the connection between behaviors and feelings. This awareness helps to decrease the anxiety. While listening to the client, the nurse observes for expressions of helplessness and hopelessness that could indicate self-harm intentions. The nurse provides follow-up care as needed based on observations and assessments. Finally, the nurse documents the event, significant information, actions taken and follow-up actions, and the client's response.

**Reference:** Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 132). St. Louis: Saunders.

1. Recognize the anxiety.
2. Establish trust.
3. Protect the client.
4. Do not criticize **coping mechanisms**.
5. Do not force the client into situations that provoke anxiety.
6. Decrease stimulation in the environment.
7. Modify the environment by setting limits or limiting interaction with others.
8. Provide creative outlets.
9. Provide activities that limit the amount of time for destructive behavior.
10. Promote relaxation techniques, such as breathing exercises or guided imagery.
11. Monitor vital signs, and administer antianxiety medications as prescribed.

 **The immediate nursing action for a client with anxiety is to decrease stimuli in the environment and provide a calm and quiet environment.**

-  **E. Interventions: Mild to moderate levels**
1. Help the client identify the anxiety.
  2. Encourage the client to talk about feelings and concerns.
  3. Help the client identify thoughts and feelings that occurred before the onset of anxiety.
  4. Encourage problem solving.
  5. Encourage gross motor exercise.
-  **F. Interventions: Severe to panic levels**
1. Reduce the anxiety quickly.
  2. Use a calm manner.
  3. Always remain with the client.
  4. Minimize environmental stimuli.
  5. Provide clear, simple statements.
  6. Use a low-pitched voice.
  7. Attend to the physical needs of the client.
  8. Provide gross motor activity.
  9. Administer antianxiety medications as prescribed.

## II. GENERALIZED ANXIETY DISORDER

-  **A. Description**
1. Generalized anxiety disorder is an unrealistic anxiety about everyday worries that persists over time and is not associated with another psychiatric or medical disorder.
  2. Physical symptoms occur.
- B. Assessment**
1. Restlessness and inability to relax
  2. Episodes of trembling and shakiness
  3. Chronic muscular tension
  4. Dizziness
  5. Inability to concentrate
  6. Chronic fatigue and sleep problems
  7. Inability to recognize the connection between the anxiety and physical symptoms
  8. Client is focused on the physical discomfort.

- C. Panic disorder**
1. Description
    - a. Panic disorder produces a sudden onset of feelings of intense apprehension and dread.
    - b. The cause usually cannot be identified.
    - c. Severe, recurrent, intermittent anxiety attacks lasting 5 to 30 minutes occur.
  2. Assessment
    - a. Choking sensation
    - b. Labored breathing
    - c. Pounding heart
    - d. Chest pain
    - e. Dizziness
    - f. Nausea
    - g. Blurred vision
    - h. Numbness or tingling of the extremities
    - i. Sense of unreality and helplessness
    - j. Fear of being trapped
    - k. Fear of dying
  3. Interventions
    - a. Remain with the client.
    - b. Attend to physical symptoms.
    - c. Assist the client to identify the thoughts that aroused the anxiety and identify the basis for these thoughts.
    - d. Assist the client to change the unrealistic thoughts to more realistic thoughts.
    - e. Use cognitive restructuring to replace distorted thinking.
    - f. Administer antianxiety medications if prescribed.

## III. POSTTRAUMATIC STRESS DISORDER

- A. Description:** After experiencing a psychologically traumatic event, the individual is prone to re-experience the event and have recurrent and intrusive dreams or flashbacks. 
- B. Stressors**
1. Natural disaster
  2. Terrorist attack
  3. Combat experiences
  4. Accidents
  5. Rape
  6. Crime or violence
  7. Sexual, physical, and emotional **abuse**
  8. Re-experiencing the event as flashbacks
- C. Assessment**
1. Emotional numbness
  2. Detachment
  3. Depression
  4. Anxiety
  5. Sleep disturbances and nightmares
  6. Flashbacks of event
  7. Hypervigilance
  8. Guilt about surviving the event
  9. Poor concentration and avoidance of activities that trigger the memory of the event
- D. Interventions (Box 74-1)**

IV. PHOBIAS

A. Description

1. Irrational fear of an object or situation that persists, although the person may recognize it as unreasonable
2. Associated with panic level anxiety if the object, situation, or activity cannot be avoided
3. **Defense mechanisms** commonly used include repression and displacement.

B. Types (Box 74-2)

C. Interventions

1. Identify the basis of the anxiety.
2. Allow the client to verbalize feelings about the anxiety-producing object or situation; frequently talking about the feared object is the first step in the desensitization process.

3. Teach relaxation techniques, such as breathing exercises, muscle relaxation exercises, and visualization of pleasant situations.
4. Promote desensitization by gradually introducing the individual to the feared object or situation in small doses.

 Always stay with the client experiencing anxiety to promote safety and security. Never force the client to have contact with the phobic object or situation.

V. OBSESSIVE-COMPULSIVE DISORDER

A. Obsessions: Preoccupation with persistently intrusive thoughts and ideas

B. Compulsions

1. A compulsion is the performance of rituals or repetitive behaviors designed to prevent some event, divert unacceptable thoughts, and decrease anxiety.
2. Obsessions and compulsions often occur together and can disrupt normal daily activities.
3. Anxiety occurs when one resists obsessions or compulsions and from being powerless to resist the thoughts or rituals.
4. Obsessive thoughts can involve issues of violence, aggression, sexual behavior, orderliness, or religion and uncontrollably can interrupt conscious thoughts and the ability to function.

C. Compulsive behavior patterns (behaviors or rituals)

1. Compulsive behavior patterns decrease the anxiety.
2. The patterns are associated with the obsessive thoughts.
3. The patterns neutralize the thought.
4. During stressful times, the ritualistic behavior increases.
5. **Defense mechanisms** include repression, displacement, and undoing.

D. Interventions (Box 74-3)

**Box 74-1 Interventions for Posttraumatic Stress Disorder**

Be nonjudgmental and supportive.  
 Assure client that his or her feelings and behaviors are normal reactions.  
 Assist client to recognize the association between his or her feelings and behaviors and the trauma experience.  
 Encourage client to express his or her feelings; provide individual therapy that addresses loss of control or anger issues.  
 Assist client to develop adaptive coping mechanisms and to use relaxation techniques.  
 Encourage use of support groups  
 Facilitate a progressive review of the trauma experience.  
 Encourage client to establish and re-establish relationships.  
 Inform client that hypnotherapy or systematic desensitization may be used as a form of treatment.

**Box 74-2 Types of Phobias**

|                |  |
|----------------|--|
| Acrophobia     | Fear of heights  |
| Agoraphobia    | Fear of open spaces  |
| Astraphobia    | Fear of electrical storms  |
| Claustrophobia | Fear of closed spaces  |
| Hematophobia   | Fear of blood  |
| Hydrophobia    | Fear of water  |
| Monophobia     | Fear of being alone  |
| Mysophobia     | Fear of dirt or germs  |
| Nyctophobia    | Fear of darkness   |
| Pyrophobia     | Fear of fires  |
| Social phobia  | Fear of situations in which one might be embarrassed or criticized; fear of making a fool of oneself |
| Xenophobia     | Fear of strangers  |
| Zoophobia      | Fear of animals  |

**Box 74-3 Interventions for Obsessive-Compulsive Disorder**

Ensure that basic needs (food, rest, grooming) are met.  
 Identify situations that precipitate compulsive behavior; encourage client to verbalize concerns and feelings.  
 Be empathetic toward client and aware of his or her need to perform the compulsive behavior.  
 Do not interrupt compulsive behaviors unless they jeopardize the safety of client or others (provide for client safety related to the behavior).  
 Allow time for client to perform the compulsive behavior, but set limits on behaviors that may interfere with client's physical well-being to protect client from physical harm.  
 Implement a schedule for client that distracts from the behaviors (structure simple activities, games, or tasks for client).  
 Establish a written contract that assists client to decrease the frequency of compulsive behaviors gradually.  
 Recognize and reinforce positive nonritualistic behaviors.

## VI. SOMATOFORM DISORDERS

### A. Description (Box 74-4)

1. Somatoform disorders are characterized by persistent worry or complaints regarding physical illness without supportive physical findings.
2. The client focuses on the physical signs and symptoms and is unable to control the signs and symptoms.
3. The physical signs and symptoms increase with psychosocial stressors.
4. The anxiety is redirected into a somatic concern.
5. The client may unconsciously use somatization for secondary gains, such as increased attention and decreased responsibilities.

### B. Conversion disorder

1. Description
  - a. A physical symptom or a deficit suggesting loss or altered body function related to psychological conflict or a neurological disorder.
  - b. Conversion disorder is an expression of a psychological conflict or need.
  - c. The most common conversion symptoms are blindness, deafness, paralysis, and the inability to talk.
  - d. Conversion disorder has no organic cause.
  - e. Symptoms are beyond the conscious control of the client and are directly related to conflict.
  - f. The development of physical symptoms reduces anxiety.
2. Assessment
  - a. *“La belle indifférence”*: Unconcerned with symptoms
  - b. Physical limitation or disability
  - c. Feelings of guilt, anxiety, or frustration
  - d. Low self-esteem and feelings of inadequacy
  - e. Unexpressed anger or conflict
  - f. Secondary gain

### C. Hypochondriasis

1. Description
  - a. Preoccupation with fears of having a serious disease
  - b. No evidence of physical illness exists.
  - c. Hypochondriasis significantly impairs social and occupational functioning.
2. Assessment
  - a. Preoccupation with physical functioning
  - b. Frequent somatic complaints
  - c. Complaints of fatigue and insomnia
  - d. Anxiety
  - e. Difficulty expressing feelings
  - f. Extensive use of home remedies or nonprescription medications

- g. Repeatedly visiting a physician despite repeated reassurance and normal test results
- h. Secondary gain

### D. Somatization disorder

1. Description
  - a. The client has multiple physical complaints involving numerous body systems.
  - b. The cause of these complaints is presumed to be psychological.
2. Assessment
  - a. Physical complaints of pain; denial of emotional problems; and signs of anxiety, fear, and low self-esteem may be present.
  - b. Secondary gain: The client may unconsciously use somatization for secondary gains, such as increased attention and decreased responsibilities.

### E. Interventions

1. Obtain a nursing history and assess for physical problems.
2. Explore the needs being met by the physical symptoms with the client.
3. Assist the client to identify alternative ways of meeting needs.
4. Assist the client to relate feelings and conflicts to the physical symptoms.
5. Convey understanding that the physical symptoms are real to the client.
6. Assure the client that physical illness has been ruled out.
7. Explore the source of anxiety and stimulate verbalization of anxiety.
8. Encourage the use of relaxation techniques as the anxiety increases.
9. Use a pain assessment scale if the client complains of pain, and implement pain reduction measures as required.
10. Report and assess any new physical complaint.
11. Encourage diversional activities.
12. Provide positive feedback.
13. Assist the client in recognizing his or her own feelings and emotions.
14. Administer antianxiety medications if prescribed.

 For a client with a somatoform disorder, allow a specific time period for the client to discuss physical complaints because the client will feel less threatened if this behavior is limited rather than stopped completely. Avoid responding with positive reinforcement about the physical complaints.

## VII. DISSOCIATIVE DISORDER

### A. Description

1. Dissociative disorder is a disruption in integrative functions of memory, consciousness, or identity.
2. Dissociative disorder is associated with exposure to an extremely traumatic event.

### B. Dissociative identity disorder (multiple personality)

### Box 74-4 Types of Somatoform Disorders

|                     |                       |
|---------------------|-----------------------|
| Conversion disorder | Somatization disorder |
| Hypochondriasis     |                       |

1. Description
    - a. Two or more fully developed, distinct and unique personalities exist within the client.
    - b. The host is the primary personality, and the other personalities are referred to as *alters*.
    - c. Alter personalities may take full control of the client, one at a time, and may or may not be aware of each other.
    - d. The alters may be aware of the host, but the host is not usually aware of the alters.
  2. Assessment
    - a. The client may have an inability to recall important information (unrelated to ordinary forgetfulness).
    - b. Transition from one personality to the other is related to stress or a traumatic event and is sudden.
    - c. Dissociation is used as a method of distancing and defending one's self from anxiety and traumatizing experiences.
- C. Dissociative amnesia**
1. Description
    - a. Inability to recall important personal information because it provokes anxiety
    - b. Memory impairment may range from partial to almost complete.
  2. Assessment
    - a. Localized: The client blocks out all memories about a specified period.
    - b. Selective: The client recalls some but not all memories about a specified period.
    - c. Generalized: The client has a loss of all memory about past life.
- D. Dissociative fugue**
1. Description
    - a. The client assumes a new identity in a new environment.
    - b. The disorder may occur suddenly.
  2. Assessment
    - a. The client may drift from place to place.
    - b. The client develops few social relationships.
    - c. When the fugue lifts, the client returns home and is unable to recall the fugue state.
- E. Depersonalization disorder**
1. Description: An altered self-perception in which one's own reality is temporarily lost or changed
  2. Assessment
    - a. Feelings of detachment
    - b. Intact reality testing
- F. Interventions**
1. Develop a trusting relationship with the client.
  2. Encourage verbal expression of painful experiences, anxieties, and concerns.
  3. Explore methods of coping.
  4. Identify sources of conflict.
  5. Focus on the client's strengths and skills.
  6. Orient the client.
  7. Provide nondemanding simple routines.
  8. Allow the client to progress at his or her own pace.
  9. Implement stress reduction techniques.
  10. Plan for individual, group, or family psychotherapy to integrate dissociated aspects of personality or memory and to expand self-awareness.

## VIII. MOOD DISORDERS

### A. Bipolar disorder

1. Description (Box 74-5)
  - a. Bipolar disorder is characterized by episodes of mania and depression with periods of normal mood and activity in between.

### Box 74-5 Assessment of Bipolar Disorder

#### Mania

Becomes angry quickly  
 Delusional self-confidence  
 Distracted by environmental stimuli  
 Extroverted personality  
 Flight of ideas  
 Grandiose and persecutory delusions  
 High and unstable affect  
 Significant decrease in appetite  
 Inability to eat or sleep because of involvement in more important things  
 Inability to sleep yet still active  
 Unlimited energy  
 Inappropriate affect  
 Inappropriate dress  
 Initiation of activity  
 Pressured speech  
 Restlessness  
 Sexually promiscuous  
 Urgent motor activity

#### Depression

Increased or decreased appetite  
 Decrease in activities of daily living  
 Decreased emotion and physical activity  
 Easily fatigued  
 Inability to make decisions  
 Poor concentration  
 Internalizing hostility  
 Introverted personality  
 Social isolation and withdrawn from groups  
 Lack of energy  
 Lack of initiative  
 Lack of self-confidence and low self-esteem  
 Lack of sexual interest  
 Psychomotor retardation  
 Suicidal thinking

**Box 74-6 Dealing With Inappropriate Behaviors Associated With Bipolar Disorder****Aggressive Behavior**

Assist client in identifying feelings of frustration and aggression. Encourage client to talk out instead of acting out feelings of frustration.

Assist client in identifying precipitating events or situations that lead to aggressive behavior.

Describe the consequences of the behavior on self and others. Assist in identifying previous coping mechanisms.

Assist client in problem-solving techniques to cope with frustration or aggression.

**De-escalation Techniques**

Maintain safety for client, other clients, and self.

Maintain large personal space and use a nonaggressive posture.

Use a calm approach and communicate with a calm, clear tone of voice (be assertive, not aggressive).

Determine what client considers to be his or her need.

Avoid verbal struggles.

Provide client with clear options that deal with client's behavior. Assist client with problem solving and decision making regarding options.

**Manipulative Behavior**

Set clear, consistent, realistic, and enforceable limits, and communicate expected behaviors.

Be clear about consequences associated with exceeding set limits and follow through with consequences in a nonpunitive manner, if necessary.

Discuss client's behavior in a nonjudgmental and nonthreatening manner.

Avoid power struggles with client (avoid arguing with client).

Assist client in developing means of setting limits on own behavior.

- 
- b. The medication of choice has traditionally been lithium carbonate, which can be toxic and requires regular monitoring of serum lithium levels.
  - c. Other medications such as divalproex (Valproate) or olanzapine (Zyprexa) may be prescribed; carbamazepine (Tegretol) may also be prescribed to reduce the symptoms of acute bipolar manic episodes.
2. Interventions for mania (Box 74-6)
    - a. Remove hazardous objects from the environment.
    - b. Assess the client closely for fatigue.
    - c. Use comfort measures to promote sleep.
    - d. Provide frequent rest periods.
    - e. Monitor the client's sleep patterns.
    - f. Provide a private room if possible.
    - g. Administer a hypnotic or sedative medication as prescribed.
    - h. Encourage the client to ventilate feelings.
    - i. Use calm, slow interactions.
    - j. Help the client focus on one topic during the conversation.
    - k. Ignore or distract the client from grandiose thinking.
    - l. Present reality to the client.
    - m. Do not argue with the client.
    - n. Limit group activities and assess the client's tolerance level; solitary activities may be necessary.
    - o. Provide high-calorie finger foods and fluids.
    - p. Supervise the client's choice of clothing.
    - q. Reduce environmental stimuli.
    - r. Set limits on inappropriate behaviors.
    - s. Provide physical activities and outlets for tension.
    - t. Avoid competitive games.
    - u. Provide gross motor activities such as walking.
    - v. Provide structured activities or one-to-one activities with the nurse.
- 
- 

**Box 74-7 Interventions for Depressed Clients**

Assess for homicidal and suicidal ideation.

Provide safety from suicidal actions.

Assist with activities of daily living.

Use gentle encouragement to participate in activities of daily living and unit therapies.

Do not push decision making or making complex choices or decisions that client is not ready to make.

Monitor sleep patterns.

Monitor nutritional intake and weight.

Monitor for general hygiene and self-care deficits; deficits may indicate worsening depression.

Provide achievable activities in which client can achieve success (focus on strengths).

Remind client of times when he or she felt better and was successful.

Spend time with client to communicate client's value.

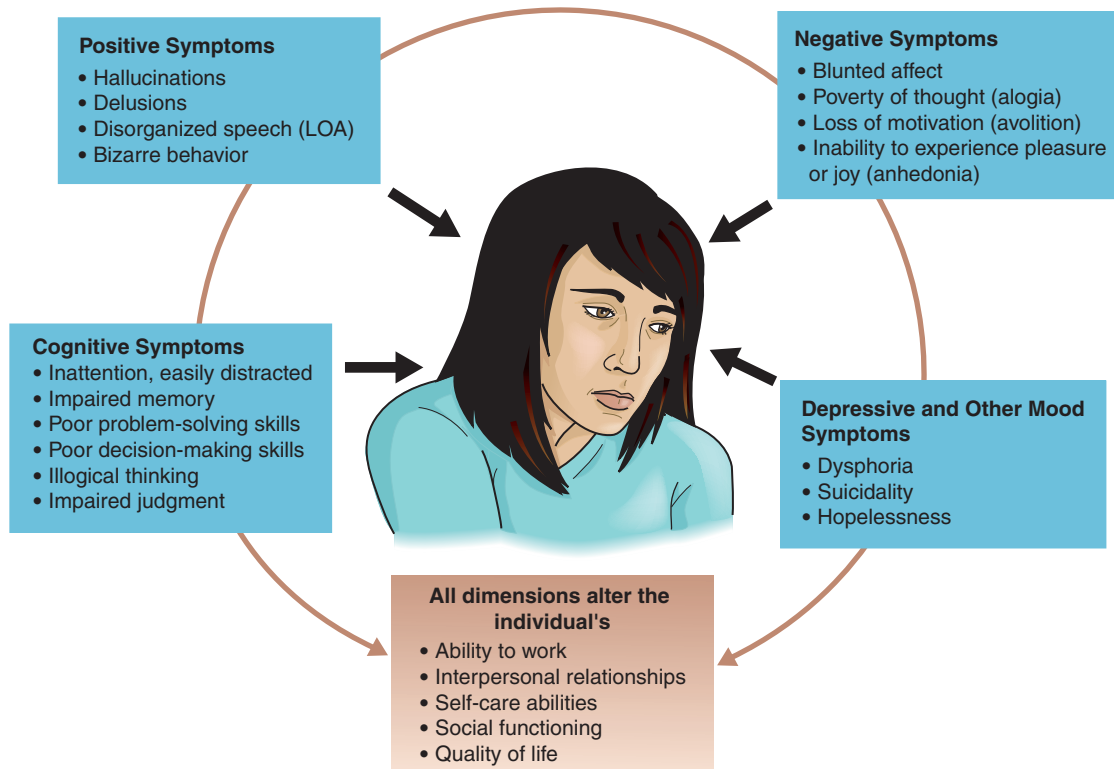

Respond to anger therapeutically.

- 
- w. Provide simple and direct explanations for routine procedures.
  - x. Supervise the administration of medication.
3. Major depressive disorder
    - a. Assessment (see Box 74-5)
    - b. Interventions for depressed clients (Box 74-7)

 **Monitor a depressed client closely for signs of suicidal ideation. If the client presents with increased energy, monitor closely because it could mean that the client now has the energy to perform the suicide act.**

**IX. SCHIZOPHRENIA****A. Description**

1. Schizophrenia is a group of mental disorders characterized by psychotic features (hallucinations and

**▲ FIGURE 74-1** Treatment-relevant dimensions of schizophrenia. LOA, looseness of association. (From Varcarolis, E., Carson, V., Shoemaker, N. [2010]. *Foundations of psychiatric mental health nursing* [6th ed.]. St. Louis: Saunders.)

delusions), disordered thought processes, and disrupted interpersonal relationships.

2. Disturbances in affect, mood, behavior, and thought processes occur.

**B. Assessment (Fig. 74-1)**

1. Physical characteristics
  - a. Unkempt appearance
  - b. Body image distortions
  - c. May be preoccupied with somatic complaints
  - d. May neglect hygiene, eating, sleeping, and elimination
2. Motor activity (Box 74-8)
  - a. Catatonic posturing: Holding bizarre postures for long periods
  - b. Catatonic excitement: Moving excitedly, with no environmental stimuli present
  - c. Possible total immobilization
  - d. Inability to respond to commands or responding only to commands
  - e. Waxy flexibility
  - f. Repetitive or stereotyped movements
  - g. Motor activity that may be increased, as evidenced by agitation, pacing, inability to sleep, loss of appetite and weight, and impulsiveness
  - h. Possible inability to initiate activity (anergia)
3. Emotional characteristics
  - a. Mistrust
  - b. View of the world as threatening and unsafe

### Box 74-8 Abnormal Motor Behaviors

#### Description

Abnormal motor behavior or activity displayed by mentally ill client that occurs as a result of a psychiatric disorder

#### Types

##### Echolalia

Repeating the speech of another person

##### Echopraxia

Repeating the movements of another person

##### Waxy flexibility

Having one's arms or legs placed in a certain position and holding that same position for hours

- c. Affect blunted, flat, or inappropriate
- d. May display feelings of ambivalence, helplessness, anxiety, anger, guilt, or depression in response to hallucinations or delusions or as a result of grief related to losses imposed by the illness
4. Compulsive rituals: Constant repetitive activity performed as an attempt to solve conflicting feelings
5. Overcompliance: Attempt to deny responsibility for any action by doing only what another person instructs exactly

**Box 74-9 Abnormal Thought Processes****Description**

Abnormal thought processes displayed by mentally ill client that occur as a result of a psychiatric disorder

**Types****Circumstantiality**

Before getting to the point or answering a question, client gets caught up in countless details and explanations

**Confabulation**

Filling a memory gap with detailed fantasy believed by the teller; the purpose of confabulation is to maintain self-esteem; seen in organic conditions such as Korsakoff's psychosis

**Flight of ideas**

Constant flow of speech in which client jumps from one topic to another in rapid succession; a connection between topics exists, although it is sometimes difficult to identify; seen in manic states

**Looseness of association**

Haphazard, illogical, and confused thinking and interrupted connections in thought; seen mostly in schizophrenic disorders

**Neologisms**

Client makes up words that have meaning only for the individual; often part of a delusional system

**Thought blocking**

Sudden cessation of a thought in the middle of a sentence; client is unable to continue the train of thought; often, sudden new thoughts come up unrelated to the topic

**Word salad**

Mixture of words and phrases that has no meaning

6. Affective disturbances
  - a. Flat or incongruent affect or inappropriate affect
  - b. Altered thought processes
7. Abnormal thought processes (Box 74-9)
  - a. Impaired reality testing
  - b. Fragmentation of thoughts
  - c. Thought blocking
  - d. Loose associations
  - e. Echolalia
  - f. Distorted perception of the environment
  - g. Neologisms
  - h. Magical thinking
  - i. Inability to conceptualize meaning in words or thoughts
  - j. Inability to organize facts logically
  - k. Delusions associated with thought processes or content
8. Types of delusions (Box 74-10)
  - a. Loss of reference, in which the client believes that certain events, situations, or interactions are related directly to self
  - b. Delusions of persecution, in which the client believes that he or she is being harassed,

**Box 74-10 Delusions****Description**

A false belief held to be true, even when there is evidence to the contrary

**Types****Grandeur**

False belief that one is a powerful and important person

**Jealousy**

False belief that one's partner or mate is going out with other persons

**Persecution**

Thought that one is being singled out for harm by others

**Interventions**

Ask client to describe the delusion.

Be open and honest in interactions to reduce suspiciousness. Focus conversation on reality-based topics, rather than on the delusion.

Encourage client to express feelings and focus on feelings that the delusions generate.

If client obsesses on the delusion, set firm limits on the amount of time for talking about the delusion.

Do not argue with client or try to convince client that the delusions are false.

Validate if part of the delusion is real.

- c. Delusions of grandeur, in which the client attaches special significance to self in relation to others or the universe and has an exaggerated sense of self that has no basis in reality
- d. Somatic delusions, in which the client believes that his or her body is changing or responding in an unusual way, which has no basis in reality
9. Perceptual distortions
  - a. Illusions, which may be brief experiences with a misinterpretation or misperception of reality
  - b. Hallucinations (five senses) with no basis in reality (Box 74-11), such as perceiving objects, sensations, or images
10. Language and communication disturbances (Box 74-12)
  - a. Related to disorders in thought process
  - b. Inability to organize language
  - c. Difficulty communicating clearly
  - d. Inappropriate responses to a situation
  - e. A single word or phrase may represent the whole meaning of the conversation such that the client may feel that he or she has communicated adequately.
  - f. Development of a private language
- C. Types of schizophrenia (Box 74-13)
  1. Catatonic schizophrenia
    - a. Psychomotor disturbances
    - b. Immobility

**Box 74-11 Hallucinations****Description**

Sense perception (occurs with one of the five senses) for which no external stimuli exist; can have an organic or functional cause

**Types****Auditory**

Hearing voices when none are present

**Gustatory**

Experiencing taste in the absence of stimuli

**Olfactory**

Smelling smells that do not exist

**Tactile**

Feeling touch sensations in the absence of stimuli

**Visual**

Seeing things that are not there

**Interventions**

Ask client directly about hallucination.

Avoid reacting to hallucination as if it were real.

Decrease stimuli or move client to another area.

Do not negate client's experience.

Focus on reality-based topics.

Attempt to engage client's attention through a concrete activity.

Respond verbally to anything real that client talks about.

Avoid touching client.

Monitor for signs of increasing anxiety or agitation, which may indicate that hallucinations are increasing.

**Box 74-12 Language and Communication Disturbances****Clang association**

Repetition of words or phrases that are similar in sound but in no other way

**Echolalia**

Repetition of words or phrases heard from another person

**Mutism**

Absence of verbal speech

**Neologism**

A new word devised that has special meaning only to the client

**Pressured speech**

Speaking as if the words are being forced out quickly

**Verbigeration**

Purposeless repetition of words or phrases

**Word salad**

Form of speech in which words or phrases are connected meaninglessly

- c. Stupor
- d. Waxy flexibility
- e. Excessive purposeless motor activity
- f. Echolalia
- g. Automatic obedience

**Box 74-13 Types of Schizophrenia**

Catatonic

Disorganized

Paranoid

Residual

Undifferentiated

- h. Stereotyped or repetitive behavior
- 2. Disorganized schizophrenia
  - a. Extreme social withdrawal
  - b. Disorganized speech or behavior
  - c. Flat or inappropriate affect
  - d. Silliness unrelated to speech
  - e. Stereotyped behaviors
  - f. Grimacing mannerisms
  - g. Inability to perform activities of daily living
- 3. Paranoid schizophrenia
  - a. Suspiciousness
  - b. Hostility
  - c. Delusions
  - d. Auditory hallucinations
  - e. Anxiety and anger
  - f. Aloofness
  - g. Persecutory themes
  - h. Violence
- 4. Residual schizophrenia
  - a. Diagnosed as schizophrenic in the past
  - b. Time limited between attacks, but may last for many years
  - c. The client exhibits considerable social isolation and withdrawal and impaired role functioning.
- 5. Undifferentiated schizophrenia
  - a. Undifferentiated schizophrenia does not meet the criteria for paranoid, disorganized, or catatonic schizophrenia.
  - b. Delusions and hallucinations
  - c. Disorganized speech
  - d. Disorganized or catatonic behavior
  - e. Flat affect
  - f. Social withdrawal
- D. Interventions (Box 74-14)
- E. Interventions: Active hallucinations
  - 1. Monitor for hallucination cues and assess content of hallucinations.
  - 2. Intervene with one-on-one contact.
  - 3. Decrease stimuli or move the client to another area.
  - 4. Avoid conveying to the client that others also are experiencing the hallucination.
  - 5. Respond verbally to anything real that the client talks about.
  - 6. Avoid touching the client.
  - 7. Encourage the client to express feelings.
  - 8. During a hallucination, attempt to engage the client's attention through a concrete activity.
  - 9. Accept and do not joke about or judge the client's behavior.

**Box 74-14 Interventions for Schizophrenia**

Assess client's physical needs.  
 Set limits on client's behavior when it interferes with others and becomes disruptive.  
 Maintain a safe environment.  
 Initiate one-on-one interaction and progress to small groups as tolerated.  
 Spend time with client, even if client is unable to respond.  
 Monitor for altered thought processes.  
 Maintain ego boundaries and avoid touching client.  
 Limit the time of interaction with client.  
 Avoid an overly warm approach; a neutral approach is less threatening.  
 Do not make promises to client that cannot be kept.  
 Establish daily routines.  
 Assist client to improve grooming and accept responsibility for personal care.  
 Sit with client in silence if necessary.  
 Provide brief, frequent contact with client.  
 Tell client when you are leaving.  
 Tell client when you do not understand.  
 Do not "go along" with client's delusions or hallucinations.

Provide simple concrete activities, such as puzzles or word games.  
 Reorient client as necessary.  
 Help client establish what is real and unreal.  
 Stay with client if he or she is frightened.  
 Speak to client in a simple, direct, and concise manner.  
 Reassure client that the environment is safe.  
 Remove client from group situations if client's behavior is too bizarre, disturbing, or dangerous to others.  
 Set realistic goals.  
 Initially, do not offer choices to client, and gradually assist client in making his or her own decisions.  
 Use canned or packaged food, especially with a paranoid schizophrenic client.  
 Provide a radio or tape player at night for insomnia.  
 Explain to client everything that is being done.  
 Set limits on client's behavior if client is unable to do so.  
 Decrease excessive stimuli in the environment.  
 Monitor for suicide risk.  
 Assist client to use alternative means to express feelings, such as through music or art therapy or writing.

10. Provide easy activities and a structured environment with routine activities of daily living.
11. Monitor for signs of increasing fear, anxiety, or agitation.
12. Decrease stimuli as needed.
13. Administer medications as prescribed.

**!** For a client with hallucinations, safety is the first priority—ensure that the client does not have an auditory command telling him or her to harm self or others.

**F. Interventions: Delusions**

1. Interact based on reality.
2. Encourage the client to express feelings.
3. Do not dispute the client or try to convince the client that delusions are false.
4. Initiate activities on a one-on-one basis.
5. Alter hospital routines as necessary, such as using canned or packaged food or food from home.
6. Recognize accomplishments and provide positive feedback for successes.

**X. PARANOID DISORDERS****A. Description**

1. Paranoid disorder is a concrete, pervasive delusional system characterized by persecutory and grandiose beliefs.
2. The client exhibits suspiciousness and mistrust of others.
3. The client often is viewed by others as hostile, stubborn, and defensive.

**B. Behaviors**

1. Suspicious and mistrustful
2. Emotionally distant
3. Distortion of reality
4. Poor insight and poor judgments
5. Hypervigilance
6. Low self-esteem
7. Highly sensitive, difficulty in admitting own error, and taking pride in being correct
8. Hypercritical and intolerant of others
9. Hostile, aggressive, and quarrelsome
10. Evasive
11. Concrete thinking

**C. Delusions**

1. Delusions serve a purpose in establishing identity and self-esteem.
2. The client may have grandiose and persecutory delusions.
3. Process of delusion includes denial, projection, and rationalization.
4. As trust in others increases, the need for delusions decreases.

**D. Types of paranoid disorders (Box 74-15)**

1. Paranoid personality disorder (see later)
  - a. Suspicious
  - b. Nonpsychotic
  - c. No hallucinations or delusions
  - d. No symptoms of schizophrenia
2. Paranoia-induced state
  - a. Abrupt onset in response to stress; subsides when stress decreases
  - b. No hallucinations, but experiences paranoid delusions
  - c. May be sensitive and suspicious before the development of delusions

- d. No symptoms of schizophrenia
- 3. Paranoia
  - a. Exhibits an organized delusional system
  - b. No hallucinations
  - c. Reserved and sensitive before onset
  - d. Psychotic state
  - e. No symptoms of schizophrenia
- 4. Paranoid schizophrenia
  - a. Before the onset, the client becomes cold, withdrawn, distrustful, resentful, argumentative, sarcastic, and defiant.
  - b. Bizarre, numerous, and changeable delusions occur.
  - c. Delusions become less logical as the client becomes more disorganized.
  - d. Persecutory hallucinations occur.
  - e. Psychotic state ensues.
  - f. All symptoms of schizophrenia are present.
- E. Interventions (Box 74-16)

**!** Do not whisper or laugh in front of a client with a paranoid disorder because the client will think that you are talking about or laughing at him or her; this increases the paranoia.

## XI. PERSONALITY DISORDERS

### A. Description

1. Personality disorders include various inflexible maladaptive behavior patterns or traits that may impair functioning and relationships.
2. The client usually remains in touch with reality and typically has a lack of insight into his or her behavior.

#### Box 74-15 Types of Paranoid Disorders

|                      |                        |
|----------------------|------------------------|
| Paranoid personality | Paranoia               |
| Paranoid state       | Paranoid schizophrenia |

3. Stress exacerbates manifestations of the personality disorder.
4. In severe cases, the personality disorder may deteriorate to a psychotic state.
- B. Characteristics
  1. Poor impulse control
    - a. Acting out to manage internal pain
    - b. Forms of acting out include physical and verbal attacks, such as yelling and swearing, and self-injurious behaviors, such as cutting own skin, banging the head, punching self, manipulation, substance **abuse**, promiscuous sexual behaviors, and **suicide attempts**.
    - c. The client may be preoccupied with self, religion, or sex.
  2. Mood characteristics
    - a. May experience abandonment and depression
    - b. Moods may include rage, guilt, fear, and emptiness.
  3. Impaired judgment
    - a. Difficulty with problem solving
    - b. Inability to perceive the consequences of behavior
  4. Impaired reality testing: Distortion of reality and often projection of own feelings onto others
  5. Impaired object relations: Rigid and inflexible, with difficulty in intimate relationships
  6. Impaired self-perception: Distorted self-perception and experience of self-hate or self-idealization
  7. Impaired thought processes
    - a. Concrete or diffuse thinking
    - b. Difficulty concentrating
    - c. Impaired memory
  8. Impaired stimulus barrier
    - a. Inability to regulate incoming sensory stimuli
    - b. Increased excitability
    - c. Excessive response to noise and light
    - d. Poor attention span
    - e. Agitated
    - f. Insomnia

#### Box 74-16 Interventions for Paranoid Disorders

Assess for suicide risk.  
 Diminish suspicious behavior.  
 Avoid direct eye contact.  
 Establish a trusting relationship.  
 Promote increased self-esteem.  
 Remain calm, nonthreatening, and nonjudgmental.  
 Provide continuity of care.  
 Respond honestly to client.  
 Follow through on commitments made to client.  
 Acknowledge client's feelings, but tell client that you do not share his or her interpretation of an event.  
 Provide a daily schedule of activities.  
 Assist client to identify diversionary activities.  
 Gradually introduce client to groups.

Refocus conversation to reality-based topics.  
 Use role playing to help client identify thoughts and feelings.  
 Provide positive reinforcement for successes.  
 Do not argue with delusions.  
 Use concrete, specific words.  
 Do not be secretive with client.  
 Do not whisper in client's presence.  
 Assure client that he or she will be safe.  
 Involve client in noncompetitive tasks.  
 Provide client with the opportunity to complete small tasks.  
 Monitor eating, drinking, sleeping, and elimination patterns.  
 Limit physical contact.  
 Monitor for agitation, and decrease stimuli as needed.

- C.** Cluster A personality disorder types include the odd, eccentric types—schizoid, schizotypal, and paranoid.
1. Schizoid personality disorder is characterized by an inability to form warm, close social relationships.
    - a. Social detachment and lack of close relationships
    - b. Interest in solitary activities
    - c. Aloof and indifferent
    - d. Restricted expression of emotions
    - e. Lack of interest in others
  2. Schizotypal personality disorder is characterized by the display of abnormal or highly unusual thoughts, perceptions, speech, and behavior patterns.
    - a. Suspicious
    - b. Paranoia
    - c. Magical thinking
    - d. Odd thinking and speech
    - e. Relationship deficits
  3. Paranoid personality disorder is characterized by suspiciousness and mistrust of others (paranoia).
    - a. May be suspicious and distrusting
    - b. May be argumentative
    - c. May be hostile, aloof
    - d. May be rigid, critical, and controlling of others
    - e. May have thoughts of grandiosity
- D.** Cluster B personality disorders include the over-emotional, erratic types—histrionic, narcissistic, antisocial, and borderline.
1. Histrionic personality disorder is characterized by overly dramatic and intensely expressive behavior.
    - a. Lively and dramatic and enjoys being the center of attention
    - b. Has poor and shallow interpersonal relations
    - c. May be sexually seductive or provocative
    - d. Dramatizes his or her life and may appear theatrical
    - e. Overly concerned with appearance
    - f. Easily bored
  2. Narcissistic personality disorder is characterized by an increased sense of self-importance and preoccupation with fantasies and unlimited success.
    - a. Need for admiration and inflation of accomplishments
    - b. Overestimation of abilities and underestimation of contributions of others
    - c. Lack of empathy and sensitivity to needs of others
  3. Antisocial personality disorder comprises a pattern of irresponsible and antisocial behavior, selfishness, an inability to maintain lasting relationships, poor sexual adjustment, a failure to accept social norms, and a tendency toward irritability and aggressiveness.
    - a. Perceives the world as hostile
    - b. Superficial charm and hostility
    - c. No shame or guilt
    - d. Self-centered
    - e. Unreliable
    - f. Easily bored
    - g. Poor work history
    - h. Inability to tolerate frustration
    - i. View others as objects to be manipulated
    - j. Poor judgment
    - k. Impulsive
- E.** Cluster C personality disorders include the anxious, fearful types of personality disorders—obsessive-compulsive personality, avoidant, and dependent.
4. Borderline personality disorder is characterized by instability in interpersonal relationships, unstable mood and self-image, and impulsive and unpredictable behavior.
    - a. Unclear identity
    - b. Unstable and intense
    - c. Extreme shifts in mood
    - d. Easily angered
    - e. Easily bored
    - f. Argumentative
    - g. Depression
    - h. Self-destructive behavior
    - i. Manipulation
    - j. Inability to tolerate anxiety
    - k. Chronic feelings of emptiness and fear of being alone
    - l. Splitting—sees others as all good or all bad; creates conflict between individuals by playing one person against another
  1. Obsessive-compulsive personality disorder is characterized by difficulty expressing warm and tender emotions, perfectionism, stubbornness, the need to control others, and a devotion to work.
    - a. Overly conscientious
    - b. Inflexible and preoccupied with details and rules
    - c. Extremely devoted to work to the exclusion of leisure activities and friendships
    - d. Miserly and stubborn
    - e. Hoarding behavior
    - f. Engages in rituals
  2. Avoidant personality disorder is characterized by social withdrawal and extreme sensitivity to potential rejection.
    - a. Feelings of inadequacy
    - b. Hypersensitive to reactions of others and poor reaction to criticism
    - c. Social isolation
    - d. Lack of support system
  3. Dependent personality disorder is characterized by an intense lack of self-confidence, low self-esteem, and inability to function independently, 

such that the individual passively allows others to make decisions and assume responsibility for major areas in the person's life; the dependent client has great difficulty making decisions.

- F.** General interventions for a client with a personality disorder
1. Maintain safety against self-destructive behaviors.
  2. Allow the client to make choices and be as independent as possible.
  3. Encourage the client to discuss feelings rather than act them out.
  4. Provide consistency in response to the client's acting-out behaviors.
  5. Discuss expectations and responsibilities with the client.
  6. Discuss the consequences that will follow certain behaviors.
  7. Inform the client that harm to self, others, and property is unacceptable.
  8. Identify splitting behavior.
  9. Assist the client to deal directly with anger.
  10. Develop a written safety or behavioral contract with the client.
  11. Encourage the client to keep a journal recording daily feelings.
  12. Encourage the client to participate in group activities, and praise nonmanipulative behavior.
  13. Set and maintain limits to decrease manipulative behavior.
  14. Remove the client from group situations in which attention-seeking behaviors occur.
  15. Provide realistic praise for positive behaviors in social situations.

## XII. COGNITIVE IMPAIRMENT DISORDERS

- A.** Autism: See Chapter 36.
- B.** Attention-deficit/hyperactivity disorder: See Chapter 36.
- C.** Dementia and Alzheimer's disease
1. Dementia
    - a. Dementia is a syndrome with progressive deterioration in intellectual functioning secondary to structural or functional changes.
    - b. Long-term and short-term memory loss occur, with impairment in judgment, abstract thinking, problem-solving ability, and behavior.
    - c. Dementia results in a self-care deficit.
    - d. The most common type of dementia is Alzheimer's disease.
  2. Alzheimer's disease (Box 74-17)
    - a. Alzheimer's disease is an irreversible form of senile dementia caused by nerve cell deterioration.
    - b. Individuals with Alzheimer's disease experience cognitive deterioration and progressive loss of ability to carry out activities of daily living.

### Box 74-17 Alzheimer's Disease

#### Agnosia

Failure to recognize or identify familiar objects despite intact sensory function

#### Amnesia

Loss of memory caused by brain degeneration

#### Aphasia

Language disturbance in understanding and expressing spoken words

#### Apraxia

Inability to perform motor activities, despite intact motor function

- c. The client experiences a steady decline in physical and mental functioning and usually requires long-term care in a specialized facility in the final stages of the illness. 
3. Interventions
  - a. Identify and reinforce retained skills.
  - b. Provide continuity of care.
  - c. Orient the client to the environment.
  - d. Furnish the environment with familiar possessions.
  - e. Acknowledge the client's feelings.
  - f. Assist the client and family members to manage memory deficits and behavior changes.
  - g. Encourage family members to express feelings about caregiving.
  - h. Provide the caregiver with support and identify the resources and support groups available.
  - i. Monitor the client's activities of daily living.
  - j. Remind the client how to perform self-care activities.
  - k. Help the client maintain independence.
  - l. Provide the client with consistent routines.
  - m. Provide the client with exercise, such as walking with an escort.
  - n. Avoid activities that tax the memory.
  - o. Allow the client plenty of time to complete a task.
  - p. Use constant encouragement with the client with a simple step-by-step approach.
  - q. Provide the client with activities that distract and occupy time, such as listening to music, coloring, and watching television.
  - r. Provide the client with mental stimulation with simple games or activities. 
4. Wandering
  - a. Provide the client with a safe environment.
  - b. Prevent unsafe wandering.
  - c. Provide the client with close supervision.
  - d. Close and secure doors.
  - e. Use identification bracelets and electronic surveillance.

 Providing a safe environment is a priority in the care of a client with Alzheimer's disease. 

5. Communication
  - a. Adapt to the communication level of the client.
  - b. Use a firm volume and a low-pitched voice to communicate.
  - c. Stand directly in front of the client and maintain eye contact.
  - d. Call the client by name and identify self; wait for a response.
  - e. Use a calm and reassuring voice.
  - f. Use pantomime gestures if the client is unable to understand spoken words.
  - g. Speak slowly and clearly, using short words and simple sentences.
  - h. Ask only one question at a time and give one direction at a time.
  - i. Repeat questions if necessary, but do not rephrase.
6. Impaired judgment
  - a. Remove throw rugs, toxic substances, and dangerous electrical appliances from the environment.
  - b. Reduce hot water heater temperature.
7. Altered thought processes
  - a. Call the client by name.
  - b. Orient the client frequently.
  - c. Use familiar objects in the room.
  - d. Place a calendar and clock in a visible place.
  - e. Maintain familiar routines.
  - f. Allow the client to reminisce.
  - g. Make tasks simple.
  - h. Allow time for the client to complete a task.
  - i. Provide positive reinforcement for positive behaviors.
8. Altered sleep patterns
  - a. Allow the client to wander in a safe place until he or she becomes tired.
  - b. Prevent shadows in the room by using indirect light.
  - c. Avoid the use of hypnotics because they cause confusion and aggravate the sundown effect.
9. Agitation
  - a. Assess the precipitant of the agitation.
  - b. Reassure the client.
  - c. Remove items that can be hazardous when the client is agitated.
  - d. Approach the client slowly and calmly from the front, and speak, gesture, and move slowly.
  - e. Remove the client to a less stressful environment; decrease excess stimuli.
  - f. Use touch gently.
  - g. Do not argue with or force the client.

### XIII. PSYCHOSEXUAL ALTERATIONS

- A. Sexuality
  1. One's sense of being a sexual individual
  2. Includes how one looks, behaves, and relates to others

#### Box 74-18 Sexual Expression

##### Bisexuality

Sexual attraction to and activity with both genders

##### Heterosexuality

Male-female sexual relationships

##### Homosexuality

Sexual attraction to a member of the same gender

##### Transvestism

Obsession with wearing clothing of the opposite gender

- B. Sexual expression (Box 74-18)
- C. Alterations in sexual behavior
  1. Transsexualism: Feeling that one's gender is inappropriate and desiring to acquire sexual characteristics of the opposite gender
  2. Exhibitionism: Sexual urges and fantasies that result in exposure of genitals to strangers to bring sexual gratification or arousal
  3. Fetishism: Using nonliving objects for sexual gratification
  4. Pedophilia: Desiring sexual activity with a child younger than 13 years of age
  5. Sexual masochism: Sexual gratification that involves receiving pain
  6. Sexual sadism: Sexual gratification that involves inflicting pain
  7. Voyeurism: Sexual gratification through observing others disrobing or engaging in sexual activity
  8. Zoophilia: Intense sexual arousal or desire for sexual contact with animals
  9. Frotteurism: Intense sexual arousal or desire when rubbing against a nonconsenting person
- D. Interventions
  1. Assess sexual history, history of trauma or **abuse**, and precipitating event for the sexual disorder.
  2. Encourage the client to explore personal beliefs.
  3. Provide a nonjudgmental attitude.
  4. Provide supportive psychotherapy.

#### MORE QUESTIONS ON THE CD!

#### Practice Questions

905. A client who is delusional says to a nurse, "The federal guards were sent to kill me." The nurse's best response is:
1. "I don't believe this is true."
  2. "The guards are not out to kill you."
  3. "What makes you think the guards were sent to hurt you?"
  4. "I don't know anything about the guards. Do you feel afraid that people are trying to hurt you?"

- 906.** A male client with delirium becomes disoriented and confused in his room at night. The best initial nursing intervention is to:
1. Move the client next to the nurse's station.
  2. Use an indirect light source and turn off the television.
  3. Keep the television and a soft light on during the night.
  4. Play soft music during the night, and maintain a well-lit room.
- 907.** A client is admitted to the mental health unit with a diagnosis of depression. A nurse develops a plan of care for the client and includes which appropriate activity in the plan?
1. Reading and writing most of the day
  2. Several activities from which the client can choose
  3. Nothing, until the client asks to participate in milieu
  4. A structured program of activities in which the client can participate
- 908.** When planning the discharge of a client with chronic anxiety, a nurse directs the goals at promoting a safe environment at home. The appropriate maintenance goal should focus on which of the following?
1. Ignoring feelings of anxiety
  2. Identifying anxiety-producing situations
  3. Continued contact with a crisis counselor
  4. Eliminating all anxiety from daily situations
- 909.** A client is unwilling to go out of the house for fear of "doing something crazy in public." Because of this fear, the client remains homebound except when accompanied outside by the spouse. Based on these data, a nurse determines that the client is experiencing:
1. Agoraphobia
  2. Social phobia
  3. Claustrophobia
  4. Hypochondriasis
- 910.** A nurse is conducting a group therapy session. During the session, a client with mania consistently talks and dominates the group session, and this behavior is disrupting group interactions. The nurse would initially:
1. Ask the client to leave the group session.
  2. Ask another nurse to escort the client out of the group session.
  3. Tell the client that she will not be able to attend any future group sessions.
  4. Tell the client that she needs to allow other clients in the group time to talk.
- 911.** A client is admitted to a medical nursing unit with a diagnosis of acute blindness. Many tests are performed, and there seems to be no organic reason why this client cannot see. The client became blind after witnessing a hit-and-run car accident, when a family of three was killed. A nurse suspects that the client may be experiencing a:
1. Psychosis
  2. Repression
  3. Conversion disorder
  4. Dissociative disorder
- 912.** A manic client announces to everyone in the day-room that a stripper is coming to perform this evening. When a nurse firmly states that this is inappropriate and will not happen, the client becomes verbally abusive and threatens physical violence to the nurse. Based on the analysis of this situation, the nurse determines that the appropriate action would be to:
1. Orient the client to time, person, and place.
  2. Tell the client that the behavior is inappropriate.
  3. Escort the manic client to her room, with assistance.
  4. Tell the client that smoking privileges are revoked for 24 hours.
- 913.** A nurse is planning activities for a client who has bipolar disorder with aggressive social behavior. Which of the following activities would be most appropriate for this client?
1. Chess
  2. Writing
  3. Ping pong
  4. Basketball
- 914.** A nurse observes that a client is pacing, agitated, and presenting aggressive gestures. The client's speech pattern is rapid, and affect is belligerent. Based on these observations, the nurse's immediate priority of care is to:
1. Provide safety for the client and other clients on the unit.
  2. Provide the clients on the unit with a sense of comfort and safety.
  3. Assist the staff in caring for the client in a controlled environment.
  4. Offer the client a less stimulated area to calm down and gain control.
- 915.** A nurse is discharging a client with a history of command hallucinations to harm self or others. The nurse provides instructions to the client about interventions for hallucinations and anxiety and determines that the client understands the instructions if the client states:

1. "My medications won't make me anxious."
2. "I'll go to support group and talk so that I don't hurt anyone."
3. "I won't get anxious or hear things if I get enough sleep and eat well."
4. "I can call my therapist when I'm hallucinating so that I can talk about my feelings and plans and not hurt anyone."

**916.** A nurse is caring for a male client diagnosed with catatonic stupor. The client is lying on the bed with his body pulled into a fetal position. The appropriate nursing intervention is which of the following?

1. Ask direct questions to encourage talking.
2. Leave the client alone and intermittently check on him.
3. Sit beside the client in silence with occasional open-ended questions.
4. Take the client into the dayroom with other clients so that they can help watch him.

**917.** A client is admitted to the mental health unit with a diagnosis of schizophrenia. A nursing diagnosis formulated for the client is *disturbed thought processes related to paranoia*. In formulating nursing interventions with the members of the health care team, a nurse provides instructions to:

1. Increase socialization of the client with peers.
2. Avoid laughing or whispering in front of the client.
3. Begin to educate the client about social supports in the community.
4. Have the client sign a release of information to appropriate parties so that adequate data can be obtained for assessment purposes.

### Alternate Item Format: Multiple Response

**918.** Select the nursing interventions for a hospitalized client with mania who is exhibiting manipulative behavior. **Select all that apply.**

- 1. Communicate expected behaviors to the client.
- 2. Ensure that the client knows that he or she is not in charge of the nursing unit.
- 3. Assist the client in identifying ways of setting limits on personal behaviors.
- 4. Follow through about the consequences of behavior in a nonpunitive manner.
- 5. Enforce rules and inform the client that he or she will not be allowed to attend therapy groups.
- 6. Be clear with the client regarding the consequences of exceeding limits that have been set regarding behavior.

## ANSWERS

### 905. 4

**Rationale:** It is most therapeutic for the nurse to empathize with the client's experience. Disagreeing with delusions may make the client more defensive, and the client may cling to the delusions even more. Encouraging discussion regarding the delusion is inappropriate.

**Test-Taking Strategy:** Use therapeutic communication techniques. Eliminate options 1 and 2 because they are comparable or alike and are statements that disagree with the client. Option 3 encourages discussion regarding the delusion. Review communication techniques with a client experiencing delusions if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 27–31, 339–340). St. Louis: Mosby.

### 906. 2

**Rationale:** Provision of a consistent daily routine and a low stimulating environment is important when a client is disoriented. Noise, including radio and television, may add to the confusion and disorientation. Moving the client next to the nurses' station is not the initial action.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *initial* in the question. Eliminate options 3 and 4 first because they are comparable or alike. Focusing on the strategic word will direct you easily to option 2. Review measures related to a client who is disoriented and confused if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**Reference:** Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 312). St. Louis: Saunders.

### 907. 4

**Rationale:** A client with depression often has a depressed mood and is withdrawn. The client also experiences difficulty concentrating, loss of interest or pleasure, low energy, fatigue, and feelings of worthlessness and poor self-esteem. The plan of care needs to provide successful experiences in a stimulating yet structured environment. Options 1, 2, and 3 are too "restrictive" and offer little or no structure and stimulation.

**Test-Taking Strategy:** Use the process of elimination. Recall that a depressed client requires a structured and stimulating program in a safe environment. Option 4 is the only option that will provide a safe and effective environment. Review

care of the client with depression if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 307). St. Louis: Mosby.

### 908. 2

**Rationale:** Recognizing situations that produce anxiety allows the client to prepare to cope with anxiety or avoid a specific stimulus. Counselors will not be available for all anxiety-producing situations, and this option does not encourage the development of internal strengths. Ignoring feelings will not resolve anxiety. Elimination of all anxiety from life is impossible.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 4 first because of the word *all*. Eliminate option 1 next because feelings should not be ignored. From the remaining options, select option 2 because this option is more client-centered and helps prepare the client to deal with anxiety should it occur. Review home care planning for a client with chronic anxiety if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Mental Health

**Reference:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., p. 189). St. Louis: Mosby.

### 909. 1

**Rationale:** Agoraphobia is a fear of open spaces and the fear of being trapped in a situation from which there may not be an escape. Agoraphobia includes the possibility of experiencing a sense of helplessness or embarrassment if an attack occurs. Avoidance of such situations usually results in reduction of social and professional interactions. Social phobia focuses more on specific situations, such as the fear of speaking, performing, or eating in public. Claustrophobia is a fear of closed places. Clients with hypochondriacal symptoms focus their anxiety on physical complaints and are preoccupied with their health.

**Test-Taking Strategy:** Use the process of elimination. Focusing on the strategic words *remains homebound* will direct you to option 1. If you had difficulty with this question, review phobia types and associated client behaviors.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Mental Health

**Reference:** Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (pp. 137–138). St. Louis: Saunders.

### 910. 4

**Rationale:** Manic clients may be talkative and can dominate group meetings or therapy sessions by their excessive talking. If this occurs, the nurse initially would set limits on the client's behavior. Initially, asking the client to leave the session or asking another person to escort the client out of the session

is inappropriate. This may agitate the client and escalate the client's behavior further. Option 3 is also an inappropriate initial action because it violates the client's right to receive treatment and is a threatening action.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *initially*. Eliminate options 1 and 2 first because they are comparable or alike. Next, eliminate option 3 because it violates the client's right to receive treatment and is a threatening action. Remember that setting firm limits with the client initially is best. Review care of a client with mania if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 287, 521). St. Louis: Mosby.

### 911. 3

**Rationale:** A conversion disorder is the alteration or loss of a physical function that cannot be explained by any known pathophysiological mechanism. A conversion disorder is thought to be an expression of a psychological need or conflict. In this situation, the client witnessed an accident that was so psychologically painful that the client became blind. A dissociative disorder is a disturbance or alteration in the normally integrative functions of identity, memory, or consciousness. Psychosis is a state in which a person's mental capacity to recognize reality, communicate, and relate to others is impaired, interfering with the person's ability to deal with life's demands. Repression is a coping mechanism in which unacceptable feelings are kept out of awareness.

**Test-Taking Strategy:** Use the process of elimination. The key to the correct option lies in the fact that the client presents no organic reason to account for the blindness—hence, a conversion disorder. If you had difficulty with this question, review defense mechanisms and the concepts associated with a conversion disorder.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Mental Health

**References:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 251, 243). St. Louis: Mosby.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (pp. 157–158). St. Louis: Saunders.

### 912. 3

**Rationale:** The client is at risk for injury to self and others and should be escorted out of the dayroom. Option 4 may increase the agitation that already exists in this client. Orientation will not halt the behavior. Telling the client that the behavior is inappropriate already has been attempted by the nurse.

**Test-Taking Strategy:** Use the process of elimination and Maslow's Hierarchy of Needs theory to answer the question. Look for the option that promotes safety of the client, other clients, and staff. If you had difficulty with this question, review the appropriate interventions when dealing with a manic client.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**References:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., pp. 221, 230). St. Louis: Mosby.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 259). St. Louis: Saunders.

### 913. 2

**Rationale:** Solitary activities that require a short attention span with mild physical exertion are the most appropriate activities for a client who is exhibiting aggressive behavior. Writing (journaling), walks with staff, and finger painting are activities that minimize stimuli and provide a constructive release for tension. Competitive games should be avoided because they can stimulate aggression and increase psychomotor activity.

**Test-Taking Strategy:** Use the process of elimination. Options 1, 3, and 4 are comparable or alike in that they are activities that the client cannot do alone. Option 2 identifies a solitary activity. Review care of a client with aggressive social behavior if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Mental Health

**References:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 233). St. Louis: Mosby.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 36). St. Louis: Saunders.

### 914. 1

**Rationale:** Safety of the client and other clients is the priority. Option 1 is the only option that addresses the safety needs of the client and other clients. Option 2 addresses other clients' needs only. Option 3 is not client-centered. Option 4 addresses the client's needs only.

**Test-Taking Strategy:** Note the strategic words *immediate priority* and use Maslow's Hierarchy of Needs theory to prioritize. Note the words *agitated*, *aggressive*, and *belligerent*. Safety is the strategic priority focus. Option 1 is the umbrella option and addresses the safety of all. Review nursing interventions to provide safety to clients if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Delegating/Prioritizing

**Reference:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., p. 521). St. Louis: Mosby.

### 915. 4

**Rationale:** The risk for impulsive and aggressive behavior may increase if a client is receiving command hallucinations to harm self or others. The nurse should ask the client whether he or she has intentions to hurt himself or herself or others. Talking about auditory hallucinations can interfere

with subvocal muscular activity associated with a hallucination. Options 1, 2, and 3 will aid in wellness, but are not specific interventions for hallucinations, if they occur.

**Test-Taking Strategy:** Use the process of elimination. Options 1, 2, and 3 are interventions that a client can carry out to aid wellness. Option 4 is a specific agreement to seek help and evidences self-responsible commitment and control over one's own behavior. Review teaching points for a client with a history of hallucinations if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Mental Health

**Reference:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., p. 269). St. Louis: Mosby.

### 916. 3

**Rationale:** Clients who are withdrawn may be immobile and mute and may require consistent, repeated approaches. Communication with withdrawn clients requires much patience from the nurse. Interventions include the establishment of interpersonal contact. The nurse facilitates communication with the client by sitting in silence, asking open-ended questions, and pausing to provide opportunities for the client to respond.

**Test-Taking Strategy:** Eliminate option 2 because the client would not be left alone. Option 4 relies on other clients to care for this client, which is an inappropriate expectation. Asking direct questions of this client is not therapeutic. Option 3 provides for client supervision and communication as appropriate. Review care of a client with catatonic stupor if this question was difficult.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**References:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., pp. 259–260). St. Louis: Mosby.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 277). St. Louis: Saunders.

### 917. 2

**Rationale:** Disturbed thought process related to paranoia is the client's problem, and the plan of care must address this problem. The client is experiencing paranoia and is distrustful and suspicious of others. The members of the health care team need to establish a rapport and trust with the client. Laughing or whispering in front of the client would be counterproductive. Options 1, 3, and 4 ask the client to trust on a multitude of levels. These options are actions that are too intrusive for a client who is paranoid.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding this disorder to answer the question. Noting that the client has paranoia will direct you to option 2. Review this disorder if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 355). St. Louis: Mosby.

### ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

**918. 1, 3, 4, 6**

**Rationale:** Interventions for dealing with the client exhibiting manipulative behavior include setting clear, consistent, and enforceable limits on manipulative behaviors; being clear with the client regarding the consequences of exceeding limits set; following through with the consequences in a nonpunitive manner; and assisting the client in identifying means of setting limits on personal behaviors. Enforcing rules and informing the client that he or she will not be allowed to attend therapy groups is a violation of a client's rights.

Ensuring that the client knows that he or she is not in charge of the nursing unit is inappropriate; power struggles need to be avoided.

**Test-Taking Strategy:** Focus on the subject, manipulative behavior. Recalling clients' rights and that power struggles need to be avoided will assist in selecting the correct interventions. Review care of the client with manipulative behavior if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**References:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 385). St. Louis: Mosby.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 259). St. Louis: Saunders.

# Addictions

## I. EATING DISORDERS

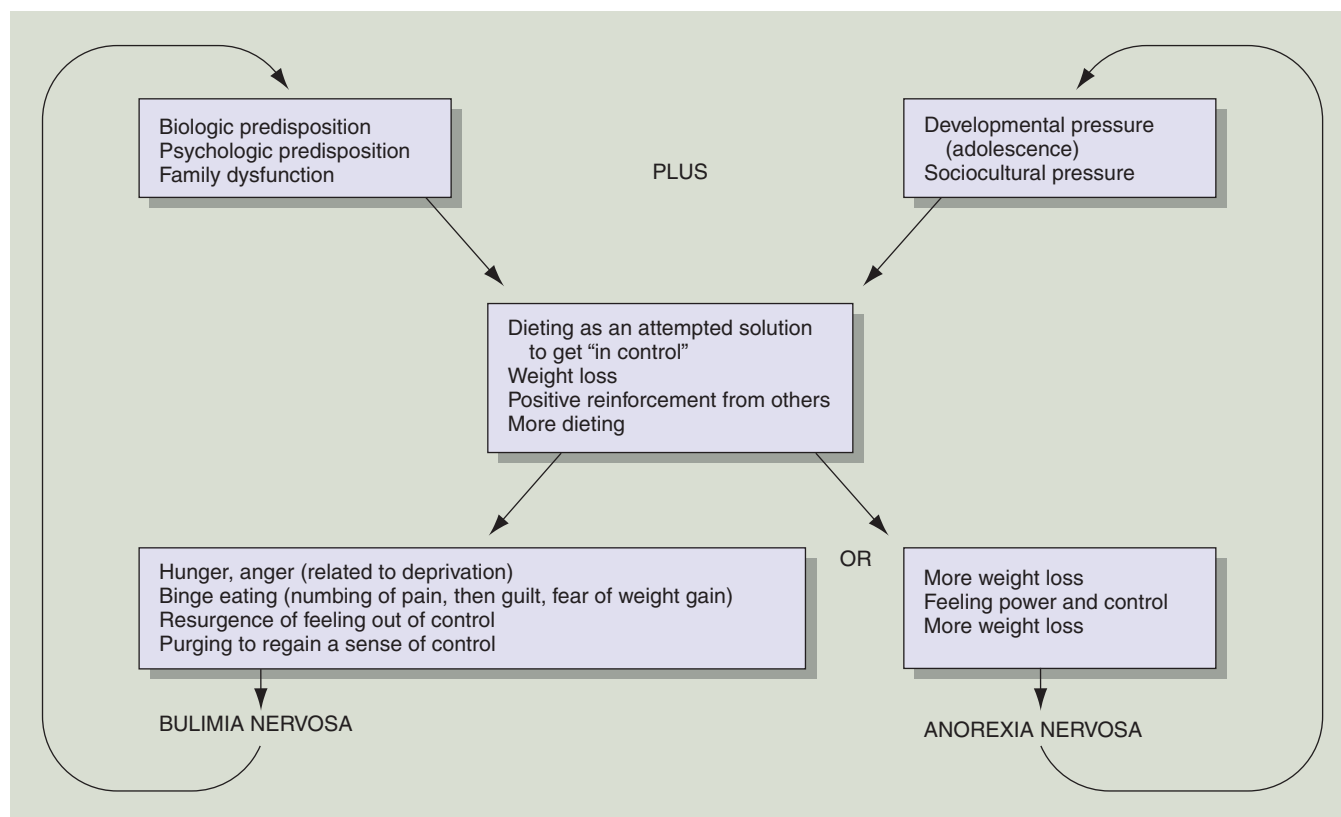

- A.** Description: Eating disorders are characterized by uncertain self-identification and grossly disturbed eating habits (Fig. 75-1).
- B.** Compulsive overeating
1. Compulsive overeating is binge-like overeating without purging.
  2. Food consumption is out of the individual's control and occurs in a stereotyped fashion.
  3. The client may be repulsed by eating, and the eating relieves tension but does not produce pleasure.
  4. The client is aware that eating patterns are abnormal and feels depressed after eating.
  5. The client eats secretly during a binge and consumes high-calorie and easily digestible food.
  6. The client repeatedly tries to diet, but without success.
  7. The client feels helpless and hopeless about weight.
  8. When experiencing guilt, anger, depression, boredom, loneliness, inadequacy, or ambivalence, the client responds by eating.
- C.** Anorexia nervosa
1. Description
    - a. Onset often is associated with a stressful life event.
    - b. The client intensely fears obesity.
    - c. Body image is distorted, and the client has a disturbed self-concept.
    - d. The client is preoccupied with foods that prevent weight gain and has a phobia against foods that produce weight gain.
    - e. The eating disorder can be life-threatening.
    - f. Death can occur from starvation, **suicide**, cardiomyopathies, or electrolyte imbalance.
  2. Assessment
    - a. Refusal to eat and appetite loss
    - b. Appetite denial
    - c. Feelings of lack of control
    - d. Self-induced vomiting and self-administered enemas
    - e. Compulsive exercising

- f. Overachiever and perfectionist
- g. Decreased temperature, pulse, and blood pressure
- h. Weight loss
- i. Gastrointestinal disturbances
- j. Constipation
- k. Electrolyte imbalances
- l. Scaly, dry skin
- m. Presence of lanugo on extremities
- n. Sleep disturbances
- o. Hormone deficiencies
- p. Amenorrhea for at least three consecutive menstrual periods
- q. Teeth and gum deterioration
- r. Cyanosis and numbness of extremities
- s. Esophageal varices from vomiting
- t. Bone degeneration

 The client with an eating disorder experiences an altered body image. 

- D.** Bulimia nervosa
1. Description
    - a. The client indulges in eating binges followed by purging behaviors.
    - b. Most clients remain within a normal weight range, but think that their lives are dominated by the eating-related conflict.
  2. Assessment
    - a. Preoccupied with body shape and weight
    - b. Consumption of high-calorie food in secret; guilt about secretive eating
    - c. Binge-purge syndrome
    - d. Attempts to lose weight through diets, vomiting, enemas, cathartics, and amphetamines or diuretics
    - e. Has a need to control, yet experiences feelings of powerlessness or loss of control
    - f. Low self-esteem
    - g. Poor interpersonal relationships
    - h. Decreased or absence of interest in sex
    - i. Mood swings
    - j. Electrolyte imbalances

▲ **FIGURE 75-1** Cycle of eating disorders. (From Fortinash, K., & Holoday-Worret, P. [2008]. *Psychiatric mental health nursing* [4th ed.]. St. Louis: Mosby.)

k. Loss of tooth enamel and dental decay

l. Stomach ulcers and rectal bleeding

m. Esophageal varices from vomiting

n. Cardiac disease and hypertension

**E. Interventions:** Clients with an eating disorder

1. Assess the client's nutritional status and the severity of any medical problems.
2. Establish a one-to-one therapeutic relationship with the client; the nurse needs to establish trust and recognize any client reluctance to establish a relationship.
3. Establish a contract with the client concerning the nutritional plan for the day.
4. Assist the client to identify precipitants to the eating disorder.
5. Encourage the client to express feelings about the eating behavior and about how the client feels about his or her body.
6. Be accepting and nonjudgmental.
7. Work with the client on exploring self-concept and establishing identity
8. Implement behavior modification techniques.
9. Supervise the client during mealtimes and for a specified period after meals.
10. Set a time limit for each meal.
11. Provide a pleasant, relaxed environment for eating.

12. Monitor for signs of physical complications related to the eating disorder.

13. Record intake and output.

14. Weigh the client daily at the same time, using the same scale, after the client voids.

15. When weighing the client, ensure that the client is wearing the same clothing as when the previous weight was taken.

16. Monitor and restore fluid and electrolyte balance.

17. Monitor elimination patterns.

18. Assess and limit the client's activity level.

19. Encourage the client to participate in diversional activities.

20. Assess the client's suicidal potential.

21. Administer antidepressant medication if prescribed.

22. Encourage psychotherapy.

23. Refer the client to support groups.

## II. SUBSTANCE ABUSE DISORDERS

**A. Description:** Substance **abuse** disorders cause behavioral and physiological changes (Box 75-1).

**B. Substance dependence**

1. Substance dependence is a pattern of repeated use of a substance, which usually results in tolerance, withdrawal, and compulsive drug-taking behavior.

**Box 75-1 CAGE Screening Questionnaire**

- C** Have you ever felt the need to cut down on your drinking/drug use?
- A** Have you ever been annoyed at criticism of your drinking/drug use?
- G** Have you ever felt guilty about something that you have done when you have been drinking or taking drugs?
- E** Have you ever had an eye opener—drinking or taking drugs first thing in the morning to get going or to avoid withdrawal symptoms?

- 2. The client takes substances in larger amounts and over longer periods than was intended.
- 3. The client has the desire to cut down, but efforts to decrease or discontinue use are unsuccessful.
- 4. Daily activities revolve around the use of a substance.

 Screening tools are available to assess a substance abuse disorder, including Michigan Alcohol Screening Test (MAST), Drug Abuse Screening Test (DAST), and CAGE screening questionnaire.

-  **C.** Substance tolerance is the need for increased amounts of the substance to achieve the desired effect.
- D.** Substance **abuse**
  - 1. The client recurrently uses substances.
  - 2. The client experiences recurrent, significant harmful consequences related to the use of substances.
  - 3. The client may have legal issues to resolve, and involvement with the legal system is common.
-  **E.** Substance withdrawal
  - 1. Physiological and substance-specific cognitive symptoms occur.
  - 2. Substance withdrawal occurs when an individual experiences a decrease in blood levels of a substance to which the individual is physiologically dependent.
- F.** Other factors to consider in a client with a substance-related disorder
  - 1. Rebellion and peer group pressure in adolescence may contribute to the onset of substance use.
  - 2. Substance use may become a coping mechanism for decreasing physical and emotional pain.
  - 3. Depression may precede or occur as a result of or in association with substance use.
  - 4. Grief and loss may be associated with substance use.
- G.** Dysfunctional behaviors related to substance **abuse**
  - 1. Preoccupation with obtaining and using substance
  - 2. Manipulation to avoid consequences of behavior
  - 3. Impulsiveness
  - 4. Anger, including physical and verbal **abuse**

- 5. Avoidance of relationships
- 6. Sense of self-importance and requiring special treatment
- 7. Denial—blaming everything but the substance use for problems
- 8. Use of rationalization and projection to justify unacceptable behavior
- 9. Likely to be involved in codependent relationships whereby a significant other also unknowingly serves as a significant enabler
- 10. Low self-esteem
- 11. Depression

**III. ALCOHOL ABUSE**

- A.** Description
    - 1. Alcohol is a central nervous system (CNS) depressant affecting all body tissues.
    - 2. Physical dependence is a biological need for alcohol to avoid physical withdrawal symptoms, whereas psychological dependence refers to craving for the subjective effect of alcohol.
  - B.** Risk factors
    - 1. Biological predisposition; genetic and familial predisposition may also be a risk factor.
    - 2. Depressed and highly anxious characteristics
    - 3. Low self-esteem
    - 4. Poor self-control
    - 5. History of rebelliousness, poor school performance, delinquency
    - 6. Poor parental relationships
  - C.** Assessment
    - 1. Slurred speech
    - 2. Uncoordinated movements
    - 3. Unsteady gait
    - 4. Restlessness
    - 5. Belligerence
    - 6. Confusion
    - 7. Sneaking drinks, drinking in the morning, experiencing blackouts
    - 8. Binge drinking
    - 9. Arguments about drinking
    - 10. Missing work
    - 11. Increased tolerance to alcohol
    - 12. Intoxication, with blood alcohol levels of 0.1% (100 mg alcohol/dL blood) or greater
-  Part of the assessment should include the type of alcohol, how much consumed, and for how many years.
- D.** Psychological symptoms
    - 1. Depression
    - 2. Hostility
    - 3. Suspiciousness
    - 4. Rationalization
    - 5. Irritability
    - 6. Isolation

7. Decrease in inhibitions
8. Decrease in self-esteem
9. Denial that a problem exists

**E.** Complications associated with chronic alcohol use

1. Vitamin deficiencies
  - a. Vitamin B deficiency causing peripheral neuropathies
  - b. Thiamine deficiency, causing Korsakoff's syndrome
2. Alcohol-induced persistent amnesic disorder, causing severe memory problems
3. Wernicke's encephalopathy, causing confusion, ataxia, and abnormal eye movements
4. Hepatitis; cirrhosis of the liver
5. Esophagitis and gastritis
6. Pancreatitis
7. Anemias
8. Immune system dysfunctions
9. Brain damage
10. Peripheral neuropathy
11. Cardiac disorders

#### IV. ALCOHOL WITHDRAWAL

**A.** Description

1. Early signs develop within a few hours after cessation of alcohol intake.
2. These signs peak after 24 to 48 hours and then rapidly disappear, unless the withdrawal progresses to alcohol withdrawal delirium.
3. At the onset of withdrawal (Box 75-2), follow agency protocol using specified withdrawal assessment scales as indicated by unit or agency policy.
4. Chlordiazepoxide (Librium) is the most commonly prescribed medication for acute alcohol withdrawal and is usually given orally, unless a more immediate onset is required (any benzodiazepine would decrease the withdrawal symptoms because of cross-tolerance; see Chapter 77 for a list of benzodiazepines).

##### Box 75-2 Early Signs of Alcohol Withdrawal

Anorexia (nausea and vomiting may occur)  
 Anxiety  
 Easily startled  
 Hyperalertness  
 Hypertension  
 Insomnia  
 Irritability  
 Jerky movements  
 Possibly experiences hallucinations, illusions, delusions, or vivid nightmares  
 Possibly reports a feeling of "shaking inside"  
 Seizures (usually appear 7 to 48 hours after cessation of alcohol)  
 Tachycardia  
 Tremors

5. An intramuscular injection of vitamin B<sub>1</sub> (thiamine) followed by several days of oral administration is administered to prevent Wernicke's encephalopathy.

**B.** Withdrawal (see Box 75-2)

- C.** Withdrawal delirium: The state of delirium usually peaks 48 to 72 hours after cessation or reduction of intake (although can occur later) and lasts 2 to 3 days (Box 75-3).

**!** Withdrawal delirium is a medical emergency. Death can occur from myocardial infarction, fat emboli, peripheral vascular collapse, electrolyte imbalance, aspiration pneumonia, or suicide.

**D.** Interventions

1. Provide care in a nonjudgmental manner.
  2. Check the client frequently.
  3. Monitor vital signs and neurological signs (every 15 minutes) and provide one-to-one supervision.
  4. Provide a quiet, nonstimulating environment; encourage a family member (one at a time) to stay with the client to minimize anxiety.
  5. Orient the client frequently.
  6. Explain all treatments and procedures in a quiet and simple manner.
  7. Initiate seizure precautions.
  8. Administer sedating or anticonvulsant medication as prescribed.
  9. Provide small, frequent, high-carbohydrate foods (administer antiemetic before meals as needed).
  10. Monitor intake and output.
  11. Administer vitamins (multivitamin, vitamin B complex including thiamine, and vitamin C)
  12. Assist client with activities of daily living and assist with ambulation if stable.
  13. Allow client to express fears.
- E.** Disulfiram (Antabuse) therapy
1. Description
    - a. Disulfiram is an alcohol deterrent that may be prescribed for alcoholic dependence.

##### Box 75-3 Manifestations of Alcohol Withdrawal Delirium

Agitation  
 Anorexia  
 Anxiety  
 Delirium  
 Diaphoresis  
 Disorientation with fluctuating levels of consciousness  
 Fever (temperature 100° F to 103° F)  
 Hallucinations and delusions  
 Insomnia  
 Tachycardia and hypertension

- b. The medication sensitizes the client to alcohol, so a disulfiram-alcohol reaction occurs if alcohol is ingested.
  - c. The client must abstain from alcohol for at least 12 hours before the initial dose is administered.
  - d. Adverse effects usually begin within several minutes to ½ half after consuming alcohol and may last ½ to 2 hours.
  - e. The client must avoid drinking alcohol for 14 days after disulfiram therapy has been discontinued; otherwise, the client is at risk for a disulfiram-alcohol reaction.
2. Adverse reactions
    - a. Facial flushing
    - b. Sweating
    - c. Throbbing headache
    - d. Neck pain
    - e. Nausea and vomiting
    - f. Hypotension
    - g. Tachycardia
    - h. Respiratory distress
  3. Client education
    - a. Educate about the effects of the medication.
    - b. Ensure that the client agrees to abstain from alcohol and any alcohol-containing substances.
    - c. Instruct the client that the effects of the medication may occur for several days after discontinuance.
    - d. Other medications used to assist with cravings include acamprosate calcium (Campral) and naltrexone (ReVia)
- F. Dealing with the client who abuses alcohol** (Boxes 75-4 and 75-5)

**!** Instruct the client who is on disulfiram (Antabuse) therapy to avoid the use of substances that contain alcohol, such as cough medicines, rubbing compounds, vinegar, mouthwashes, and aftershave lotions. The client needs to read the labels of all products.

#### Box 75-4 Dealing With the Client Who Abuses Alcohol

Direct the client's focus to the substance abuse problem. Identify situations that precipitate angry feelings with the client.

Set limits on manipulative behavior and verbal and physical abuse.

Hold the client firmly to reasonable limits, consistently reinforcing rules, with reasonable consequences for breaking rules.

Hold the client accountable for all behaviors.

Assist the client to explore strengths and weaknesses.

Encourage the client to focus on strengths if the client is losing control.

Encourage the client to participate in group therapy and support groups.

## V. DRUG DEPENDENCY

- A. CNS depressants**
  1. CNS depressants include alcohol, benzodiazepines, and barbiturates and act as a depressant, sedative, or hypnotic.
  2. Intoxication (Box 75-6)
  3. Overdose can produce cardiovascular or respiratory depression, coma, shock, seizures, and death.
  4. Overdose: If the client is awake, vomiting is induced and activated charcoal is administered; if the client is comatose, establishment and maintenance of an airway and gastric lavage with activated charcoal are the priorities; seizure precautions are indicated.
  5. Flumazenil (Romazicon) intravenously may be used for benzodiazepine overdose to reverse the effects.
  6. Withdrawal effects include nausea, vomiting, tachycardia, diaphoresis, irritability, tremors, insomnia, and seizures; withdrawal must be treated with a carefully titrated similar drug (abrupt withdrawal can lead to death).
  7. Withdrawal from CNS depressants such as barbiturates is generally treated with a barbiturate such as phenobarbital or a long-acting benzodiazepine.
- B. CNS stimulants**
  1. CNS stimulants include substances such as amphetamines, cocaine, and crack.
  2. Intoxication (Box 75-7)

#### Box 75-5 Therapies for Clients With Substance Abuse and Their Families

Behavior therapy, aversion conditioning with disulfiram (Antabuse) or another medication

Hospitalization

Psychotherapy (individual, group, family)

Support groups such as Alcoholics Anonymous; Narcotics Anonymous; Pills Anonymous; Al-Anon, Al-a-Teen, or Narc-Anon (for family members and friends of alcoholics or addicts); and Adult Children of Alcoholics

Transitional living programs (halfway houses)

#### Box 75-6 Intoxication: Central Nervous System Depressants

Drowsiness

Hypotension

Impairment of memory, attention, judgment, and social or occupational functioning

Incoordination and unsteady gait

Irritability

Slurred speech

**Box 75-7 Intoxication: Central Nervous System Stimulants**

Dilated pupils  
 Euphoria  
 Hypertension  
 Impairment of judgment and social or occupational functioning  
 Insomnia  
 Nausea and vomiting  
 Paranoia, delusions, hallucinations  
 Potential for violence  
 Tachycardia

**Box 75-8 Intoxication: Opioids**

Constricted pupils  
 Decreased respirations  
 Drowsiness  
 Euphoria  
 Hypotension  
 Impairment of memory, attention, and judgment  
 Psychomotor retardation  
 Slurred speech

3. Overdose can produce respiratory distress, ataxia, hyperpyrexia, seizures, coma, stroke, myocardial infarction, and death.
4. Overdose is treated with antipsychotics and management of associated effects.
5. Withdrawal effects include fatigue, depression, agitation, apathy, anxiety, insomnia, disorientation, lethargy, and craving.
6. Withdrawal is treated with antidepressants, a dopamine agonist, or bromocriptine (Parlodel); withdrawal is primarily supportive, particularly when dealing with the severe depression and suicidal ideation that accompanies stimulant withdrawal.

**C. Opioids**

1. Opioids include substances such as opium, heroin, meperidine (Demerol), morphine sulfate, codeine sulfate, methadone (Dolophine), hydromorphone (Dilaudid), OxyContin (oxycodone), hydrocodone (Lortab), and fentanyl (Sublimaze).
2. Intoxication (Box 75-8)
3. Overdose can produce respiratory depression, shock, coma, seizures, and death.
4. Overdose is treated with an opioid antagonist such as naloxone (Narcan).
5. Withdrawal effects include yawning, insomnia, irritability, rhinorrhea, diaphoresis, cramps, nausea and vomiting, muscle aches, chills, fever, lacrimation, and diarrhea.
6. Withdrawal may be treated by methadone detoxification or tapering dosage with other opioids.

**Box 75-9 Intoxication: Hallucinogens**

Agitation and belligerence  
 Anxiety and depression  
 Bizarre behavior, regressive behavior, or violent behavior  
 Blank stare  
 Diaphoresis  
 Dilated pupils  
 Elevated vital signs including blood pressure  
 Hallucinations  
 Impairment of judgment and social and occupational functioning  
 Incoordination  
 Muscular rigidity and chronic jerking  
 Paranoia  
 Seizures  
 Tachycardia  
 Tremors

7. Clonidine (Catapres), an  $\alpha$ -adrenergic blocker, assists in reducing the severity of sympathetic nervous system-generated withdrawal discomfort.
8. Specific measures for symptom management may also be used, such as bismuth subsalicylate (Kaopectate) for diarrhea and acetaminophen (Tylenol) for muscle aches.

**D. Hallucinogens**

1. Hallucinogens include substances such as lysergic acid diethylamide (LSD), mescaline (peyote), psilocybin (mushrooms), and phencyclidine (PCP).
2. Intoxication (Box 75-9)
3. Overdose effects of LSD, peyote, and psilocybin include psychosis, brain damage, and death; effects of PCP include psychosis, hypertensive **crisis**, hyperthermia, seizures, and respiratory arrest.
4. Treatment (LSD, peyote, psilocybin) involves low environmental stimuli (speak slowly, clearly, and in a low voice) and medications to treat anxiety.
5. Treatment (PCP) involves possible gastric lavage (if alert); treatment to acidify the urine to assist in excreting drug; and interventions to treat behavioral disturbances, hyperthermia, hypertension, and respiratory distress.
6. Withdrawal is primarily supportive and may include medications to target particular problem behaviors, such as agitation.

**E. Inhalants**

1. Inhalants include gases or liquids such as butane, paint thinner, paint and wax removers, airplane glue, nail polish remover, and nitrous oxide.
2. Intoxication (Box 75-10)
3. Overdose can cause damage to the nervous system and death.
4. Management of withdrawal is mainly supportive including treating affected body systems.

**Box 75-10 Intoxication: Inhalants**

Enhancement of sexual pleasure  
 Euphoria  
 Excitation followed by drowsiness, lightheadedness, disinhibition, and agitation  
 Giggling and laughter

**F. Marijuana (*Cannabis sativa*)**

1. Marijuana generally is smoked, but can be ingested.
2. Marijuana causes euphoria, detachment, relaxation, talkativeness, slowed perception of time, anxiety, and paranoia.
3. Long-term dependence can result in lethargy, difficulty concentrating, memory loss, and possibly chronic respiratory disorders.
4. Withdrawal management is mainly supportive.

**G. Other recreational and club drugs**

1. Methylenedioxymethamphetamine (MDMA, ecstasy), gamma hydroxybutyrate (GHB), methamphetamine (crank, meth, crystal meth), and ketamine (special K)
2. Effects include euphoria, increased energy, increased self-confidence, and increased sociability.
3. Adverse effects include hyperthermia, rhabdomyolysis, renal failure, hepatotoxicity, depression, panic attacks, psychosis, cardiovascular collapse, and death.
4. The use of over-the-counter medications containing ephedrine or pseudoephedrine to manufacture illegal supplies of methamphetamine has led many states to adopt laws requiring limited sales and signatures for the purchase of these medications.
5. Programs for **addiction** also address nicotine withdrawal and the pharmacological and psychotherapeutic interventions for this problem, such as nicotine patches, nicotine inhalers, and bupropion (Zyban) for the reduction of withdrawal and cravings.
6. Anabolic steroids have also gained increased attention as increasingly adverse events, including death, have become more widely publicized.

**H. Interventions: Withdrawal (Box 75-11)**

1. Initiate seizure precautions.
2. Hydrate the client.
3. Monitor vital signs every hour.
4. Monitor intake and output.
5. Orient the client frequently.
6. Maintain minimal stimuli.
7. Approach the client in an accepting and non-judgmental manner.
8. Direct the client's focus to the substance **abuse** problem.

**Box 75-11 Withdrawal: Nursing Care**

Obtain information regarding the type of drug and amount consumed.  
 Assess vital signs.  
 Remove unnecessary objects from the environment.  
 Provide one-to-one supervision if necessary.  
 Provide a quiet, calm environment with minimal stimuli.  
 Maintain client orientation.  
 Ensure client's safety by implementing seizure precautions.  
 Use security devices if necessary and prescribed to prevent client from harming self and others.  
 Provide for physical needs.  
 Provide food and fluids as tolerated.  
 Administer medications as prescribed to decrease withdrawal symptoms.  
 Collect blood and urine samples for drug screening.

9. Assist the client with identifying situations that precipitate angry feelings.
  10. Assist the client to deal with emotions.
  11. Limit the client's placing blame or rationalizing to explain the substance **abuse** problem.
  12. Assist the client to use assertive techniques rather than manipulation to meet needs.
  13. Set limits on manipulative behavior and verbal and physical **abuse**.
  14. Maintain firm and reasonable limits, consistently reinforcing rules, with reasonable consequences for breaking rules.
  15. Hold the client accountable for all behaviors.
  16. Assist the client to explore strengths and weaknesses.
  17. Encourage the client to focus on strengths if the client is losing control.
  18. Encourage the client to participate in unit activities.
  19. Encourage the client to participate in group therapy and support groups.
- I. Dual diagnoses**
1. Sometimes the use of alcohol and drugs masks underlying psychiatric pathology.
  2. Psychiatric pathology may also be precipitated by substance use and **abuse**.
  3. When psychiatric disorders and substance **abuse** are present together, it is often referred to as dual diagnosis.
  4. Separating psychiatric diagnosis from substance dependence can be done only over time after a sustained period of abstinence.
- J. Addiction and abuse in health care professionals:**  
 Suspicious signs
1. Frequently reporting that drugs have been wasted without being witnessed by another nurse

2. Administering maximum dosages of controlled substances when other nurses do not
3. A variance in usual pain relief in the absence of a change in dosage or frequency in their clients
4. Work patterns include the following: Always volunteering to carry narcotic (opioids) keys; choosing shifts in which less supervision is present; choosing work areas where the use of controlled substances is high, such as critical care units, operating room, anesthesia, and trauma units.
5. Nurses have a professional and ethical obligation to report impaired coworkers.
6. Most impaired nurses are able to return to work through the State Board of Nursing assistance and monitoring programs; such programs usually require strict adherence to clearly stated rules and regular reports and drug screens.

**K. Codependency issues**

1. Codependency refers to the presence of coexisting behaviors present in a significant other, which serves to enable the addict or alcoholic to continue the irresponsible patterns of use without experiencing consequences.
2. Examples of codependency: Paying bills for which the addict or alcoholic is responsible, bailing the addict or alcoholic out of jail, helping the addict or alcoholic to call in sick.
3. It is important to address codependency issues with the family to maximize the chance for recovery of the client with the **addiction** and the person with the codependent behaviors.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 919.** A home health nurse visits a client at home and determines that the client is dependent on drugs. Which of the following assessment questions would assist the nurse to provide appropriate nursing care?
1. "Why did you get started on these drugs?"
  2. "How much do you use and what effect does it have on you?"
  3. "How long did you think you could take these drugs without someone finding out?"
  4. The nurse does not ask any questions for fear that the client is in denial and will throw the nurse out of the home.
- 920.** A female client with anorexia nervosa is a member of a pre-discharge support group. The client verbalizes that she would like to buy some new clothes, but her finances are limited. Group members have brought some used clothes to the client to replace the client's old clothes. The client believes that the new clothes were much too tight and has reduced her calorie intake to 800 calories daily. A nurse evaluates this behavior as:
1. Normal behavior
  2. Evidence of the client's disturbed body image
  3. Regression as the client is moving toward the community
  4. Indicative of the client's ambivalence about hospital discharge
- 921.** A nurse determines that the wife of an alcoholic client is benefiting from attending an Al-Anon group when the nurse hears the wife say:
1. "I no longer feel that I deserve the beatings my husband inflicts on me."
  2. "My attendance at the meetings has helped me to see that I provoke my husband's violence."
  3. "I enjoy attending the meetings because they get me out of the house and away from my husband."
  4. "I can tolerate my husband's destructive behaviors now that I know they are common with alcoholics."
- 922.** A hospitalized client with a history of alcohol abuse tells a nurse, "I am leaving now. I have to go. I don't want any more treatment. I have things that I have to do right away." The client has not been discharged. The client is scheduled for an important diagnostic test to be performed in 1 hour. After the nurse discusses the client's concerns with the client, the client dresses and begins to walk out of the hospital room. The appropriate nursing action is to:
1. Call the nursing supervisor.
  2. Call security to block all exit areas.
  3. Restrain the client until the physician can be reached.
  4. Tell the client that the client cannot return to this hospital again if the client leaves now.
- 923.** A nurse is preparing to perform an admission assessment on a client with a diagnosis of bulimia nervosa, and a nursing student will be observing the nurse. The nurse asks the student about the expected assessment findings and determines that the student needs to research the disorder further if the student states that which of the following is a characteristic finding?
1. Dental decay
  2. Loss of tooth enamel
  3. Electrolyte imbalances
  4. Body weight well below ideal range

**924.** A nurse is caring for a female client who was admitted to the mental health unit recently for anorexia nervosa. The nurse enters the client's room and notes that the client is engaged in rigorous push-ups. Which nursing action is appropriate?

1. Interrupt the client and weigh her immediately.
2. Interrupt the client and offer to take her for a walk.
3. Allow the client to complete her exercise program.
4. Tell the client that she is not allowed to exercise rigorously.

**925.** A client with a diagnosis of anorexia nervosa, who is in a state of starvation, is in a two-bed room. A newly admitted client will be assigned to this client's room. Which of the following clients would be an appropriate choice as this client's roommate?

1. A client with pneumonia
2. A client receiving diagnostic tests
3. A client who thrives on managing others
4. A client who could benefit from the client's assistance at mealtime

**926.** A nurse is monitoring a client who abuses alcohol for signs of alcohol withdrawal. Which of the following would alert the nurse to the potential for withdrawal delirium?

1. Hypotension, ataxia, hunger
2. Stupor, agitation, muscular rigidity
3. Hypotension, coarse hand tremors, agitation
4. Hypertension, changes in level of consciousness, hallucinations

**927.** The spouse of a client admitted to the mental health unit for alcohol withdrawal says to a nurse, "I should get out of this bad situation." The most helpful response by the nurse would be:

1. "Why don't you tell your husband about this?"
2. "What do you find difficult about this situation?"
3. "This is not the best time to make that decision."
4. "I agree with you. You should get out of this situation."

### Alternate Item Format: Multiple Response

**928.** Select the appropriate interventions for caring for a client in alcohol withdrawal. **Select all that apply.**

- 1. Monitor vital signs.
- 2. Maintain NPO status.
- 3. Provide a safe environment.
- 4. Address hallucinations therapeutically.
- 5. Provide stimulation in the environment.
- 6. Provide reality orientation as appropriate.

## ANSWERS

### 919. 2

**Rationale:** Whenever the nurse carries out an assessment for a client who is dependent on drugs, it is best for the nurse to attempt to elicit information by being nonjudgmental and direct. Option 1 is incorrect because it is judgmental and off focus and reflects the nurse's bias. Option 3 is incorrect because it is judgmental, insensitive, and aggressive, which is nontherapeutic. Option 4 is incorrect because it indicates passivity on the nurse's part and uses rationalization to avoid the therapeutic nursing intervention.

**Test-Taking Strategy:** Use the process of elimination and therapeutic communication techniques to answer the question. Also, focus on the subject, provide appropriate nursing care. Review assessment of a client who is a substance abuser if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Mental Health

**Reference:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., pp. 316–317). St. Louis: Mosby.

### 920. 2

**Rationale:** Disturbed body image is a concern with clients with anorexia nervosa. Although the client may struggle with ambivalence and show regressed behavior, the client's coping pattern relates to the basic issue of disturbed body image. The nurse should address this need in the support group.

**Test-Taking Strategy:** Use the process of elimination, focusing on the information provided in the question, which is related directly to an altered body image. This should direct you to the correct option. Review the needs of a client with anorexia nervosa if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 466, 472). St. Louis: Mosby.

### 921. 1

**Rationale:** Al-Anon support groups are a protected, supportive opportunity for spouses and significant others to learn what to expect and to obtain excellent pointers about successful behavioral changes. Option 1 is the healthiest response because it exemplifies an understanding that the alcoholic

partner is responsible for his behavior and cannot be allowed to blame family members for loss of control. In option 2, the nonalcoholic partner should not feel responsible when the spouse loses control. Option 4 indicates that the wife remains codependent. Option 3 indicates that the group is viewed as an escape, not a place to work on issues.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *benefiting from attending an Al-Anon group*. This will direct you to option 1. Review the purpose of this group if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 431, 449). St. Louis: Mosby.

### 922. 1

**Rationale:** A nurse can be charged with false imprisonment if a client is made to believe wrongfully that he or she cannot leave the hospital. Most health care facilities have documents that the client is asked to sign relating to the client's responsibilities when the client leaves against medical advice. The client should be asked to sign this document before leaving. The nurse should request that the client wait to speak to the physician before leaving, but if the client refuses to do so, the nurse cannot hold the client against the client's will. Restraining the client and calling security to block exits constitutes false imprisonment. All clients have a right to health care and cannot be told otherwise.

**Test-Taking Strategy:** Use the process of elimination. Keeping the concept of false imprisonment in mind, eliminate options 2 and 3 because they are comparable or alike. Eliminate option 4, knowing that all clients have a right to health care. From the options presented, the best action is option 1. Review the points related to false imprisonment if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**Reference:** Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 528). St. Louis: Saunders.

### 923. 4

**Rationale:** Clients with bulimia nervosa initially may not appear to be physically or emotionally ill. They are often at or slightly below ideal body weight. On further inspection, a client exhibits dental decay and loss of tooth enamel if the client has been inducing vomiting. Electrolyte imbalances are present.

**Test-Taking Strategy:** Focus on the subject, bulimia nervosa, and note the strategic words *needs to research*. Eliminate options 1 and 2 because they are comparable or alike. From the remaining options, recall that in anorexia nervosa the body weight is normally well below ideal body weight. Option 4 is a characteristic sign of anorexia nervosa, not bulimia nervosa. Review the characteristics of these disorders if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Mental Health

**References:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., p. 397). St. Louis: Mosby.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 200). St. Louis: Saunders.

### 924. 2

**Rationale:** Clients with anorexia nervosa frequently are preoccupied with rigorous exercise and push themselves beyond normal limits to work off caloric intake. The nurse must provide for appropriate exercise and place limits on rigorous activities. Options 1, 3, and 4 are inappropriate nursing actions.

**Test-Taking Strategy:** Use the process of elimination and focus on the client's diagnosis. Also, focus on the need for the nurse to set firm limits with clients who have this disorder. If you had difficulty with this question, review interventions for the client with anorexia nervosa.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 470). St. Louis: Mosby.

### 925. 2

**Rationale:** The client undergoing diagnostic tests is an acceptable roommate. The client with anorexia nervosa is most likely experiencing hematological complications, such as leukopenia. Having a roommate with pneumonia would place the client with anorexia nervosa at risk for infection. The client with anorexia nervosa should not be put in a situation in which the client can focus on the nutritional needs of others or being managed by others because this may contribute to sublimation and suppression of personal hunger.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words, *in a state of starvation*. Recalling the characteristics associated with anorexia nervosa will direct you to option 2. Review care of the client with anorexia nervosa if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Mental Health

**References:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 461–462). St. Louis: Mosby.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 199). St. Louis: Saunders.

### 926. 4

**Rationale:** Symptoms associated with withdrawal delirium typically include anxiety, insomnia, anorexia, hypertension, disorientation, hallucinations, changes in level of consciousness, agitation, fever, and delusions.

**Test-Taking Strategy:** Use the process of elimination. Review each option carefully to ensure that all the symptoms in the option are correct. Eliminate options 1 and 3 first, knowing

that hypertension rather than hypotension occurs. From the remaining options, recalling that the client who is stuporous is not likely to exhibit withdrawal delirium will direct you to option 4. Review these symptoms if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 434–435). St. Louis: Mosby.

### 927. 2

**Rationale:** The most helpful response is one that encourages the client to solve problems. Giving advice implies that the nurse knows what is best and can foster dependency. The nurse should not agree with the client, and the nurse should not request that the client provide explanations.

**Test-Taking Strategy:** Use therapeutic communication techniques. Eliminate option 1 because of the word *why*, which should be avoided in communication. Eliminate option 4 because the nurse is agreeing with the client. Eliminate option 3 because this option places the client's feelings on hold. Option 2 is the only option that addresses the client's feelings. Review therapeutic communication techniques if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 27–31, 189). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 928. 1, 3, 4, 6

**Rationale:** When the client is experiencing withdrawal from alcohol, the priority for care is to prevent the client from harming self or others. The nurse would provide a low stimulation environment to maintain the client in as calm a state as possible. The nurse would monitor the vital signs closely and report abnormal findings. The nurse would reorient the client to reality frequently and would address hallucinations therapeutically. Adequate nutritional and fluid intake need to be maintained.

**Test-Taking Strategy:** Use therapeutic communication techniques to assist in selecting the correct interventions. Also, recalling the characteristics associated with alcohol withdrawal will assist in answering correctly. Review these interventions if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**Reference:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., p. 392). St. Louis: Mosby.

# Crisis Theory and Intervention

## I. CRISIS INTERVENTION

### A. Description

1. **Crisis** is a temporary state of severe emotional disorganization caused by failure of **coping mechanisms** and lack of support.
2. The ability for decision making and problem solving is inadequate.
3. Treatment is aimed at assisting the client and the family through the stressful situation.

### B. Phases of a **crisis**

1. Phase 1: External precipitating event
2. Phase 2
  - a. Perception of the threat
  - b. Increase in anxiety
  - c. Client may cope or resolve the **crisis**.
3. Phase 3
  - a. Failure of coping
  - b. Increasing disorganization
  - c. Emergence of physical symptoms
  - d. Relationship problems
4. Phase 4
  - a. Mobilization of internal and external resources
  - b. Goal is to return the client to at least a precrisis level of functioning.

### C. Types of crises (Box 76-1)

### D. **Crisis** intervention

1. Treatment is immediate, supportive, and directly responsive to the immediate **crisis**.
2. Interventions are goal-directed.
3. Feelings of the client are acknowledged.
4. Intervention provides opportunities for expression and validation of feelings.
5. Connections are made between the meaning of the event and the **crisis**.
6. The client explores alternative **coping mechanisms** and tries out new behaviors.

## II. GRIEF

- A. Grief is a natural emotional response to loss that individuals must experience as they attempt to accept the loss.
- B. Grief usually involves moving through a series of stages or tasks to help resolve the grief (Box 76-2).

- C. Feelings associated with grief include anger, frustration, loneliness, sadness, guilt, regret, and peace.
- D. Healing can occur when the pain of the loss has lessened and the survivor has adapted to life without the deceased; the survivor continues to experience memories of the deceased.
- E. Types of grief
  1. Normal grief: Physical, emotional, cognitive, or behavioral reactions can occur; the process of resolution can take months to years.
  2. Anticipatory grief occurs before the loss and is associated with an acute, chronic, or terminal illness.
  3. Disenfranchised grief occurs when a loss is experienced and cannot be acknowledged openly (societal norms do not define the loss as a loss within its traditional definition).
  4. Dysfunctional grief occurs with prolonged emotional instability and a lack of progression to successful coping with the loss.
  5. Grief in children is based on the developmental level of the child (Box 76-3).

## III. LOSS

- A. Loss is the absence of something desired or previously thought to be available.
- B. Actual loss can be identified by others and can arise in response to or in anticipation of a situation.
- C. Perceived loss is experienced by one person and cannot be verified by others.
- D. Anticipatory loss is experienced before the loss occurs.
- E. Mourning
  1. Mourning is the outward and social expression of loss.
  2. Mourning may be dictated by cultural and religious beliefs.
- F. Bereavement
  1. Bereavement includes the inner feelings and the outward reactions of the survivor.
  2. Bereavement includes grief and mourning.

## IV. NURSE'S ROLE: GRIEF AND LOSS (Box 76-4)

- A. Allow ongoing opportunities for fully informed choices.

**Box 76-1 Types of Crises****Maturational**

Relates to developmental stages and associated role changes; examples include marriage, birth of a child, and retirement

**Situational**

Arises from an external source, is often unanticipated, and is associated with a life event that upsets an individual's or group's psychological equilibrium; examples include loss of a job or a change in job, change in financial status, death of a loved one, divorce, abortion, and severe physical or mental illness

**Adventitious**

Relates to a crisis of disaster or an event that is not a part of everyday life and is unplanned and accidental; this type of crisis may result from a natural disaster or catastrophic event, such as a flood, earthquake, hurricane, fire, tornado, war, riots, or act of terrorism, or a crime of violence, such as rape, assault, murder, or spousal or child abuse

**Box 76-2 The Grief Response****Stage 1: Shock and Disbelief**

Survivor may have feelings of numbness, difficulties with decision making, emotional outbursts, denial, and isolation.

**Stage 2: Experiencing the Loss**

Survivor may feel angry at the loved one who died or may feel guilt about the death.

Bargaining or depression or both also may occur in this stage.

**Stage 3: Reintegration**

Survivor begins to reorganize his or her life and accepts the reality of the loss.

- B.** Facilitate the grief process; assess the survivor's grief, and assist the survivor to feel the loss and complete the tasks of the grief process.
- C.** Grief affects survivors physically, psychologically, socially, and spiritually; a multidisciplinary team approach, including a bereavement specialist, facilitates the grief process.

 The nurse's role in the grief and loss process includes communicating with the client, family members, and significant other. The nurse must consider the survivor's culture, religion, family structure, individual life experiences, coping skills, and support systems.

**V. END-OF-LIFE ISSUES**

- A.** Description: End-of-life issues are related to death and dying.
- B.** Cultural and religious issues (see Chapter 6 and Box 6-4 for information regarding cultural and religious issues)

**Box 76-3 Grief in Children****Birth to 1 Year**

Infant has no concept of death.

Infant reacts to the loss of mother or caregiver.

**1 to 2 Years**

Toddler may see death as reversible.

Grief response occurs only to the death of the significant person in the toddler's life.

Toddler may scream, withdraw, or become disinterested in the environment.

**2 to 5 Years**

Child may see death as reversible.

Child has a sense of loss and is concerned about who will provide care.

Regressive or aggressive behavior may occur.

**5 to 9 Years**

Child begins to see death as permanent.

Child may feel responsible for the occurrence.

Child has difficulty concentrating.

**Preadolescent Through Adolescent**

Adolescent sees death as permanent.

Adolescent experiences a strong emotional reaction.

Adolescent may regress.

**Box 76-4 Communication Process**

Determine how much the client and family want to know. Determine whether there is a spokesperson for the family. Be aware of cultural and religious beliefs and how they may affect the communication process; consider personal space issues, eye contact, and touch.

Obtain an interpreter, if necessary.

Allow opportunity for informed choices.

Assist with the decision-making process if asked; use problem solving to assist in decision making, and avoid interjecting personal views or opinions.

Encourage expression of feelings, concerns, and fears.

Be honest, and let the client and family know that you will not abandon them.

Ask the client and family about their expectations and needs. Be a sensitive listener; sit in silence if necessary and appropriate.

Extend touch and hold the client's or family member's hand if appropriate.

Encourage reminiscing.

If you do not know what to do in a particular situation, seek assistance.

If you do not know what to say to a client or family who is talking about death, listen attentively and use therapeutic communication techniques, such as open-ended questions or reflection.

Acknowledge your own feelings; let the client and family know that the topic of conversation is a difficult one and that you do not know what to say.

Realize that it is acceptable to cry with the client and family during the grief process.

- C. Legal and ethical issues**
1. Outcomes related to care during illness and the dying experience should be based on the client's wishes.
  2. Issues for consideration may include organ and tissue donations, advance directives or other legal documents, withholding or withdrawing treatment, and cardiopulmonary resuscitation.
- D. Palliative care**
1. Palliative care focuses on caring interventions and symptom management rather than cure for diseases that no longer respond to treatment.
  2. Pain and symptoms are controlled; the dying client should be as pain-free and as comfortable as possible.
  3. Hospice care provides support and care for clients in the last phases of incurable diseases so that they might live as fully and as comfortably as possible; client and family needs are the focus of any intervention.
- E. Near-death physiological manifestations**
1. As death approaches, metabolism is reduced, and the body gradually slows down until all function ends.
  2. Sensory: The client experiences blurred vision, decreased sense of taste and smell, decreased pain and touch perception, and loss of blink reflex and appears to stare (hearing is believed to be the last sense lost).
  3. Respirations
    - a. Respirations may be rapid, slow, shallow, and irregular.
    - b. Respirations may be noisy and wet sounding (death rattle).
    - c. Cheyne-Stokes respiration is alternating periods of apnea and deep, rapid breathing.
- 4. Circulation**
- a. Heart rate slows, and blood pressure falls progressively.
  - b. Skin is cool to touch, and the extremities become pale, mottled, and cyanotic.
  - c. Skin is wax-like very near death.
- 5. Urinary output gradually decreases; incontinence may occur.**
- 6. Gastrointestinal motility and peristalsis diminish, leading to constipation, gas accumulation, and distention; a bowel movement may occur before death or at the time of death.**
- 7. Musculoskeletal system: The client gradually loses ability to move, has difficulty speaking and swallowing, and loses the gag reflex.**
- F. Death**
1. Death occurs when all vital organs and body systems cease to function.
  2. Generally, respirations cease first, and then the heartbeat stops a few minutes thereafter.
- G. Brain death occurs when the cerebral cortex stops functioning or is irreversibly damaged.**
- H. Nursing care**
1. Frequency of assessment depends on the client's stability (at least every 8 hours); as changes occur, assessment needs to be done more frequently.
  2. Physical care (Box 76-5)

**!** Avoid repeated, unnecessary assessments on a dying client. Assessment should be limited to obtaining essential data.

### Box 76-5 Physical Care of the Dying Client

#### **Pain**

Administer pain medication.  
Do not delay or deny pain medication.

#### **Dyspnea**

Elevate the head of the bed or position the client on his or her side.  
Administer supplemental oxygen.  
Suction fluids from the airway as needed.

#### **Skin**

Assess color and temperature.  
Assess for breakdown.  
Implement measures to prevent breakdown.

#### **Dehydration**

Maintain regular oral care.  
Encourage taking ice chips and sips of fluid.  
Do not force the client to eat or drink.  
Use moist cloths to provide moisture to the mouth.  
Apply lubricant to the lips and oral mucous membranes.

#### **Anorexia, Nausea, and Vomiting**

Provide antiemetics before meals.  
Have family members provide the client's favorite foods.  
Provide frequent small portions of favorite foods.

#### **Elimination**

Monitor urinary and bowel elimination.  
Place absorbent pads under the client and check frequently.

#### **Weakness and Fatigue**

Provide rest periods.  
Assess tolerance for activities.  
Provide assistance and support as needed for maintaining bed or chair positions.

#### **Restlessness**

Maintain a calm soothing environment.  
Do not restrain.  
Limit the number of visitors at the client's bedside (consider cultural practices).  
Allow a family member to stay with the client.

3. Psychosocial care
  - a. Monitor for anxiety and depression.
  - b. Monitor for fear (Box 76-6).
  - c. Encourage the client and family to express feelings.
  - d. Provide support and advocacy for the client and family.
  - e. Provide privacy for the client and family.
  - f. Provide a private room for the client.
4. Postmortem care (Box 76-7)
  - a. Maintain respect and dignity for the client.
  - b. Determine whether the client is an organ donor; if so, follow appropriate procedures related to the donation.
  - c. Consider cultural rituals, state laws, and agency procedures when performing postmortem care.
  - d. Prepare the body for immediate viewing by the family.
  - e. Provide privacy and time for the family to be with the deceased person.

## VI. DEPRESSION

- A. Description (see Chapter 74)
  1. Depression affects feelings, thoughts, and behaviors.
  2. It can occur after a loss, including loss of self-esteem, the end of a significant relationship, the death of a loved one, or a traumatic event.

### Box 76-6 Fear Associated With Dying

#### Fear of Pain

Fear of pain may occur based on anxieties related to dying. Do not delay or deny pain relief measures to a terminally ill client.

#### Fear of Loneliness and Abandonment

Allow family members to stay with the client. Holding hands, touching (if culturally acceptable), and listening to the client are important.

#### Fear of Being Meaningless

Client may feel hopeless and powerless. Encourage life reviews and focus on the positive aspects of the client's life.

Modified from Lewis, S., Heitkemper, M., & Dirksen, S. (2007). *Medical-surgical nursing: Assessment and management of clinical problems* (7th ed.). St. Louis: Mosby.

### Box 76-7 General Postmortem Procedures

Close the client's eyes.  
 Replace dentures.  
 Wash the body.  
 Place pads under the perineum.  
 Remove tubes and dressings.  
 Straighten the body and place a pillow under the head in preparation for family viewing.

3. The loss is followed by grief and mourning; if this process does not resolve, depression results.
  4. Depression may be mild, moderate, or severe.
  5. Treatment includes counseling, antidepressant medication, and electroconvulsive therapy (ECT).
- B. Mild depression
    1. Mild depression is triggered by an external event and follows the normal grief reaction.
    2. Mild depression lasts less than 2 weeks.
    3. Feeling sad
    4. Feeling let down or disappointed
    5. Mild alterations in sleep patterns
    6. Feeling less alert
    7. Irritability
    8. Disinterested in spending time with others
    9. Increased use of alcohol or drugs
  - C. Moderate depression
    1. Moderate depression persists over time.
    2. The person experiences a sense of change and often seeks help.
    3. Despondent and gloomy
    4. Dejected
    5. Low self-esteem
    6. Helplessness and powerlessness
    7. May experience intense anxiety and anger
    8. Diurnal variation: The person may feel better at a certain time of the day, such as in the morning.
    9. Slow thought processes and difficulty in concentrating
    10. Rumination: Persistent thinking about and discussion of a particular subject
    11. Negative thinking and suicidal thoughts
    12. Sleep disturbances
    13. Social withdrawal
    14. Anorexia, weight loss, and fatigue
    15. Somatic complaints
    16. Menstrual changes
    17. Increased use of alcohol or drugs
  - D. Severe depression
    1. Intense and pervasive
    2. Despair and hopelessness
    3. Guilt and worthlessness
    4. Flat affect
    5. May show agitation and pace about
    6. Poor posture and unkempt appearance
    7. Decreased speech
    8. Self-destructive thoughts; however, the person may lack energy to act on the thought
    9. Social withdrawal
    10. Poor concentration and overwhelmed by simple tasks
    11. Severe psychomotor retardation
    12. Anorexia and considerable weight loss
    13. Constipation and urinary retention
    14. Lack of sexual interest
    15. Terminal insomnia

16. Diurnal variation: The person feels worse in the morning and better as the day goes on.
17. Delusions and hallucinations

#### E. Interventions

1. Altered thought processes
  - a. Encourage the client to discuss losses or changes in the life situation.
  - b. Encourage the client to express sadness or anger and allow adequate time for verbal responses.
  - c. Assist the client in developing short-term goals.
  - d. Encourage the use of problem solving and positive thinking.
  - e. Limit decision making.
  - f. Spend short periods of time throughout the day with the client.
  - g. Be on time when a schedule is planned with the client.
  - h. Sit in silence with a client who is not verbalizing.
  - i. Use simple, concrete words when communicating.
  - j. Avoid a cheerful attitude.
2. Risk for self-harm
  - a. Assess for **suicide** clues and intervene to provide safety precautions as necessary.
  - b. Assess lethality of plans.
  - c. Do not leave the client alone for extended periods.
  - d. If the client has a suicidal plan, place on one-to-one supervision.
  - e. Form a suicidal contract with the client.

 For a client at risk for self-harm, ask the client directly, "Have you thought of hurting yourself?"

3. Activity intolerance
  - a. Encourage daily exercise.
  - b. Assist with activities of daily living if the client is unable to perform them.
  - c. Begin with one-to-one activities.
  - d. Provide activities for easy mastery to increase self-esteem and help in alleviating guilt feelings.
  - e. Provide activities that do not require a great deal of concentration (simple card games, drawing).
  - f. Engage in gross motor activities (walking).
  - g. Eventually bring the client into small group activities and then large groups.
4. Altered nutrition
  - a. Ensure adequate nutrition.
  - b. Offer small, high-calorie, high-protein snacks and fluids throughout the day.
  - c. Stay with the client during meals.
  - d. Weigh the client weekly.
  - e. Assess bowel patterns for constipation.

5. Sleep pattern disturbance
  - a. Ensure adequate sleep.
  - b. Provide rest periods after activities.
  - c. Encourage the client to dress and stay out of bed during the day.
  - d. Provide relaxation measures at bedtime.
  - e. Decrease environmental stimuli at bedtime.
  - f. Spend time with the client before bedtime.

## VII. ELECTROCONVULSIVE THERAPY (ECT)

### A. Description

1. ECT is an effective treatment for depression that consists of inducing a tonic-clonic seizure by passing an electrical current through electrodes attached to the temples.
2. The administration of a muscle relaxant minimizes seizure activity, preventing damage to long bones and cervical vertebrae.
3. The usual course is 6 to 12 treatments given 2 to 3 times per week.
4. Maintenance ECT once a month may help decrease the relapse rate for a client with recurrent depression.
5. ECT is not a permanent cure.
6. ECT is not always effective in clients with dysthymic depression, depression and personality disorders, drug dependence, or depression secondary to situational or social difficulties.
7. At-risk clients include clients with recent myocardial infarction, brain attack (stroke), or intracranial mass lesions.

### B. Uses

1. Clients with major depressive and bipolar depressive disorders, especially when psychotic symptoms are present, such as delusions of guilt, somatic delusions, and delusions of infidelity
2. Clients who have depression with marked psychomotor retardation and stupor
3. Manic clients whose conditions are resistant to lithium and antipsychotic medications and clients who are rapid cyclers (a client with a bipolar disorder who has many episodes of mood swings close together)
4. Clients with schizophrenia (especially catatonia), clients with schizoaffective syndromes, and psychotic clients

### C. Indications for use (Box 76-8)

### D. Preprocedure

1. Explain the procedure to the client.
2. Encourage the client to discuss feelings, including myths regarding ECT.
3. Teach the client and family what to expect.
4. Informed consent must be obtained when voluntary clients are being treated.
5. For involuntary clients, when informed consent cannot be obtained, permission may be obtained from the next of kin, although in

### Box 76-8 Electroconvulsive Therapy (ECT): Indications for Use

When antidepressant medications have no effect  
 When there is a need for a rapid definitive response, such as when a client is suicidal or homicidal  
 When the client is in extreme agitation or stupor  
 When the risks of other treatments outweigh the risk of ECT  
 When the client has a history of poor medication response, a history of good ECT response, or both  
 When the client prefers ECT as a treatment

some states the permission for ECT must be obtained from the court.

6. Maintain NPO status after midnight or at least 4 hours before treatment.
7. Baseline vital signs are taken.
8. The client is requested to void.
9. Hairpins, contact lenses, and dentures are removed.
10. Administer preoperative medication if prescribed; glycopyrrolate (Robinul) or atropine sulfate may be prescribed to prevent the potential for aspiration and to minimize bradycardia in response to electrical stimulus.

-  **E.** During the procedure
1. Place a blood pressure cuff on one of the client's arms.
  2. As the intravenous line is inserted, electroencephalographic and electrocardiographic electrodes are attached.
  3. A pulse oximeter is placed on the client's finger.
  4. Blood pressure is monitored throughout the treatment.
  5. Medications administered may include a short-acting anesthetic such as methohexital sodium (Brevital Sodium), thiopental sodium (Pentothal), and a muscle relaxant such as succinylcholine (Anectine).
  6. Throughout the procedure, 100% oxygen by mask via positive pressure is administered.
  7. An airway or bite-block is placed to prevent biting the tongue.
  8. An electrical stimulus is administered; the seizure should last 30 to 60 seconds.

-  **F.** Postprocedure
1. The client is transported to a recovery room with the blood pressure cuff and oximeter in place, where oxygen, suction, and other emergency equipment are available.
  2. When the client is awake, talk to the client and take vital signs.
  3. The client may be confused; provide frequent orientation (brief, distinct, and simple) and reassurance.

### Box 76-9 Suicidal Clues

Giving away personal, special, and prized possessions  
 Canceling social engagements  
 Making out or changing a will  
 Taking out or changing insurance policies  
 Positive or negative changes in behavior  
 Poor appetite  
 Sleeping difficulties  
 Feelings of hopelessness  
 Difficulty in concentrating  
 Loss of interest in activities  
 Client statements indicating an intent to attempt suicide  
 Sudden calmness or improvement in a depressed client  
 Client inquiries about poisons, guns, or other lethal objects

4. The client returns to the nursing unit when at least a 90% oxygen saturation level is maintained, vital signs are stable, and mental status is satisfactory.
  5. Assess the gag reflex before giving the client fluids, food, or medication.
- G.** Potential side effects
1. Major side effects include confusion, disorientation, and short-term memory loss.
  2. The client may be confused and disoriented on awakening.
  3. Memory deficits may occur, but memory usually recovers completely, although some clients have memory loss lasting 6 months.

## VIII. SUICIDAL BEHAVIOR

- A.** Description
1. Suicidal clients characteristically have feelings of worthlessness, guilt, and hopelessness that are so overwhelming that they feel unable to go on with life and feel unfit to live.
  2. The nurse caring for a depressed client always considers the possibility of **suicide**.
- B.** High-risk groups
1. Clients with a history of previous **suicide attempts**
  2. Family history of **suicide attempts**
  3. Adolescents
  4. Older adults
  5. Disabled or terminally ill clients
  6. Clients with personality disorders
  7. Clients with organic brain syndrome or dementia
  8. Depressed or psychotic clients
  9. Substance abusers
- C.** Clues (Box 76-9)
- D.** Assessment (Box 76-10)
- E.** Interventions
1. Initiate **suicide** precautions.
  2. Remove harmful objects.
  3. Do not leave the client alone.
  4. Provide a nonjudgmental, caring attitude.

**Box 76-10 Suicidal Client: Assessment****Plan**

Does the client have a plan?

What is the plan, how lethal is the plan, and how likely is death to occur?

Does the client have the means to carry out the plan?

**Client History of Attempts**

What suicide attempts occurred in the past and what harm occurred?

Was the client accidentally rescued?

Have the past attempts and methods been the same, or have methods increased in lethality?

**Psychosocial Factors**

Is client alone or alienated from others?

Is hostility or depression present?

Do hallucinations exist?

Is substance abuse present?

Has client had any recent losses or physical illness?

Has client had any environmental or lifestyle changes?

5. Develop a contract that is written, dated, and signed and that indicates alternative behavior at times of suicidal thoughts.
6. Encourage the client to talk about feelings and to identify positive aspects about self.
7. Encourage active participation in own care.
8. Keep the client active by assigning achievable tasks.
9. Check that visitors do not leave harmful objects in the client's room.
10. Identify support systems.
11. Do not allow the client to leave the unit unless accompanied by a staff member.
12. Continue to assess the client's **suicide** potential.

 Provide one-to-one supervision at all times for the client at risk for suicide.

**IX. ABUSIVE BEHAVIORS****A. Anger**

1. Anger is a feeling of annoyance that may be displaced onto an object or person.
2. Anger is used to avoid anxiety and gives a feeling of power in situations in which the person feels out of control.

**B.** Aggression can be harmful and destructive when not controlled.

 **C.** Violence is physical force that is threatening to the safety of self and others.

 **D.** Assessment

1. History of violence or self-harm
2. Poor impulse control and low tolerance of frustration
3. Defiant and argumentative
4. Raising of voice

5. Making verbal threats
6. Pacing and agitation
7. Muscle rigidity
8. Flushed face
9. Glaring at others

**E. Interventions**

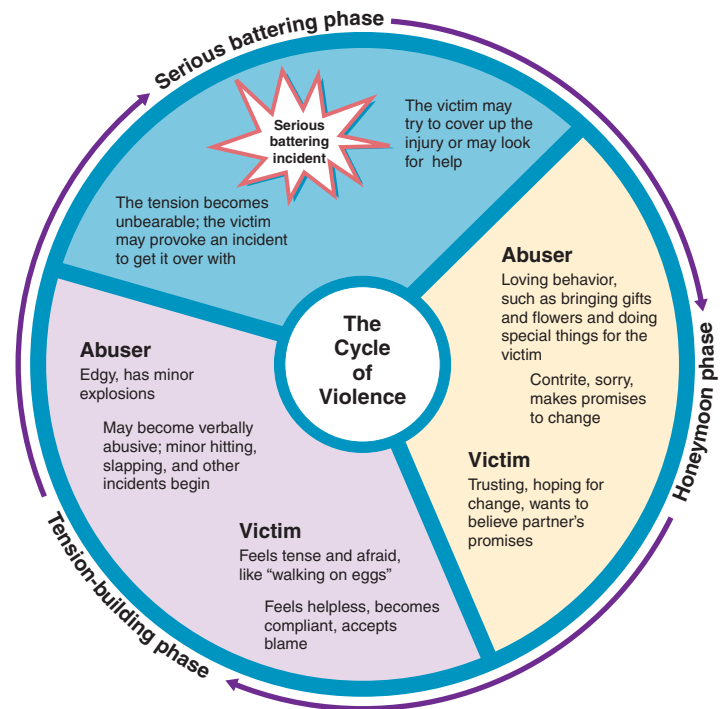

1. Maintain safety.
2. Use a calm approach and communicate with a calm, clear tone of voice (be assertive, not aggressive, and avoid verbal struggles).
3. Maintain a large personal space and use a non-aggressive posture.
4. Listen actively and acknowledge the client's anger.
5. Determine what the client considers to be his or her need.
6. Provide the client with clear options that deal with the client's behavior, set limits on behavior, and make the client aware of the consequences of anger and violence.
7. Discuss the use of **restraints** or **seclusion** if the client is unable to control angry behavior that may lead to violence.
8. Assist the client with problem solving and decision making regarding the options.

**F. Restraints and seclusion**

1. Description
  - a. **Physical restraints:** Any manual method or mechanical device, material, or equipment that inhibits free movement
  - b. **Seclusion:** A process in which a client is placed alone in a specially designed room for protection and close supervision
  - c. **Chemical restraints:** Medications given for a specific purpose of inhibiting a specific behavior or movement and that have an impact on the client's ability to relate to the environment
2. Use of **restraints** and **seclusion**

 Restraints require a written prescription by a physician, which must be reviewed and renewed every 24 hours; the prescription must specify the type of restraint to be used, the duration of the restraint or seclusion, and the criteria for release (agency policy and procedures need to be followed).

- a. **Restraints** and **seclusion** should never be used as punishment or for the convenience of the health care staff.
- b. **Restraints** and **seclusion** are used when behavior is physically harmful to the client or others and when alternative or less restrictive measures are insufficient in protecting the client or others from harm.
- c. The nurse must document the behavior leading to the use of **restraints** or **seclusion**.

▲ **FIGURE 76-1** The cycle of violence. (From Varcarolis, E., Carson, V., & Shoemaker, N. [2010]. *Foundations of psychiatric mental health nursing* [6th ed.]. St. Louis: Saunders.)

- d. **Restraints** and **seclusion** are used when the client anticipates that a controlled environment would be helpful and requests **seclusion**.
- e. In an emergency, a qualified nurse may place a client in **restraints** or **seclusion** and obtain a written or verbal prescription as soon as possible thereafter.
- f. Within 1 hour of the initiation of **restraints** or **seclusion**, the psychiatrist must make a face-to-face assessment and evaluation of the client and must continuously re-evaluate the need for continued **restraints** or **seclusion**.
- g. While in **restraints** or **seclusion**, the client must be protected from all sources of harm by having one-to-one supervision with a staff member within an arm's length of the client.
- h. The client in **restraints** or **seclusion** needs constant one-to-one supervision; physical, safety, and comfort needs must be assessed every 15 to 30 minutes, and these observations are also documented (e.g., food, fluids, bathroom needs, range-of-motion exercise, and ambulation).

## X. FAMILY VIOLENCE

### A. Description (Fig. 76-1)

1. Violence begins with threats or verbal or physical minor assaults (tension building), and the victim attempts to comply with the requests of the abuser.
2. The abuser loses control and becomes destructive and harmful (acute battering), while the victim attempts to protect himself or herself.

3. After the battering, the abuser becomes loving and attempts to make peace (calmness and defusion of tension).
4. The abuser justifies that violence is normal and the victim is responsible for the **abuse**.
5. Outsiders are usually unaware of what is happening in the family.
6. Family members are isolated socially and lack autonomy and trust among each other; caring and intimacy in the family are absent.
7. Family members expect other members of the family to meet their needs, but none are able to do so.
8. The abuser threatens to abandon the family.

### B. Types of violence (Box 76-11)

#### C. The vulnerable person

1. The vulnerable person is the one in the family unit against whom violence is perpetrated.
2. The most vulnerable individuals are children and older adults.
3. The perpetrator of violence and the person targeted by the violence can be male or female.
4. Battering is a crime.

#### D. Characteristics of abusers

1. Impaired self-esteem
2. Strong dependency needs
3. Narcissistic and suspicious
4. History of **abuse** during childhood
5. Perceive victims as their property and believe that they are entitled to **abuse** them

#### E. Characteristics of victims

1. Victims feel trapped, dependent, helpless, and powerless.

**Box 76-11 Types of Violence****Physical Violence**

Infliction of physical pain or bodily harm

**Sexual Violence**

Any form of sexual contact without consent

**Emotional Violence**

Infliction of mental anguish

**Physical Neglect**

Failure to provide health care to prevent or treat physical or emotional illnesses

**Developmental Neglect**

Failure to provide physical and cognitive stimulation needed to prevent developmental deficits

**Educational Neglect**

Depriving a child of education

**Economic Exploitation**

Illegal or improper exploitation of money, funds, or other resources for one's personal gain

2. Victims of **abuse** may become depressed as they are trapped in the abusers' power and control cycle (see Fig. 76-1).
3. As victims' self-esteem becomes diminished with chronic **abuse**, they may blame themselves for the violence and be unable to see a way out of the situation.

**F. Interventions**

1. Report suspected or actual cases of child **abuse** or **abuse** of an older adult to appropriate authorities (follow state and agency guidelines).
2. Assess for evidence of physical injuries.
3. Ensure privacy and confidentiality during the assessment, and provide a nonjudgmental and empathetic approach to foster trust; reassure the victim that he or she has not done anything wrong. Box 76-12 lists sample assessment questions.
4. Assist the victim to develop self-protective and other problem-solving abilities.
5. Even if the victim is not ready to leave the situation, encourage the victim to develop a specific safety plan (a fast escape if the violence returns) and where to obtain help (hotlines, safe houses, and shelters); an abused person is usually reluctant to call the police.
6. Assess suicidal potential of the victim.
7. Assess the potential for homicide.
8. Assess for the use of drugs and alcohol.
9. Determine family coping patterns and support systems.
10. Provide support and assistance in coping with contacting the legal system.
11. Assist in resolving family dysfunction with prescribed therapies.

**Box 76-12 Assessment Questions for Violence and Abuse**

"Has anyone ever touched you in a way that made you uncomfortable?"

"Is anyone hurting you now?"

"How do you and your partner deal with anger (or disagreement)?"

"Has your partner ever hit you?"

"Have you ever been threatened by \_\_\_\_\_?"

"Does your partner prevent you from seeing family or friends?"

"Does your partner ever use the children to manipulate you?"

"Did (or does) anyone in your family deal with anger by hitting?"

"Who do you play with most often? Is there anyone you do not like playing with? Are there games you don't like playing?"

12. Encourage individual therapy for the victim that promotes coping with the trauma and prevents further psychological conflict.
13. Encourage individual therapy for the abuser that focuses on preventing violent behavior and repairing relationships.
14. Encourage psychotherapy, counseling, group therapy, and support groups to assist family members to develop coping strategies.
15. Assist the family to identify an access to community and personal resources.
16. Maintain accurate and thorough medical health records.

**XI. CHILD ABUSE** (see Chapter 36)

**A.** Description: Child **abuse** involves physical, emotional, or sexual **abuse** and neglect.

**B. Assessment**

1. Physical **abuse**
  - a. Unexplained bruises, burns, or fractures
  - b. Bald spots on the scalp
  - c. Apprehensiveness in the child
  - d. Extreme aggressiveness or withdrawal
  - e. Fear of parents
  - f. Lack of crying when approached by a stranger
2. Physical neglect
  - a. Inadequate weight gain
  - b. Poor hygiene
  - c. Consistent hunger (begs or steals food)
  - d. Inconsistent school attendance
  - e. Constant fatigue
  - f. Reports of lack of child supervision
  - g. Delinquency
3. Emotional **abuse**
  - a. Speech disorders
  - b. Habit disorders, such as sucking, biting, rocking
  - c. Learning disorders
  - d. Self-harm behaviors

4. Sexual **abuse**
  - a. Difficulty walking or sitting
  - b. Torn, stained, or bloody underclothing
  - c. Pain, swelling, or itching of the genitals
  - d. Bruises, bleeding, or lacerations in the genital or anal area
  - e. Poor peer relations
  - f. Delinquency
  - g. Changes in sleep patterns
  - h. Self-harm behaviors
5. Shaken baby syndrome
  - a. **Abuse** can cause intracranial hemorrhage, leading to cerebral edema and death.
  - b. The infant often has respiratory problems.
  - c. The nurse would note full bulging fontanels and a head circumference greater than expected.
6. Child abduction
  - a. Many cases involve abduction by a family member (usually a parent) who takes or keeps the child and violates a custody order.
  - b. Children younger than 6 years of age are most vulnerable to abduction.
  - c. Parents more likely to abduct their child include parents who have made a prior threat of intent, parents who suspect **abuse** of the child, parents wanting the child to grow up in their country of origin, and parents with a mental illness (especially sociopaths).
- C. Interventions
  1. Assess injuries; support the child during a thorough physical assessment.
  2. The child is likely to be removed from the abusive environment to a safe place to prevent further injury while the case is being investigated.
  3. Move slowly and avoid any loud noises when near the child.
  4. Communicate with the child at the child's eye level.
  5. Reassure the child that he or she is not "bad" and is not responsible for the abuser's behavior.
  6. Document accurately and completely all information related to the suspected **abuse**.
  7. When working with parents in follow-up care or counseling, assist the parents in identifying stressors and alternative ways to express feelings.
  8. Provide education to the parents, and refer parents to **crisis** hotlines and community support systems such as Parents Anonymous (a group for parents who have been abused or fear that they may **abuse** their child physically) or Parents United International (a group devoted to helping sexually abused families).

 Report cases of suspected abuse of a child or older adult to appropriate authorities (follow state and agency guidelines); reporting is mandated by federal law.

## XII. ABUSE OF THE OLDER ADULT

- A. Description
  1. **Abuse** of an older adult involves physical, emotional, or sexual **abuse**; neglect; and economic exploitation.
  2. Older adults at most risk include individuals who are dependent because of illness, immobility, or altered mental status.
  3. Factors that contribute to **abuse** and neglect include long-standing family violence, caregiver stress, and the older adult's increasing dependence on others.
  4. Victims may attempt to dismiss injuries as accidental, and abusers may prevent victims from receiving proper medical care to avoid discovery.
  5. Victims often are isolated socially by their abusers.
- B. Assessment
  1. Physical **abuse**
    - a. Sprains, dislocations, or fractures
    - b. Abrasions, bruises, or lacerations
    - c. Pressure sores
    - d. Puncture wounds
    - e. Burns
    - f. Skin tears
  2. Sexual **abuse**
    - a. Torn or stained underclothing
    - b. Discomfort or bleeding in the genital area
    - c. Difficulty in walking or sitting
    - d. Unexplained genital infections or disease
  3. Emotional **abuse**
    - a. Confusion
    - b. Fearful and agitated
    - c. Changes in appetite and weight
    - d. Withdrawn and loss of interest in self and social activities
  4. Neglect
    - a. Disheveled appearance
    - b. Dressed inadequately or inappropriately
    - c. Dehydration and malnutrition
    - d. Lacking physical needs, such as glasses, hearing aids, and dentures
  5. Signs of medication overdose
  6. Economic exploitation
    - a. Inability to pay bills and fearful when discussing finances
    - b. Confused, inaccurate, or no knowledge of finances
- C. Interventions
  1. Assess for physical injuries and treat physical injuries.
  2. Report cases of suspected **abuse** to appropriate authorities (follow state and agency guidelines).
  3. Separate the older adult from the abusive environment, if possible, and contact adult protective services for assistance in placement while the **abuse** is being investigated.
  4. Explore alternative living arrangements that are least restrictive and disruptive to the victim.

### PRIORITY NURSING ACTIONS!

#### Actions to Take When an Older Client Is Physically Abused

1. Assess and treat the wounds.
2. Remove the victim from immediate danger.
3. Adhere to mandatory abuse reporting laws.
4. Notify the caseworker of the family situation.
5. Document the occurrence, findings, actions taken, and the victim's response.

When a victim is abused, the priority is to assess and treat any physical injuries. The nurse stays with the victim and provides comfort and support. After physical injuries are treated, the nurse ensures that the client is safe and is removed from the threatening environment. Elder abuse needs to be reported, so the nurse would adhere to the mandatory abuse reporting laws of the state. The nurse also contacts the caseworker of the family situation so that the incident is reported and follow-up with the family can occur. If there is no caseworker, the nurse contacts social services or the appropriate service to initiate this process. Finally, the nurse documents the occurrence, findings, actions taken, and the victim's response.

**References:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., pp. 491-492). St. Louis: Mosby. Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 328). St. Louis: Mosby.

5. The older adult who has been abused may need assistance for financial or legal matters.
6. Provide referrals to emergency community resources.
7. When working with caregivers, assess the need for respite care or counseling if needed to deal with caregiver stress (see Priority Nursing Actions).

### XIII. RAPE AND SEXUAL ASSAULT

#### A. Description

1. Rape is engaging another person in a sexual act or sexual intercourse through the use of force and without the consent of the sexual partner.
2. The victim is not required by law to report the rape or assault.
3. Often, the victim is blamed by others and receives no support from significant others.
4. Acquaintance rape involves someone known to the victim.
5. Statutory rape is the act of sexual intercourse with a person younger than the age of legal consent, even if the minor consents.
6. Marital rape
  - a. The belief that marriage bestows rights to sex whenever wanted and without consent of the partner contributes to the occurrence of marital rape.

- b. Victims of marital rape describe being forced to perform acts they did not wish to perform and being physically abused during sex.

#### B. Assessment

1. Female client
  - a. Obtain the date of the last menstrual period.
  - b. Determine the form of birth control used and the last act of intercourse before rape.
  - c. Determine the duration of intercourse, orifices violated, and whether penile penetration occurred.
  - d. Determine whether a condom was used by the perpetrator.
2. Shame, embarrassment, and humiliation
3. Anger and revenge
4. Afraid to tell others because of fear of not being believed

#### C. Males may be sexually abused as children and as adults and are the usual targeted victim of pedophiles; males may have more difficulty with disclosing their abuse.

#### D. Rape trauma syndrome

1. Sleep disturbances, nightmares
2. Loss of appetite
3. Fears, anxiety, phobias, suspicion
4. Decrease in activities and motivation
5. Disruptions in relationships with partner, family, friends
6. Self-blame, guilt, shame
7. Lowered self-esteem, feelings of worthlessness
8. Somatic complaints

#### E. Interventions

1. Perform the assessment in a quiet, private area.
2. Stay with the victim.
3. Assess the victim's stress level before performing treatments and procedures.
4. Victim should not shower, bathe, douche (female), or change clothing until an examination is performed.
5. Obtain written consent for the examination, photographs, laboratory tests, release of information, and laboratory samples.
6. Assist with the female pelvic examination and obtain specimens to detect semen (the pelvic examination may trigger a flashback of the attack); a shower and fresh clothing should be made available to the client after the examination.
7. Preserve any evidence.
8. Treat physical injuries and provide client safety.
9. Document all events in the care of the victim.
10. Reinforce to the victim that surviving the assault is most important; if the victim survived the rape, he or she did exactly what was necessary to stay alive.
11. Refer the victim to crisis intervention and support groups.

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 929.** A nurse in the emergency department is caring for a young female victim of sexual assault. The client's physical assessment is complete, and physical evidence has been collected. The nurse notes that the client is withdrawn, confused, and at times physically immobile. These behaviors are interpreted by the nurse as:
1. Signs of depression
  2. Normal reactions to a devastating event
  3. Evidence that the client is a high suicide risk
  4. Indicative of the need for hospital admission
- 930.** A nurse is reviewing the assessment data of a client admitted to the mental health unit. The nurse notes that the admission nurse documented that the client is experiencing anxiety as a result of a situational crisis. The nurse determines that this type of crisis could be caused by:
1. Witnessing a murder
  2. The death of a loved one
  3. A fire that destroyed the client's home
  4. A recent rape episode experienced by the client
- 931.** A nurse is conducting an initial assessment on a client in crisis. When assessing the client's perception of the precipitating event that led to the crisis, the appropriate question to ask is:
1. "With whom do you live?"
  2. "Who is available to help you?"
  3. "What leads you to seek help now?"
  4. "What do you usually do to feel better?"
- 932.** A nurse is developing a plan of care for a client in a crisis state. When developing the plan, the nurse considers which of the following?
1. A crisis state indicates that the client has a mental illness.
  2. A crisis state indicates that the client has an emotional illness.
  3. Presenting symptoms in a crisis situation are similar for all clients experiencing a crisis.
  4. A client's response to a crisis is individualized and what constitutes a crisis for one client may not constitute a crisis for another client.
- 933.** A nurse observes that a client with a potential for violence is agitated, pacing up and down the hallway, and is making aggressive and belligerent gestures at other clients. Which statement would be appropriate to make to this client?
1. "You need to stop that behavior now."
  2. "You will need to be placed in seclusion."
  3. "You seem restless; tell me what is happening."
  4. "You will need to be restrained if you do not change your behavior."
- 934.** A depressed client on an inpatient unit says to a nurse, "My family would be better off without me." The nurse's best response is:
1. "Have you talked to your family about this?"
  2. "Everyone feels this way when they are depressed."
  3. "You will feel better once your medication begins to work."
  4. "You sound very upset. Are you thinking of hurting yourself?"
- 935.** A nurse has been observing a client closely who has been displaying aggressive behaviors. The nurse observes that the behavior displayed by the client is escalating. Which nursing intervention is least helpful to this client at this time?
1. Initiate confinement measures.
  2. Acknowledge the client's behavior.
  3. Assist the client to an area that is quiet.
  4. Maintain a safe distance with the client.
- 936.** Which behavior observed by a nurse indicates a suspicion that a depressed adolescent client may be suicidal?
1. The client runs out of the therapy group, swearing at the group leader, and runs to her room.
  2. The client gives away a prized CD and a cherished autographed picture of the performer.
  3. The client becomes angry while speaking on the telephone and slams down the receiver.
  4. The client gets angry with her roommate when the roommate borrows the client's clothes without asking.
- 937.** A client is admitted to the mental health unit after an attempt of suicide by hanging. A nurse's most important aspect of care is to maintain client safety. This is accomplished best by:
1. Requesting that a peer remain with the client at all times
  2. Removing the client's clothing and placing the client in a hospital gown
  3. Assigning a staff member to the client who will remain with the client at all times
  4. Admitting the client to a seclusion room where all potentially dangerous articles are removed
- 938.** The police arrive at the emergency department with a client who has seriously lacerated both wrists. The initial nursing action is to:
1. Administer an antianxiety agent.
  2. Examine and treat the wound sites.

3. Secure and record a detailed history.
  4. Encourage and assist the client to ventilate feelings.
- 939.** A moderately depressed client who was hospitalized 2 days ago suddenly begins smiling and reporting that the crisis is over. The client says to a nurse, "I'm finally cured." The nurse interprets this behavior as a cue to modify the treatment plan by:
1. Suggesting a reduction of medication
  2. Allowing increased "in-room" activities
  3. Increasing the level of suicide precautions
  4. Allowing the client off-unit privileges as needed
- 940.** A nurse is planning care for a client being admitted to the nursing unit who attempted suicide. Which of the following priority nursing interventions would the nurse include in the plan of care?
1. One-to-one suicide precautions
  2. Suicide precautions with 30-minute checks
  3. Checking the whereabouts of the client every 15 minutes
  4. Asking the client to report suicidal thoughts immediately
- 941.** An emergency department nurse is caring for an adult client who is a victim of family violence. Which priority instruction would be included in the discharge instructions?
1. Information regarding shelters
  2. Instructions regarding calling the police
  3. Instructions regarding self-defense classes
  4. Explaining the importance of leaving the violent situation
- 942.** A female victim of a sexual assault is being seen in the crisis center. The client states that she still feels "as though the rape just happened yesterday," even though it has been a few months since the incident. The appropriate nursing response is which of the following?
1. "You need to try to be realistic. The rape did not just occur."
  2. "It will take some time to get over these feelings about your rape."
  3. "Tell me more about the incident that causes you to feel like the rape just occurred."
  4. "What do you think that you can do to alleviate some of your fears about being raped again"?

### Alternate Item Format: Multiple Response

- 943.** A nurse is preparing to care for a dying client, and several family members are at the client's bedside. Select the therapeutic techniques that the nurse would use when communicating with the family. **Select all that apply.**
- 1. Discourage reminiscing.
  - 2. Make the decisions for the family.
  - 3. Encourage expression of feelings, concerns, and fears.
  - 4. Explain everything that is happening to all family members.
  - 5. Touch and hold the client's or family member's hand if appropriate.
  - 6. Be honest and let the client and family know that they will not be abandoned by the nurse.

## ANSWERS

### 929. 2

**Rationale:** During the acute phase of the rape crisis, the client can display a wide range of emotional and somatic responses. The symptoms noted indicate a normal reaction. Options 1, 3, and 4 are incorrect interpretations.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding client responses to devastating events to answer the question. Focus on the symptoms noted in the question to direct you to option 2. If you had difficulty with this question, review normal and abnormal client responses to dealing with devastating crisis events.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Mental Health

**Reference:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., pp. 507–508). St. Louis: Mosby.

### 930. 2

**Rationale:** A situational crisis arises from external rather than internal sources. External situations that could precipitate a crisis include loss of or change of a job, the death of a loved one, abortion, change in financial status, divorce, addition of new family members, pregnancy, and severe illness. Options 1, 3, and 4 identify adventitious crises. An adventitious crisis refers to a crisis of disaster; it is unplanned or accidental.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1, 3, and 4 because they are comparable or alike types of occurrences. If you had difficulty with this question, review the types of crisis.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 186–187). St. Louis: Mosby.

**931. 3**

**Rationale:** A nurse's initial task when assessing a client in crisis is to assess the individual or family and the problem. The more clearly the problem can be defined, the better the chance a solution can be found. Option 3 would assist in determining data related to the precipitating event that led to the crisis. Options 1 and 2 assess situational supports. Option 4 assesses personal coping skills.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *precipitating event*. Focus on these strategic words when selecting the correct option. Eliminate options 1 and 2 because these data would determine support systems. Eliminate option 4 because this question would be asked when determining coping skills. Review assessment techniques for the client in crisis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Mental Health

**Reference:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., p. 456). St. Louis: Mosby.

**932. 4**

**Rationale:** Although each crisis response can be described in similar terms as far as presenting symptoms are concerned, what constitutes a crisis for one client may not constitute a crisis for another client because each is a unique individual. Being in the crisis state does not mean that the client has an emotional or mental illness.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 3 because of the word *all*. Next, eliminate options 1 and 2 because a crisis does not indicate "illness." Review the characteristics of a crisis state if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 190). St. Louis: Mosby.

**933. 3**

**Rationale:** The best statement is to ask the client what is causing the agitation. This will assist the client to become aware of the behavior and may assist the nurse in planning appropriate interventions for the client. Option 1 is demanding behavior that could cause increased agitation in the client. Options 2 and 4 are threats to the client and are inappropriate.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 1 because of the demand that it places on the client. Eliminate options 2 and 4 because they indicate threats to the client. Review appropriate nursing actions for the agitated client if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 27–31, 342). St. Louis: Mosby.

**934. 4**

**Rationale:** Clients who are depressed may be at risk for suicide. It is critical for the nurse to assess suicidal ideation and plan. The nurse should ask the client directly whether a plan for self-harm exists. Options 1, 2, and 3 do not deal directly with the client's feelings.

**Test-Taking Strategy:** Using therapeutic communication techniques will assist in directing you to the correct option. Option 4 is the only option that deals directly with the client's feelings. Additionally, clients at risk for suicide need to be assessed directly regarding the potential for self-harm. Review care of the client at risk for suicide if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 27–31, 296). St. Louis: Mosby.

**935. 1**

**Rationale:** During the escalation period, the client's behavior is moving toward loss of control. Nursing actions include taking control, maintaining a safe distance, acknowledging behavior, moving the client to a quiet area, and medicating the client if appropriate. To initiate confinement measures during this period is inappropriate. Initiation of confinement measures is most appropriate during the crisis period.

**Test-Taking Strategy:** Note the strategic words *behavior*, *escalating*, and *least helpful*. Recalling that the least restrictive measures should be used will direct you to option 1. Review care of the client with aggressive behavior if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**Reference:** Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (pp. 428–431). St. Louis: Saunders.

**936. 2**

**Rationale:** A depressed suicidal client often gives away that which is of value as a way of saying goodbye and wanting to be remembered. Options 1, 3, and 4 deal with anger and acting-out behaviors that are often typical of any adolescent.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1, 3, and 4 because they are comparable or alike. Option 2 is different and is an action that could indicate that the client may be "saying goodbye." Review behaviors that indicate a suicide intent if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 316). St. Louis: Mosby.

**937. 3**

**Rationale:** Hanging is a serious suicide attempt. The plan of care must reflect action that ensures the client's safety. Constant observation status (one-to-one) with a staff member who is never less than an arm's length away is the best choice. Seclusion should not be the initial intervention, and the least restrictive measure should be used. Placing the client in a hospital gown and requesting that a peer remain with the client would not ensure a safe environment.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 4 because seclusion should not be the initial intervention. Eliminate option 1 next because the responsibility to safeguard a client is not the peer's responsibility. Eliminate option 2 because removing one's clothing would not maximize all possible safety strategies. Review nursing interventions for the client at risk for suicide if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 327). St. Louis: Mosby.

**938. 2**

**Rationale:** The initial nursing action is to assess and treat the self-inflicted injuries. Injuries from lacerated wrists can lead to a life-threatening situation. Other interventions, such as options 1, 3, and 4, may follow after the client has been treated medically.

**Test-Taking Strategy:** Note the strategic word *initial*. Use Maslow's Hierarchy of Needs theory to prioritize. Physiological needs come first. Option 2 addresses the physiological need. Review care of the client who attempted suicide if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Delegating/Prioritizing

**References:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., p. 473). St. Louis: Mosby.

Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 316). St. Louis: Mosby.

**939. 3**

**Rationale:** A client who is moderately depressed and has only been in the hospital 2 days is unlikely to have such a dramatic cure. When a depression suddenly lifts, it is likely that the client may have made the decision to harm himself or herself. Suicide precautions are necessary to keep the client safe.

**Test-Taking Strategy:** Use the process of elimination. Options 1 and 4 support the client's notion that a cure has occurred. Option 2 allows the client to increase isolation and would present a threat to the client's safety. Safety is of the utmost importance; option 3 is the correct option. Review care of the client with depression if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 287, 301). St. Louis: Mosby.

**940. 1**

**Rationale:** One-to-one suicide precautions are required for a client who has attempted suicide. Options 2 and 3 may be appropriate, but not at the present time, considering the situation. Option 4 also may be an appropriate nursing intervention, but the priority is identified in option 1. The best intervention is constant supervision so that the nurse may intervene as needed if the client attempts to harm himself or herself.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *attempted suicide*. Option 1 is the only option that provides a safe environment. Review interventions for the suicidal client if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**References:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 327). St. Louis: Mosby.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 417). St. Louis: Saunders.

**941. 1**

**Rationale:** Tertiary prevention of family violence includes assisting the victim after the abuse has already occurred. The nurse should provide the client with information regarding where to obtain help, including a specific plan for removing the self from the abuser and information regarding escape, hotlines, and the location of shelters. An abused person is usually reluctant to call the police. Teaching the victim to fight back is not the appropriate action for the victim when dealing with a violent person.

**Test-Taking Strategy:** Note the strategic word *priority*. Focus on the subject of the question, which relates to providing the client with a safe environment. Use Maslow's Hierarchy of Needs theory to assist in directing you to option 1. If you had difficulty with this question, review the nursing measures for caring for a victim of family violence.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**Reference:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., pp. 491–492). St. Louis: Mosby.

**942. 3**

**Rationale:** Option 3 allows the client to express her ideas and feelings more fully and portrays a nonhurried, nonjudgmental, supportive attitude on the part of the nurse. Clients need to be reassured that their feelings are normal and that they may express their concerns freely in a safe, caring environment. Option 4 places the problem solving totally on the client. Option 2 places the client's feelings on hold. Option 1 immediately blocks communication.

**Test-Taking Strategy:** Use the process of elimination. Option 3 is the only option that addresses the client's feelings. Always address the client's feelings first. Review therapeutic communication techniques if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Caring

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 27–31, 722). St. Louis: Mosby.

### ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

943. 3, 5, 6

**Rationale:** The nurse must determine whether there is a spokesperson for the family and how much the client and

family want to know. The nurse needs to allow the family and client the opportunity for informed choices and assist with the decision-making process if asked. The nurse should encourage expression of feelings, concerns, and fears and reminiscing. The nurse needs to be honest and let the client and family know that they will not be abandoned. The nurse should touch and hold the client's or family member's hand, if appropriate.

**Test-Taking Strategy:** Recalling therapeutic communication techniques and client and family rights will assist you in answering this question. Review these techniques and care of the dying client if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Caring

**Content Area:** Mental Health

# Psychiatric Medications

## I. SELECTIVE SEROTONIN REUPTAKE INHIBITORS (SSRIs) (Box 77-1)

### A. Description

1. Inhibit serotonin uptake and elicit an antidepressant response
2. The potential for medication interactions is high, and complete medication assessments must be obtained and evaluated; inquire about the use of herbal therapies, especially St. John's wort.

### B. Side effects

1. Nausea, vomiting, cramping, and diarrhea
2. Dry mouth
3. Central nervous system (CNS) stimulation, including akathisia (restlessness, agitation)
4. Blood pressure changes
5. Photosensitivity
6. Insomnia, somnolence (sleepy, drowsy), apathy
7. Nervousness
8. Headache, dizziness
9. Seizure activity
10. Weight loss or gain
11. Decreased libido
12. Apathy
13. Tremors
14. Increased sweating

### C. Interventions

1. SSRIs interact with numerous medications.
2. Monitor vital signs because SSRIs can potentially lower or elevate blood pressure.
3. Monitor weight.
4. Initiate safety precautions, particularly if dizziness occurs.
5. Instruct the client to avoid alcohol.
6. Administer with a snack or meal to reduce the risk of dizziness and lightheadedness.
7. Monitor the suicidal client, especially during improved mood and increased energy levels.
8. Instruct the client taking fluoxetine (Prozac) or bupropion (Wellbutrin) to take the medication early in the day to prevent interference with sleep.
9. For the client on long-term therapy, monitor liver and renal function test results; altered values may occur requiring dosage adjustments.

10. Monitor white blood cell and neutrophil counts; the medication may be discontinued if levels decrease below normal.
11. If priapism (painful, prolonged penile erection) occurs, the medication is withheld and the physician is notified.
12. Inform the client about the possibility of decreased libido.
13. Instruct the client to change positions slowly to avoid a hypotensive effect.
14. Instruct the client to report any visual changes to the physician.
15. Educate the client about the potential for discontinuation syndrome if medication is stopped abruptly rather than tapered; the syndrome is characterized by gastrointestinal distress, behavioral or perceptual oddities, movement problems, and sleep disturbances.
16. Be aware of the potential for serotonin syndrome, characterized by elevated temperature, muscle rigidity, and elevated creatine phosphokinase levels; this risk is greatly increased when SSRIs are given with monoamine oxidase inhibitors (MAOIs). This medication combination needs to be avoided.
17. Instruct the client that over-the-counter (OTC) cold medicines can increase the likelihood of serotonin syndrome.
18. In pregnancy, consultation with an obstetrician is recommended regarding taking these medications.
19. Monitor the medication response in children, adolescents, and older adults because the response may be different than in an adult client.
20. Encourage psychotherapy.

## II. TRICYCLIC ANTIDEPRESSANTS (Box 77-2)

### A. Description

1. Block the reuptake of norepinephrine (and serotonin) at the presynaptic neuron; used to treat depression
2. May reduce seizure threshold
3. May reduce effectiveness of antihypertensive agents
4. Concurrent use with alcohol or antihistamines can cause CNS depression.

- 
- 
5. Concurrent use with MAOIs can cause hypertensive **crisis**.
  6. Cardiac toxicity can occur, and all clients should receive an electrocardiogram (ECG) before treatment and periodically thereafter.
  7. Overdose is life-threatening, necessitating immediate treatment (see Priority Nursing Actions).
  8. The tricyclic antidepressant clomipramine (Anafranil) may be used to treat obsessive-compulsive disorder.

- B. Side effects**
  1. Anticholinergic effects: Dry mouth, difficulty voiding, dilated pupils and blurred vision, decreased gastrointestinal motility, constipation
  2. Photosensitivity
  3. Cardiovascular disturbances such as tachycardia or dysrhythmias; orthostatic hypotension
  4. Sedation
  5. Seizures (with bupropion)
  6. Weight gain
  7. Anxiety, restlessness, irritability
  8. Decreased or increased libido with ejaculatory and erection disturbances
- C. Interventions**
  1. Monitor the suicidal client, especially during improved mood and increased energy levels. 
  2. Instruct the client to change positions slowly to avoid a hypotensive effect.
  3. Monitor pattern of daily bowel activity. 
  4. Assess for urinary retention.
  5. For the client on long-term therapy, monitor liver and renal function test results.
  6. Administer with food or milk if gastrointestinal distress occurs. 
  7. Administer the entire daily oral dose at one time, preferably at bedtime. 
  8. Instruct the client to avoid alcohol and nonprescription medications to prevent adverse medication interactions.
  9. Instruct the client to avoid driving and other activities requiring alertness until the response is known; sedation is expected in early therapy and may subside with time.
  10. When the medication is discontinued by the physician, it should be tapered gradually.
  11. The potential for medication interactions with OTC cold medication exists.
  12. Caution the client about photosensitivity and to take measures to prevent exposure to sunlight.
  13. Encourage oral hygiene and the use of hard candies and mouth rinses to relieve dry mouth.
  14. Encourage psychotherapy.

### Box 77-1 Reuptake Inhibitors

#### Selective Serotonin Reuptake Inhibitors

Citalopram (Celexa)  
 Escitalopram (Lexapro)  
 Fluoxetine (Prozac)  
 Fluvoxamine (Luvox)  
 Paroxetine (Paxil, Pexeva)  
 Sertraline (Zoloft)

#### Serotonin-Norepinephrine Reuptake Inhibitors

Venlafaxine (Effexor)  
 Duloxetine (Cymbalta)  
 Desvenlafaxine (Pristiq)

#### Atypical Antidepressants

Amoxapine  
 Bupropion (Wellbutrin)  
 Mirtazapine (Remeron)  
 Nefazodone  
 Trazodone (Desyrel)

### PRIORITY NURSING ACTIONS!

#### Actions to Take for a Tricyclic Antidepressant Overdose

1. Check airway and maintain a patent airway.
2. Administer oxygen.
3. Check vital signs.
4. Obtain an electrocardiogram.
5. Prepare for gastric lavage with activated charcoal.
6. Prepare to administer physostigmine (a cholinesterase inhibitor) and antidysrhythmic medications.
7. Document the event, actions taken, and the client's response.

A tricyclic antidepressant overdose can be life-threatening. Signs and symptoms include dysrhythmias, including tachycardia, intraventricular blocks, complete atrioventricular block, and ventricular fibrillation; hypothermia; flushing; dry mouth; dilation of the pupils; confusion, agitation, and hallucinations; and seizures followed by coma. The immediate action is to check the airway and institute measures such as oxygen to maintain a patent airway. Vital signs are checked and monitored, and an electrocardiogram is obtained to check for dysrhythmias. Gastric lavage with activated charcoal is done to prevent further absorption of the medication. Physostigmine (a cholinesterase inhibitor) is given to counteract anticholinergic effects, and antidysrhythmics are administered as needed. The nurse documents the event, actions taken, and the client's response.

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 342). St. Louis: Saunders.

### Box 77-2 Tricyclic Antidepressants

|                          |                                      |
|--------------------------|--------------------------------------|
| Amitriptyline            | Nortriptyline (Aventyl HCl, Pamelor) |
| Clomipramine (Anafranil) | Protriptyline (Vivactil)             |
| Desipramine (Norpramin)  | Trimipramine (Surmontil)             |
| Doxepin (Sinequan)       |                                      |
| Imipramine (Tofranil)    |                                      |

**Box 77-3 Monoamine Oxidase Inhibitors**

|                         |                           |
|-------------------------|---------------------------|
| Isocarboxazid (Marplan) | Tranylcypromine (Parnate) |
| Phenelzine (Nardil)     | Selegiline (Emsam)        |

 Inform the client that antidepressant medication may take several weeks to produce the desired effect (client response may not occur until 2 to 4 weeks after the first dose).

### III. MONOAMINE OXIDASE INHIBITORS (MAOIs) (Box 77-3)

**A. Description**

1. Inhibit the enzyme monoamine oxidase, which is present in the brain, blood platelets, liver, spleen, and kidneys
2. Monoamine oxidase metabolizes amines, norepinephrine, and serotonin, so the concentration of these amines increases with MAOIs.
3. Clients who have depression and have not responded to other antidepressant therapies, including electroconvulsive therapy, are given MAOIs.
4. Concurrent use with amphetamines, antidepressants, dopamine, epinephrine, guanethidine, levodopa, methyl dopa, nasal decongestants, norepinephrine, reserpine, tyramine-containing foods, or vasoconstrictors may cause hypertensive **crisis**.
5. Concurrent use with opioid analgesics may cause hypertension or hypotension, coma, or seizures.

**B. Side effects**

1. Orthostatic hypotension
2. Restlessness
3. Insomnia
4. Dizziness
5. Weakness, lethargy
6. Gastrointestinal upset
7. Dry mouth
8. Weight gain
9. Peripheral edema
10. Anticholinergic effects
11. CNS stimulation (anxiety, agitation, mania)
12. Delay in ejaculation

### C. Hypertensive **crisis**

1. Hypertension
2. Occipital headache radiating frontally
3. Neck stiffness and soreness
4. Nausea and vomiting
5. Sweating
6. Fever and chills
7. Clammy skin
8. Dilated pupils
9. Palpitations, tachycardia, or bradycardia
10. Constricting chest pain
11. Antidote for hypertensive **crisis**: phentolamine by intravenous injection

**D. Interventions**

1. Monitor blood pressure frequently for hypertension.
2. Monitor for signs of hypertensive **crisis**.
3. If palpitations or frequent headaches occur, withhold the medication and notify the physician.
4. Administer with food if gastrointestinal distress occurs.
5. Instruct the client that the medication effect may be noted during the first week of therapy, but maximum benefit may take 3 weeks.
6. Instruct the client to report headache, neck stiffness, or neck soreness immediately.
7. Instruct the client to change positions slowly to prevent orthostatic hypotension.
8. Instruct the client to avoid caffeine or OTC preparations such as weight-reducing pills or medications for hay fever and colds.
9. Monitor for client compliance with medication administration.
10. Instruct the client to carry a Medic-Alert card indicating that an MAOI medication is being taken.
11. Avoid administering the medication in the evening because insomnia may result.
12. When the medication is discontinued by the physician, it should be discontinued gradually.
13. Instruct the client to avoid foods that require bacteria or molds for their preparation or preservation and foods that contain tyramine (Fig. 77-1; Box 77-4).

 Teach the client about foods that contain tyramine. Consuming tyramine-containing foods when taking an MAOI can cause hypertensive crisis.

### **IV. MOOD STABILIZERS** (Box 77-5)

**A. Description:** Affect cellular transport mechanism and enhance serotonin or  $\gamma$ -aminobutyric acid (GABA) function, or both, which are associated with mood

**B. Lithium**

1. Concurrent use with diuretics, fluoxetine (Prozac), methyl dopa, or nonsteroidal anti-inflammatory drugs increases lithium reabsorption by the kidney or inhibits lithium excretion, either of which increases the risk of lithium toxicity.
2. Acetazolamide (Diamox), aminophylline, phenothiazines, or sodium bicarbonate may increase renal excretion of lithium, reducing its effectiveness.
3. The therapeutic dose is only slightly less than the amount producing toxicity.
4. The therapeutic drug serum level of lithium is 0.6 to 1.2 mEq/L; the actual dose at which the therapeutic effect is achieved and the levels at which toxicity occurs is highly variable among individual clients.

**▲ FIGURE 77-1** Interaction between dietary tyramine and monoamine oxidase inhibitors (MAOIs). **A**, In the absence of MAOIs, dietary tyramine is absorbed from the intestine, transported to the liver, and immediately activated by monoamine oxidase (MAO). No tyramine reaches the general circulation. **B**, Three events occur in the presence of MAOIs: (1) inhibition of neuronal MAO increases levels of norepinephrine (NE) in sympathetic nerve terminals; (2) inhibition of hepatic MAO allows dietary tyramine to pass through the liver and enter the systemic circulation intact; (3) on reaching peripheral sympathetic nerve terminals, tyramine promotes the release of accumulated NE stores, causing massive vasoconstriction and excessive stimulation of the heart. *R*, receptor for NE. (From Lehne, R. [2010]. *Pharmacology for nursing care* [7th ed.]. St. Louis: Saunders.)

### Box 77-4 Foods to Avoid That Contain Tyramine

Avocados  
 Bananas  
 Beef or chicken liver  
 Brewer's yeast  
 Broad beans  
 Caffeine, such as in coffee, tea, or chocolate  
 Cheese, especially aged, except cottage cheese  
 Figs  
 Meat extracts and tenderizers  
 Overripe fruit  
 Papaya  
 Pickled herring  
 Raisins  
 Red wine, beer, sherry  
 Sausage, bologna, pepperoni, salami  
 Sour cream  
 Soy sauce  
 Yogurt

### Box 77-5 Mood Stabilizers

#### Lithium Preparations

Lithium carbonate (Lithobid)  
 Lithium citrate

#### Other Mood Stabilizers

Aripiprazole (Abilify)  
 Carbamazepine (Tegretol)  
 Gabapentin (Neurontin)  
 Lamotrigine (Lamictal)  
 Olanzapine (Zyprexa)  
 Olanzapine/fluoxetine (Symbyax)  
 Oxcarbazepine (Trileptal)  
 Quetiapine (Seroquel)  
 Risperidone (Risperdal)  
 Valproate sodium (Depacon), valproic acid (Depakene),  
 divalproex sodium (Depakote)  
 Ziprasidone (Geodon)

- The causes of an increase in the lithium level include decreased sodium intake; fluid and electrolyte loss associated with excessive sweating, dehydration, diarrhea, or diuretic therapy; and illness or overdose.
- Serum lithium levels should be checked every 1 to 2 months or whenever any behavioral change suggests an altered serum level.
- Blood samples to check serum lithium levels should be drawn in the morning, 12 hours after the last dose was taken.

#### C. Side effects

- Polyuria
- Polydipsia
- Anorexia, nausea
- Dry mouth
- Mild thirst
- Weight gain
- Abdominal bloating
- Soft stools or diarrhea
- Fine hand tremors
- Inability to concentrate
- Muscle weakness
- Lethargy
- Fatigue
- Headache
- Hair loss
- Hypothyroidism

#### D. Interventions

- Monitor the suicidal client, especially during improved mood and increased energy levels.
- Administer the medication with food to minimize gastrointestinal irritation.
- Instruct the client to avoid excessive amounts of coffee, tea, or cola, which have a diuretic effect.
- Do not administer diuretics while the client is taking lithium.

5. Instruct the client to avoid alcohol.
6. Instruct the client to avoid OTC medications.
7. Instruct the client that he or she may take a missed dose within 2 hours of the scheduled time; otherwise, the client should skip the missed dose and take the next dose at the scheduled time.
8. Instruct the client not to adjust the dosage without consulting the physician because lithium should be tapered and not discontinued abruptly.
9. Instruct the client about the signs and symptoms of lithium toxicity.
10. Instruct the client to notify the physician if polyuria, prolonged vomiting, diarrhea, or fever occurs.
11. Instruct the client that the therapeutic response to the medication is noted in 1 to 3 weeks.
12. Monitor the ECG, renal function tests, and thyroid tests (ensure that these tests are performed before the start of therapy).
13. Instruct the client to take the medication with food or milk to decrease gastrointestinal upset.
14. Monitor weight.

 **Instruct the client taking lithium (Lithobid) to maintain a fluid intake of six to eight glasses of water a day and an adequate salt intake to prevent lithium toxicity.**

#### E. Lithium toxicity

1. Description
  - a. Occurs when ingested lithium cannot be detoxified and excreted by the kidneys
  - b. Symptoms of toxicity begin to appear when the serum lithium level is 1.5 to 2 mEq/L.
2. Mild toxicity
  - a. Serum lithium level is 1.5 mEq/L.
  - b. Apathy
  - c. Lethargy
  - d. Diminished concentration
  - e. Mild ataxia
  - f. Coarse hand tremors
  - g. Slight muscle weakness
3. Moderate toxicity
  - a. Serum lithium level 1.5 to 2.5 mEq/L
  - b. Nausea, vomiting
  - c. Severe diarrhea
  - d. Mild to moderate ataxia and incoordination
  - e. Slurred speech
  - f. Tinnitus
  - g. Blurred vision
  - h. Muscle twitching
  - i. Irregular tremor
4. Severe toxicity
  - a. Serum lithium level greater than 2.5 mEq/L
  - b. Nystagmus
  - c. Muscle fasciculations

#### Box 77-6 Benzodiazepines

Alprazolam (Xanax, Niravam)  
 Chlordiazepoxide (Librium)  
 Clonazepam (Klonopin)  
 Clorazepate (Tranxene)  
 Diazepam (Valium)  
 Flurazepam (Dalmane)  
 Lorazepam (Ativan)  
 Midazolam (Versed)  
 Oxazepam (Serax)  
 Quazepam (Doral)  
 Temazepam (Restoril)  
 Triazolam (Halcion)

#### Nonbenzodiazepine Anxiolytic

Buspirone (BuSpar)

- d. Deep tendon hyperreflexia
- e. Visual or tactile hallucinations
- f. Oliguria or anuria
- g. Impaired level of consciousness
- h. Tonic-clonic seizures or coma, leading to death
5. Interventions for lithium toxicity
  - a. Withhold lithium and notify the physician.
  - b. Monitor vital signs and level of consciousness.
  - c. Monitor cardiac status.
  - d. Prepare to obtain samples monitoring lithium, electrolyte, blood urea nitrogen, and creatinine levels and complete blood cell count.
  - e. Monitor for suicidal tendencies and institute suicide precautions.

#### V. ANTIANXIETY OR ANXIOLYTIC MEDICATIONS

##### A. Description

1. Antianxiety medications depress the CNS, increasing the effects of GABA, which produces relaxation and may depress the limbic system.
2. Benzodiazepines have anxiety-reducing (anxiolytic), sedative-hypnotic, muscle-relaxing, and anticonvulsant actions (Box 77-6).
3. Benzodiazepines are contraindicated in clients with acute narrow-angle glaucoma and should be used cautiously in children and older adults.
4. Benzodiazepines interact with other CNS medications, producing an additive effect.
5. Abrupt withdrawal of benzodiazepines can be potentially life-threatening, and withdrawal should occur only under medical supervision.

##### B. Side effects

1. Daytime sedation
2. Ataxia
3. Dizziness
4. Headaches
5. Blurred or double vision
6. Hypotension

7. Tremor
8. Amnesia
9. Slurred speech
10. Urinary incontinence
11. Constipation
12. Paradoxical CNS excitement
13. Lethargy
14. Behavioral change

**C. Acute toxicity**

1. Somnolence
2. Confusion
3. Diminished reflexes and coma
4. Flumazenil (Romazicon), a benzodiazepine antagonist administered intravenously, reverses benzodiazepine intoxication in 5 minutes.
5. A client being treated for an overdose of a benzodiazepine may experience agitation, restlessness, discomfort, and anxiety.

**D. Interventions**

1. Monitor for motor responses such as agitation, trembling, and tension.
2. Monitor for autonomic responses such as cold clammy hands and sweating.
3. Monitor for paradoxical CNS excitement during early therapy, particularly in older adults and debilitated clients.
4. Monitor for visual disturbances because the medications can worsen glaucoma.
5. Monitor liver and renal function test results and complete blood cell counts.
6. Reduce the medication dose as prescribed for the older adult client and for the client with impaired liver function.
7. Initiate safety precautions because the older adult client is at risk for falling when taking the medication for sleep or anxiety.
8. Assist with ambulation if drowsiness or light-headedness occurs.
9. Instruct the client that drowsiness usually disappears during continued therapy.
10. Instruct the client to avoid tasks that require alertness until the response to the medication is established.
11. Instruct the client to avoid alcohol.
12. Instruct the client not to take other medications without consulting the physician.
13. Instruct the client not to stop the medication abruptly (can result in seizure activity).

**E. Withdrawal**

1. To lessen withdrawal symptoms, the dosage of a benzodiazepine should be tapered gradually over 2 to 6 weeks.
2. Abrupt or too rapid withdrawal results in the following:
  - a. Restlessness
  - b. Irritability
  - c. Insomnia

### Box 77-7 Barbiturates and Sedative-Hypnotics

**Barbiturates**

Amobarbital sodium (Amytal Sodium)  
 Butobarbital sodium (Butisol Sodium)  
 Pentobarbital sodium (Nembutal Sodium)  
 Phenobarbital sodium (Luminal Sodium)  
 Secobarbital sodium (Seconal Sodium)

**Sedative-Hypnotics**

Chloral hydrate (Aquachloral Suppettes, Somnote)  
 Eszopiclone (Lunesta)  
 Meprobamate (Miltown)  
 Ramelteon (Rozerem)  
 Zaleplon (Sonata)  
 Zolpidem (Ambien)

- d. Hand tremors
- e. Abdominal or muscle cramps
- f. Sweating
- g. Vomiting
- h. Seizures

## VI. BARBITURATES AND SEDATIVE-HYPNOTICS (Box 77-7)

**A. Description**

1. Depress the reticular activating system by promoting the inhibitory synaptic action of the neurotransmitter GABA
2. Used for short-term treatment of insomnia or for sedation to relieve anxiety, tension, and apprehension

**B. Side effects**

1. Dizziness and drowsiness
2. Confusion
3. Irritability
4. Allergic reactions
5. Agranulocytosis
6. Thrombocytopenic purpura
7. Megaloblastic anemia

**C. Overdose**

1. Tachycardia
2. Hypotension
3. Cold and clammy skin
4. Dilated pupils
5. Weak and rapid pulse
6. Signs of shock
7. Depressed respirations
8. Absent reflexes
9. Coma and death may result from respiratory and cardiovascular collapse.

**D. Withdrawal**

1. Severe withdrawal symptoms begin within 24 hours after the medication is discontinued in an individual with severe medication dependence.
2. Gradual withdrawal is used to detoxify a dependent client.

3. Anxiety
4. Insomnia
5. Nightmares
6. Daytime agitation
7. Tremors
8. Delirium
9. Seizures
10. Behavioral changes

#### E. Interventions

1. Administer lower doses as prescribed for the older client.
2. Medications should be used with caution in the client who has suicidal tendencies or has a history of drug **addiction**.
3. Maintain safety by supervising ambulation and using side rails at night.
4. Instruct the client to take the medication as directed.
5. Instruct the client to avoid driving or operating hazardous equipment if drowsiness, dizziness, or unsteadiness occurs.
6. Instruct the client to avoid alcohol.
7. For insomnia, instruct the client to take the medication 30 minutes before bedtime; avoid taking with a large amount of food to help absorption.
8. Instruct the client that a hangover effect may occur in the morning.
9. Instruct the client not to discontinue the medication abruptly.
10. Instruct the client taking chloral hydrate to take the medication with food and a full glass of water, fruit juice, or ginger ale to prevent gastric irritation.

### VII. ANTIPSYCHOTIC MEDICATIONS (Box 77-8)

#### A. Description

1. Improve the thought processes and the behavior of the client with psychotic symptoms, especially clients with schizophrenia

#### Box 77-8 Antipsychotic Medications

##### Typical Antipsychotics

Chlorpromazine (Thorazine)  
 Fluphenazine decanoate (Prolixin Decanoate)  
 Haloperidol  
 Loxapine (Loxitane)  
 Molindone (Moban)  
 Pimozide (Orap)  
 Thiothixene (Navane)  
 Trifluoperazine

##### Atypical Antipsychotics

Aripiprazole (Abilify)  
 Clozapine (Clozaril)  
 Olanzapine (Zyprexa)  
 Quetiapine (Seroquel)  
 Risperidone (Risperdal)  
 Ziprasidone (Geodon)

2. Affect dopamine receptors in the brain, reducing the psychotic symptoms
3. Typical antipsychotics are more effective for positive symptoms of schizophrenia, such as hallucinations, aggression, and delusions; typical antipsychotic medications also block the chemoreceptor trigger zone and vomiting center in the brain, producing an antiemetic effect.
4. Atypical antipsychotics are more effective for the negative symptoms of schizophrenia, such as avolition, apathy, and alogia.
5. The effects of antipsychotic medications are potentiated when given with other medications acting on the CNS.

#### B. Side effects (Box 77-9)

#### Box 77-9 Side Effects of Antipsychotic Medications

##### Anticholinergic Effects

Dry mouth  
 Increased heart rate  
 Urinary retention  
 Constipation  
 Hypotension

##### Extrapyramidal Side Effects

###### *Parkinsonism*

Tremors  
 Mask-like facies  
 Rigidity  
 Shuffling gait  
 Dysphagia  
 Drooling

###### *Dystonias*

Abnormal or involuntary eye movements, including oculogyric crisis  
 Facial grimacing  
 Twisting of the torso or other muscle groups

###### *Akathisia*

Restlessness  
 Constant moving about

###### *Tardive Dyskinesia*

Protrusion of the tongue  
 Chewing motion  
 Involuntary movements of the body and extremities

##### Other Side Effects

Drowsiness  
 Blood dyscrasias  
 Pruritus  
 Photosensitivity  
 Elevated blood glucose level  
 Increased weight  
 Impaired body temperature regulation  
 Gynecomastia  
 Lactation

**C. Extrapyramidal syndrome**

1. Parkinsonism
  - a. Tremors
  - b. Mask-like facies
  - c. Dysphagia, drooling
  - d. Rigidity, shuffling gait
2. Dystonia
  - a. Facial grimacing
  - b. Abnormal or involuntary eye movements
3. Akathisia
  - a. Restlessness
  - b. Constant moving about
4. Tardive dyskinesia
  - a. Protrusion of the tongue
  - b. Chewing motions
  - c. Involuntary movements of the body and extremities

**D. Interventions**

1. Monitor vital signs.
2. Monitor for symptoms of neuroleptic malignant syndrome (can occur with antipsychotic medications).
3. Monitor urine output.
4. Monitor serum glucose level.
5. The client taking an antipsychotic medication may require long-term medication for parkinsonian symptoms.
6. Administer the medication with food or milk to decrease gastric irritation.
7. For oral use, the liquid form might be preferred because some clients hide tablets in their mouths to avoid taking them.
8. The absorption rate is faster with the liquid form of oral medication.
9. Avoid skin contact with the liquid concentrate to prevent contact dermatitis.
10. Protect the liquid concentrate from light.
11. Dilute the liquid concentrate with fruit juice.
12. Inform the client that a full therapeutic effect of the medication may not be evident for 3 to 6 weeks after initiation of therapy; however, an observable therapeutic response may be apparent after 7 to 10 days.
13. Inform the client that some medications may cause a harmless change in urine color to pinkish to red-brown.
14. Instruct the client to use sunscreen, hats, and protective clothing when outdoors.
15. Instruct the client to avoid alcohol or other CNS depressants.
16. Instruct the client to change positions slowly to avoid orthostatic hypotension.
17. Instruct the client to report signs of agranulocytosis, including sore throat, fever, and malaise.
18. Instruct the client to report signs of liver dysfunction, including jaundice, malaise, fever, and right upper abdominal pain.

19. When discontinuing antipsychotics, the medication dosage should be reduced gradually to avoid sudden recurrence of psychotic symptoms.

 **Monitor for extrapyramidal side effects in the client taking an antipsychotic medication.**

**VIII. NEUROLEPTIC MALIGNANT SYNDROME****A. Description**

1. Neuroleptic malignant syndrome is a potentially fatal syndrome that may occur at any time during therapy with neuroleptic (antipsychotic) medications.
2. Although rare, neuroleptic malignant syndrome more commonly occurs at the initiation of therapy, after the client has changed from one medication to another, after a dosage increase, or when a combination of medications is used.

**B. Assessment**

1. Dyspnea or tachypnea
2. Tachycardia or irregular pulse rate
3. Fever
4. High or low blood pressure
5. Increased sweating
6. Loss of bladder control
7. Skeletal muscle rigidity
8. Pale skin
9. Excessive weakness or fatigue
10. Altered level of consciousness
11. Seizures
12. Severe extrapyramidal side effects
13. Difficulty swallowing
14. Excessive salivation
15. Oculogyric **crisis**
16. Dyskinesia
17. Elevated white blood cell count, liver function results, and creatine phosphokinase level

**C. Interventions**

1. Notify the physician.
2. Monitor vital signs.
3. Initiate safety and seizure precautions.
4. Prepare to discontinue the medication.
5. Monitor level of consciousness.
6. Administer antipyretics as prescribed.
7. Use a cooling blanket to lower the body temperature.
8. Monitor electrolyte levels and administer fluids intravenously as prescribed.

**IX. MEDICATIONS TO TREAT ATTENTION-DEFICIT/HYPERACTIVITY DISORDER (Box 77-10)**

- A.** Children with attention-deficit/hyperactivity disorder may require medication to reduce hyperactive behavior and lengthen attention span.
- B.** Medications that are most effective in controlling this disorder are CNS stimulants.

**Box 77-10 Medications to Treat Attention-Deficit/Hyperactivity Disorder**

Amphetamine  
 Atomoxetine (Strattera)  
 Dexamethylphenidate (Focalin)  
 Dextroamphetamine (Dexedrine)  
 Dextroamphetamine and amphetamine (Adderall XR)  
 Methamphetamine (Desoxyn)  
 Methylphenidate (Ritalin, Concerta, Metadate CD, Methylin)

**Box 77-11 Medications to Treat Alzheimer's Disease**

|                        |                       |
|------------------------|-----------------------|
| Donepezil (Aricept)    | Rivastigmine (Exelon) |
| Galantamine (Razadyne) | Tacrine (Cognex)      |
| Memantine (Namenda)    |                       |

- C.** CNS stimulants, which increase agitation and activity in adults, have a calming effect on children with attention-deficit/hyperactivity disorder and increase alertness and sensitivity to stimuli.
- D.** Side effects
1. Tachycardia
  2. Anorexia and weight loss
  3. Elevated blood pressure
  4. Dizziness
  5. Agitation
- E.** Interventions
1. Monitor for CNS side effects.
  2. Obtain a baseline ECG.
  3. Monitor the blood pressure
  4. Instruct the child and parents that OTC medications need to be avoided.
  5. Instruct the child and parents that the last dose of the day should be taken at least 6 hours before bedtime (14 hours for extended-release forms) to prevent insomnia.
  6. Monitor height and weight (particularly in children).
  7. Reinforce that several weeks of therapy may be necessary before the therapeutic effect is noted.
  8. Instruct the client and parents that a drug-free period may be prescribed to allow growth of the child if the medication has caused growth retardation.

**X. MEDICATIONS TO TREAT ALZHEIMER'S DISEASE (Box 77-11)**

- A.** Acetylcholinesterase inhibitors may be used in clients with Alzheimer's disease to improve cognitive functions in the early stages.
- B.** Donepezil (Aricept)
1. An inhibitor of acetylcholinesterase used to treat mild to moderate dementia of Alzheimer's disease

2. Side effects include nausea and diarrhea.
3. Donepezil can slow the heart rate through its vagotonic effect.

**C.** Galantamine (Razadyne)

1. An inhibitor of cholinesterase used to treat mild to moderate dementia of Alzheimer's disease.
2. Side effects include nausea, vomiting, diarrhea, anorexia, and weight loss.
3. Galantamine can cause bronchoconstriction; it should be used with caution in clients with asthma and chronic obstructive pulmonary disease.

**D.** Memantine (Namenda)

1. *N*-methyl-D-aspartate (NMDA) receptor antagonist indicated for treatment of moderate to severe dementia of Alzheimer's disease
2. Side effects include dizziness, headache, confusion, and constipation.
3. Memantine should not be used in combination with other NMDA antagonists such as amantadine (Symmetrel) or ketamine (Ketalar); such combinations produce undesirable additive effects.
4. Sodium bicarbonate and other medications that alkalinize the urine can decrease renal excretion of memantine; accumulation to toxic levels can result.

**E.** Rivastigmine (Exelon)

1. Cholinesterase inhibitor used to treat mild to moderate dementia of Alzheimer's disease
2. Side effects include nausea, vomiting, diarrhea, abdominal pain, and anorexia.
3. Rivastigmine should be used with caution in clients with peptic ulcer disease, bradycardia, sick sinus syndrome, urinary obstruction, and lung disease because it enhances cholinergic transmission, intensifying symptoms of these disorders.

**F.** Tacrine (Cognex)

1. A centrally acting cholinesterase inhibitor used to treat mild to moderate dementia of Alzheimer's disease
2. Side effects include ataxia, loss of appetite, nausea, vomiting, and diarrhea.
3. An adverse effect is hepatotoxicity; liver function studies need to be monitored.

**MORE QUESTIONS ON THE CD!****Practice Questions**

- 944.** A client's medication sheet contains a prescription for sertraline (Zoloft). To ensure safe administration of the medication, a nurse would administer the dose:
1. On an empty stomach
  2. At the same time each evening
  3. Evenly spaced around the clock
  4. As needed when the client complains of depression

- 945.** A client with schizophrenia has been started on medication therapy with clozapine (Clozaril). A nurse assesses the results of which laboratory study to monitor for adverse effects from this medication?
1. Platelet count
  2. Blood glucose level
  3. White blood cell count
  4. Liver function studies
- 946.** A client is scheduled for discharge and will be taking phenobarbital (Luminal) for an extended period. A nurse would place highest priority on teaching the client which of the following points that directly relates to client safety?
1. Take the medication only with meals.
  2. Take the medication at the same time each day.
  3. Use a dose container to help prevent missed doses.
  4. Avoid drinking alcohol while taking this medication.
- 947.** A nurse is describing the medication side effects to a client who is taking oxazepam (Serax). The nurse incorporates in discussions with the client the need to:
1. Consume a low-fiber diet.
  2. Increase fluids and bulk in the diet.
  3. Rest if the heart begins to beat rapidly.
  4. Take antidiarrheal agents if diarrhea occurs.
- 948.** A nurse is administering risperidone (Risperdal) to a client who is scheduled to be discharged. Before discharge, which of the following should the nurse teach the client?
1. Get adequate sunlight.
  2. Avoid foods rich in potassium.
  3. Continue driving as usual.
  4. Get up slowly when changing positions.
- 949.** A nurse is teaching a client who is being started on imipramine (Tofranil) about the medication. The nurse informs the client that the maximum desired effects may:
1. Start during the first week of administration
  2. Not occur for 2 to 3 weeks of administration
  3. Start during the second week of administration
  4. Not occur until after 2 months of administration
- 950.** A client receiving tricyclic antidepressants arrives at the mental health clinic. Which observation would indicate that the client is following the medication plan correctly?
1. Client reports not going to work for this past week.
  2. Client arrives at the clinic neat and appropriate in appearance.
  3. Client complains of not being able to “do anything” anymore.
  4. Client reports sleeping 12 hours per night and 3 to 4 hours during the day.
- 951.** A nurse notes that a client with schizophrenia and receiving an antipsychotic medication is moving her mouth, protruding her tongue, and grimacing as she watches television. The nurse determines that the client is experiencing:
1. Parkinsonism
  2. Tardive dyskinesia
  3. Hypertensive crisis
  4. Neuroleptic malignant syndrome
- 952.** A nurse is performing a follow-up teaching session with a client discharged 1 month ago. The client is taking fluoxetine (Prozac). What information would be important for the nurse to obtain during this client visit regarding the side effects of the medication?
1. Cardiovascular symptoms
  2. Gastrointestinal dysfunctions
  3. Problems with mouth dryness
  4. Problems with excessive sweating
- 953.** A client who has been taking buspirone (BuSpar) for 1 month returns to the clinic for a follow-up assessment. A nurse determines that the medication is effective if the absence of which manifestation has occurred?
1. Paranoid thought process
  2. Rapid heartbeat or anxiety
  3. Alcohol withdrawal symptoms
  4. Thought broadcasting or delusions
- 954.** A client taking lithium carbonate (Lithobid) reports vomiting, abdominal pain, diarrhea, blurred vision, tinnitus, and tremors. The lithium level is 2.5 mEq/L. The nurse interprets this level as:
1. Toxic
  2. Normal
  3. Slightly above normal
  4. Excessively below normal
- 955.** A home health nurse visits a client. The client gives the nurse a bottle of clomipramine (Anafranil). The nurse notes that the medication has not been taken by the client in 2 months. What behaviors observed in the client would validate noncompliance with this medication?
1. Complaints of insomnia
  2. Complaints of hunger and fatigue
  3. A pulse rate less than 60 beats/min
  4. Frequent handwashing with hot soapy water

**956.** A hospitalized client has begun taking bupropion (Wellbutrin) as an antidepressant agent. A nurse monitors this client for which side effect indicating that the client is taking an excessive amount of medication?

1. Constipation
2. Seizure activity
3. Increased weight
4. Dizziness when getting upright

### Alternate Item Format: Multiple Response

**957.** A hospitalized client is started on phenelzine (Nardil) for the treatment of depression. A nurse instructs the client to avoid consuming which foods while taking this medication? **Select all that apply.**

- 1. Figs
- 2. Yogurt
- 3. Crackers
- 4. Aged cheese
- 5. Tossed salad
- 6. Oatmeal cookies

## ANSWERS

### 944. 2

**Rationale:** Sertraline (Zoloft) is classified as an antidepressant. Sertraline generally is administered once every 24 hours. It may be administered in the morning or evening, but evening administration may be preferable because drowsiness is a side effect. The medication may be administered without food or with food if gastrointestinal distress occurs. Sertraline is not prescribed for use as needed.

**Test-Taking Strategy:** Use the process of elimination. Recalling that this medication is an antidepressant administered daily will direct you to option 2. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 417). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 356). St. Louis: Saunders.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 233). St. Louis: Saunders.

### 945. 3

**Rationale:** A client taking clozapine (Clozaril) may experience agranulocytosis, which is monitored by reviewing the results of the white blood cell count. Treatment is interrupted if the white blood cell count decreases to less than 3000 cells/mm<sup>3</sup>. Agranulocytosis could be fatal if undetected and untreated. The other options are not related specifically to the use of this medication.

**Test-Taking Strategy:** Use the process of elimination. Recalling that this medication causes agranulocytosis will direct you to option 3. Review the adverse effects of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 267). St. Louis: Saunders.

### 946. 4

**Rationale:** Phenobarbital (Luminal) is an anticonvulsant and hypnotic agent. The client should avoid taking any other CNS depressants such as alcohol while taking this medication. The medication may be given without regard to meals. Taking the medication at the same time each day enhances compliance and maintains more stable blood levels of the medication. Using a dose container or “pillbox” may be helpful for some clients.

**Test-Taking Strategy:** Use the process of elimination. Focus on the subject, client safety, and note the strategic words *highest priority*. This tells you that more than one or all the options may be partially or totally correct and that you must prioritize your answer. Remember that alcohol should not be consumed when a hypnotic is taken. Review client teaching points related to this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 902). St. Louis: Saunders.

### 947. 2

**Rationale:** Oxazepam (Serax) causes constipation, and the client is instructed to increase fluid intake and bulk (high fiber) in the diet. If the heart begins to beat fast, the physician is notified because this could indicate overdose. Additionally, diarrhea could indicate an incomplete intestinal obstruction and, if this occurs, the physician is notified.

**Test-Taking Strategy:** Use the process of elimination. Recalling that constipation is a side effect of this medication will direct you to option 2. Review the side effects and adverse effects of oxazepam if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 518). St. Louis: Mosby.

### 948. 4

**Rationale:** Risperidone (Risperdal) can cause orthostatic hypotension. Sunlight should be avoided by the client taking this medication. Food interaction is not a concern. With any

psychotropic medication, caution needs to be taken until the individual can determine whether his or her level of alertness is affected.

**Test-Taking Strategy:** Knowledge regarding the nursing considerations related to the administration of risperidone is required to answer this question. Remember that risperidone can cause orthostatic hypotension. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 1005). St. Louis: Saunders.

### 949. 2

**Rationale:** The maximum therapeutic effects of imipramine (Tofranil) may not occur for 2 to 3 weeks after antidepressant therapy has been initiated. Options 1, 3, and 4 are incorrect.

**Test-Taking Strategy:** Focus on the strategic word *maximum*. Recalling that it takes 2 to 3 weeks for a maximum therapeutic effect to occur with most antidepressants will direct you to option 2. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 589). St. Louis: Saunders.

### 950. 2

**Rationale:** Depressed individuals sleep for long periods, are unable to go to work, and feel as if they cannot “do anything.” When these clients have had some therapeutic effect from their medication, they report resolution of many of these complaints and exhibit an improvement in their appearance.

**Test-Taking Strategy:** Use the process of elimination. The client’s behaviors or reports identified in options 1, 3, and 4 are symptoms of depression. The improvement in appearance indicates a therapeutic response to the medication, indicating compliance with the medication regimen. Review the expected effect of a tricyclic antidepressant if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Pharmacology

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 410). St. Louis: Saunders.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 231). St. Louis: Saunders.

### 951. 2

**Rationale:** Tardive dyskinesia is a reaction that can occur from antipsychotic medication. It is characterized by uncontrollable involuntary movements of the body and extremities, particularly the tongue. Parkinsonism is characterized

by tremors, mask-like facies, rigidity, and a shuffling gait. Hypertensive crisis can occur from the use of monoamine oxidase inhibitors and is characterized by hypertension, occipital headache radiating frontally, neck stiffness and soreness, nausea, and vomiting. Neuroleptic malignant syndrome is a potentially fatal syndrome that may occur at any time during therapy with neuroleptic (antipsychotic) medications. It is characterized by dyspnea or tachypnea, tachycardia or irregular pulse rate, fever, blood pressure changes, increased sweating, loss of bladder control, and skeletal muscle rigidity.

**Test-Taking Strategy:** Focus on the data in the question. Remember that tardive dyskinesia is characterized by uncontrollable involuntary movements of the body and extremities, particularly the tongue. Review the side effects and extrapyramidal side effects of antipsychotic medications if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**References:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 528). St. Louis: Mosby.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (pp. 294, 298). St. Louis: Saunders.

### 952. 2

**Rationale:** The most common side effects related to this medication include central nervous system and gastrointestinal system dysfunction. Fluoxetine (Prozac) affects the gastrointestinal system by causing nausea and vomiting, cramping, and diarrhea. Excessive sweating, dry mouth, and cardiovascular symptoms are not side effects associated with this medication.

**Test-Taking Strategy:** Use the process of elimination. Recalling that this medication causes gastrointestinal problems will direct you to option 2. Review the side effects related to this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**References:** Edmunds, M. (2010). *Introduction to clinical pharmacology* (6th ed., p. 276). St. Louis: Mosby.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 356–357). St. Louis: Saunders.

### 953. 2

**Rationale:** Buspirone (BuSpar) is not recommended for the treatment of drug or alcohol withdrawal, thought disorders, or schizophrenia. Buspirone most often is indicated for the treatment of anxiety.

**Test-Taking Strategy:** Note the strategic words *absence of which manifestation*. Recalling that buspirone is an anti-anxiety medication will direct you to the correct option. Review the action and use of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Pharmacology

**References:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (pp. 154–155). St. Louis: Saunders.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 146). St. Louis: Saunders.

#### 954. 1

**Rationale:** Maintenance serum levels of lithium are 0.6 to 1.2 mEq/L. Symptoms of toxicity begin to appear at levels of 1.5 to 2 mEq/L. Lithium toxicity requires immediate medical attention with lavage and possible peritoneal dialysis or hemodialysis.

**Test-Taking Strategy:** Use the process of elimination. Recalling that the high end of the maintenance level is 1.2 mEq/L will direct you to option 1. Review the maintenance level and signs of toxicity if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 683). St. Louis: Saunders.

#### 955. 4

**Rationale:** Clomipramine (Anafranil) is a tricyclic antidepressant used to treat obsessive-compulsive disorder. Weight gain and tachycardia are side effects of this medication. Sedation sometimes occurs. Insomnia seldom is a side effect.

**Test-Taking Strategy:** Recalling that this medication is a tricyclic antidepressant used to treat obsessive-compulsive disorder will direct you to option 4. Review the purpose and use of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Pharmacology

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 416). St. Louis: Saunders.

Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 388). St. Louis: Saunders.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 149). St. Louis: Saunders.

#### 956. 2

**Rationale:** The nurse monitors for signs of toxicity. Seizure activity is common in bupropion dosages greater than 450 mg daily. This medication does not cause significant orthostatic blood pressure changes. Weight gain is an occasional side effect, whereas constipation is a common side effect of this medication.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *side effect* and *excessive amount*. These strategic words will direct you to option 2. Review this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 154). St. Louis: Saunders.

### ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

#### 957. 1, 2, 4

**Rationale:** Phenyelzine (Nardil) is a monoamine oxidase inhibitor (MAOI). The client should avoid ingesting foods that are high in tyramine. Ingestion of these foods could trigger a potentially fatal hypertensive crisis. Foods to avoid include yogurt; aged cheeses; smoked or processed meats; red wines; and fruits such as avocados, raisins, or figs.

**Test-Taking Strategy:** Recall that phenelzine is an MAOI and that foods high in tyramine needed to be avoided. Next, from the food items listed in the question, identify the foods that contain tyramine. Review the food items to avoid with MAOIs if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**Reference:** Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 237). St. Louis: Saunders.

## UNIT XX

# Comprehensive Test

- 958.** An emergency department nurse is caring for a client who has been identified as a victim of physical abuse. In planning care for the client, which of the following is the priority nursing action?
1. Adhering to the mandatory abuse reporting laws
  2. Notifying the case worker of the family situation
  3. Removing the client from any immediate danger
  4. Obtaining treatment for the abusing family member
- 959.** A nurse assesses a client with the admitting diagnosis of bipolar affective disorder, mania. The symptom presented by the client that requires the nurse's immediate intervention is the client's:
1. Outlandish behaviors and inappropriate dress
  2. Nonstop physical activity and poor nutritional intake
  3. Grandiose delusions of being a royal descendant of King Arthur
  4. Constant, incessant talking that includes sexual innuendoes and teasing the staff
- 960.** A nurse is caring for a client who is scheduled for electroconvulsive therapy. The nurse notes that an informed consent has not been obtained for the procedure. On review of the record, the nurse notes that the admission was an involuntary hospitalization. Based on this information, the nurse determines:
1. That the physician will provide the informed consent
  2. That an informed consent does not need to be obtained
  3. That an informed consent should be obtained from the family
  4. That an informed consent needs to be obtained from the client
- 961.** A client newly diagnosed with diabetes mellitus is instructed by the physician to obtain glucagon for emergency home use. The client asks a home care nurse about the purpose of the medication. The nurse instructs the client that the purpose of the medication is to treat:
1. Hypoglycemia from insulin overdose
  2. Hyperglycemia from insufficient insulin
  3. Lipoatrophy from insulin injections
  4. Lipohypertrophy from inadequate insulin absorption
- 962.** A nurse is providing care to a Puerto Rican-American client who is terminally ill. Numerous family members are present most of the time, and many of the family members are very emotional. The appropriate action is to:
1. Restrict the number of family members visiting at one time.
  2. Inform the family that emotional outbursts are to be avoided.
  3. Request permission to move the client to a private room and allow the family members to visit.
  4. Contact the physician to speak to the family regarding their behaviors.
- 963.** A client presents to the emergency department with upper gastrointestinal bleeding and is in moderate distress. In planning care, which nursing action would be the first priority for this client?
1. Thorough investigation of precipitating events
  2. Insertion of a nasogastric tube and Hematest of emesis
  3. Complete abdominal examination
  4. Assessment of vital signs

- 964.** A nurse is performing an assessment on a client with dementia. Which data gathered during the assessment indicate a manifestation associated with dementia?
1. Confabulation
  2. Improvement in sleeping
  3. Absence of sundown syndrome
  4. Presence of personal hygienic care
- 965.** A nurse is caring for a client with anorexia nervosa. The nurse is monitoring the behavior of the client and understands that a client with anorexia nervosa manages anxiety by:
1. Engaging in immoral acts
  2. Always reinforcing self-approval
  3. Observing rigid rules and regulations
  4. Having the need always to make the right decision
- 966.** A nurse provides instructions to a malnourished client regarding iron supplementation during pregnancy. Which statement, if made by the client, would indicate an understanding of the instructions?
1. "The iron is best absorbed if taken on an empty stomach."
  2. "Meat does not provide iron and should be avoided."
  3. "Iron supplements will give me diarrhea."
  4. "My body has all the iron it needs and I don't need to take supplements."
- 967.** Levothyroxine (Synthroid) is prescribed for a client diagnosed with hypothyroidism. A nurse reviews the client's record and notes that the client is presently taking warfarin (Coumadin). The nurse contacts the physician, anticipating that the physician will prescribe which of the following?
1. An increased dosage of Coumadin
  2. A decreased dosage of Coumadin
  3. An increased dosage of Synthroid
  4. A decreased dosage of Synthroid
- 968.** A nurse is teaching a client with emphysema about positions that help breathing during dyspneic episodes. The nurse instructs the client to avoid which of the following positions that would aggravate breathing?
1. Sitting up with the elbows resting on knees
  2. Standing and leaning against a wall
  3. Lying on the back in a low-Fowler's position
  4. Sitting up and leaning on a table
- 969.** A client is about to undergo a lumbar puncture. A nurse describes to the client that which of the following positions will be used during the procedure?
1. Side-lying with the legs pulled up and the head bent down onto the chest
  2. Side-lying with a pillow under the hip
  3. Prone with a pillow under the abdomen
  4. Prone in slight Trendelenburg's position
- 970.** A nurse recognizes that which of the following interventions is unlikely to facilitate effective communication between a dying client and family?
1. The nurse encourages the client and family to identify and discuss feelings openly.
  2. The nurse makes decisions for the client and family to relieve them of unnecessary demands.
  3. The nurse assists the client and family in carrying out spiritually meaningful practices.
  4. The nurse maintains a calm attitude and one of acceptance when the family or client expresses anger.
- 971.** A depressed client verbalizes feelings of low self-esteem and self-worth typified by statements such as "I'm such a failure. I can't do anything right." The best nursing response would be to:
1. Tell the client that this is not true, that we all have a purpose in life.
  2. Identify recent behaviors or accomplishments that demonstrate the client's skills.
  3. Reassure the client that you know how the client is feeling and that things will get better.
  4. Remain with the client and sit in silence; this will encourage the client to verbalize feelings.
- 972.** A nurse has just admitted to the nursing unit a client with a basilar skull fracture who is at risk for increased intracranial pressure. Pending specific physician prescriptions, the nurse would safely place the client in which positions? **Select all that apply.**
- 1. Neck in neutral position
  - 2. Head of bed elevated 30 to 45 degrees
  - 3. Flat, with head turned to the side
  - 4. Head midline
  - 5. Neck in a flexed position
- 973.** A nurse reviews the arterial blood gas results of an assigned client and notes that the laboratory report indicates a pH of 7.30, Pco<sub>2</sub> of 58 mm Hg, Po<sub>2</sub> of 80 mm Hg, and HCO<sub>3</sub> of 27 mEq/L. The nurse interprets that the client has which acid-base disturbance?
1. Metabolic acidosis
  2. Metabolic alkalosis
  3. Respiratory acidosis
  4. Respiratory alkalosis

- 974.** A nurse has admitted a client to the clinical nursing unit after a modified right radical mastectomy for the treatment of breast cancer. The nurse plans to place the right arm in which of the following positions?
1. Elevated above shoulder level
  2. Elevated on a pillow
  3. Level with the right atrium
  4. Dependent to the right atrium
- 975.** On the second postpartum day, a client complains of burning on urination, urgency, and frequency of urination. A urinalysis indicates the presence of a urinary tract infection. A nurse instructs the client regarding measures to take for the treatment of the infection. Which of the following statements, if made by the client, would indicate a need for further instructions?
1. "The prescribed medication must be taken until it is finished."
  2. "My fluid intake should be increased to at least 3000 mL daily."
  3. "I need to urinate frequently throughout the day."
  4. "Foods and fluids that will increase urine alkalinity should be consumed."
- 976.** A client received 20 units of Humulin NPH insulin subcutaneously at 8:00 AM. A nurse should assess the client for a hypoglycemic reaction at:
1. 10:00 AM
  2. 11:00 AM
  3. 5:00 PM
  4. 11:00 PM
- 977.** A community health nurse is working with disaster relief in a local community after a hurricane that destroyed many homes in the community. The nurse is working to find housing for the survivors and is organizing counseling services. The nurse's actions represent which type of level of prevention?
1. Primary
  2. Secondary
  3. Tertiary
  4. Fourth
- 978.** A pregnant woman in her second trimester calls a prenatal clinic nurse to report a recent exposure to a child with rubella. Which of the following responses by the nurse would be appropriate and supportive to the woman?
1. "There is no need to be concerned if you don't have a fever or rash within the next 2 days."
  2. "Be sure to tell the physician on your next prenatal visit, but there is little risk in the second trimester."
  3. "You should avoid all school-age children during pregnancy."
  4. "You were wise to call. I will check your rubella titer screening results, and we can immediately identify if future interventions are needed."
- 979.** A breast-feeding mother of an infant with lactose intolerance asks a nurse about dietary measures. The nurse tells the mother to avoid:
1. Hard cheeses
  2. Green leafy vegetables
  3. Dried beans
  4. Egg yolk
- 980.** A client with diabetes mellitus is told that amputation of the leg is necessary to sustain life. The client is very upset and tells a nurse, "This is all the doctor's fault. I have done everything that the doctor has asked me to do!" The nurse interprets the client's statement as:
1. An expected coping mechanism
  2. A need to notify the hospital lawyer
  3. An expression of guilt on the part of the client
  4. An ineffective coping mechanism
- 981.** A client brought to the emergency department is dead on arrival (DOA). The family of the client tells the physician that the client had a terminal cancer. The emergency department physician examines the client and asks a nurse to contact the medical examiner regarding an autopsy. The family of the client tells the nurse that they do not want an autopsy performed. Which of the following responses to the family is appropriate?
1. "It is required by federal law. Why don't we talk about it and why don't you tell me why you don't want the autopsy done?"
  2. "The decision is made by the medical examiner."
  3. "I will contact the medical examiner regarding your request."
  4. "An autopsy is mandatory for any client who is DOA."
- 982.** A client who is positive for human immunodeficiency virus (HIV) delivers a newborn infant. A nurse provides instructions to help the client regarding care of her infant. Which statement by the client indicates the need for further instructions?
1. "I will be sure to wash my hands before and after bathroom use."
  2. "Support groups are available to assist me with understanding my diagnosis of HIV."
  3. "I need to breast-feed, especially for the first 6 weeks postpartum."
  4. "My newborn infant should be on antiviral medications for the first 6 weeks after delivery."

- 983.** An adolescent client is diagnosed with conjunctivitis, and a nurse provides information to the client about the use of contact lenses. Which statement by the client indicates the need for further information?
1. "My contact lenses can be worn if they are cleaned as directed."
  2. "I should not wear my contact lenses."
  3. "I should obtain new contact lenses."
  4. "My old contact lenses should be discarded."
- 984.** A client with diabetes mellitus is self-administering NPH insulin from a vial that is kept at room temperature. The client asks a nurse about the length of time an unrefrigerated vial of insulin will maintain its potency. The appropriate response to the client is which of the following?
1. 2 weeks
  2. 1 month
  3. 2 months
  4. 6 months
- 985.** A nurse is caring for a client scheduled for a transsphenoidal hypophysectomy. The preoperative teaching instructions should include which most important statement?
1. "Your hair will need to be shaved."
  2. "Deep breathing and coughing will be needed after surgery."
  3. "Brushing your teeth will not be permitted for at least 2 weeks after surgery."
  4. "You will receive spinal anesthesia."
- 986.** During a routine prenatal visit, a client complains of gums that bleed easily with brushing. A nurse performs an assessment and teaches the client about proper nutrition to minimize this problem. Which statement, if made by the client, indicates an understanding of the proper nutrition to minimize this problem?
1. "I will eat three servings of cracked wheat bread each day."
  2. "I will eat fresh fruits and vegetables for snacks and for dessert each day."
  3. "I will drink 8 oz of water with each meal."
  4. "I will eat two saltine crackers before I get up each morning."
- 987.** A 6-year-old child has just been diagnosed with localized Hodgkin's disease, and chemotherapy is planned to begin immediately. The mother of the child asks a nurse why radiation therapy was not prescribed as a part of the treatment. The appropriate and supportive response to the mother is:
1. "I'm not sure. I'll discuss it with the physician."
  2. "The child is too young to have radiation therapy."
  3. "It's very costly, and chemotherapy works just as well."
  4. "The physician would prefer that you discuss treatment options with the oncologist."
- 988.** A nurse is preparing to care for a newborn who will be returning from surgery with a colostomy that was created for imperforate anus. When the infant returns from surgery, the nurse assesses the stoma and notes that it is red and edematous. Which of the following is the appropriate nursing intervention?
1. Call the physician.
  2. Document the findings.
  3. Apply ice immediately.
  4. Elevate the buttocks.
- 989.** A nurse in the labor room is performing an initial assessment on a newborn infant. On assessment of the infant's head, the nurse notes that the ears are low-set. Which of the following nursing actions would be most appropriate?
1. Cover the ears with gauze pads.
  2. Document the findings.
  3. Arrange for hearing testing.
  4. Notify the physician.
- 990.** A clinic nurse is assessing jaundice in a child with hepatitis. Which anatomical area would provide the best data regarding the presence of jaundice?
1. The nail beds
  2. The skin in the abdominal area
  3. The skin in the sacral area
  4. The membranes in the ear canal
- 991.** A nurse is assigned to care for a client who is in traction. The nurse prepares a plan of care for the client and includes which nursing action in the plan?
1. Monitor the weights to ensure that they are resting on a firm surface.
  2. Check the weights to ensure that they are off of the floor.
  3. Ensure that the knots are at the pulleys.
  4. Ensure the head of the bed is kept at a 45- to 90-degree angle.
- 992.** A nurse is setting up the physical environment for an interview with a client and plans to obtain subjective data regarding the client's health. Which interventions are appropriate? **Select all that apply.**
- 1. Set the room temperature at a comfortable level.
  - 2. Provide seating for the client so that the client faces a strong light.
  - 3. Ensure that the distance between the client and nurse is at least 6 feet.
  - 4. Place a chair for the client across from the nurse's desk.

- ❑ 5. Remove distracting objects from the interviewing area.
- ❑ 6. Ensure comfortable seating at eye level for the client and nurse.

**993.** A nurse is caring for an older adult who has been placed in Buck's extension traction after a hip fracture. On assessment of the client, the nurse notes that the client is disoriented. The appropriate nursing intervention is to:

1. Ask the family to stay with the client.
2. Apply restraints to the client.
3. Ask the laboratory to perform electrolyte studies.
4. Reorient the client frequently and place a clock and calendar in the client's room.

**994.** A nurse is preparing a plan of care for a client in skin traction. The nurse includes in the plan that a priority intervention is to assess the client frequently for:

1. The presence of bowel sounds
2. Signs of infection around the pin sites
3. Signs of skin breakdown
4. Urinary incontinence

**995.** A home care nurse is visiting a client who is in a body cast. While performing an assessment, the nurse evaluates the psychosocial adjustment of the client to the cast. The nurse would most appropriately assess:

1. The type of transportation available for follow-up care
2. The ability to perform activities of daily living
3. The need for sensory stimulation
4. The amount of home care support available

**996.** When counseling a female Amish client, a nurse should:

1. Speak only to the husband.
2. Use complex medical terminology.
3. Avoid using scientific or medical jargon.
4. Stand close to the client and speak loudly.

**997.** A client has refused to eat more than a few spoonfuls of breakfast. The physician has prescribed that tube feedings be initiated if the client fails to eat at least half of a meal because the client had been losing weight for the prior 2 months. A nurse enters the room, looks at the tray, and states, "If you don't eat any more than that, I'm going to have to put a tube down your throat and get a feeding in that way." The client begins crying and tries to eat more. Based on the nurse's actions, the nurse may also be accused of a tort known as which of the following?

1. Assault
2. Battery

3. Slander
4. Invasion of privacy

**998.** A registered nurse (RN) is planning assignments for the clients on a nursing unit. The RN needs to assign four clients and has one RN, a licensed practical (vocational) nurse, and two nursing assistants on a nursing team. Which of the following clients would the RN most appropriately assign to the licensed practical (vocational) nurse?

1. A client who requires a 24-hour urine collection
2. An older adult requiring assistance with a bed bath and frequent ambulation
3. A client on a mechanical ventilator requiring frequent assessment and suctioning
4. A client with an abdominal wound requiring frequent wound irrigations and dressing changes

**999.** To perform cardiopulmonary resuscitation (CPR), a nurse would use this method to open the airway in which of the following situations?

From Harkreader, H., Hogan, M.A., & Thobaben, M. [2007]. *Fundamentals of nursing: Caring and clinical judgment* [3rd ed., p. 968]. St. Louis: Saunders.

1. In all situations requiring CPR
2. If neck trauma is suspected
3. If the client has a history of seizures
4. If the client has a history of headaches

**1000.** A nurse teaches skin care to a client receiving external radiation therapy. Which of the following statements, if made by the client, would indicate the need for further instruction?

1. "I will handle the area gently."
2. "I will avoid the use of deodorants."
3. "I will limit sun exposure to 1 hour daily."
4. "I will wear loose-fitting clothing."

**1001.** A physician's prescription reads levothyroxine (Synthroid), 150 mcg orally daily. The medication label reads Synthroid, 0.1 mg per tablet. A nurse administers how many tablet(s) to the client?

\_\_\_\_\_ tablet(s)

- 1002.** Metformin (Glucophage) is prescribed for a client with type 2 diabetes mellitus. A nurse tells the client that the most common side effect of the medication is:
1. Hypoglycemia
  2. Gastrointestinal disturbances
  3. Weight gain
  4. Flushing and palpitations
- 1003.** Which interventions apply to the care of a child who is having a seizure? **Select all that apply.**
- 1. Insert an oral airway.
  - 2. Place the child in a supine position.
  - 3. Loosen clothing around the child's neck.
  - 4. Restrain the child.
  - 5. Time the seizure.
  - 6. Stay with the child.
- 1004.** A 13-year-old child is diagnosed with Ewing's sarcoma of the femur. After a course of radiation and chemotherapy, it has been decided that leg amputation is necessary. After the amputation, the child becomes very frightened because of aching and cramping felt in the missing limb. Which nursing statement would be appropriate to assist in alleviating the child's fear?
1. "This aching and cramping is normal and temporary and will subside."
  2. "This normally occurs after the surgery and we will teach you ways to deal with it."
  3. "The pain medication that I give you will take these feelings away."
  4. "This pain is not real pain, and relaxation exercises will help it go away."
- 1005.** A nursing instructor asks a nursing student to identify the priorities of care for an assigned client. The student correctly identifies the client needs that are the priority by telling the nursing instructor that:
1. Actual or life-threatening concerns are the priority.
  2. Time constraints related to the client's needs are the priority.
  3. Obtaining needed supplies to care for the client is the priority.
  4. Completing care in a reasonable time frame is the priority.
- 1006.** A client arrives at the clinic complaining of fatigue, lack of energy, constipation, and depression. Hypothyroidism is diagnosed, and levothyroxine (Synthroid) is prescribed. A nurse instructs the client that the expected outcome of the medication is to:
1. Increase energy levels.
  2. Achieve normal thyroid hormone levels.
  3. Increase blood glucose levels.
  4. Alleviate depression.
- 1007.** A community health nurse is preparing a poster for an educational session for a group of women and will be discussing the risk factors associated with breast cancer. Which risk factors for breast cancer should the nurse list on the poster? **Select all that apply.**
- 1. Family history of breast cancer
  - 2. Early menarche
  - 3. Early menopause
  - 4. Previous cancer of the breast, uterus, or ovaries
  - 5. Multiparity
  - 6. High-dose radiation exposure to chest
- 1008.** A nurse is caring for a client with acute pancreatitis and is monitoring the client for paralytic ileus. Which assessment data would alert the nurse to this occurrence?
1. Firm, nontender mass palpable at the lower right costal margin
  2. Severe, constant pain with rapid onset
  3. Inability to pass flatus
  4. Loss of anal sphincter control
- 1009.** A nurse inspects the color of the drainage from a nasogastric tube on a postoperative client approximately 24 hours after gastric surgery. Which of the following findings indicate the need to notify the physician?
1. Light yellowish brown drainage
  2. Dark red drainage
  3. Dark brown drainage
  4. Green-tinged drainage
- 1010.** A nurse is preparing to discontinue a client's nasogastric tube. The client is positioned properly, and the tube has been flushed with 15 mL of air to clear secretions. Before removing the tube, the nurse makes which statement to the client?
1. "Take a deep breath when I tell you and breathe normally while I remove the tube."
  2. "Take a deep breath when I tell you and bear down while I remove the tube."
  3. "Take a deep breath when I tell you and slowly exhale while I remove the tube."
  4. "Take a deep breath when I tell you and hold it while I remove the tube."
- 1011.** A client with a history of lung disease is at risk for developing respiratory acidosis. A nurse assesses this client for which signs and symptoms characteristic of this disorder?

1. Bradycardia and hyperactivity
  2. Decreased respiratory rate and depth
  3. Headache, restlessness, and confusion
  4. Bradypnea, dizziness, and paresthesias
- 1012.** A nurse is caring for a client with a resolved intestinal obstruction who has a nasogastric tube in place. The client has tolerated the tube being clamped every 2 hours for 1 hour. The physician has now prescribed the nasogastric tube to be removed. Before removing the tube, the nurse assesses for:
1. Proper nasogastric tube placement
  2. Normal serum electrolyte levels
  3. The presence of bowel sounds in all four quadrants
  4. Normal pH of the gastric aspirate
- 1013.** A nurse has administered approximately half of an enema solution to a preoperative client when the client complains of pain and cramping. Which nursing action is the most appropriate?
1. Raise the enema bag so that the solution can be instilled quickly.
  2. Clamp the tubing for 30 seconds and restart the flow at a slower rate.
  3. Reassure the client and continue the flow.
  4. Discontinue the enema and notify the physician.
- 1014.** A client experiencing a great deal of stress and anxiety is being taught to use self-control therapy. Which statement by the client indicates a need for further teaching about the therapy?
1. "An advantage of this technique is that change is likely to last."
  2. "This form of therapy can be applied to new situations."
  3. "Talking to oneself is a basic component of this form of therapy."
  4. "It provides a negative reinforcement when the stimulus is produced."
- 1015.** A nurse is preparing a list of home care instructions regarding stoma and laryngectomy care to a client who had a laryngectomy. Which instructions that would be included in the list? **Select all that apply.**
- 1. Avoid swimming and use care when showering.
  - 2. Keep the humidity in the home low.
  - 3. Avoid exposure to people with infections.
  - 4. Restrict fluid intake.
  - 5. Obtain a Medic-Alert bracelet.
  - 6. Prevent debris from entering the stoma.
- 1016.** A physician prescribes 2000 mL of 5% dextrose and half-normal saline to infuse over 24 hours. The drop factor is 15 drops (gtt)/1 mL. A nurse sets the flow rate at how many drops per minute? (Round to the nearest whole number.)  
\_\_\_\_\_ gtt/min
- 1017.** A client is returned to the nursing unit after thoracic surgery with chest tubes in place. During the first few hours postoperatively, a nurse assesses for drainage and expects to note that it is:
1. Serous
  2. Serosanguineous
  3. Bloody
  4. Bloody, with frequent small clots
- 1018.** A client has had radical neck dissection and begins to hemorrhage at the incision site. A nurse should take which actions in this situation? **Select all that apply.**
- 1. Lower the head of the bed to a flat position.
  - 2. Apply manual pressure over the site.
  - 3. Monitor the client's airway.
  - 4. Call the physician immediately.
  - 5. Monitor vital signs.
- 1019.** A sexually active 20-year-old client has developed viral hepatitis. Which of the following statements, if made by the client, would indicate a need for further teaching?
1. "A condom should be used for sexual intercourse."
  2. "I can never drink alcohol again."
  3. "I won't go back to work right away."
  4. "My close friends should get the vaccine."
- 1020.** A nurse would include which interventions in the plan of care for a client with hypothyroidism? **Select all that apply.**
- 1. Instruct the client about thyroid replacement therapy.
  - 2. Encourage the client to consume fluids and high-fiber foods in the diet.
  - 3. Provide a cool environment for the client.
  - 4. Instruct the client to consume a high-fat diet.
  - 5. Instruct the client to contact the physician if episodes of chest pain occur.
  - 6. Inform the client that iodine preparations will be prescribed to treat the disorder.
- 1021.** A nurse is preparing to care for a client who will be weaned from a cuffed tracheostomy tube. The nurse is planning to use a tracheostomy plug and plans to insert it into the opening in the outer cannula. Which of the following nursing interventions are required before plugging the tube?

1. Place the inner cannula into the tube.
2. Deflate the cuff on the tube.
3. Ensure that the client is able to swallow.
4. Ensure that the client is able to speak.

**1022.** A client is diagnosed with glaucoma. Which of the following assessment data gathered by a nurse identifies a risk factor associated with this eye disorder?

1. A history of migraine headaches
2. Frequent urinary tract infections
3. Cardiovascular disease
4. Frequent upper respiratory infections

**1023.** A client with retinal detachment is admitted to the nursing unit in preparation for a scleral buckling procedure. Which of the following would a nurse anticipate to be prescribed?

1. Bathroom privileges only
2. Elevating the head of the bed to 45 degrees
3. Placing an eye patch over the client's affected eye
4. Wearing dark glasses to read or watch television

**1024.** A nurse is caring for a client who is on strict bedrest. The nurse develops a plan of care with goals related to the prevention of deep vein thrombosis and pulmonary emboli. Which of the following nursing actions would be most helpful to prevent these disorders from developing?

1. Applying a heating pad to the lower extremities
2. Encouraging active range-of-motion exercises
3. Placing a pillow under the knees
4. Restricting fluids

**1025.** A nurse is caring for a suicidal client. The appropriate nursing intervention in dealing with this client is to:

1. Demonstrate confidence in the client's ability to deal with stressors.
2. Provide hope and reassurance that the problems will resolve themselves.
3. Display an attitude of detachment, confrontation, and efficiency.
4. Provide authority, action, and participation.

**1026.** A client with tuberculosis whose status is being monitored in an ambulatory care clinic asks a nurse when it is permissible to return to work. The nurse replies that the client may resume employment when:

1. Three sputum cultures are negative.
2. Five sputum cultures are negative.

3. A sputum culture and a chest x-ray are negative.
4. A sputum culture and a Mantoux test are negative.

**1027.** A client comes to the emergency department after an assault and is extremely agitated, trembling, and hyperventilating. The appropriate initial nursing action would be to:

1. Encourage the client to discuss the assault.
2. Place the client in a quiet room alone to decrease stimulation.
3. Remain with the client until the anxiety decreases.
4. Begin to teach relaxation techniques.

**1028.** A nurse is caring for a client admitted to the hospital with a suspected diagnosis of acute appendicitis. Which of the following laboratory results would the nurse expect to note if the client does have appendicitis?

1. Leukopenia with a shift to the right
2. Leukocytosis with a shift to the right
3. Leukocytosis with a shift to the left
4. Leukopenia with a shift to the left

**1029.** A nurse is developing a plan of care for a client experiencing anxiety after the loss of a job. The client is verbalizing concerns regarding the ability to meet role expectations and financial obligations. The appropriate nursing diagnosis for this client is:

1. *Dysfunctional family process*
2. *Disturbed thought process*
3. *Risk for anxiety*
4. *Ineffective coping*

**1030.** A nurse is monitoring the chest tube drainage system in a client with a chest tube. The nurse notes intermittent bubbling in the water seal chamber. Which of the following is the appropriate action?

1. Change the chest tube drainage system.
2. Document the findings.
3. Check for an air leak.
4. Notify the physician.

**1031.** A client arrives in the emergency department in a crisis state. The client shows signs of profound anxiety and is unable to focus on anything but the object of the crisis and the impact on self. The initial nursing assessment would focus on:

1. The object of the crisis
2. The presence of support systems
3. The physical condition of the client
4. The client's coping mechanisms

- 1032.** After performing an initial abdominal assessment on a client with a diagnosis of cholelithiasis, a nurse documents that the bowel sounds are normal. Which of the following descriptions best describes “normal bowel sounds”?
1. Waves of loud gurgles auscultated in all four quadrants

2. Very high-pitched loud rushes auscultated especially in one or two quadrants
3. Relatively high-pitched clicks or gurgles auscultated in all four quadrants
4. Low-pitched swishing auscultated in one or two quadrants

## ANSWERS

### 958. 3

**Rationale:** Whenever an abused client remains in the abusive environment, priority must be placed on ascertaining whether the client is in any immediate danger. If so, emergency action must be taken to remove the client from the abusing situation. Options 1, 2, and 4 may be appropriate interventions, but are not the priority.

**Test-Taking Strategy:** Use Maslow’s Hierarchy of Needs theory, remembering that if a physiological need is not present, safety is the priority. This will direct you to option 3, the only option that directly addresses client safety. Review care of a client who is a victim of physical abuse if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Mental Health

**Reference:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., pp. 491-492). St. Louis: Mosby.

### 959. 2

**Rationale:** Mania is a mood characterized by excitement, euphoria, hyperactivity, excessive energy, decreased need for sleep, and impaired ability to concentrate or complete a single train of thought. Mania is a period when the mood is predominantly elevated, expansive, or irritable. All options reflect a client’s possible symptoms. Option 2 clearly presents a problem, however, that compromises physiological integrity and needs to be addressed immediately.

**Test-Taking Strategy:** Note the strategic word *immediate* and use Maslow’s Hierarchy of Needs theory to assist you in answering the question. Option 2 is the only option that reflects a physiological need. Review care of a client with mania if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 287, 521). St. Louis: Mosby.

### 960. 4

**Rationale:** Clients who are admitted involuntarily do not lose their right to informed consent. Clients must be considered legally competent until they have been declared incompetent through a legal proceeding. The informed consent needs to be obtained from the client.

**Test-Taking Strategy:** Knowledge regarding the hospital admission processes and client’s rights is necessary to answer this question. If you had difficulty with this question, focus on the subject of client rights to direct you to option 4. Review client rights if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership and Management—Ethical/Legal

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 538). St. Louis: Mosby.

### 961. 1

**Rationale:** Glucagon is used to treat hypoglycemia resulting from insulin overdose. The family of the client is instructed in how to administer the medication. In an unconscious client, arousal usually occurs within 20 minutes of glucagon injection. When consciousness has been regained, oral carbohydrates should be given. Lipoatrophy and lipohypertrophy result from insulin injections.

**Test-Taking Strategy:** Use the process of elimination. Noting the word *glucagon* will assist in determining that the medication contains some form of glucose. This relationship will direct you to option 1. Review the purpose of this medication if you are unfamiliar with it.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 803). St. Louis: Saunders.

### 962. 3

**Rationale:** In the Puerto Rican–American culture, loud crying and other physical manifestations of grief are considered socially acceptable. Of the options provided, option 3 is the only one that identifies a culturally sensitive approach on the part of the nurse. Options 1, 2, and 4 are inappropriate nursing interventions.

**Test-Taking Strategy:** Focus on the clients of the question, the family members. Use the process of elimination and therapeutic nursing interventions, recalling the characteristics of the culture and the importance of cultural sensitivity. This will direct you to option 3. If you had difficulty with this question, review the characteristics of this culture.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Cultural Diversity

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 82). St. Louis: Saunders.

Giger, J., & Davidhizar, R. (2008). *Transcultural nursing assessment and intervention* (5th ed. p. 679). St. Louis: Mosby.

### 963. 4

**Rationale:** The priority nursing action is to assess the vital signs. This would indicate the amount of blood loss that has occurred and provides a baseline by which to monitor the progress of treatment. The client may be unable to provide subjective data until the immediate physical needs are met. Although an abdominal examination and an assessment of the precipitating events may be necessary, these actions are not the priority.

**Test-Taking Strategy:** Note the strategic words *first priority*. Use the process of elimination and the ABCs—airway, breathing, and circulation. This will direct you to option 4. Review care of a client with a gastrointestinal bleed if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 709, 1223). St. Louis: Saunders.

### 964. 1

**Rationale:** The clinical picture of dementia ranges from mild cognitive deficits to severe, life-threatening alterations in neurological functioning. For the client to use confabulation or the fabrication of events or experiences to fill in memory gaps is not unusual. Often, lack of inhibitions on the part of the client may constitute the first indication of something being “wrong” to the client’s significant others (e.g., the client may undress in front of others, or the formerly well-mannered client may exhibit slovenly table manners). As the dementia progresses, the client will have episodes of wandering or sundowning.

**Test-Taking Strategy:** Use the process of elimination and focus on the client’s diagnosis. Noting the subject, a manifestation, will direct you to option 1. If you had difficulty with this question, review the manifestations associated with dementia.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Mental Health

**References:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., p. 394). St. Louis: Mosby.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 311). St. Louis: Saunders.

### 965. 3

**Rationale:** Clients with anorexia nervosa have the desire to please others. Their need to be correct or perfect interferes with rational decision-making processes. These clients are moralistic. Rules and rituals help these clients manage their anxiety.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject, managing anxiety. Eliminate options

2 and 4 because of the close-ended word *always*. Option 1 is not characteristic of a client with anorexia. Review the characteristics associated with this disorder if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Mental Health

**References:** Fortinash, K., & Holoday-Worret, P. (2008). *Psychiatric mental health nursing* (4th ed., p. 400). St. Louis: Mosby.

Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 199). St. Louis: Saunders.

### 966. 1

**Rationale:** Iron is needed to allow for transfer of adequate iron to the fetus and to permit expansion of the maternal red blood cell mass. During pregnancy, the relative excess of plasma causes a decrease in the hemoglobin concentration and hematocrit, known as physiological anemia of pregnancy. This is a normal adaptation during pregnancy. Meats are an excellent source of iron. Iron supplements usually cause constipation. Iron is best absorbed if taken on an empty stomach.

**Test-Taking Strategy:** Use the process of elimination, focusing on the strategic words *understanding of the instructions*. Knowledge of basic principles related to nutrition during pregnancy will assist in eliminating options 2 and 4. From the remaining options, remember that iron causes constipation. Review client teaching points related to iron supplementation if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 304). St. Louis: Saunders.

### 967. 2

**Rationale:** Levothyroxine (Synthroid) accelerates the degradation of vitamin K–dependent clotting factors. As a result, the effects of warfarin (Coumadin) are enhanced. If thyroid hormone replacement therapy is instituted in a client who has been taking warfarin, the dosage of warfarin should be reduced.

**Test-Taking Strategy:** Use the process of elimination. Recalling that levothyroxine enhances the effects of warfarin will direct you to the correct option. Review these medication interactions if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., p. 694). St. Louis: Saunders.

### 968. 3

**Rationale:** The client should use the positions outlined in options 1, 2, and 4. These allow for maximal chest expansion.

The client should not lie on the back because it reduces movement of a large area of the client's chest wall. Sitting is better than standing, whenever possible. If no chair is available, leaning against a wall while standing allows accessory muscles to be used for breathing and not posture control.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *dyspneic episodes* and *avoid*. Also, note that options 1, 2, and 4 are comparable or alike in that they all address upright positions. If you had difficulty with this question, review client teaching points related to emphysema.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Respiratory

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 624). St. Louis: Saunders.

### 969. 1

**Rationale:** A client undergoing lumbar puncture is positioned lying on the side, with the legs pulled up to the abdomen and the head bent down onto the chest. This position helps open the spaces between the vertebrae and allows for easier needle insertion by the physician. The nurse remains with the client during the procedure to help the client maintain this position. The other options identify incorrect positions for this procedure.

**Test-Taking Strategy:** Use the process of elimination. Recalling that a lumbar puncture is the introduction of a needle into the subarachnoid space will direct you to option 1. It is reasonable that the position of the client must facilitate this, and the correct option is the only position that flexes the vertebrae and widens the spaces between them. Review care of a client undergoing a lumbar puncture if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Neurological

**Reference:** Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed., p. 615). St. Louis: Mosby.

### 970. 2

**Rationale:** Maintaining effective and open communication among family members affected by death and grief is of the greatest importance. Option 1 describes encouraging discussion of feelings and is likely to enhance communications. Option 3 is also an effective intervention because spiritual practices give meaning to life and have an impact on how people react to crisis. Option 4 is also an effective technique because the client and family need to know that someone will be there who is supportive and nonjudgmental. Option 2 describes the nurse removing autonomy and decision making from the client and family, who are already experiencing feelings of loss of control in that they cannot change the process of dying. This is an ineffective intervention, which could impair communication further.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *unlikely to facilitate*. Understanding that

people in crisis usually feel helpless and unable to control their circumstances can assist in identifying option 2 as a response that further removes control. Review these therapeutic interventions if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Caring

**Content Area:** Fundamental Skills—End-of-Life Care

**References:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 478). St. Louis: Mosby.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 113). St. Louis: Mosby.

### 971. 2

**Rationale:** Feelings of low self-esteem and worthlessness are common symptoms of a depressed client. An effective plan of care to enhance the client's personal self-esteem is to provide experiences for the client that are challenging, but that will not be met with failure. Reminders of the client's past accomplishments or personal successes are ways to interrupt the client's negative self-talk and distorted cognitive view of self. Silence may be interpreted as agreement. Options 1 and 3 give advice and devalue the client's feelings.

**Test-Taking Strategy:** Use the process of elimination and therapeutic communication techniques. Focus on the client's diagnosis. You can eliminate options 1 and 3 easily. From the remaining options, focusing on the client's diagnosis will direct you to option 2. Review care of a client with depression if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 286, 289). St. Louis: Mosby.

### 972. 1, 2, 4

**Rationale:** The head of the client at risk for or with increased intracranial pressure should be positioned so that the head is in a neutral, midline position. The nurse should avoid flexing or extending the neck or turning the head side to side. The head of the bed should be raised to 30 to 45 degrees. Use of proper positions promotes venous drainage from the cranium to keep intracranial pressure from elevating.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *at risk for increased intracranial pressure*. Visualize each of the positions identified in the options and identify those that will increase intracranial pressure. Review care of a client at risk for or with increased intracranial pressure if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Neurological

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1932, 1942). St. Louis: Saunders.

**973. 3**

**Rationale:** The normal pH is 7.35 to 7.45. Normal  $P_{CO_2}$  is 35 to 45 mm Hg. In respiratory acidosis, the pH is low and  $P_{CO_2}$  is elevated. Options 1, 2, and 4 are incorrect interpretations of the values identified in the question.

**Test-Taking Strategy:** Remember that in a respiratory imbalance you will find an opposite response between the pH and  $P_{CO_2}$ . Also, remember that the pH is low in an acidotic condition. Recalling this information will allow you to eliminate each of the incorrect options. Review interpretation of arterial blood gas results if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 204-206). St. Louis: Saunders.

**974. 2**

**Rationale:** The client's operative arm should be positioned so that it is elevated on a pillow and not exceeding shoulder elevation. This position promotes optimal drainage from the limb, without impairing the circulation to the arm. If the arm is positioned flat (option 3) or dependent (option 4), this could increase the edema in the arm, which is contraindicated because of lymphatic disruption caused by surgery.

**Test-Taking Strategy:** Use the process of elimination. Read each option carefully and attempt to visualize the position identified in the option. Using the principles of circulation and gravity will direct you to option 2. Option 2 avoids the two extremes of height in positioning the limb affected by surgery. Review care of a client after mastectomy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Oncology

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1674). St. Louis: Saunders.

**975. 4**

**Rationale:** A client with a urinary tract infection must be encouraged to take the medication for the entire time it is prescribed. The client should also be instructed to drink at least 3000 mL of fluid each day to flush the infection from the bladder and to urinate frequently throughout the day. Foods and fluids that acidify the urine need to be encouraged.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *indicate a need for further instructions*. These words indicate a negative event query and ask you to select an option that is incorrect. Recall that foods and fluids that acidify the urine should be consumed, rather than foods and fluids that cause urine alkalinity. If you had difficulty with this question, review nursing considerations for a client with a urinary tract infection.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 707). St. Louis: Saunders.

**976. 3**

**Rationale:** NPH is an intermediate-acting insulin. The onset of action is 1.5 hours, it peaks in 4 to 12 hours, and the duration of action is 16 to 24 hours. Hypoglycemic reactions most likely occur during peak time.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the onset, peak, and duration of action for NPH insulin. Recalling that peak action is between 4 and 12 hours will direct you to option 3. Review the characteristics of NPH insulin if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Endocrine

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1485). St. Louis: Saunders.

**977. 3**

**Rationale:** Tertiary prevention involves the reduction of the amount and degree of disability, injury, and damage after a crisis. Primary prevention means keeping the crisis from occurring, and secondary prevention focuses on reducing the intensity and duration of the crisis during the crisis itself. There is no known fourth care prevention level.

**Test-Taking Strategy:** Identify the scenario in the question and the role of the nurse in the question. Focus on these nursing roles and use knowledge regarding the various levels of prevention to answer the question. If you had difficulty with this question, review the levels of prevention.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care*. (6th ed., pp. 163-164). St. Louis: Saunders.

Maurer, F., & Smith, C. (2009). *Community/public health nursing practices: Health for families and populations* (4th ed., pp. 574-576). St. Louis: Saunders.

**978. 4**

**Rationale:** Rubella virus is spread by aerosol droplet transmission through the upper respiratory tract and has an incubation period of 14 to 21 days. The risks of maternal and subsequent fetal infection during the second trimester include hearing loss and congenital anomalies. Rubella titer determination is a standard antenatal test for pregnant women during their initial screening and entry into the health care delivery system. Option 4 helps clarify maternal concerns with accurate information based on the acquisition of rubella infection and potential fetal side effects.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the transmission of rubella virus to the fetus. Also, use of therapeutic communication techniques will

direct you to option 4. Option 4 addresses the client's concerns. Review concepts related to exposure to rubella during pregnancy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Caring

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 177-178). St. Louis: Saunders.

### 979. 1

**Rationale:** Breast-feeding mothers with lactose-intolerant infants need to be encouraged to limit dairy products. Cheese is a dairy product. Alternative calcium sources that can be consumed by the mother include egg yolk, green leafy vegetables, dried beans, cauliflower, and molasses.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic word *avoid* in the question. Knowledge that lactose is the sugar found in dairy products will easily direct you to option 1. Review the dietary management for an infant with lactose intolerance if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Nutrition

**Reference:** Nix, S. (2009). *Williams' basic nutrition and diet therapy* (13th ed., p. 77). St. Louis: Mosby.

### 980. 1

**Rationale:** The nurse needs to be aware of the effective and ineffective coping mechanisms that can occur in a client when loss is anticipated. The expression of anger is known to be a normal response to impending loss, and the anger may be directed toward the self, God or other spiritual being, or caregivers. Notifying the hospital lawyer is inappropriate. Guilt may or may not be a component of the client's feelings, and the data in the question do not indicate that guilt is present.

**Test-Taking Strategy:** Focus on the data provided in the question. Note that options 1 and 4 address coping mechanisms. This provides you with the clue that one of these options may be the correct response. Additionally, knowledge of the stages of grief associated with loss will direct you to option 1. Review these stages and expected client responses if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Mental Health

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 1200, 1202-1203). St. Louis: Saunders.

### 981. 3

**Rationale:** An autopsy is required by state law in certain circumstances, including the sudden death of a client and a death that occurs under suspicious circumstances. A client may have provided oral or written instructions regarding an autopsy after death. If an autopsy is not required by law, these oral or written requests will be granted. If no oral or written

instructions were provided, state law determines who has the authority to consent for an autopsy. Most often, the decision rests with the surviving relative or next of kin.

**Test-Taking Strategy:** Use knowledge regarding the laws and issues surrounding autopsy and therapeutic communication techniques to answer the question. Eliminate options 1 and 4 because these statements are not completely accurate. From the remaining options, option 3 is the therapeutic and appropriate response to the family. Review the issues and laws surrounding autopsy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Caring

**Content Area:** Fundamental Skills—End-of-Life Care

**Reference:** Potter, P., & Perry, A. (2009) *Fundamentals of nursing* (7th ed., p. 479). St. Louis: Mosby.

### 982. 3

**Rationale:** The mode of perinatal transmission of human immunodeficiency virus (HIV) to the fetus or neonate of an HIV-positive woman can occur during the antenatal, intrapartum, or postpartum period. HIV transmission can occur during breast-feeding. HIV-positive clients should be encouraged to bottle-feed their infants. Frequent handwashing is encouraged. Support groups and community agencies can be identified to assist the parents with the newborn infant's home care, the impact of the diagnosis of HIV infection, and available financial resources. It is recommended that infants of HIV-positive clients receive antiviral medications for the first 6 weeks of life.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *need for further instructions* in the question. These words indicate a negative event query and ask you to select an option that is incorrect. Recalling that breast-feeding is discouraged in the HIV-positive woman will direct you to the correct option. Review home care measures for the HIV-positive client if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 88, 657). St. Louis: Saunders.

### 983. 1

**Rationale:** If the client wears contact lenses, he or she should be instructed to discontinue wearing them until the infection has cleared completely. Obtaining new contact lenses would eliminate the chance of reinfection from contaminated contact lenses and would lessen the risk of a corneal ulceration.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *need for further information* in the question. These words indicate a negative event query and ask you to select an option that is incorrect. Options 2, 3, and 4 are comparable or alike in that they relate to avoiding the use of contact lenses during infection. If you had difficulty with this question, review treatment measures for conjunctivitis.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/ Cardiovascular

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1563). St. Louis: Saunders.

### 984. 2

**Rationale:** An insulin vial in current use can be kept at room temperature for 1 month without significant loss of activity. Direct sunlight and heat must be avoided.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic word *unrefrigerated* in the question. This word will assist in directing you to the correct option. If you are unfamiliar with the concepts related to insulin stability, review this information.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 793). St. Louis: Saunders.

### 985. 3

**Rationale:** Based on the location of the surgical procedure, spinal anesthesia would not be used. Additionally, the hair would not be shaved. Although coughing and deep breathing are important, specific to this procedure is avoiding brushing the teeth to prevent disruption of the surgical site.

**Test-Taking Strategy:** Consider the anatomical location and the surgical procedure itself to eliminate options 1 and 4. Although you may be tempted to select option 2, note the strategic words *most important*. Because of the anatomical location of the surgery, option 3 is most important. Review this surgical procedure if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Endocrine

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1432). St. Louis: Saunders.

### 986. 2

**Rationale:** Fresh fruits and vegetables provide vitamins and minerals needed for healthy gums. Cracked wheat bread may abrade the tender gums. Drinking water with meals has no direct effect on gums. Eating saltine crackers before arising helps decrease nausea.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject of the question. Eliminate options 1 and 4 first because these measures could irritate fragile gums. From the remaining options, eliminate option 3, remembering that drinking water with meals has no direct effect on gums. Review measures that promote dental health during pregnancy if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Maternity—Antepartum

**Reference:** Nix, S. (2009). *Williams' basic nutrition and diet therapy* (13th ed., pp. 18-19). St. Louis: Mosby.

### 987. 2

**Rationale:** Radiation therapy is usually delayed until a child is 8 years old, whenever possible, to prevent retardation of bone growth and soft tissue development. Options 1, 3, and 4 are inappropriate responses to the mother.

**Test-Taking Strategy:** Note the age of the child in the question. Additionally, use therapeutic communication techniques and knowledge regarding the effects of radiation to answer this question. Options 1 and 4 are nontherapeutic and place the mother's inquiry on hold. From the remaining options, use the child's age as a guide in directing you to option 2. Review the effects of radiation therapy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Hematological/Oncological

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1310). St. Louis: Saunders.

### 988. 2

**Rationale:** A fresh colostomy stoma would be red and edematous, but this would decrease with time. The colostomy site then becomes pink without evidence of abnormal drainage, swelling, or skin breakdown. The nurse would document these findings because this is a normal expectation. Options 1, 3, and 4 are inappropriate interventions.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *returns from surgery*. You would expect redness and edema at this time. Review postoperative colostomy assessment if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1126). St. Louis: Saunders.

### 989. 4

**Rationale:** Low or oddly placed ears are associated with various congenital defects and should be reported immediately. Although the findings would be documented, the most appropriate action would be to notify the physician. Options 1, 2, and 3 are inaccurate and inappropriate nursing actions.

**Test-Taking Strategy:** Use the process of elimination. Knowledge regarding the normal assessment findings in a newborn infant is required to answer this question. Recalling that low-set ears is an abnormal finding will direct you to option 4. Review normal assessment findings in a newborn if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 508). St. Louis: Saunders.

### 990. 1

**Rationale:** Jaundice, if present, is best assessed in the sclera, nail beds, and mucous membranes. Generalized jaundice appears in the skin throughout the body. Option 4 is an inappropriate area to assess for the presence of jaundice.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic word *best* in the question. Options 2 and 3 can be eliminated first because jaundice present in the skin is generalized. From the remaining options, recalling that skin discoloration can best be assessed in the nail beds will direct you to option 1. Review assessment findings related to jaundice if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Gastrointestinal/Renal

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1133). St. Louis: Saunders.

### 991. 2

**Rationale:** To achieve proper traction, weights need to be free-hanging, with knots kept away from the pulleys. Weights should not be kept resting on a firm surface. The head of the bed is usually kept low to provide countertraction.

**Test-Taking Strategy:** Use the process of elimination. Attempt to visualize the traction, recalling that there must be weight to exert the pull from the traction setup. This concept will assist in eliminating options 1 and 3. Recalling that countertraction is needed will assist in eliminating option 4. Review care of a client in traction if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Musculoskeletal

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 525). St. Louis: Saunders.

### 992. 1, 5, 6

**Rationale:** When preparing the physical environment for an interview, the nurse would set the room temperature at a comfortable level. The nurse would provide sufficient lighting for the client and nurse to see each other. The nurse would avoid having the client face a strong light because the client would have to squint into the full light. Distracting objects and equipment should be removed from the interview area. The nurse should arrange seating so that the nurse and client are seated comfortably at eye level, and the nurse avoids facing the client across a desk or table because this creates a barrier. The distance between the nurse and the client should be set by the nurse at 4 to 5 feet. If the nurse places the client any closer, the nurse will be invading the client's private space and

may create anxiety in the client. If the nurse places the client farther away, the nurse may be seen as distant and aloof by the client.

**Test-Taking Strategy:** Read each intervention carefully. Use the guidelines for preparing the physical environment for conducting an interview to select the appropriate interventions. Review these guidelines if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Health Assessment/Physical Exam

**Reference:** Jarvis, C. (2008). *Physical examination and health assessment* (5th ed, pp. 57-58). St. Louis: Saunders.

### 993. 4

**Rationale:** An inactive older adult may become disoriented because of lack of sensory stimulation. The most appropriate nursing intervention would be to reorient the client frequently and to place objects such as a clock and a calendar in the client's room to maintain orientation. The family can assist with orientation of the client, but it is inappropriate to ask the family to stay with the client. It is not within the scope of nursing practice to prescribe laboratory studies. Restraints may cause further disorientation and should not be applied unless specifically prescribed; agency policies and procedures should be followed before the application of restraints.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 3 first because it is not within the realm of nursing practice to prescribe laboratory studies. Next, eliminate option 2 because restraints may add to the disorientation that the client is experiencing. It is inappropriate to place the responsibility of the client on the family, so eliminate option 1. Note the relationship between the words *disoriented* in the question and *reorient* in the correct option. Review the measures related to caring for a client who is disoriented if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 755). St. Louis: Mosby.

### 994. 3

**Rationale:** Skin traction is achieved by Ace wraps, boots, and slings that apply a direct force on the client's skin. Traction is maintained with 5 to 8 lb of weight, and this type of traction can cause skin breakdown. There are no pin sites with skin traction. Urinary incontinence is not related to the use of skin traction. Although constipation can occur as a result of immobility and monitoring bowel sounds may be a component of the assessment, this intervention is not the priority assessment.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic word *priority* in the question. Eliminate option 2 first because there are no pin sites with skin traction. Visualizing the traction setup and knowledge of the complications

associated with this type of traction will direct you to option 3. Review the complications associated with skin traction and the priority nursing interventions if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 515). St. Louis: Saunders.

### 995. 3

**Rationale:** A psychosocial assessment of a client who is immobilized would most appropriately include the need for sensory stimulation. This assessment should also include such factors as body image, past and present coping skills, and coping methods used during the period of immobilization. Although transportation, home care support, and the ability to perform activities of daily living are components of an assessment, they are not as specifically related to psychosocial adjustment as is the need for sensory stimulation.

**Test-Taking Strategy:** Use the process of elimination and focus on the strategic words *psychosocial* and *most appropriately*. Option 2 can be eliminated first because it relates to physiological integrity rather than psychosocial integrity. Next, eliminate options 1 and 4 because they are most closely related to physical supports, rather than psychosocial needs of the client. Review the components of a psychosocial assessment if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Musculoskeletal

**Reference:** Potter, P., & Perry, A. (2009) *Fundamentals of nursing* (7th ed., pp. 1348-1349). St. Louis: Mosby.

### 996. 3

**Rationale:** Complex scientific or medical terminology should be avoided when counseling an Amish client (or any client). When counseling a female Amish client, most often the husband and wife will want to discuss health care options together. Standing close and speaking loudly is inappropriate in most counseling situations.

**Test-Taking Strategy:** Use knowledge of the Amish society and therapeutic communication techniques to answer this question. Options 2 and 4 can be eliminated first because option 4 is inappropriate and option 2 is not a therapeutic intervention. Option 1 can be eliminated because of Amish cultural habits. Review Amish society and cultural beliefs if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Fundamental Skills—Cultural Diversity

**Reference:** Maurer, F., & Smith, C. (2009). *Community/public health nursing practices: Health for families and populations* (4th ed., pp. 278-281, 294). St. Louis: Saunders.

### 997. 1

**Rationale:** Assault occurs when a person puts another person in fear of harmful or offensive contact and the victim fears and believes that harm will result as a result of the threat. In this situation, the nurse could be accused of the tort of assault. Battery is the intentional touching of another's body without the person's consent. Slander is verbal communication that is false and harms the reputation of another. Invasion of privacy is committed when the nurse intrudes into the client's personal affairs or violates confidentiality.

**Test-Taking Strategy:** Use the process of elimination. Focusing on the words used by the nurse and noting that the nurse threatens the client will direct you to option 1. Review the descriptions in each option if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Ethical/Legal

**Reference:** Potter, P., & Perry, A. (2009) *Fundamentals of nursing* (7th ed., p. 331). St. Louis: Mosby.

### 998. 4

**Rationale:** When delegating nursing assignments, the nurse needs to consider the skills and educational level of the nursing staff. Collecting a 24-hour urine sample and frequent ambulation can most appropriately be provided by the nursing assistant, considering the clients identified in each option. The client on the mechanical ventilator requiring frequent assessment and suctioning should most appropriately be cared for by the registered nurse. The licensed practical (vocational) nurse is skilled in wound irrigation and dressing changes, so this client would be assigned to this staff member.

**Test-Taking Strategy:** Use the principles related to delegations and assignments, and consider the education and job position as described by the nurse practice act and employee guidelines. Note the strategic word *assessment* in option 3. This should alert you that this client should be assigned to the registered nurse. Options 1 and 2 can be eliminated because a nursing assistant can easily perform these tasks. This will assist in directing you to option 4. If you had difficulty with this question, review the principles related to a delegation and assignment making.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership and Management—Delegating/Prioritizing

**Reference:** Cherry, B., & Jacob, S. (2008). *Contemporary nursing: Issues, trends, & management* (4th ed., pp. 406-407). St. Louis: Mosby.

### 999. 2

**Rationale:** The jaw thrust without the head tilt maneuver is used when head or neck trauma is suspected. This maneuver opens the airway while maintaining proper head and neck alignment, reducing the risk of further damage to the neck. Options 1, 3, and 4 are incorrect. Additionally, it is unlikely that the nurse would be able to obtain data about the client's history.

**Test-Taking Strategy:** Focus on the data in the question. Eliminate option 1 because of the close-ended word *all*. Noting that the client requires CPR will assist in eliminating options 3 and 4. Review CPR guidelines and the various test-taking strategies if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Critical Care

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 2197). St. Louis: Saunders.

Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., pp. 732-733). St. Louis: Mosby.

### 1000. 3

**Rationale:** The client needs to be instructed to avoid exposure to the sun. Options 1, 2, and 4 are accurate measures in the care of a client receiving external radiation therapy.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *need for further instruction*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Eliminate option 1 because of the word *gently* and option 4 because of the word *loose*. From the remaining options, recalling that sun exposure is to be avoided will assist in answering the question. Review skin care measures for a client receiving external radiation if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Oncology

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 420). St. Louis: Saunders.

### 1001. 1.5

**Rationale:** It is necessary to convert 150 mcg to mg. In the metric system, to convert smaller to larger, divide by 1000 or move the decimal three places to the left: 150 mcg = 0.15 mg. Next, use the formula to calculate the correct dose.

*Formula:*

$$\frac{\text{Desired}}{\text{Available}} \times \text{Tablet} = \text{Tablets per dose}$$

$$\frac{0.15 \text{ mg}}{0.1 \text{ mg}} \times 1 \text{ tablet} = 1.5 \text{ tablets}$$

**Test-Taking Strategy:** In this medication calculation problem, it is necessary first to convert micrograms to milligrams. Next, follow the formula for the calculation of the correct dose. Label each figure, including the answer. Recheck your work, and make sure that the answer makes sense. If you had difficulty with this question, review medication calculation problems.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Kee, J., & Marshall, S. (2009). *Clinical calculations: With applications to general and specialty areas* (6th ed., p. 86). St. Louis: Saunders.

### 1002. 2

**Rationale:** The most common side effect of metformin (Glucophage) is gastrointestinal disturbances, including decreased appetite, nausea, and diarrhea. These generally subside over time. This medication does not cause weight gain; clients lose an average of 7 to 8 lb because the medication causes nausea and decreased appetite. Although hypoglycemia can occur, it is not the most common side effect.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *most common side effect*. Remember that the most common side effect of metformin is gastrointestinal disturbances. Review these side effects if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**Reference:** Hodgson, B., & Kizior, R. (2010). *Saunders nursing drug handbook 2010* (p. 726). St. Louis: Saunders.

### 1003. 3, 5, 6

**Rationale:** During a seizure, the child is placed on his or her side in a lateral position. Positioning on the side prevents aspiration because saliva drains out the corner of the child's mouth. The child is not restrained because this could cause injury to the child. The nurse would loosen clothing around the child's neck and ensure a patent airway. Nothing is placed in the child's mouth during a seizure because this could injure the child's mouth, gums, or teeth. The nurse would stay with the child to reduce the risk of injury and allow for observation and timing of the seizure.

**Test-Taking Strategy:** Visualize this clinical situation. Recalling that airway patency and safety is the priority will assist in determining the appropriate interventions. Review care of a child experiencing a seizure if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Neurological/Musculoskeletal

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 1012). St. Louis: Mosby.

### 1004. 1

**Rationale:** After amputation, phantom limb pain is a temporary condition that some children may experience. This sensation of burning, aching, or cramping in the missing limb is most distressing to the child. The child needs to be reassured that the condition is normal and only temporary. Options 2, 3, and 4 are inappropriate responses to the child.

**Test-Taking Strategy:** Use therapeutic communication techniques. Note that the subject of the question relates to alleviating the child's fear. Option 1 is the only option that would alleviate fear. Options 2, 3, and 4 imply that this pain may be permanent. Review care of a child after amputation if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Caring

**Content Area:** Child Health—Hematological/Oncological

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., pp. 1121-1122). St. Louis: Mosby.

### 1005. 1

**Rationale:** Setting priorities means deciding which client needs or problems require immediate action and which can be delayed until a later time because they are not urgent. Client problems that involve actual or life-threatening concerns are always considered first. Although time constraints, obtaining needed supplies, and completing care in a reasonable time frame are components of time management, these items are not the priority in planning care for the client, based on the options provided.

**Test-Taking Strategy:** Use the process of elimination and principles related to prioritizing to answer the question. Noting the strategic words *life-threatening* in option 1 will assist in directing you to this option. Review the principles related to prioritizing if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership and Management—Delegating/Prioritizing

**Reference:** Potter, P., & Perry, A. (2009) *Fundamentals of nursing* (7th ed., pp. 262-263). St. Louis: Mosby.

### 1006. 2

**Rationale:** Laboratory determinations of serum thyroid-stimulating hormone (TSH) level are an important means of evaluation. Successful therapy causes elevated TSH levels to decline. These levels begin their decline within hours of the onset of therapy and continue to decrease as plasma levels of thyroid hormone build up. If an adequate dosage is administered, TSH levels remain suppressed for the duration of therapy.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *expected outcome*. Relate the diagnosis hypothyroidism with *thyroid* hormone levels in the correct option. If you had difficulty with this question, review the therapeutic effects of levothyroxine (Synthroid).

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Lehne, R. (2010). *Pharmacology for nursing care* (7th ed., pp. 693-694, 699). St. Louis: Saunders.

### 1007. 1, 2, 4, 6

**Rationale:** Risk factors for breast cancer include family history of breast cancer; age older than 40 years; early menarche; late menopause; previous cancer of the breast, uterus, or ovaries; nulliparity or first child born after age 30 years; and high-dose radiation exposure to chest.

**Test-Taking Strategy:** Focus on the subject, the risk factors associated with breast cancer. Thinking about the physiology associated with the reproductive system and the most common causes of cancer will assist in answering the question. Review these risk factors if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Oncology

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1665). St. Louis: Saunders.

### 1008. 3

**Rationale:** An inflammatory reaction such as acute pancreatitis can cause paralytic ileus, the most common form of non-mechanical obstruction. Inability to pass flatus is a clinical manifestation of paralytic ileus. Option 1 is the description of the physical finding of liver enlargement. The liver is usually enlarged in cases of cirrhosis or hepatitis. Although this client may have an enlarged liver, an enlarged liver is not a sign of paralytic ileus or intestinal obstruction. Pain is associated with paralytic ileus, but the pain usually manifests as a more constant generalized discomfort. Pain that is severe, constant, and rapid in onset is more likely caused by strangulation of the bowel. Loss of sphincter control is not a sign of paralytic ileus.

**Test-Taking Strategy:** Use the process of elimination. Noting the word *paralytic* will assist in directing you to option 3. Review the clinical manifestations of paralytic ileus if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1303). St. Louis: Saunders.

### 1009. 2

**Rationale:** For the first 12 hours after gastric surgery, the nasogastric tube drainage may be dark brown to dark red. Later, the drainage should change to a light yellowish brown color. The presence of bile may cause a green tinge. The physician should be notified if dark red drainage is noted 24 hours postoperatively.

**Test-Taking Strategy:** Focus on the subject, need to notify the physician. Use the process of elimination and recall that bleeding is a concern in the postoperative client. This concept will direct you to option 2. Review the signs of postoperative complications after gastric surgery if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 291). St. Louis: Saunders.

### 1010. 3

**Rationale:** The client should take a deep breath because the client's airway will be temporarily obstructed during tube removal. The client is then told to exhale slowly and the tube is withdrawn during exhalation. Bearing down could inhibit the removal of the tube. Breathing normally could result in aspiration of gastric secretions during inhalation. Holding the breath does not facilitate tube removal.

**Test-Taking Strategy:** Use the process of elimination and attempt to visualize the process of tube removal to direct you to option 3. Remember, exhaling slowly facilitates the process of removal. Review the procedure for removal of a nasogastric tube if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1209). St. Louis: Mosby.

### 1011. 3

**Rationale:** When a client is experiencing respiratory acidosis, the respiratory rate and depth increase in an attempt to compensate. The client also experiences headache; restlessness; mental status changes, such as drowsiness and confusion; visual disturbances; diaphoresis; cyanosis as the hypoxia becomes more acute; hyperkalemia; rapid, irregular pulse; and dysrhythmias.

**Test-Taking Strategy:** Use the process of elimination and knowledge of the signs and symptoms of respiratory acidosis to answer this question. Remember that restlessness and confusion occur in respiratory acidosis. If this question was difficult, review the clinical manifestations associated with respiratory acidosis.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 206). St. Louis: Saunders.

### 1012. 3

**Rationale:** Distention, vomiting, and abdominal pain are a few of the symptoms associated with intestinal obstruction. Nasogastric tubes may be used to remove gas and fluid from the stomach, relieving distention and vomiting. Bowel sounds return to normal as the obstruction is resolved and normal bowel function is restored. Discontinuing the nasogastric tube before normal bowel function may result in a return of the symptoms, necessitating reinsertion of the nasogastric tube. Serum electrolyte levels, tube placement, and pH of the gastric aspirate are important assessments for the client with a nasogastric tube in place, but would not assist in determining the readiness for removing the nasogastric tube.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 4 first because they are comparable or alike. Assessing the pH of the gastric aspirate is one method of assessing tube placement. From the remaining options, focus on the subject and the client's diagnosis to direct you to option 3. Review abdominal assessment in a client with an intestinal obstruction if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1208). St. Louis: Mosby.

### 1013. 2

**Rationale:** The enema fluid should be administered slowly. If the client complains of fullness or pain, the flow is stopped for 30 seconds and restarted at a slower rate. Slow enema administration and stopping the flow temporarily, if necessary, decrease the likelihood of intestinal spasm and premature ejection of the solution. The higher the solution container is held above the rectum, the faster the flow and the greater the force in the rectum. There is no need to discontinue the enema and notify the physician at this time. Although client reassurance is important, continuing the flow is inappropriate.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 3 first because they are comparable or alike. From the remaining options, focusing on the subject will direct you to option 2. Review the procedure for administering an enema if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Perioperative Care

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., pp. 912-913). St. Louis: Mosby.

### 1014. 4

**Rationale:** Option 4 describes aversion therapy. Options 1, 2, and 3 are characteristics of self-control therapy.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *need for further teaching* in the question. These words indicate a negative event query and ask you to select an option that is incorrect. Think about the subject, self-control. This subject will direct you to option 4. If you are unfamiliar with self-control therapy, review this content.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Mental Health

**Reference:** Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 30). St. Louis: Saunders.

### 1015. 1, 3, 5, 6

**Rationale:** The nurse would teach the client how to care for the stoma, depending on the type of laryngectomy performed. Most interventions focus on protection of the stoma and the prevention of infection. Interventions include to avoid swimming, use care when showering, avoid exposure to people with infections, prevent debris from entering the stoma, and obtain a Medic-Alert bracelet. Additional interventions include wearing a stoma guard or high-collared clothing to cover the stoma, increasing the humidity in the home, and increasing fluid intake to 3000 mL/day to keep the secretions thin.

**Test-Taking Strategy:** Recalling that most interventions focus on protection of the stoma and the prevention of infection will assist in identifying the client instructions for home care. Review stoma and laryngeal care instructions if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Oncology

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 605-606). St. Louis: Saunders.

### 1016. 21

**Rationale:** Use the intravenous flow rate formula.

**Formula:**

$$\frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in minutes}} \times = \text{Drops per minute}$$

$$\frac{2000 \text{ mL} \times 15 \text{ gtt}}{1440 \text{ minutes}} = \frac{30,000}{1440} = 20.8, \text{ or } 21 \text{ gtt/min}$$

**Test-Taking Strategy:** Use the formula for calculating intravenous flow rates when answering the question. Verify the answer using a calculator. Review intravenous infusion rates if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Kee, J., & Marshall, S. (2009). *Clinical calculations: With applications to general and specialty areas* (6th ed., p. 223). St. Louis: Saunders.

### 1017. 3

**Rationale:** In the first few hours after surgery, the drainage from the chest tube is bloody. After several hours, it becomes serosanguineous. The client should not experience frequent clotting. Proper chest tube function should allow for drainage of blood before it has the chance to clot in the chest or the tubing.

**Test-Taking Strategy:** Recall that after thoracic surgery, there may be considerable capillary oozing for hours in the postoperative period. This will lead you to choose the bloody drainage over serous or serosanguineous. Knowing that patent chest tubes do not allow blood to collect in the pleural space eliminates the option of blood with clots. If you had difficulty with this question, review the assessment measures required for the care of a client with a chest tube.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Respiratory

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1617). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 646, 648). St. Louis: Saunders.

### 1018. 2, 3, 4, 5

**Rationale:** If the client begins to hemorrhage from the surgical site after radical neck dissection, the nurse elevates the head of the bed to maintain airway patency and prevent aspiration. The nurse applies pressure over the bleeding site and calls the physician immediately. The nurse monitors the client's airway and vital signs.

**Test-Taking Strategy:** Focus on the client situation. Options 2 and 3 are indicated if the client is hemorrhaging. Calling the physician is also indicated immediately, but lowering the head of bed does not help with airway maintenance. If you had difficulty with this question, review nursing actions if a client begins to hemorrhage.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Respiratory

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1561). St. Louis: Saunders.

### 1019. 2

**Rationale:** To prevent transmission of hepatitis, a condom is advised during sexual intercourse and vaccination of the partner. Alcohol should be avoided because it is detoxified in the liver and may interfere with recovery. Rest is especially important until laboratory studies show that liver function has returned to normal. The client's activity is increased gradually.

**Test-Taking Strategy:** Use the process of elimination, focusing on the strategic words *need for further teaching*. These words indicate a negative event query and ask you to select an option that is incorrect. Noting the strategic word *never* in option 2 will direct you to this option. Review client instructions regarding hepatitis if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1358). St. Louis: Saunders.

### 1020. 1, 2, 5

**Rationale:** The clinical manifestations of hypothyroidism are the result of decreased metabolism from low levels of thyroid hormone. Interventions are aimed at replacement of the hormones and providing measures to support the signs and symptoms related to a decreased metabolism. The nurse encourages the client to consume a well-balanced diet that is low in fat for weight reduction and high in fluids and high-fiber foods to prevent constipation. The client often has cold intolerance and requires a warm environment. The client would notify the physician if chest pain occurs because it could be an indication of overreplacement of thyroid hormone. Iodine preparations may be used to treat hyperthyroidism. These medications decrease blood flow through the thyroid gland and reduce the production and release of thyroid hormone.

**Test-Taking Strategy:** Focus on the client's diagnosis, hypothyroidism. Recalling that in this disorder the client has a decreased metabolic rate will assist in determining the appropriate interventions. Review interventions for the client with hypothyroidism and hyperthyroidism if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Endocrine

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1023). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1458). St. Louis: Saunders.

### 1021. 2

**Rationale:** Plugging a tracheostomy tube is usually done by inserting the tracheostomy plug (decannulation stopper) into the opening of the outer cannula. This closes off the tracheostomy, and airflow and respiration occur normally through the nose and mouth. When plugging a cuffed tracheostomy tube, the cuff must be deflated. If it remains inflated, ventilation cannot occur, and respiratory arrest could result. The ability to swallow or speak is unrelated to weaning and plugging the tube.

**Test-Taking Strategy:** Note the strategic word *required* in the question. This should assist in directing you to the option that addresses a priority physiological need. Use the process of elimination to direct you to option 2 because an inflated cuff would cause airway obstruction. Review this procedure if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Respiratory

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1546-1547). St. Louis: Saunders.

### 1022. 3

**Rationale:** Hypertension, cardiovascular disease, diabetes mellitus, and obesity are associated with the development of glaucoma. Options 1, 2, and 4 do not identify risk factors associated with this eye disorder.

**Test-Taking Strategy:** Use the process of elimination. Focusing on the subject, a risk factor associated with glaucoma, will direct you to option 3. If you had difficulty with this question, review the risk factors associated with this disorder.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Eye

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1700). St. Louis: Saunders.

### 1023. 3

**Rationale:** The nurse places an eye patch over the client's affected eye to reduce eye movement. Some clients may need bilateral patching. Depending on the location and size of the retinal break, activity restrictions may be needed immediately. These restrictions are necessary to prevent further tearing or detachment and to promote drainage of any subretinal fluid. The nurse positions the client as prescribed by the physician.

**Test-Taking Strategy:** Use the process of elimination. Remember that the eye needs to be protected and rested. This should direct you to option 3. If you had difficulty with this question, review care of a client with retinal detachment.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Eye

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1101). St. Louis: Saunders.

### 1024. 2

**Rationale:** Clients at greatest risk for pulmonary emboli are immobilized clients. Basic preventive measures include early ambulation, leg elevation, active leg exercises, elastic stockings, and intermittent pneumatic calf compression. Keeping the client well hydrated is essential because dehydration predisposes to clotting. A pillow under the knees may cause venous stasis. Heat should not be applied without a physician's prescription.

**Test-Taking Strategy:** Use the process of elimination and basic principles related to the care of the immobile client to answer this question. If you are unfamiliar with these basic measures, review this content.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Adult Health—Respiratory

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 678). St. Louis: Saunders.

### 1025. 4

**Rationale:** A crisis is an acute, time-limited state of disequilibrium resulting from situational, developmental, or societal sources of stress. A person in this state is temporarily unable to cope with or adapt to the stressor by using previous coping mechanisms. The person who intervenes in this situation (the nurse) "takes over" for the client who is not in control and devises a plan (action) to secure and maintain the client's safety. When this has occurred, the nurse works collaboratively with the client (participates) in developing new coping and problem-solving strategies.

**Test-Taking Strategy:** Use the process of elimination. A client who experiences a suicidal crisis is in a state of acute disequilibrium. Remember that in a crisis an authority figure must emerge to take action. Review care of the client in crisis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**Reference:** Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 371). St. Louis: Saunders.

### 1026. 1

**Rationale:** The client must have sputum cultures performed every 2 to 4 weeks after initiation of antituberculosis drug therapy. The client may return to work when the results of three sputum cultures are negative because the client is considered noninfectious at that point.

**Test-Taking Strategy:** Use the process of elimination. Knowing that a positive Mantoux test never reverts to negative helps you eliminate option 4. From the remaining options, it is necessary to know that three negative sputum cultures are

required. If this question was difficult, review these concepts related to tuberculosis.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Respiratory

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 670). St. Louis: Saunders.

### 1027. 3

**Rationale:** This client is in a severe state of anxiety. When a client is in a severe or panic state of anxiety, it is crucial for the nurse to remain with the client. Processing the anxiety at this point would increase the client's level of anxiety further. The client in a severe state of anxiety would be unable to learn relaxation techniques.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *appropriate initial*. The best action in this situation is to remain with the client. If you are unfamiliar with the symptoms of the different levels of anxiety and the interventions that are indicated, review this information.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Mental Health

**Reference:** Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 132). St. Louis: Saunders.

### 1028. 3

**Rationale:** Laboratory findings do not establish the diagnosis of appendicitis, but there is often an elevation of the white blood cell count (leukocytosis) with a shift to the left (an increased number of immature white blood cells).

**Test-Taking Strategy:** Use the process of elimination. Knowledge that an inflammatory process causes an increase in the white blood cell count will assist in eliminating options 1 and 4. From the remaining options, it is necessary to understand the significance of a shift to the left. If you are unfamiliar with the meaning of shift to the left, review this content.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1316). St. Louis: Saunders.

### 1029. 4

**Rationale:** Ineffective coping may be evidenced by inability to meet basic needs, inability to meet role expectations, alteration in social participation, use of inappropriate defense mechanisms, or impairment of usual patterns of communication. Disturbed thought processes are evidenced by altered attention span; distractibility; and disorientation to time, place, person, and events. A dysfunctional family process may exist when the family has difficulty adapting or responding to the changes or traumatic experience of the member in crisis.

**Test-Taking Strategy:** Use the data presented in the question to direct you to the correct option. Option 3 can be

eliminated because the client is presently experiencing anxiety. Eliminate option 1 because there are no data in the question that address the family. Similarly, there are no data to suggest disturbed thought processes, so this option can be eliminated, leaving option 4 as the correct option. Review nursing diagnoses for a client experiencing anxiety if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Mental Health

**Reference:** Stuart, G. (2009). *Principles and practice of psychiatric nursing* (9th ed., pp. 228-229, 231). St. Louis: Mosby.

### 1030. 2

**Rationale:** Bubbling in the water seal chamber is caused by air passing out of the pleural space into the fluid in the chamber. Intermittent bubbling is normal. It indicates that the system is accomplishing one of its purposes, removing air from the pleural space. Continuous bubbling during inspiration and expiration indicates that an air leak exists. If this occurs, it must be corrected.

**Test-Taking Strategy:** Focus on the strategic words *intermittent bubbling* and *water seal chamber*. Recalling that intermittent bubbling is normal will direct you to option 2. If you are unfamiliar with chest tube drainage systems, review this content.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Adult Health—Respiratory

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1622). St. Louis: Saunders.

### 1031. 3

**Rationale:** The initial nursing assessment of a client in a crisis state is to evaluate the physical condition of the client, the potential for self-harm, and the potential for harm to others. After this has been determined and appropriate interventions have been initiated, the nurse proceeds with the mental health interview.

**Test-Taking Strategy:** Use Maslow's Hierarchy of Needs theory to answer the question. Physiological needs take priority over other needs. Option 3 is the only option that addresses a physiological need. Review care of a client in crisis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Mental Health

**Reference:** Varcarolis, E., & Halter, M. (2009). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care* (p. 371). St. Louis: Saunders.

### 1032. 3

**Rationale:** Although frequency and intensity of bowel sounds vary depending on the phase of digestion, normal bowel sounds are relatively high-pitched clicks or gurgles. Loud gurgles (borborygmi) indicate hyperperistalsis. Bowel sounds are more high-pitched and louder (hyperresonance) when the intestines are under tension, such as in intestinal obstruction.

A swishing or buzzing sound represents turbulent blood flow associated with a bruit. Bruits are not normal sounds.

**Test-Taking Strategy:** Use the process of elimination. Normally, bowel sounds are audible in all four quadrants, so options 2 and 4 can be eliminated. From the remaining options, use knowledge regarding normal findings to direct you to option 3. Review abdominal assessment if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Gastrointestinal

**Reference:** Jarvis, C. (2008) *Physical examination and health assessment* (5th ed, p. 570). St. Louis: Saunders.

### Accidents

- increases with aging, 181, 181*b*
- safety measures to prevent, 181, 181*b*

### Accommodation

- of conflict, 70
- vision/eye, 395*b*, 898, 905

### Accountability

- definition of, 64, 66
- with delegation, 72
- lacking in functional nursing, 66

### Acculturation, 35, 39

### Accutane, 594*b*, 595

### Acetaminophen

- description and side effects of, 971*b*, 972
- poisoning, 480

### Acid-ash diet, 876*b*

### Acid-base balance

- arterial blood gases, 108, 108*b*, 109, 109*b*, 109*t*
- components of, 103
- hydrogen ion regulation in blood, 103, 103*b*, 103*f*
- illustration of healthy, 103*f*
- imbalances, 109*b*, 109*t*
- and kidney function, 851
- metabolic acidosis, 106, 107, 107*b*, 107*t*
- metabolic alkalosis, 107*t*, 108, 108*b*
- pyramid study points, 102–109, 731–732
- respiratory acidosis, 104, 105*b*, 105*f*, 106*t*
- respiratory alkalosis, 106, 106*b*, 107*t*, 109*t*

### Acidity (pH)

- homeostasis, 852
- and kidney function, 851
- values with acidosis and alkalosis, 109*t*

### Acidosis

- clinical manifestations of, 106*t*
- diagram illustrating, 105*f*

### Acids, 103

### Acitretin, 593, 593*b*

### Acne vulgaris, 572, 594, 594*b*, 595*f*

### Acoustic neuroma, 917

### Acquired immunity, 1010–1011, 1012

### Acquired immunodeficiency syndrome (AIDS)

- cancer incidence higher with, 602
- CD T-cell counts, 124
- in children, 538, 539*b*, 539*f*, 540*b*, 540*t*
- antiretroviral medications for, 538, 540*b*
- common infections and conditions with, 539*b*
- description and treatment, 1018
- high risk groups, 1018
- life cycle correlation with medications, 1027*f*
- medications, 1025, 1027*f*
- during pregnancy, 285, 285*b*
- tests to evaluate progression of, 1019*b*

### Acrocyanosis, 340, 343*f*

### Actinic keratosis, 571, 591, 592*b*

### Active transport, 86

### Acuity tests, 901

### Acute lymphocytic leukemia, 607, 608*b*

### in children, 527, 527*b*

### Acute myelogenous leukemia, 607, 608*b*

### in children, 527, 527*b*

### Acute renal failure (ARF)

- definition of, 849–850
- description and causes of, 855, 857*b*
- phases and signs of, 855, 857*b*

### Acute respiratory distress syndrome, 746

### Acute respiratory failure, 745

### Adapalene, 594*b*, 595

### Addictions

- defining, 1034–1035
- eating disorders, 1071, 1072*f*
- in newborns, 351*f*, 350, 351
- substance abuse disorders
  - alcohol abuse, 1073, 1075*b*
  - alcohol withdrawal, 1074, 1074*b*
  - defining, 1072
  - drug dependency, 1075, 1075*b*, 1076*b*, 1077*b*
  - screening tools, 1073, 1073*b*

### Addisonian crisis

- definition of, 646, 653, 653*b*, 653*t*

### Addison's disease, 646, 653, 653*b*, 653*t*

### Adenocarcinomas

- definition of, 600–601
- prostate cancer, 619

### Adenoiditis, 434, 434*f*

### Administration

- of blood transfusions, 167–177, 169, 171*b*
- of intravenous therapy, 156
- of medications
  - calculating dosages, 193, 194*b*
  - Celsius and Fahrenheit conversion, 191, 191*b*
  - drug measurement systems/conversions, 190, 190*b*, 191, 191*b*
  - infusions by unit dosage per hour, 195, 195*b*
  - intravenous flow rates, 194, 194*b*

### Administration (*Continued*)

- labels, 191
- metric system conversion, 190, 190*b*, 191*b*
- oral medications, 192
- parenteral medications, 192, 192*f*, 193*f*
- percentage and ratio solutions, 191*b*, 194
- in powder form, 193, 194*b*
- prescriptions, 191, 191*b*
- Pyramid terms and study points, 189–195
- of parenteral nutrition, 141–146, 142*f*
- types of gastrointestinal tube feedings, 237, 237*b*
- of vaccines, 551*b*
- Administrative staff
  - roles of, 71
- Admission agreements, 54*b*
- Adolescents
  - characteristics of hospitalized, 378
  - communication approaches with, 379
  - developmental characteristics of, 385
  - as maternal risk factor, 262
  - medication administration considerations in, 562*b*
  - risky behaviors by, 385
- Adrenal cortex
  - disorders of, 653, 653*b*, 653*t*
  - function and location of, 648, 649*b*
  - hormones of, 650*b*
- Adrenal glands
  - disorders, 653, 653*b*, 653*t*, 654*f*, 655*b*
  - function and location of, 648, 649*b*
  - renal function of, 852
- Adrenal medulla
  - disorders of, 653, 653*b*, 653*t*
  - function and location of, 648, 649*b*
- Adrenalectomy, 646, 655, 655*b*
- Adrenergic agonists, 842, 842*b*
- Adrenergic blockers, 837, 837*b*, 928
- Adrenocorticotropic hormone (ACTH), 649*b*, 650*f*, 651, 654
- Advance directives
  - definition of, 48
