#### Notices

Knowledge and best practice in this field are constantly changing. As new research and experience broaden our understanding, changes in research methods, professional practices, or medical treatment may become necessary.

Practitioners and researchers must always rely on their own experience and knowledge in evaluating and using any information, methods, compounds, or experiments described herein. In using such information or methods they should be mindful of their own safety and the safety of others, including parties for whom they have a professional responsibility.

With respect to any drug or pharmaceutical products identified, readers are advised to check the most current information provided (i) on procedures featured or (ii) by the manufacturer of each product to be administered, to verify the recommended dose or formula, the method and duration of administration, and contraindications. It is the responsibility of practitioners, relying on their own experience and knowledge of their patients, to make diagnoses, to determine dosages and the best treatment for each individual patient, and to take all appropriate safety precautions.

To the fullest extent of the law, neither the Publisher nor the authors, contributors, or editors, assume any liability for any injury and/or damage to persons or property as a matter of products liability, negligence or otherwise, or from any use or operation of any methods, products, instructions, or ideas contained in the material herein.

To my parents—  
To my mother, **Frances Mary**,  
and in loving memory of my father, **Arnold Lawrence**,  
who taught me to always love, care, and be the best that I could be.

And  
in loving memory of my sweet and loyal West Highland terrier **Pynsea**,  
who was always by my side as I created this publication.

To All Future Registered Nurses,

Congratulations to you!

You should be very proud and pleased with yourself on your most recent well-deserved accomplishment of completing your nursing program to become a registered nurse. I know that you have worked very hard to become successful and that you have proven to yourself that indeed you can achieve your goals.

In my opinion, you are about to enter the most wonderful and rewarding profession that exists. Your willingness, desire, and ability to assist those who need nursing care will bring great satisfaction to your life. In the profession of nursing, your learning will be a lifelong process. This aspect of the profession makes it stimulating and dynamic. Your learning process will continue to expand and grow as the profession continues to evolve. Your next very important endeavor will be the learning process involved to achieve success in your examination to become a registered nurse.

I am excited and pleased to be able to provide you with the *Saunders Pyramid to Success* products, which will help you prepare for your next important professional goal, becoming a registered nurse. I want to thank all of my former nursing students whom I have assisted in their studies for the NCLEX-RN exam for their willingness to offer ideas regarding their needs in preparing for licensure. Student ideas have certainly added a special uniqueness to all of the products available in the *Saunders Pyramid to Success*.

*Saunders Pyramid to Success* products provide you with everything that you need to ready yourself for the NCLEX-RN exam. These products include material that is required for the NCLEX-RN exam for all nursing students regardless of educational background, specific strengths, areas in need of improvement, or clinical experience during the nursing program.

So let's get started and begin our journey through the *Saunders Pyramid to Success*, and welcome to the wonderful profession of nursing!

Sincerely,

*Linda Anne Silvestri*

Linda Anne Silvestri

## About the Author

Linda Anne Silvestri. (Photo by Laurent W. Valliere.)

As a child, I always dreamed of becoming either a nurse or a teacher. Initially I chose to become a nurse because I really wanted to help others, especially those who were ill. Then I realized that both of my dreams could come true; I could be both a nurse and a teacher. So I pursued my dreams.

I received my diploma in nursing at Cooley Dickinson Hospital School of Nursing in Northampton, Massachusetts. Afterward, I worked at Baystate Medical Center in Springfield, Massachusetts, where I cared for clients in acute medical-surgical units, the intensive care unit, the emergency department, pediatric units, and other acute care units. Later I received an associate degree from Holyoke Community College in Holyoke, Massachusetts, my BSN from American International College in Springfield, Massachusetts, and my MSN from Anna Maria College in Paxton, Massachusetts, with a dual major in Nursing Management and Patient Education. I received my PhD in Nursing from the University of Nevada, Las Vegas, and conducted research on self-efficacy and the predictors of NCLEX success. I am also a member of the Honor Society of Nursing, Sigma Theta Tau International, Phi Kappa Phi, the Western Institute of Nursing, the Eastern Nursing Research Society, National League for Nursing, and the Golden Key International Honour Society.

As a native of Springfield, Massachusetts, I began my teaching career as an instructor of medical-surgical nursing and leadership-management nursing in 1981 at Baystate Medical Center School of Nursing. In 1989, I relocated to Rhode Island and began teaching advanced medical-surgical nursing and psychiatric nursing to RN and LPN students at the Community College of Rhode Island. While teaching there, a group of students approached me for assistance in preparing for the NCLEX examination. I have always had a very special interest in test success for nursing students because of my own personal experiences with testing. Taking tests was never easy for me, and as a student I needed to find methods and strategies that would bring success. My own difficult experiences, desire, and dedication to assist nursing students to overcome the obstacles associated with testing inspired me to develop and write the many products that would foster success with testing. My experiences as a student, nursing educator, and item writer for the NCLEX exams aided me as I developed a comprehensive review course to prepare nursing graduates for the NCLEX examination.

Later, in 1994, I began teaching medical-surgical nursing at Salve Regina University in Newport, Rhode Island, and remain there as an adjunct faculty member. I also prepare nursing students at Salve Regina University for the NCLEX-RN examination.

I established Professional Nursing Seminars, Inc., in 1991 and Nursing Reviews, Inc, in 2000. Both companies are dedicated to conducting review courses for the NCLEX-RN and the NCLEX-PN examinations and helping nursing graduates achieve their goals of becoming registered nurses, licensed practical/vocational nurses, or both.

Today, I conduct review courses for the NCLEX examinations throughout New England and am the successful author of numerous review products. I am so pleased that you have decided to join me on your journey to success in testing for nursing examinations and for the NCLEX-RN examination!

# Preface

“To laugh often and much, to appreciate beauty, to find the best in others, to leave the world a bit better, to know that even one life has breathed easier because you have lived, this is to have succeeded.”

Ralph Waldo Emerson

Welcome to Saunders *Pyramid to Success!*

## AN ESSENTIAL RESOURCE FOR TEST SUCCESS

*Saunders Comprehensive Review for the NCLEX-RN® Examination* is one in a series of products designed to assist you in achieving your goal of becoming a registered nurse. This text will provide you with a comprehensive review of all of the nursing content areas specifically related to the new 2010 test plan for the NCLEX-RN examination, which is implemented by the National Council of State Boards of Nursing. This resource will help you achieve success on your nursing examinations during nursing school and on the NCLEX-RN examination.

## ORGANIZATION

This book contains 20 units and 77 chapters. The chapters are designed to identify specific components of nursing content, and they contain practice questions, both multiple choice and alternate item formats, that reflect the chapter content and the 2010 test plan for the NCLEX-RN exam. The final unit contains a 75-question Comprehensive Test.

The new test plan identifies a framework based on *Client Needs*. These Client Needs categories include Safe and Effective Care Environment, Health Promotion and Maintenance, Psychosocial Integrity, and Physiological Integrity. *Integrated Processes* are also identified as a component of the test plan. These include Caring, Communication and Documentation, Nursing Process, and Teaching and Learning. All the chapters address the components of the test plan framework.

## SPECIAL FEATURES OF THE BOOK

### PYRAMID TERMS

Each content area, discussed in either a chapter or a unit, begins with *Pyramid Terms* and their definitions. These *Pyramid Terms* terms are important to the discussion of the content. Therefore they are in bold magenta type throughout the content section.

### PYRAMID TO SUCCESS

The *Pyramid to Success*, a feature part of the chapter or unit introduction, provides you with an overview, guidance, and direction regarding the focus of review in the particular content area, as well as the content area's relative importance to the 2010 test plan for the NCLEX-RN exam. Specific nursing content areas, as specified in the test plan, are identified. The *Pyramid to Success* reviews the Client Needs as they pertain to the content in that unit or chapter. These points identify the specific components to keep in mind as you review the chapter.

### PYRAMID POINTS

*Pyramid Points* are the little icons that are placed next to specific content throughout the chapters. The *Pyramid Points* highlight content that is important for preparing for the NCLEX-RN examination and identify content that typically appears on the NCLEX-RN examination.

### PYRAMID ALERTS

*Pyramid Alerts* are the red text found throughout the chapters that alert you to important information about nursing concepts. These alerts identify content that typically appears on the NCLEX-RN examination.

### PRIORITY NURSING ACTIONS

Numerous *Priority Nursing Actions* boxes have been placed throughout the chapters. These boxes present a

clinical nursing situation and the priority actions to take in the event of its occurrence. A rationale is provided that explains the correct order of action, along with a reference for additional research.

## SPECIAL FEATURES FOUND ON THE COMPANION CD

### HEART, LUNG, AND BOWEL SOUND QUESTIONS

The accompanying software contains *Audio Questions* representative of content addressed in the 2010 test plan for the NCLEX-RN exam. These questions are in NCLEX-style format, and each question presents an audio sound as a component of the question.

### VIDEO QUESTIONS

The accompanying software also contains new *Video Questions* representative of content addressed in the 2010 test plan for the NCLEX-RN exam. These questions are in NCLEX-style format, and each question presents a video clip as a component of the question.

### AUDIO REVIEW SUMMARIES

The companion CD now includes three *Audio Review Summaries* that cover challenging subject areas under the 2010 NCLEX-RN test plan, including *Pharmacology*, *Acid-Base Balance*, and *Fluids and Electrolytes*. These audio reviews are downloadable in mp3 format, and you can listen to them at your convenience any time on your computer, iPod, or portable mp3 player of choice.

## PRACTICE QUESTIONS

While preparing for the NCLEX-RN examination, it is crucial for students to practice taking test questions. This book contains 1032 NCLEX-style multiple-choice and alternate item format questions. The accompanying software includes all the questions from the book, plus an additional 3478 questions for a total of 4510 questions.

### MULTIPLE-CHOICE AND ALTERNATE ITEM FORMAT QUESTIONS

Starting with Unit II, each chapter is followed by a practice test. Each practice test contains several multiple-choice questions and an alternate item format question. The alternate item format questions at the end of the chapters and on the accompanying CD may be presented as one of the following:

- Fill-in-the-blank question
- Multiple response question

- Prioritizing (ordered response) question, also known as a drag-and-drop question
- Figure/illustration question, also known as a hot spot question
- Graphic options question, in which each option contains a figure or illustration
- Chart/exhibit question
- Audio question that include a heart, lung, or bowel sound
- Video question

These questions provide you with practice in prioritizing, decision-making, and critical thinking skills.

## ANSWER SECTION

The answer sections include the correct answer, rationale, test-taking strategy, question categories, and a reference. The structure for the answer section is unique and provides the following information:

- **Rationale:** The rationale provides you with the significant information regarding both correct and incorrect options.
- **Test-Taking Strategy:** The test-taking strategy provides a logical path for selecting the correct option and helps you select an answer to a question on which you might have to guess. Specific suggestions for review are identified in the test-taking strategy.
- **Question Categories:** Each question is tagged with categories based on the 2010 NCLEX-RN test plan. Additional content categories are provided with each question to assist you in identifying areas in need of review. The categories identified with each practice question include Level of Cognitive Ability, Client Needs, Integrated Process, and the specific nursing Content Area. All categories are identified by their full names so that you do not need to memorize codes or abbreviations. Additionally, every question on the companion CD is organized by these question codes, so you can customize your study session to be as specific or as generic as you need.
- **Reference:** A reference, including a page number, is provided so you can easily find the information that you need to review in your undergraduate nursing textbooks.

## PHARMACOLOGY AND MEDICATION CALCULATIONS REVIEW

Students consistently state that pharmacology is an area with which they need assistance. The 2010 NCLEX-RN test plan continues to incorporate pharmacology in the examination as it has in the past. Therefore pharmacology chapters have been included for your review and practice. This book includes 13 pharmacology chapters, a medication and intravenous calculation chapter, and a pediatric medication

calculation chapter. Each of these chapters is followed by a practice test that uses the same question format described earlier. This book contains numerous pharmacology questions. Additionally, more than 700 pharmacology questions can be found on the accompanying software.

### NCLEX-RN® REVIEW CD

Packaged in this book is a CD containing more than 4500 practice questions. This CD contains all the multiple choice questions; the alternate item format questions; the heart, lung, and bowel sound questions; and the video questions. This CD also includes a 75-question pretest that provides you with feedback on your strengths and weaknesses. The results of your pretest will generate an individualized study calendar to guide you in your preparation for the NCLEX examination. This Windows- and Mac-compatible program offers three testing modes for review: study, quiz, and exam. In addition, the companion CD includes three mp3-downloadable *Audio Review Summaries* that discuss pharmacology, acid-base balance, and fluids and electrolytes to help you study these difficult subjects on the go.

### HOW TO USE THIS BOOK

*Saunders Comprehensive Review for the NCLEX-RN® Examination* is especially designed to help you with your successful journey to the peak of the *Saunders Pyramid to Success*, becoming a registered nurse. As you begin your journey through this book, you will be introduced to all the important points regarding the 2010 NCLEX-RN examination, the process of testing, and unique and special tips regarding how to prepare yourself for this very important examination.

You should begin your process through the *Saunders Pyramid to Success* by reading all of Unit I in this book and becoming familiar with the central points regarding the NCLEX-RN examination. Read Chapter 4, written by a nursing graduate who recently passed the examination and note what she has to say about the testing experience. Chapter 5, "Test-Taking Strategies," will provide you with the critical testing strategies that will guide you in selecting the correct option or assist you in selecting an answer to a question if you must guess. Keep these strategies in mind as you proceed through this book. Continue by studying the specific content areas addressed in Units II through XIX. Review the *Pyramid Terms* and *Pyramid to Success* notes, and identify the Client Needs specific to the test plan in each area. Read through the chapters and focus on the *Pyramid Points* and *Pyramid Alerts* that identify the areas most likely to be tested on the NCLEX-RN examination. Pay particular attention to the Priority Nursing Actions boxes because they provide information about

the steps that you will take in clinical situations requiring prioritization.

As you read each chapter, identify your areas of strength and those in need of further review. Highlight these areas and test your abilities by taking all the practice tests provided at the end of the chapters. Be sure to review all the rationales and the test-taking strategies. The rationale provides you with information regarding both the correct and incorrect options. The test-taking strategy offers a logical path to selecting the correct option. Use the references to easily find any information you need to review.

After reviewing all the chapters in the book, turn to Unit XX, the Comprehensive Test. Take this examination and then review each question, answer, and rationale. Identify any areas requiring further review; then take the time to review those areas again in both the book and the companion CD.

### CLIMBING THE PYRAMID TO SUCCESS

The purpose of this book is to provide a **comprehensive review** of the nursing content you will be tested on during the NCLEX-RN examination. However, *Saunders Comprehensive Review for the NCLEX-RN® Examination* is intended to do more than simply prepare you for the rigors of the NCLEX; this book is also meant to serve as a valuable study tool that you can refer to throughout your nursing program, with customizable software to help identify and reinforce key content areas.

After using this book for comprehensive content review, your next step on the *Pyramid to Success* is to get additional practice with a **Q&A review** product. *Saunders Q&A Review for the NCLEX-RN® Examination* offers more than 5200 unique practice questions in the book and on the companion CD. The questions are focused on the Client Needs and Integrated Processes of the NCLEX test plan, making it easy to access

your study area of choice. For on-the-go Q&A review, you can pick up *Saunders Q&A Review Cards for the NCLEX-RN® Examination*, or, if you own an iPhone or iPod Touch, you can search for “Saunders Q&A Review” in Apple’s App Store.

Your final step on the *Pyramid to Success* is to master the **online review**. *Saunders Online Review for the NCLEX-RN® Examination* provides an interactive and individualized platform to get you ready for your final licensure exam. This online course provides a high-level content overview, supplemented with instructional videos, animations, audio, illustrations, case studies, and several subject matter exams. In addition, you can assess your progress with a pre-test and post-test cumulative exam in a computerized environment that prepares you for the actual NCLEX-RN exam.

At the base of the *Pyramid to Success* are my **test-taking strategies**, which provide a foundation for understanding and unpacking the complexities of NCLEX exam questions, including alternate item formats. *Saunders Strategies for Test Success: Passing Nursing School and the NCLEX® Exam* takes a detailed look at all the test-taking strategies you will need to know in order to pass any nursing examination, including the NCLEX. Special tips are integrated for beginning nursing students, and there are 500 practice questions included so you can apply the testing strategies.

Good Luck with your journey through the *Saunders Pyramid to Success*. I wish you continued success throughout your new career as a registered nurse!

**Linda Anne Silvestri, PhD, RN**

# Acknowledgments

Sincere appreciation and warmest thanks are extended to the many individuals who in their own ways have contributed to the publication of this book.

First, I want to thank all my nursing students at the Community College of Rhode Island in Warwick who approached me in 1991 and persuaded me to help them prepare to take the NCLEX-RN examination. Their enthusiasm and inspiration led to the commencement of my professional endeavors in conducting review courses for the NCLEX-RN exam for nursing students. I also thank the numerous nursing students who have attended my review courses for their willingness to share their needs and ideas. Their input has certainly added a special uniqueness to this publication.

I wish to acknowledge all the nursing faculty who taught in my review courses for the NCLEX-RN exam. Their commitment, dedication, and expertise have certainly helped nursing students achieve success with the NCLEX-RN exam. Additionally, I want to acknowledge and sincerely thank Laurent W. Valliere, or Larry, for his contribution to this publication, for teaching in my review courses for the NCLEX-RN exam, and for his commitment and dedication in helping my nursing students prepare for the NCLEX-RN exam from a non-academic point of view. Larry has supported my many professional endeavors and was so loyal and loving to me each and every moment as I worked to achieve my professional goals. Larry, thank you so much! A special thank you also goes to Sarah Hollenberg, RN, for writing a chapter for this book about her experiences preparing for and taking the NCLEX-RN examination. I would like to acknowledge Jackie Arnett, a registered nurse and staff development coordinator for Life Care Centers of America in Tucson, Arizona, for her impeccable revisions to the Instructor's Evolve Resources accompanying this text, as well as for all her help reviewing and writing practice items for this book and companion CD. I also wish to acknowledge Lois Marshall for her useful contributions to the previous edition of the Instructor's Evolve Resources. Thank you Lois and Jackie for making this an invaluable resource!

I want to thank Nancy O'Brien, my former managing editor, for her creativity and all of her assistance in the initial planning of this edition of the book. I also sincerely acknowledge and thank two very important individuals from Elsevier Health Sciences: my senior editor, Kristin Geen, and my developmental editor, Todd McKenzie. Thank you, Kristin, for your continuous enthusiasm, tremendous support, and expert professional guidance throughout the preparation of this publication. And, Todd, well, I could not have completed this without him! Todd was with me during the initial planning of this publication and throughout its entire process of preparation and publication. So a very special and sincere thank you extends to Todd. Todd provided me with a tremendous amount of support during the many personal obstacles that I faced during the preparation of this publication. Additionally, his creativity, planning, and capable organizational and prioritizing skills kept me on track. He was an expert at maintaining the enormous amount of order needed to submit my manuscript into production. Thank you, Todd!

A special thank you and acknowledgment goes to two important individuals, Dianne Elodia Ventrice, and Lawrence Fiorentino. They provided continuous support and dedication to my work in both the NCLEX exam review courses and preparing this publication. Dianne was so dedicated to my work, and she helped maintain its excellent quality by providing expert reference support and expert secretarial responsibilities for the fifth edition of this book.

I want to acknowledge all of the staff at Elsevier for their tremendous assistance throughout the preparation and production of this publication. A special thank you to all of them. I thank all the important people in the production department, including Doug Turner, my longtime senior project manager; Clay Broeker, senior project manager; Anne Altepeter and Jeff Patterson, publishing services managers; Sarah Spalding-Eichorn, multimedia producer; David Rushing, multimedia team lead; and Margaret Reid, designer, who all played such significant roles in finalizing this publication. I sincerely thank those in the

marketing department who helped with the promotion of this book, including Bob Boehringer, executive marketing director; Pat Crowe, executive marketing manager; and Susan Copeland and Jamie Heberlein, associate marketing managers. I would like to thank Jennifer Palada, editorial assistant, for all her help organizing the numerous contributors and reviewers involved in this project. I also sincerely thank Lauren Harms, developmental editor, for assisting me in completing this project. And a special thank you to Loren Wilson, vice president and publisher, for her years of expert guidance and continuous support for all the products in the *Pyramid to Success*.

I would also like to acknowledge Patricia Mieg, former educational sales representative, who encouraged me to submit my ideas and initial work for the first edition of this book to the W.B. Saunders Company.

I want to acknowledge my parents who opened my door of opportunity in education. I thank my mother, Frances Mary, for all of her love, support, and assistance as I continuously worked to achieve my professional goals. I thank my father, Arnold Lawrence, who always provided insightful words of encouragement. My memories of his love and support will always remain in my heart. I am certain that he would be very proud of my professional accomplishments.

I also thank my sister, Dianne Elodia Ventrice, and my brother, Lawrence Peter Silvestri, as well as all my nieces and nephews who were continuously supportive, giving, and helpful during my research and preparation of this publication.

I want to acknowledge all the individuals who reviewed content and practice questions and the item writers who updated and provided many of the practice questions. I also thank Dr. Bethany Sykes for her work in organizing Chapter 34, "Health and Physical Assessment of the Adult Client." I also thank the many faculty and student reviewers for their thoughts and ideas. A very special thank you to all of you!

I also need to thank Salve Regina University for the opportunity to educate nursing students in the baccalaureate nursing program and for its support during my research and writing of this publication. I would like to especially acknowledge my colleagues, Dr. Peggy Matteson, Dr. Ellen McCarty, Dr. JoAnn Mullaney, and Dr. Bethany Sykes for all their encouragement and support.

I wish to acknowledge the Community College of Rhode Island, which provided me the opportunity to educate nursing students in the Associate Degree of Nursing Program, and a special thank you to Patricia Miller, MSN, RN, and Michelina McClellan, MS, RN, from Baystate Medical Center, School of Nursing, in Springfield, Massachusetts, who were my first mentors in nursing education.

Lastly, a very special thank you to all my nursing students, past, present and future. All of you light up my life! Your love and dedication to the profession of nursing and your commitment to provide health care will bring never ending rewards!

# NCLEX-RN® Exam Preparation

# The NCLEX-RN<sup>®</sup> Examination

## THE PYRAMID TO SUCCESS

### Welcome to the Pyramid to Success

*Saunders Comprehensive Review for the NCLEX-RN<sup>®</sup> Examination* is specially designed to help you begin your successful journey to the peak of the pyramid, becoming a registered nurse. As you begin your journey, you will be introduced to all the important points regarding the NCLEX-RN examination and the process of testing, and to the unique and special tips regarding how to prepare yourself for this important examination. You will read what a nursing graduate who recently passed the NCLEX-RN examination has to say about the test. Important test-taking strategies are detailed. These details will guide you in selecting the correct option or assist you in selecting an answer to a question at which you must guess.

Each of the content areas in this book begins with the Pyramid to Success. The Pyramid to Success addresses specific points related to the NCLEX-RN examination, including the Pyramid Terms, and the Client Needs and Integrated Processes as identified in the test plan framework for the examination. Pyramid Terms are key words that are defined and are set in **boldface** throughout each chapter to direct your attention to significant points for the examination. The Client Needs specific to the content of the chapter are identified.

Throughout each chapter, you will find Pyramid Point bullets that identify areas most likely to be tested on the NCLEX-RN examination. Read each chapter, and identify your strengths and areas that are in need of further review. Test your strengths and abilities by taking all the practice tests provided in this book and on the accompanying software. Be sure to read all the rationales and test-taking strategies. The rationale provides you with significant information regarding the correct and incorrect options. The test-taking strategy provides you with the logical path to selecting the correct option. The test-taking strategy also identifies the content area to review, if required. The reference source and page number are provided so that you can

find the information easily that you need to review. Each question is coded based on the level of cognitive ability, the Client Needs category, the Integrated Process, and the nursing content area.

Following the completion of your comprehensive review in this book, continue on your journey through the Pyramid to Success with the companion book, *Saunders Q&A Review for the NCLEX-RN<sup>®</sup> Examination*, which provides you with more than 5200 practice questions based on the NCLEX-RN examination test plan framework, with a specific focus on Client Needs and Integrated Processes. Then, you will be ready for *Saunders Online Review for the NCLEX-RN<sup>®</sup> Examination*. Additional products in Saunders Pyramid to Success include *Saunders Strategies for Test Success: Passing Nursing School and the NCLEX<sup>®</sup> Exam* and *Saunders Q&A Review Cards for the NCLEX-RN<sup>®</sup> Exam*. These products are described next.

*Saunders Online Review for the NCLEX-RN<sup>®</sup> Examination* addresses all areas of the test plan identified by the National Council of State Boards of Nursing (NCSBN). The course contains a pretest that provides feedback regarding your strengths and weaknesses and generates an individualized study schedule in a calendar format. Content review is in an outline format and includes self-check practice questions and case studies, figures and illustrations, a glossary, and animations and videos. Numerous online exams are included. There are more than 2000 practice questions; the types of questions in this course include multiple-choice and alternate item formats.

*Saunders Strategies for Test Success: Passing Nursing School and the NCLEX<sup>®</sup> Exam* focuses on the test-taking strategies that will help you pass your nursing examinations while in nursing school and will prepare you for the NCLEX-RN examination. The chapters describe various test-taking strategies and include sample questions that illustrate how to use the strategies; 500 practice questions accompany this book. The practice questions reflect the framework and the content identified in the current NCLEX-RN test plan and include multiple-choice and alternate item format questions. Several appendices are included that provide a review

of test-taking strategies, cultural characteristics and practices, pharmacology strategies, medication and intravenous calculations, laboratory values, positioning guidelines, and therapeutic diets.

*Saunders Q&A Review Cards for the NCLEX-RN® Exam* is organized specifically by the test plan framework of the current NCLEX-RN test plan. This product provides you with 1000 unique practice test questions on portable and easy-to-use cards. The question is on the front of the card, and the answer, rationale, test-taking strategy, and Integrated Process code are on the back of the card. This product includes multiple-choice questions and alternate item format questions, including fill-in-the-blank, multiple-response, prioritizing (ordered response), image (hot-spot questions), and chart/exhibit questions.

All the products in Saunders Pyramid to Success can be obtained online by visiting <http://elsevierhealth.com> or by calling 800-545-2522.

Let's begin our journey through the Pyramid to Success.

## EXAMINATION PROCESS

An important step in the Pyramid to Success is to become as familiar as possible with the examination process. Candidates facing the challenge of this examination can experience significant anxiety. Knowing what the examination is all about and knowing what you will encounter during the process of testing will assist in alleviating fear and anxiety. The information contained in this chapter addresses the procedures related to the development of the NCLEX-RN examination test plan, the components of the test plan, and the answers to the questions most commonly asked by nursing students and graduates preparing to take the NCLEX-RN examination. The information contained in this chapter related to the test plan was obtained from the NCSBN Web site (<http://www.ncsbn.org>) and from the NCSBN test plan for the NCLEX-RN Examination (effective date, April 2010). You can obtain additional information regarding the test and its development by accessing the NCSBN Web site or by writing to the National Council of State Boards of Nursing, 111 East Wacker Drive, Suite 2900, Chicago, IL 60601. You are encouraged to access the NCSBN Web site because this site provides you with valuable information about the NCLEX and other resources available to an NCLEX candidate.

## COMPUTER ADAPTIVE TESTING

The acronym *CAT* stands for computer adaptive test, which means that the examination is created as the test-taker answers each question. All the test questions are categorized based on the test plan structure

and the level of difficulty of the question. As you answer a question, the computer determines your competency based on the answer you selected. If you selected a correct answer to a question, the computer scans the question bank and selects a more difficult question. If you selected an incorrect answer, the computer scans the question bank and selects an easier question. This process continues until the test plan requirements are met and a reliable pass-or-fail decision is made.

When a test question is presented on the computer screen, you must answer it or the test will not move on. This means that you will not be able to skip questions, go back and review questions, or go back and change answers. In a CAT examination, once an answer is recorded, all subsequent questions administered depend, to an extent, on the answer selected for that question. Skipping and returning to earlier questions are not compatible with the logical methodology of a CAT. The inability to skip questions or go back to change previous answers will not be a disadvantage to you; you will not fall into that "trap" of changing a correct answer to an incorrect one with the CAT system.

If you are faced with a question that contains unfamiliar content, you may need to guess at the answer. There is no penalty for guessing on this examination. With most of the questions, the answer will be right there in front of you. If you need to guess, use your nursing knowledge and clinical experiences to their fullest extent and all the test-taking strategies that you have practiced in this review program.

You do not need any computer experience to take this examination. A keyboard tutorial is provided and administered to all test-takers at the start of the examination. The tutorial will instruct you on the use of the on-screen optional calculator, the use of the mouse, and how to record an answer. In addition to the traditional four-option, multiple-choice question, the tutorial provides instructions on how to respond to alternate item format questions. This tutorial is provided on the NCSBN Web site, and you are encouraged to view the tutorial when you are preparing for the NCLEX examination. Additionally, at the testing site, a proctor is present to assist in explaining the use of the computer to ensure your full understanding of how to proceed.

## DEVELOPMENT OF THE TEST PLAN

The test plan for the NCLEX-RN examination is developed by the NCSBN. The NCLEX examination is a national examination; the NCSBN considers the legal scope of nursing practice as governed by state laws and regulations, including the nurse practice act, and uses these laws to define the areas on the examination that will assess the competence of the test-taker for licensure.

The NCSBN also conducts an important study every 3 years, known as a practice analysis study, to determine the framework for the test plan for the examination. The participants in this study include newly licensed registered nurses from all types of basic nursing education programs. From a list provided, the participants select the nursing activities that they perform, the frequency of performing these specific activities, the impact of the activities on maintaining client safety, and the setting where the activities were performed. A panel of content experts at the NCSBN analyzes the results of the study and makes decisions regarding the test plan framework. The results of this study, most recently conducted in 2008, provided the structure for the test plan implemented in April 2010.

## ITEM WRITERS

The NCSBN selects question (item) writers after an extensive application process. The writers are registered nurses who hold a master's degree or a higher degree. Many of the writers are nursing educators; a nurse currently employed in clinical nursing practice and working directly with nurses who have entered practice within the past 12 months also may be selected to participate in this process. Question writers voluntarily submit an application to become a writer and must meet specific criteria established by the council to be accepted as participants in the process.

## TEST PLAN

The content of the NCLEX-RN examination reflects the activities identified in the practice analysis study conducted by the NCSBN. The questions are written to address Level of Cognitive Ability, Client Needs, and Integrated Processes as identified in the test plan developed by the NCSBN (Box 1-1).

## Level of Cognitive Ability

The practice of nursing requires critical thinking in decision making. Most questions on the NCLEX examination are written at the application level or higher levels of cognitive ability, such as the analysis level. Box 1-2 presents an example of a question that requires you to apply data.

### Box 1-1 Examination Questions

Each examination question addresses the following:

- A Level of Cognitive Ability
- A Client Needs category
- An Integrated Process

## Client Needs

In the test plan implemented in April 2010, the NCSBN has identified a test plan framework based on Client Needs. The NCSBN identifies four major categories of Client Needs. Some of these categories are divided further into subcategories. The Client Needs categories include Safe and Effective Care Environment, Health Promotion and Maintenance, Psychosocial Integrity, and Physiological Integrity (Table 1-1).

### Safe and Effective Care Environment

The Safe and Effective Care Environment category includes two subcategories, Management of Care and Safety and Infection Control. According to the NCSBN, Management of Care (16% to 22% of questions) addresses content that tests the nurse's knowledge, skills, and ability required to ensure a safe care delivery setting to protect clients, families, significant others,

### Box 1-2 Level of Cognitive Ability: Applying

A nurse notes blanching, coolness, and edema at the peripheral intravenous (IV) site. Based on these findings, the nurse implements which action?

1. Discontinues the IV
2. Applies a warm compress
3. Checks for a blood return
4. Measures the area of infiltration

#### Answer: 1

This question requires that you focus on the data identified in the question and determine that the client is experiencing an infiltration. Next you need to consider the harmful effects of infiltration and determine the action to implement. Because infiltration can be damaging to the surrounding tissue, the most appropriate action is to discontinue the IV to prevent any further damage.

**TABLE 1-1** Client Needs Categories and Percentage of Questions on the NCLEX-RN® Examination

| Client Needs Category                      | Percentage of Questions |
|--|-------------------------|
| <b>Safe and Effective Care Environment</b> |                         |
| Management of Care                         | 16-22                   |
| Safety and Infection Control               | 8-14                    |
| <b>Health Promotion and Maintenance</b>    | 6-12                    |
| <b>Psychosocial Integrity</b>              | 6-12                    |
| <b>Physiological Integrity</b>             |                         |
| Basic Care and Comfort                     | 6-12                    |
| Pharmacological and Parenteral Therapies   | 13-19                   |
| Reduction of Risk Potential                | 10-16                   |
| Physiological Adaptation                   | 11-17                   |

visitors, and health care personnel. The NCSBN indicates that Safety and Infection Control (8% to 14% of questions) addresses content that tests the nurse's knowledge, skills, and ability required to protect clients, families, significant others, visitors, and health care personnel from health and environmental hazards. Box 1-3 presents examples of questions that address these two subcategories.

### Health Promotion and Maintenance

The Health Promotion and Maintenance category (6% to 12% of questions) addresses the principles related to growth and development. According to the NCSBN, this Client Needs category also addresses content that tests the nurse's knowledge, skills, and ability required to assist the client, family members, and significant others to prevent health problems; to recognize alterations in health; and to develop health practices that promote and support wellness. See Box 1-4 for an example of a question in this Client Needs category.

### Psychosocial Integrity

The Psychosocial Integrity category (6% to 12% of questions) addresses content that tests the nurse's knowledge, skills, and ability required to promote and support the ability of the client, client's family, and client's significant other to cope, adapt, and problem solve during

stressful events. The NCSBN also indicates that this Client Needs category addresses the emotional, mental, and social well-being of the client, family, or significant other, and the knowledge, skills, and ability required to care for the client with an acute or chronic mental illness. See Box 1-5 for an example of a question in this Client Needs category.

#### Box 1-4 Health Promotion and Maintenance

The nurse is choosing age-appropriate toys for a toddler. Which of the following would be the best toy?

1. Puzzle
2. Toy soldiers
3. Large stacking blocks
4. A card game with large pictures

**Answer: 3**

This question addresses the Client Needs category, Health Promotion and Maintenance, and specifically relates to the principles of growth and development of a toddler. Toddlers like to master activities independently, such as stacking blocks. Because toddlers do not have the developmental ability to determine what could be harmful, toys that are safe need to be provided. A puzzle and toy soldiers provide objects that can be placed in the mouth and may be harmful for a toddler. A card game with large pictures may require cooperative play, which is more appropriate for a school-age child.

#### Box 1-3 Safe and Effective Care Environment

##### Management of Care

A nurse has received the client assignment for the day. Which client should the nurse assess first?

1. The client who has a nasogastric tube attached to intermittent suction
2. The client who needs to receive subcutaneous insulin before breakfast
3. The client who is 2 days postoperative and is complaining of incisional pain
4. The client who has a blood glucose level of 50 mg/dL and complaints of blurred vision

**Answer: 4**

This question addresses the subcategory, Management of Care, in the Client Needs category, Safe and Effective Care Environment. It requires you to establish priorities by comparing the needs of each client and deciding which need is urgent. The client described in option 4 has a blood glucose level and symptoms reflective of hypoglycemia. This client should be assessed first so that treatment can be implemented. Although the clients in options 1, 2, and 3 have needs that require assessment, they are not a priority and can wait until the client in option 4 is stabilized.

##### Safety and Infection Control

A nurse prepares to care for a client on contact precautions who has a hospital-acquired infection caused by methicillin-resistant *Staphylococcus aureus* (MRSA). The client has an abdominal wound that requires irrigation and has a tracheostomy attached to a mechanical ventilator, which requires frequent suctioning. The nurse assembles which of the following necessary protective items before entering the client's room?

1. Gloves and a gown
2. Gloves, mask, and goggles
3. Gloves, mask, gown, and goggles
4. Gloves, gown, and shoe protectors

**Answer: 3**

This question addresses the subcategory, Safety and Infection Control, in the Client Needs category, Safe and Effective Care Environment. It addresses content related to protecting oneself from contracting an infection and requires that you consider the methods of possible transmission of infection, based on the client's condition. Because splashes of infective material can occur during the wound irrigation or suctioning of the tracheostomy, option 3 is correct.

### Physiological Integrity

The Physiological Integrity category includes four subcategories, Basic Care and Comfort, Pharmacological and Parenteral Therapies, Reduction of Risk Potential, and Physiological Adaptation. The NCSBN describes these subcategories as follows. Basic Care and Comfort (6% to 12% of questions) addresses content

#### Box 1-5 Psychosocial Integrity

A client with coronary artery disease has selected guided imagery to help cope with psychological stress. Which of the following statements indicates the client's understanding of this stress reduction measure?

1. "This will work for me only if I am alone in a quiet area."
2. "This will help only if I play music at the same time."
3. "I need to do this only when I lie down in case I fall asleep."
4. "The best thing about this is that I can use it anywhere, anytime."

**Answer: 4**

This question addresses the Client Needs category, Psychosocial Integrity, and the content addresses coping mechanisms. Guided imagery involves the client's creation of an image in the mind, concentrating on the image, and gradually becoming less aware of the offending stimulus. It can be done anytime and anywhere; some clients may use other relaxation techniques or play music with it.

that tests the nurse's knowledge, skills, and ability required to provide comfort and assistance to the client in the performance of activities of daily living. Pharmacological and Parenteral Therapies (13% to 19% of questions) addresses content that tests the nurse's knowledge, skills, and ability required to administer medications and parenteral therapies such as intravenous therapies and the administration of blood and blood products. Reduction of Risk Potential (10% to 16% of questions) addresses content that tests the nurse's knowledge, skills, and ability required to prevent complications or health problems related to the client's condition or any prescribed treatments or procedures. Physiological Adaptation (11% to 17% of questions) addresses content that tests the nurse's knowledge, skills, and ability required to provide care to clients with acute, chronic, or life-threatening conditions. See Box 1-6 for examples of questions in this Client Needs category.

### Integrated Processes

The NCSBN identifies four processes that are fundamental to the practice of nursing. These processes are a component of the test plan and are incorporated throughout the major categories of Client Needs. The Integrated Process subcategories include Caring, Communication and Documentation, Nursing Process (Assessment, Analysis, Planning, Implementation, and Evaluation), and Teaching and Learning. See Box 1-7

#### Box 1-6 Physiological Integrity

##### Basic Care and Comfort

A client with Parkinson's disease develops akinesia while ambulating, increasing the risk for falls. Which suggestion should the nurse provide to the client to alleviate this problem?

1. Use a wheelchair to move around.
2. Stand erect and use a cane to ambulate.
3. Keep the feet close together while ambulating and use a walker.
4. Consciously think about walking over imaginary lines on the floor.

**Answer: 4**

This question addresses the subcategory, Basic Care and Comfort, in the Client Needs category, Physiological Integrity, and addresses client mobility and promoting assistance in an activity of daily living to maintain safety. Clients with Parkinson's disease can develop bradykinesia (slow movement) or akinesia (freezing or no movement). Having these clients imagine lines on the floor to step over can keep them moving forward while remaining safe.

##### Pharmacological and Parenteral Therapies

The nurse monitors a client receiving digoxin (Lanoxin) for which early manifestation of digoxin toxicity?

1. Anorexia
2. Facial pain
3. Photophobia
4. Yellow color perception

**Answer: 1**

This question addresses the subcategory, Pharmacological and Parenteral Therapies, in the Client Needs category, Physiological Integrity. Digoxin is a cardiac glycoside that is used to manage and treat heart failure and to control ventricular rates in clients with atrial fibrillation. The most common early manifestations of toxicity include gastrointestinal disturbances such as anorexia, nausea, and vomiting. Neurological abnormalities can also occur early and include fatigue, headache, depression, weakness, drowsiness, confusion, and nightmares. Facial pain, personality changes, and ocular disturbances (photophobia, light flashes, halos around bright objects, yellow or green color perception) are also signs of toxicity, but are not early signs.

for an example of a question that incorporates the Integrated Process of caring.

## TYPES OF QUESTIONS ON THE EXAMINATION

The types of questions that may be administered on the examination include multiple-choice; fill-in-the-blank; multiple-response; prioritizing (ordered response), also known as drag and drop; questions that contain a picture or graphic (hot spot), chart/exhibit, or graphic option item; and audio or video item formats. Some questions may require you to use the mouse and cursor on the computer. For example, you may be presented with a picture that displays the arterial vessels of an adult client. In this picture, you may be asked to “point and click” (using the mouse) on the area (hot spot) where the dorsalis pedis pulse could be felt. In all types of questions, the answer is scored as either right or wrong. Credit is not given for a partially correct answer. Additionally, all question types may include pictures, graphics, tables, charts, sound, or video. The NCSBN provides specific directions for you to follow with all question types to guide you in your process of testing. Be sure to read these directions as they appear on the computer screen. Examples of some of these types of questions are noted in this chapter. All question types are provided in this book and on the accompanying software.

## Multiple-Choice Questions

Most of the questions that you will be asked to answer will be in the multiple-choice format. These questions provide you with data about a client situation and four answers or options.

### Box 1-7 Integrated Processes

A client is scheduled for angioplasty. The client says to the nurse, “I’m so afraid that it will hurt and will make me worse off than I am.” Which response by the nurse is therapeutic?

1. “Can you tell me what you understand about the procedure?”
2. “Your fears are a sign that you really should have this procedure.”
3. “Try not to worry. This is a well-known and easy procedure for the doctor.”
4. “Those are very normal fears, but please be assured that everything will be okay.”

#### Answer: 1

This question addresses the subcategory, Caring, in the category, Integrated Processes. Option 1 is a therapeutic communication technique that explores the client’s feelings, determines the level of client understanding about the procedure, and displays caring. Option 2 demeans the client and does not encourage further sharing by the client. Option 3 diminishes the client’s feelings by directing attention away from the client and to the physician’s importance. Option 4 does not address the client’s fears and puts the client’s feelings on hold.

### Box 1-6 Physiological Integrity—cont’d

#### Reduction of Risk Potential

A magnetic resonance imaging (MRI) study is prescribed for a client with a suspected brain tumor. The nurse implements which action to prepare the client for this test?

1. Keeps the client NPO for 6 hours before the test
2. Shaves the groin for insertion of a femoral catheter
3. Removes all metal-containing objects from the client
4. Instructs the client in inhalation techniques for the administration of the radioisotope

#### Answer: 3

This question addresses the subcategory, Reduction of Risk Potential, in the Client Needs category, Physiological Integrity, and the nurse’s responsibilities in preparing the client for the diagnostic test. In an MRI study, radiofrequency pulses in a magnetic field are converted into pictures. All metal objects, such as rings, bracelets, hairpins, and watches, should be removed. In addition, a history should be taken to ascertain whether the client has any internal metallic devices, such as orthopedic hardware, pacemakers, or shrapnel. For an abdominal MRI study, the client is usually NPO. NPO status is not necessary for an MRI study of the head. The groin may be shaved for an angiogram, and inhalation of the radioisotope may be

prescribed with a positron emission tomography (PET) scan or ventilation/perfusion lung scan.

#### Physiological Adaptation

A client with renal insufficiency has a magnesium level of 3.6 mg/dL. Based on this laboratory result, the nurse interprets which of the following signs as significant?

1. Hyperpnea
2. Drowsiness
3. Hypertension
4. Physical hyperactivity

#### Answer: 2

This question addresses the subcategory, Physiological Adaptation, in the Client Needs category, Physiological Integrity. It addresses an alteration in body systems. The normal magnesium level is 1.6 to 2.6 mg/dL. A magnesium level of 3.6 mg/dL indicates hypermagnesemia. Neurological manifestations begin to occur when magnesium levels are elevated and are noted as symptoms of neurological depression, such as drowsiness, sedation, lethargy, respiratory depression, muscle weakness, and areflexia. Bradycardia and hypotension also occur.

**Box 1-8 Fill-in-the-Blank Question**

A prescription reads: acetaminophen (Tylenol Extra Strength) liquid, 650 mg orally every 4 hours PRN for pain. The medication label reads: 500 mg/15 mL. The nurse prepares how many milliliters to administer one dose?

**Answer:** 19.5 mL

**Formula:**

$$\frac{\text{Desired}}{\text{Available}} \times \text{Volume} = \text{mL}$$

$$\frac{650 \text{ mg}}{500 \text{ mg}} \times 15 \text{ mL} = 19.5 \text{ mL}$$

In this question, you need to use the formula for calculating a medication dose. When the dose is determined, you will need to type your numeric answer in the answer box. Always follow the specific directions noted on the computer screen when answering the question. Also, remember that there will be an on-screen calculator on the computer for your use if needed.

**Fill-in-the-Blank Questions**

Fill-in-the-blank questions may ask you to perform a medication calculation, determine an intravenous flow rate, or calculate an intake or output record on a client. You will need to type only a number (your answer) in the answer box. If the question requires rounding the answer, this needs to be performed at the end of the calculation. The rules for rounding an answer are provided in the tutorial provided by the NCSBN, and are also provided in the specific question. Additionally, you must type in a decimal point if necessary; however, it is not necessary to type a "0" before the decimal point. See Box 1-8 for an example.

**Multiple-Response Questions**

For a multiple-response question, you will be asked to select or check all the options, such as nursing interventions, that relate to the information in the question. No partial credit is given for correct selections. You need to do exactly as the question asks, which will be to select all the options that apply. See Box 1-9 for an example.

**Prioritizing (Ordered Response) or Drag and Drop Questions**

In this type of question, you will be asked to use the computer mouse to drag and drop your nursing actions in order of priority. Information will be presented in a question, and, based on the data, you

**Box 1-9 Multiple-Response Question**

An emergency department nurse is caring for a child suspected of acute epiglottitis. Which interventions apply in the care of the child? **Select all that apply.**

- 1. Obtain a throat culture.
- 2. Ensure a patent airway.
- 3. Prepare the child for a chest x-ray.
- 4. Maintain the child in a supine position.
- 5. Obtain a pediatric-size tracheostomy tray.
- 6. Place the child on an oxygen saturation monitor.

In a multiple-response question, you will be asked to select or check all the options, such as interventions, that relate to the information in the question. To answer this question, recall that acute epiglottitis is a serious obstructive inflammatory process that requires immediate intervention. To reduce respiratory distress, the child should sit upright. Examination of the throat with a tongue depressor or attempting to obtain a throat culture is contraindicated because the examination can precipitate further obstruction. The child is placed on an oxygen saturation monitor to monitor oxygenation status. A lateral neck and chest x-ray is obtained to determine the degree of obstruction, if present. Tracheostomy and intubation may be necessary if respiratory distress is severe. Remember to follow the specific directions given on the computer screen.

need to determine what you will do first, second, third, and so forth. The unordered options will be located in boxes on the left side of the screen, and you need to move all options in order of priority to ordered response boxes on the right side of the screen. Specific directions for moving the options are provided with the question. See Box 1-10 for an example.

**Picture or Graphic (Hot Spot) Questions**

A question with a picture or graphic will ask you to answer the question based on the picture or graphic. The question could contain a chart, a table, or a figure or illustration. You also may be asked to use the computer mouse to point and click on a specific area in the visual. A figure or illustration may appear in any type of question, including a multiple-choice question. See Box 1-11 for an example.

**Chart/Exhibit Questions**

In this type of question, you will be presented with a problem and a chart or exhibit. You will be provided with tabs or buttons that you need to click to obtain the information needed to answer the question. A prompt or message will appear that will indicate the need to click on a tab or button. See Box 1-12 for an example.

**Box 1-10 Prioritizing (Ordered Response), or Drag and Drop Question**

A nurse is preparing to suction a client who has a tracheostomy tube and gathers the supplies needed for the procedure. Arrange in order of priority the actions that the nurse takes to perform this procedure. All options must be used.

| Unordered Options   | Ordered Response  |
|---|---|
| Hyperoxygenate the client.  | Place the client in a semi-Fowler's position.   |
| Place the client in a semi-Fowler's position.   | Turn on the suction device and set the regulator at 80 mm Hg.                                 |
| Turn on the suction device and set the regulator at 80 mm Hg.                                 | Apply gloves and attach the suction tubing to the suction catheter.                           |
| Apply gloves and attach the suction tubing to the suction catheter.                           | Hyperoxygenate the client.  |
| Apply intermittent suction and slowly withdraw the catheter while rotating it back and forth. | Insert the catheter into the tracheostomy until resistance is met and then pull back 1 cm.    |
| Insert the catheter into the tracheostomy until resistance is met and then pull back 1 cm.    | Apply intermittent suction and slowly withdraw the catheter while rotating it back and forth. |

This question requires you to arrange in order of priority the nursing actions that should be taken to suction a client who has a tracheostomy tube. The nurse positions the client first, and then turns the suction device on and sets the regulator. The nurse then dons gloves and attaches the suction tubing to the suction catheter. The nurse hyperoxygenates the client before and after suctioning. The nurse then inserts the catheter into the tracheostomy until resistance is met and pulls back 1 cm, applies intermittent suction, and slowly withdraws the catheter while rotating it back and forth. Remember that the client and equipment are prepared before performing the procedure. Also, remember that on the NCLEX examination, you will use the computer mouse to place the unordered options in an ordered response.

**Box 1-11 Picture or Graphic (Hot Spot) Question**

Rhythm strip. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

A client who experienced a myocardial infarction is being monitored via cardiac telemetry. The nurse notes the sudden onset of this cardiac rhythm on the monitor and immediately takes which action?

1. Takes the client's blood pressure
2. Initiates cardiopulmonary resuscitation (CPR)
3. Places a nitroglycerin tablet under the client's tongue
4. Continues to monitor the client and then contacts the physician

**Answer: 2**

This question requires you to identify the cardiac rhythm, and then determine the priority nursing action. This cardiac rhythm identifies a coarse ventricular fibrillation (VF). The goals of treatment are to terminate VF promptly and to convert it to an organized rhythm. The physician or an advanced cardiac life support (ACLS)-qualified nurse or other health care provider must immediately defibrillate the client. If a defibrillator is not readily available, CPR is initiated until the defibrillator arrives. Options 1, 3, and 4 are incorrect actions and delay life-saving treatment.

**Box 1-12 Chart/Exhibit Question**

| CLIENT'S CHART  |  |  |
|---|--|--|
| History and Physical  | Medications                                    | Diagnostic Results                             |
| <i>Item 1:</i><br>Has renal calculi<br><i>Item 2:</i><br>Had thrombophlebitis<br>1 year ago | <i>Item 3:</i><br>Multivitamin<br>orally daily | <i>Item 4:</i><br>Electrocardiogram:<br>normal |

The nurse reviews the history and physical examination documented in the medical record of a client requesting a prescription for oral contraceptives. The nurse determines that oral contraceptives are contraindicated because of which documented item?

**Answer: 2**

This chart/exhibit question provides you with data from the client's medical record and asks you to identify the item that is a contraindication to the use of oral contraceptives. Oral contraceptives are contraindicated in women with a history of any of the following: thrombophlebitis and thromboembolic disorders, cardiovascular or cerebrovascular diseases (including stroke), any estrogen-dependent cancer or breast cancer, benign or malignant liver tumors, impaired liver function, hypertension, and diabetes mellitus with vascular involvement. Adverse effects of oral contraceptives include increased risk of superficial and deep venous thrombosis, pulmonary embolism, thrombotic stroke (or other types of strokes), myocardial infarction, and accelerations of preexisting breast tumors.

**Graphic Option Questions**

In this type of question, the option selections will be pictures rather than text. Each option will be preceded by a circle, and you will need to use the computer mouse to click in the circle that represents your answer choice. See Box 1-13 for an example.

**Audio Questions**

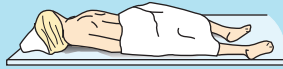

Audio questions will require listening to a sound to answer the question. These questions will prompt you to use the headset provided and to click on the sound icon. You will be able to click on the volume button to adjust the volume to your comfort level, and you will be able to listen to the sound as many times as necessary. Content examples include, but are not limited to, various lung sounds, heart sounds, or bowel sounds. Examples of these question types are located on the accompanying software.

**Video Questions**

Video questions will require viewing an animation or video clip to answer the question. These questions will prompt you to click on the video icon. There may be sound associated with the animation and video, in which you will be prompted to use the headset.

**Box 1-13 Graphic Options Question**

The nurse places the client in which position to administer a soapsuds enema?

1. 
2. 
3. 
4. 

**Answer: 2**

This question requires you to select the picture that represents your answer choice. To administer an enema, the nurse assists the client into the left side-lying (Sims) position with the right knee flexed. This position allows the enema solution to flow downward by gravity along the natural curve of the sigmoid colon and rectum, improving the retention of solution. Option 1 is a prone position. Option 3 is a dorsal recumbent position. Option 4 is a supine position.

Reference: Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed.). St. Louis: Mosby.

Content examples include, but are not limited to, assessment techniques, nursing procedures, or communication skills. Examples of these question types are located on the accompanying software.

**REGISTERING TO TAKE THE EXAMINATION**

It is important to obtain an NCLEX examination candidate bulletin from the NCSBN Web site at [www.ncsbn.org](http://www.ncsbn.org) because this bulletin provides all the information that you need to register for and schedule your examination. It also provides you with Web site and telephone information for NCLEX examination contacts. The initial step in the registration process is to submit an application to the state board of nursing in the state in which you intend to obtain licensure. You need to obtain information from the board of nursing regarding the specific registration process because the process may vary from state to state. When you receive confirmation from the board of nursing that you have met all of the state requirements, you can register to take the NCLEX examination with Pearson Vue. You may register for the examination through the Internet, by U.S. mail, or by telephone. The NCLEX candidate Web site is <http://www.pearsonvue.com/nclex>.

Following the registration instructions and completing the registration forms precisely and accurately are important. Registration forms not properly completed or not accompanied by the proper fees in the required method of payment will be returned to you and will delay testing. You must pay a fee for taking the examination; you also may have to pay additional fees to the board of nursing in the state in which you are applying. You will then be made eligible by the licensure board and will receive an Authorization to Test (ATT) form. If you do not receive an ATT form within two weeks of registration, you should contact the candidate services at 1-866-496-2539 (U.S. candidates).

### **AUTHORIZATION TO TEST FORM AND SCHEDULING AN APPOINTMENT**

You cannot make an appointment until the board of nursing declares eligibility and you receive an ATT form. Note the validity dates on the ATT form, and schedule a date and time when you receive the ATT. The examination will take place at a Pearson Professional Center; U.S. candidates can make an appointment through the Internet (<http://www.pearsonvue.com/nclex>) or by telephone (1-866-496-2539). You can schedule an appointment at any Pearson Professional Center. You do not have to take the examination in the same state in which you are seeking licensure. A confirmation of your appointment with the appointment date and time and the directions to the testing center will be sent to you.

The ATT form contains important information, including your test authorization number, candidate identification number, and validity date. You need to take your ATT form to the test center on the day of your examination. You will not be admitted to the examination if you do not have it.

### **CANCELING OR RESCHEDULING THE APPOINTMENT**

If for any reason you need to cancel or reschedule your appointment to test, you can make the change on the candidate Web site (<http://www.pearsonvue.com/nclex>) or by calling candidate services. The change needs to be made one full business day (24 hours) before your scheduled appointment. If you fail to arrive for the examination or fail to cancel your appointment to test without providing appropriate notice, you will forfeit your examination fee and your ATT form will be invalidated. This information will be reported to the board of nursing in the state in which you have applied for licensure, and you will be required to register and pay the testing fees again.

### **DAY OF THE EXAMINATION**

It is important that you arrive at the testing center at least 30 minutes before the test is scheduled. If you arrive late for the scheduled testing appointment, you may be required to forfeit your examination appointment. If it is necessary to forfeit your appointment, you will need to reregister for the examination and pay an additional fee. The board of nursing will be notified that you did not take the test. A few days before your scheduled date of testing, take the time to drive to the testing center to determine its exact location, the length of time required to arrive to that destination, and any potential obstacles that might delay you, such as road construction, traffic, or parking sites.

You must have the ATT and proper identification (ID) to be admitted to take the examination. Acceptable identification includes U.S. driver's license, passport, U.S. state ID, or U.S. military ID. All acceptable identification must be valid and not expired and contain a photograph and signature (in English). Additionally, the first and last names on the ID must match the ATT form. According to the NCSBN guidelines, any name discrepancies require legal documentation, such as a marriage license, divorce decree, or court action legal name change.

### **SPECIAL TESTING CIRCUMSTANCES**

If you require special testing accommodations, you should contact the board of nursing before submitting a registration form. The board of nursing will provide the procedures for the request. The board of nursing must authorize special testing accommodations. Following board of nursing approval, the NCSBN reviews the requested accommodations and must approve the request. If the request is approved, the candidate will be notified and provided the procedure for registering for and scheduling the examination.

### **TESTING CENTER**

The test center is designed to ensure complete security of the testing process. Strict candidate identification requirements have been established. You must bring the ATT form and required forms of identification. You will be asked to read the rules related to testing. A digital fingerprint and palm vein print will be taken, and this procedure is usually done twice. A digital signature and photograph will also be taken at the test center. These identity confirmations will accompany the NCLEX exam results. Additionally, if you leave the testing room for any reason, you may be required to perform these identity confirmation procedures again to be readmitted to the room.

Personal belongings are not allowed in the testing room. Secure storage, such as a locker and locker key,

will be provided for you; however, storage space is limited, so you must plan accordingly. In addition, the testing center will not assume responsibility for your personal belongings. The testing waiting areas are generally small; friends or family members who accompany you are not permitted to wait in the testing center while you are taking the examination.

Once you have completed the admission process, the proctor will escort you to the assigned computer. You will be seated at an individual work space area that includes computer equipment, appropriate lighting, and erasable note board or white board and a marker. No items, including unauthorized scratch paper, are allowed into the testing room. Electronic devices, such as watches, beepers, or cell phones, are not allowed in the testing room. Eating, drinking, or the use of tobacco is not allowed in the testing room. You will be observed at all times by the test proctor while taking the examination. Additionally, video and audio recordings of all test sessions are made. Pearson Professional Centers has no control over the sounds made by typing on the computer by others. If these sounds are distracting, raise your hand to summon the proctor. Earplugs are available on request.

You must follow the directions given by the test center staff and must remain seated during the test except when authorized to leave. If you think that you have a problem with the computer, need an additional erasable or white board, need to take a break, or need the test proctor for any reason, you must raise your hand. You are also encouraged to access the candidate Web site (<http://www.pearsonvue.com/nclex>) to obtain additional information about the physical environment of the test center.

## TESTING TIME

The maximum testing time is 6 hours; this period includes the tutorial, the sample items, all breaks, and the examination. All breaks are optional. The first optional break will be offered after 2 hours of testing. The second optional break is offered after 3½ hours of testing. Remember that all breaks count against testing time. If you take a break, you must leave the testing room and, when you return, you may be required to perform identity confirmation procedures to be readmitted.

## LENGTH OF THE EXAMINATION

The minimum number of questions that you will need to answer is 75. Of these 75 questions, 60 will be operational (scored) questions and 15 will be pretest (unscored) questions. The maximum number of questions in the test is 265. Fifteen of the total number of questions that you need to answer will be pretest (unscored) questions.

The pretest questions are questions that may be presented as scored questions on future examinations.

These pretest questions are not identified as such. In other words, you do not know which questions are the pretest (unscored) questions.

## PASS-OR-FAIL DECISIONS

All the examination questions are categorized by test plan area and level of difficulty. This is an important point to keep in mind when you consider how the computer makes a pass-or-fail decision because a pass-or-fail decision is not based on a percentage of correctly answered questions.

After the minimum number of questions have been answered (75 questions; 60 operational and 15 pretest questions), the computer compares the test-taker's ability level with the standard required for passing. The standard required for passing is based on the expert judgment of several individuals appointed by the NCSBN. If the test-taker is clearly above the passing standard, the examination ends, and the test-taker passes the examination. If the test-taker is clearly below the passing standard, the examination ends, and the test-taker fails the examination. If the computer is unable to determine clearly whether the test-taker has passed or failed because the test-taker's ability is close to the passing standard, the computer continues asking questions until the outcome is determined.

If the examination ends because you have run out of time, the computer may not have enough information to make a clear pass-or-fail decision. If this is the case, the computer will review the test-taker's performance during testing. If the test-taker's ability was consistently above the passing standard on the last 60 questions, the test-taker passes. If the test-taker's ability falls to or below the passing standard, even once, the test-taker fails.

## COMPLETING THE EXAMINATION

When the examination has ended, you will complete a brief computer-delivered questionnaire about your testing experience. After you complete this questionnaire, you need to raise your hand to summon the test proctor. The test proctor will collect and inventory all erasable or white boards and then permit you to leave.

## PROCESSING RESULTS

Every computerized examination is scored twice, once by the computer at the testing center and again after the examination is transmitted to Pearson Professional Centers. No results are released at the test center. The board of nursing receives your result within 12 to 24 hours, and your result will be mailed to you 2 days to 2 weeks after you take the examination. In some states, an unofficial result can be obtained via the Quick Results Service 2 business days after taking the examination. This can be done through the Internet or

telephone, and there is a fee for this service. Information about obtaining your NCLEX result by this method can be obtained on the NCSBN Web site under candidate services.

### **CANDIDATE PERFORMANCE REPORT**

A candidate performance report is provided to a test-taker who failed the examination. This report provides the test-taker with information about her or his strengths and weaknesses in relation to the test plan framework and provides a guide for studying and retaking the examination. If a retake is necessary, most states require 45 days between examination administration. Test-takers should refer to the state board of nursing in the state in which licensure is sought for procedures regarding when the examination can be taken again.

### **INTERSTATE ENDORSEMENT**

Because the NCLEX-RN examination is a national examination, you can apply to take the examination in any state. When licensure is received, you can apply for interstate endorsement, which is obtaining another license in another state to practice nursing in that state. The procedures and requirements for interstate endorsement may vary from state to state, and these procedures can be obtained from the state board of

nursing in the state in which endorsement is sought. You may also be allowed to practice nursing in another state if the state has enacted a Nurse Licensure Compact. The state boards of nursing can be accessed via the NCSBN Web site at <http://www.ncsbn.org>. States that participate in the Nurse Licensure Compact can also be located on this Web site.

### **NURSE LICENSURE COMPACT**

It may be possible to hold one license from the state of residency and practice nursing in another state under the mutual recognition model of nursing licensure if the state has enacted a Nurse Licensure Compact. To obtain information about the Nurse Licensure Compact and the states that are part of this interstate compact, access the NCSBN Web site at <http://www.ncsbn.org>.

### **ADDITIONAL INFORMATION ABOUT THE EXAMINATION**

Additional information regarding the NCLEX-RN examination can be obtained through the NCLEX examination candidate bulletin located on the NCSBN Web site and from the NCSBN, 111 East Wacker Drive, Suite 2900, Chicago, IL 60601. The telephone number for the NCLEX examinations department is 866-293-9600. The Web site is <http://www.ncsbn.org>.

# Preparation for the NCLEX-RN<sup>®</sup> Examination: Transitional Issues for Foreign-Educated Nurses

You have taken an important first step—seeking the information that you need to know to become a registered nurse (RN) in the United States. The challenge that is presented to you is one that requires great patience and endurance. The positive result of your endeavor will reward you professionally, however, and give you the personal satisfaction of knowing that you have become part of a family of highly skilled professionals, registered nurses.

## NATIONAL COUNCIL OF STATE BOARDS OF NURSING

The National Council of State Boards of Nursing (NCSBN) is the agency that develops and administers the NCLEX-RN examination, the examination that you need to pass to become licensed as a registered nurse in the United States. Guidelines and procedures must be followed and documents must be sought and submitted to become eligible to take this examination. This chapter provides general information regarding the process you need to pursue to become a registered nurse in the United States. An important first step in the process of obtaining information about becoming a registered nurse in the United States is to access the NCSBN Web site at <http://www.ncsbn.org> and obtain information provided for international nurses in the NCLEX Web site link. The NCSBN provides information about some of the documents you need to obtain as an international nurse seeking licensure as a registered nurse in the United States and about credentialing agencies. The NCSBN also provides a resource manual for international nurses that contains all of the necessary licensure information regarding the requirements for education, English proficiency, and immigration requirements such as visas and VisaScreens. You are encouraged to access the NCSBN Web site to obtain the most current information about seeking licensure as a registered nurse in the United States.

 A first step is to access the NCSBN Web site at <http://www.ncsbn.org> and obtain information provided for international nurses in the NCLEX Web site link.

## STATE REQUIREMENTS FOR LICENSURE

An important factor to consider as you pursue this process is that some requirements may vary from state to state. You need to contact the board of nursing in the state in which you are planning to obtain licensure to determine the specific requirements and documents that you need to submit. Boards of nursing can decide either to use a credentialing agency to evaluate your documents or to review your documents at the specific state board, known as in-house evaluation. When you contact the board of nursing in the state in which you intend to work as a nurse, inform them that you were educated outside of the United States and ask that they send you an application to apply for licensure by examination. Be sure to specify that you are applying for registered nurse (RN) licensure. You should also ask about the specific documents needed to become eligible to take the NCLEX exam. You can obtain contact information for each state board of nursing through the NCSBN Web site at <http://www.ncsbn.org>. When you have accessed the NCSBN Web site, select the link titled “Boards of Nursing.” Additionally, you can write to the NCSBN regarding the NCLEX exam. The address is 111 East Wacker Drive, Suite 2900, Chicago, IL 60601. The telephone number for the NCSBN is (866) 293-9600; the fax number is (312) 279-1036.

 Contact the board of nursing in the state in which you are planning to obtain licensure to determine the specific requirements and documents that you need to submit. Documents that you need to submit vary state by state.

## CREDENTIALING AGENCIES

The state board of nursing in the state in which you are seeking licensure may choose to use a credentialing agency to review your documents. It is necessary that you seek this information from the state board and use the credentialing agency that the state requires. The state board of nursing will provide you with the name and contact information of the credentialing agency. Seeking this information is important because you need to know where to send your required documents. Additionally, the NCSBN Web site (<http://www.ncsbn.org>) can provide information about credentialing agencies.

## GENERAL LICENSURE REQUIREMENTS

Required documents may vary depending on the state requirements. These documents must be sent to either the state board of nursing or the credentialing agency specified by the state. Neither the credentialing agency nor the state board of nursing will accept these documents if they are sent directly from you. These documents must be official documents sent directly from the licensing authority or other agency in your home country to verify validity. Some of the general documents required are listed in Box 2-1; however, remember that the documents you need to submit vary state by state. Use the list provided in Box 2-1 as a checklist for yourself after you have found out about the documents you are required to submit.

When all of your documents have been submitted, they will be reviewed. If you have met the eligibility requirements to take the NCLEX examination, you will be notified that you are eligible. Then you need to obtain an application to take the NCLEX exam from the state in which you intend to seek licensure and submit the required fees. Your application will be reviewed and processed, and you will be notified that you can make an appointment to take the NCLEX exam. Additional information about the application process for the NCLEX exam can be obtained at the NCSBN Web site at [www.ncsbn.org](http://www.ncsbn.org). Box 2-2 provides a brief guide of the general steps to take in the licensure process.

 **Official documents must be sent directly from the licensing authority or other agency in your home country.**

## WORK VISA

A foreign-educated nurse who wants to work in the United States needs to obtain the proper work visa or visas. Obtaining the work visa is a U.S. federal government requirement. To obtain information about the work visa and the application process, contact the Department of Homeland Security (DHS), Office of

### Box 2-1 Some Documents Needed to Obtain Licensure

1. Proof of citizenship or lawful alien status
2. Work visa
3. VisaScreen certificate
4. Commission on Graduates of Foreign Nursing Schools (CGFNS) certificate
5. Criminal background check documents
6. Official transcripts of educational credentials sent directly to credentialing agency or board of nursing from home country school of nursing
7. Validation of a comparable nursing education as that provided in U.S. nursing programs; this may include theoretical instruction and clinical practice in a variety of nursing areas, including, but not limited to, medical nursing, surgical nursing, pediatric nursing, maternity and newborn nursing, community and public health nursing, and mental health nursing
8. Validation of safe professional nursing practice in home country
9. Copy of nursing license or diploma or both
10. Proof of proficiency in the English language
11. Photograph(s)
12. Social security number
13. Application and fees

### Box 2-2 General Steps in the Licensure Process

1. Access the NCSBN Web site at <http://www.ncsbn.org> and read the literature provided for international nurses.
2. Contact the board of nursing in the state in which you are planning to obtain licensure to determine the specific requirements and documents that you need to submit.
3. Have the required documents sent from the appropriate agency in your home country.
4. When you are notified about eligibility to take the NCLEX exam, obtain the application form from the state in which you intend to obtain licensure, complete the form, and submit it with required fees.
5. Schedule an appointment to take the NCLEX exam when you receive your Authorization to Test (ATT) form.
6. Take the NCLEX exam.
7. Become a registered nurse in the United States.

U.S. Citizenship and Immigration Services (USCIS). The Web site is [http://uscis.gov/graphics/howdoi/Health\\_Cert.htm](http://uscis.gov/graphics/howdoi/Health_Cert.htm).

## VISASCREEN

U.S. immigration law requires certain health care professionals to complete a screening program successfully before receiving an occupational (work) visa

(Section §343 of the Illegal Immigration Reform and Immigration Responsibility Act of 1996). To become a registered nurse in the United States, you are required to obtain a VisaScreen certificate. You can ask about the VisaScreen certificate when you make your initial contact with the state board of nursing in which you are seeking licensure. The VisaScreen is a federal screening program, and the certificate needs to be obtained through an organization that offers this program.

 Obtaining the work visa and the VisaScreen is a U.S. federal government requirement.

The Commission on Graduates of Foreign Nursing Schools (CGFNS) is an organization that offers this federal screening program. The VisaScreen components of this program include an educational analysis, license verification, assessment of proficiency in the English language, and an examination that tests nursing knowledge. When the applicant successfully achieves each component, the applicant is presented with a VisaScreen certificate. You can obtain information related to the VisaScreen through the CGFNS Web site at <http://www.cgfns.org>. The CGFNS Web site also provides you with specific information about the components of this program.

The Commission on Graduates of Foreign Nursing Schools (CGFNS) is also a credentialing agency and awards a CGFNS certificate to the applicant when all eligibility requirements are met. Some state boards of nursing use the CGFNS as a credentialing agency and require a CGFNS certificate, whereas others do not. Check with the state board of nursing regarding this certificate. The CGFNS certification program contains three parts, and you must complete all parts successfully to be awarded a CGFNS certificate. The three parts include a credentials review, a qualifying examination that tests nursing knowledge, and an English language proficiency examination. These components are similar to those needed to obtain the VisaScreen certificate. You can obtain information related to the CGFNS certificate through the CGFNS Web site at <http://www.cgfns.org>.

 The NCLEX examination is administered in English only.

## REGISTERING TO TAKE THE NCLEX® EXAM

When you have completed all state and federal requirements and received documentation that you are eligible to take the NCLEX examination, you can register for the exam. You need to obtain information from the state board of nursing in the state in which you are seeking licensure regarding the specific registration process

because the process may vary from state to state. The NCLEX candidate Web site is <http://www.pearsonvue.com/nclex>, and you are encouraged to access this site for additional information. Following the registration instructions and completing the registration forms precisely and accurately are important. You must pay a fee for taking the examination, and you may have to pay additional fees to the board of nursing in the state in which you are applying. When your eligibility is determined by the state licensure board, you will receive an Authorization to Test (ATT) form. You cannot make an appointment to test until the board of nursing declares eligibility and you receive an ATT form.

 Registration forms for taking the NCLEX exam that are not properly completed or not accompanied by the proper fees in the required method of payment will be returned to you and will delay testing.

The examination takes place at a Pearson Professional Center, and you can make an appointment through the Internet or by telephone. You can schedule an appointment at any Pearson Professional Center. You do not have to take the exam in the state in which you are seeking licensure. NCLEX exam testing abroad is also available in some countries, and it is recommended that you visit the NCLEX Web site for current information about international testing sites. Chapter 1 contains additional information regarding the NCLEX exam and testing procedures. You can also obtain information about the registration process and testing procedures from the NCSBN Web site at <http://www.ncsbn.org>.

## PREPARING TO TAKE THE NCLEX® EXAM

When you have successfully completed the requirements to become eligible to take the NCLEX exam, you have one more important goal to achieve: to pass the NCLEX exam.

 Begin preparing for the NCLEX exam as soon as possible; start preparing even before you begin the licensure process.

I highly recommend adequate preparation for the NCLEX exam because the examination is difficult. An important step that you have taken in preparing is that you are using this book, *Saunders Comprehensive Review for the NCLEX-RN® Examination*. After you have reviewed the content and answered the practice questions, the next step in your journey to success is to use the companion book, *Saunders Q&A Review for the NCLEX-RN® Examination*; this book provides you with more than 5200 practice questions based on the NCLEX-RN examination test plan framework, with a

specific focus on Client Needs and Integrated Processes. Then you will be ready for *Saunders Online Review for the NCLEX-RN® Examination*. Additional products in Saunders Pyramid to Success include *Saunders Strategies for Test Success: Passing Nursing School and the NCLEX® Exam* and *Saunders Q&A Review Cards for the NCLEX-RN® Exam*. These additional products are described next.

*Saunders Online Review for the NCLEX-RN® Examination* addresses all areas of the test plan identified by the NCSBN. The course contains a pretest that provides feedback regarding your strengths and weaknesses and that generates an individualized study schedule in a calendar format. Content review is in an outline format and includes self-check practice questions and case studies, figures and illustrations, a glossary, and animations and videos. Numerous practice exams are included. There are more than 2000 practice questions, and the types of questions in this course include multiple-choice and alternate item formats.

*Saunders Strategies for Test Success: Passing Nursing School and the NCLEX® Exam* focuses on the test-taking strategies that will prepare you for the NCLEX-RN exam. The chapters describe all the test-taking strategies and include several sample questions that illustrate how to use the test-taking strategy. This book has 500 practice questions. All the practice questions reflect the framework and the content identified in the current NCLEX-RN test plan and include multiple-choice and alternate item format questions. Several appendices

are included that provide a review of test-taking strategies, cultural characteristics and practices, pharmacology strategies, medication and intravenous calculations, laboratory values, positioning guidelines, and therapeutic diets.

*Saunders Q&A Review Cards for the NCLEX-RN® Exam* is organized specifically by the test plan framework of the current NCLEX-RN test plan. This product provides 1000 practice test questions on portable and easy to use cards. The question is on the front of the card, and the answer, rationale, test-taking strategy, and Integrated Process code are on the back of the card. This product includes multiple-choice questions and alternate item format questions including fill-in-the-blank, multiple-response, prioritizing (ordered response), image (hot spot questions), and chart/exhibit questions.

All the products in Saunders Pyramid to Success can be obtained online by visiting <http://elsevierhealth.com> or by calling 800-545-2522.

 Stay positive and confident, and believe that you can achieve your goal.

Finally, never lose sight of your goal. Patience and dedication contribute significantly to your achieving the status of registered nurse. Remember, success is climbing a mountain, facing the challenge of obstacles, and reaching the top of the mountain. I wish you the best success in your journey and beginning your career as a registered nurse in the United States.

# Pathways to Success

Laurent W. Valliere, BS

## THE PYRAMID TO SUCCESS

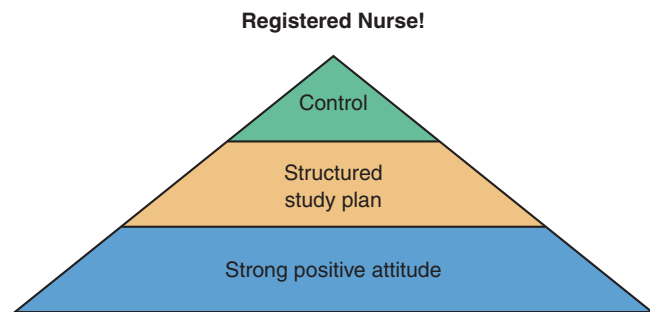

Preparing to take the NCLEX-RN examination can produce a great deal of anxiety. You may be thinking that the NCLEX-RN exam is the most important examination you will ever have to take and that it reflects the culmination of everything that you have worked so hard for. The NCLEX-RN exam is an important examination because receiving your nursing license means that you can begin your career as a registered nurse. Your success on the NCLEX-RN exam involves getting rid of all your thoughts that allow this examination to appear overwhelming and intimidating. Such thoughts can take complete control over your destiny. A strong positive attitude, a structured plan for preparation, and maintaining control in your pathway to success ensure achievement in reaching the peak of the Pyramid to Success (Fig. 3-1).

## PATHWAYS TO SUCCESS (Box 3-1)

### Foundation

The foundation of pathways to success begins with a strong positive attitude, the belief that you will achieve success, and developing control. It also includes developing a list of your personal short-term and long-term goals and a plan for preparation. A strong positive attitude, belief in yourself, control, and a list of personal goals will help lead you to becoming a registered nurse. Without these components, your pathway to success leads to nowhere and has no endpoint. You will expend energy and valuable time in your journey, lack control over where you are heading, and experience exhaustion without any accomplishment. It is imperative that you take the time to develop a positive attitude and establish your short-term and long-term goals.

Where do you start? To begin this process, find a location that offers solitude. Sit or lie in a comfortable position, close your eyes, relax, inhale deeply, hold your breath to a count of four, exhale slowly, and, again, relax. Repeat this breathing exercise several times until you begin to feel relaxed, free from anxiety, and in control of your destiny. Allow your mind to become void of all the mind chatter; now you are in control

▲ FIGURE 3-1 Pyramid to Success.

and your mind's eye can see for miles. Your highway of life has a multitude of destinations to which you may travel. Next, reflect on all that you have accomplished and the path that brought you to where you are today. Keep a journal of your reflections as you plan the order of your journey through the Pyramid to Success.

### List

It is time to create the "List." The List is your set of short-term and long-term goals. At this time, you may or may not have a scheduled date for taking the NCLEX-RN examination. Begin by developing the goals that you wish to accomplish today, tomorrow, over the next month, and in the future. Allow yourself the opportunity to list all that is flowing from your mind. Write your goals in your personal journal. When the List is complete, put it away for 2 or 3 days. After that time, retrieve and review the List and begin the process of planning to prepare for the NCLEX-RN exam.

### Plan for Preparation

Now that you have the List in order, look at the goals that relate to studying for the licensing exam. The first task is to decide what study pattern works best for you. Think about what has worked most successfully for you in the past. Questions that must be

**Box 3-1 Pathways to Success****Foundation**

Maintaining a strong positive attitude  
 Thinking about short-term and long-term realistic goals  
 Developing a plan for preparation  
 Maintaining control

**List**

Writing short-term and long-term realistic goals in a journal

**Plan for Preparation**

Developing a study plan and schedule  
 Deciding on the place to study  
 Balancing personal and work obligations with the study schedule  
 Sharing the study schedule and personal needs with others  
 Implementing the study plan

**Positive Pampering**

Planning time for exercise and fun activities  
 Establishing healthy eating habits  
 Including activities in the schedule that provide positive mental stimulation

**Final Preparation**

Reviewing goals  
 Identifying goals achieved  
 Remaining focused to complete the plan of study  
 Writing down the date and time of the examination and posting it next to your name with the letters “RN” following, and the word “yes!”  
 Planning a test drive to the testing center  
 Relaxing activities on the day before the examination

**Day of the Examination**

Grooming yourself for success  
 Eating a nutritious breakfast  
 Maintaining a confident and positive attitude  
 Maintaining control—breath and focus  
 Meeting the challenges of the day  
 Reaching the peak of the Pyramid to Success

addressed to develop your plan for study are listed in Box 3-2.

The plan must include a schedule. Use a calendar to plan and document the times and nursing content areas for your study sessions. Establish a realistic schedule that includes your daily, weekly, and future goals, and adhere to it. This consistency will provide advantages to you and the people supporting you. A daily schedule allows you to plan your content areas for study more carefully. Stick to your plan of study. Adherence to the plan helps you develop a rhythm that can enhance your retention and positive momentum. The people who are supporting you will share this rhythm and will be able to schedule their activities and lives better when you are consistent with your study schedule. You are moving forward, and you are in control.

**Box 3-2 Developing a Plan for Study**

Do I work better alone or in a group study environment?  
 If I work best in a group, does the group consist of one, two, or more study partners?  
 Who are these study partners?  
 How long should my study sessions last?  
 Does the time of day that I study make a difference for me?  
 Do I retain more if I study in the morning?  
 How does my work schedule affect my study pattern?  
 How do I balance my family obligations with my need to study?  
 Do I have a comfortable study area at home or do I need to find another environment that is conducive to my study needs?

The length of the study session depends on you and your ability to focus and concentrate. You need to think about quality rather than quantity when you are deciding on a realistic amount of time for each session. Plan to schedule at least 2 hours of quality time daily. If you can spend more than 2 hours, by all means do so.

You may be asking yourself, “What do you mean by quality time?” Quality time means spending uninterrupted quiet time at your study session. This may mean that you will have to isolate yourself for these study sessions. Think again about what has worked for you during nursing school when you studied for examinations; select a study place now that has worked for you in the past. If you have a special study room at home that you have always used, plan your study sessions in that special room. If you have always studied at a library, plan your study sessions at the library. If you plan to study at home, make the time spent studying uninterrupted and quiet. Sometimes it is difficult to balance your study time with your family obligations and possibly a work schedule, but, if you can, plan your study time when you know that you will be at home alone. Try to eliminate anything that may be distracting during your study time. Unplug your telephone or shut off your cell phone so that you will not be disturbed. If you have small children, plan your study time during their nap time or during their school hours.

Your plan must include how you will manage your study needs and the demands of your work, family, and friends. Take time to think about how you will balance your everyday commitments with your plan for study. Your family and friends are key players in your life and are going to become part of your Pyramid to Success. After you have established your study needs, communicate your needs and the importance of your study plan in achieving your goal of becoming a registered nurse to your family and friends.

A difficult part of the plan may be how to deal with family members and friends who choose not to participate in your plan for success. What if an individual

chooses not to be part of your plan? For example, what do you do if a friend asks you to go to a movie and it is your scheduled study time? Your friend may say, “Come on. Take some time off. You have plenty of time to study. Study later when we get back!” You are faced with a decision. You must weigh all the factors carefully. You must keep your goals in mind and remember that your need for positive momentum is critical. Your decision may not be an easy one, but it must be one that will help ensure your goal of becoming a registered nurse is achieved. A positive momentum and meeting your goals are most important.

### POSITIVE PAMPERING

Positive pampering means that you must continue to care for yourself holistically. Positive momentum can be maintained only if you are properly balanced. Proper exercise, diet, and positive mental stimulation are crucial to achieving your goal of becoming a registered nurse. Just as you have developed a schedule for study, you should have a schedule that includes some fun and some form of physical activity. It is your choice—aerobics, running, walking, weight lifting, bowling, or whatever makes you feel good about yourself. Time spent away from the hard study schedule and devoted to some form of fun and physical exercise pays you back a hundred fold. You will feel alive and more energetic with a schedule that includes these activities.

Establish healthy eating habits. Stay away from fatty foods because they slow you down. Eat lighter meals and eat more frequently. Include complex carbohydrates in your diet for energy, and be careful not to include too much caffeine in your daily diet. Continue to feel good about yourself because you are in control.

Take the time to pamper yourself with activities that make you feel even better about who you are. Make dinner reservations at your favorite restaurant with someone who is special and is supporting your goal to become a registered nurse. Take walks in a place that has a particular tranquility that enables you to reflect on the positive momentum that you have achieved and maintained. Whatever it is, wherever it takes you, allow yourself the time to do some positive pampering.

### FINAL PREPARATION

You have established the foundation of your Pyramid to Success. You have developed your list of goals and your study plan, and you have maintained your positive momentum. You are moving forward, and you are in control. When you receive your date and time for the NCLEX-RN examination, you may immediately think, “I am not ready!” Stop! Reflect on all that you have achieved. Think about your goal achievement and the organization of the positive life momentum with which you have surrounded yourself. Think about

all the people who love and support your effort to become a registered nurse. Believe that the challenge that awaits you is one that you have successfully prepared for and will lead you to your goal of becoming a registered nurse.

Take a deep breath and organize the remaining days so that they support your educational and personal needs. Support your positive momentum with a visual technique. Write your name in large letters, and write the letters “RN” after it. Post one or more of these visual reinforcements in areas that you frequent. This form of visual motivational technique works for many nursing graduates preparing for this examination.

Through all that you have accomplished so far, it is imperative that you not fall into the trap of expecting too much of yourself. The idea of perfection must not drive you to a point that causes your positive momentum to hesitate. You must believe in who you are, as you are, and stay focused on your goal. Allow yourself the opportunity to continue to carry out your plan in a manner that is most conducive to who you are, not someone else. The date and time are at hand. Write down the date and time, and underneath write the word “yes!” Post this next to your name plus “RN”

You must ensure that you have command over how to get to the testing center. A test run is a must. Time the drive, and allow for road construction or whatever might occur to slow traffic down. On the test run, when you arrive at the test facility, you may want to walk into it. Go in and become familiar with the lobby and the surroundings. This may help alleviate some of the peripheral nervousness associated with entering an unknown building. Remember that you must do whatever it takes to keep yourself in control. If familiarizing yourself with the facility will help you maintain positive momentum, by all means be sure to do so. Who is in control? You are!

It is time to check your study plan and make the necessary adjustments now that a firm date and time are set. Adjust your review so that it flows to your needs and that your study plan ends 2 days before the examination. The mind is like a muscle. If it is overworked, it has no strength or stamina. Your strategy is to rest the body and mind on the day before the examination. Your strategy is to stay in control and allow yourself the opportunity to be absolutely fresh and attentive on the day of the examination. This strategy will help you control the nervousness that is natural, achieve the clear thought processes required, and feel confident that you have done all that is necessary to prepare and conquer this challenge. The day before the examination is to be one of pleasure. Treat yourself to what you enjoy the most.

Relax! Take a deep breath, hold to a count of four, and exhale slowly. You have prepared yourself well for the challenge of tomorrow. Allow yourself a restful night’s sleep, and wake up on the day of the

examination knowing that you are absolutely prepared to succeed. Look at your name with “RN” after it and the word “yes!”

### **DAY OF THE EXAMINATION** (Box 3-3)

Wake up believing in yourself and that all you have accomplished is about to propel you to the professional level of registered nurse. Allow yourself plenty of time, eat a nutritious breakfast, and groom yourself for success. You are ready to meet the challenges of

the day and overcome any obstacle that may face you. Today will soon be history, and tomorrow will bring you the envelope on which you read your name with the words “Registered Nurse” after it.

Be proud and confident of your achievements. You have worked hard to achieve your goal of becoming a registered nurse. If you believe in yourself and your goals, no one person or obstacle can move you off the pathway that leads to success, to the peak of the Pyramid! Congratulations, and I wish you the very best in your career as a registered nurse!

#### **Box 3-3 Day of the Examination**

*Breathe:* Inhale deeply, hold your breath to a count of four, exhale slowly

*Believe:* Have positive thoughts today and always about your achievements

*Control:* You are in command

*Believe:* This is your day

*Visualize:* R.N. with your name

# The NCLEX-RN<sup>®</sup> Examination: From a Graduate's Perspective

*Sarah Hollenberg, RN*

The NCLEX exam was always one of those daunting topics that loomed over my head throughout nursing school. During my first three semesters, the NCLEX exam seemed so far away that I put it on the “back burner” to deal with my current hurdles. As every nursing student knows, there is so much on your plate while in nursing school that you just don’t have time to “wrap your head around it all.” Although all along I knew I needed to face the NCLEX exam, as my last semester approached I realized that the NCLEX exam had managed to creep up on me. It was time to start formulating a plan of action. Initially, the panic set in. I had viewed the NCLEX exam as a compilation of all the stresses that I experienced before each test in nursing school, and that’s a lot of stress! I had to calm down and look at this rationally. People do pass this test. I needed to realize that this goal was absolutely attainable. I just needed to use the knowledge I had gained over the years and continue to prepare myself for this exam after graduation.

My school conducted a review class during the last semester that was dedicated to reviewing areas of the NCLEX exam, test strategies, and question formats. We used *Saunders Comprehensive Review for the NCLEX-RN<sup>®</sup> Examination*, the book that you are currently reading, for this class. It worked out great because it made me very familiar with the book and the CD accompanying it. Our tests for the class came directly from the CD. Answering practice questions repeatedly until the grade I wanted was achieved provided great practice on its own. I really liked the breakdown of the outline of the book, which made it easy to focus on specific body systems and topics. Each week we focused on a content area included in the book. This review and the pretest on the CD helped to identify my areas of strengths and weaknesses. The amount of information to know is massive, and being able to narrow your focus to what you need to do to prepare is a huge time saver. I kept track of my weak areas so that I could spend more time on those areas and incorporate them into my study plan after graduation.

Making a study plan was crucial to ensure that I used my time and resources effectively to increase my chance of passing. First things first post-graduation, celebrate! Take a break, let yourself breathe, and give yourself the kudos you deserve. Graduating from nursing school is a major accomplishment, and it needs to be celebrated. I graduated near the end of December and decided to go ahead and enjoy the holidays. I took this time off to relax, let loose, and feel the happiness about how far I had come. After I basked in the glory of getting through countless tests, skills test outs, and the stress, it was time to study and tackle the NCLEX exam. Just taking that time helped to boost my confidence about the NCLEX exam because I reflected back on the times in school when I thought I may not make it, but I did. I read and asked friends about different ideas for setting up a study plan; however, in the end I just did what worked best for me.

I set goals on how many review questions to do and the minimum amount of time to study each day. I set up study periods of 1 hour in the morning and 1 hour at night. I tried to do at least 100 to 200 questions a day. Even though I thought I had developed a pretty decent study plan, sticking to it was difficult. Life, as it usually does, gets in the way. One thing I made sure of was not to beat myself up if I missed a day to study or didn’t get in quite as much as I would have liked.

One thing I found to be important was to have practice questions available at all times. Whenever I would find myself somewhere waiting around and with nothing to do, I would regret not having practice questions with me. These were perfect opportunities to get in some additional study time. After being caught in that situation, I decided to bring practice questions with me everywhere, stuffed away in my book bag or purse, so that at anytime I could grab them and look them over. I can remember going to the doctor’s office and being in the waiting room answering practice questions. I even reviewed practice questions as I was waiting to be interviewed for nursing jobs and fellowships. I used flashcards and a test-taking strategies book

by Linda Silvestri. These were easy to transport from place to place because they are small in size. Have practice questions on hand at all times for those spur-of-the-moment study opportunities.

When it came to my “sit down planned study sessions,” initially I tried to review chapters of the book. I didn’t read each chapter, but I would skim and look over information that was more difficult for me or that I found to be confusing. So to start with I really did try to review each area to some extent. I focused on my weaknesses and devoted extra time to those areas to strengthen my knowledge and feel more confident.

Another technique that helped me was to split the practice questions and topics up and not to take on too much at a time. Also, I would limit the amount of time I spent studying at each session; otherwise I would get to a point at which everything began to jumble in my brain. Just as in nursing school, I found that I could retain information better this way. It took me some time to go through the practice questions during study sessions because I would make sure to read the rationales for all of the options. I thought it was important to read the rationale for every practice question, even those that I got correct to make sure that my thought process was accurate. Reading the rationales is such a great way to see how your mind should be thinking to select the correct option, which is crucial on the actual test day.

When I studied, I made sure that I was comfortable and without distractions. I chose to study on my own and with a group of nursing classmates. When I studied on my own, it worked well because it was easier to focus and get through more practice questions. In a group, when going over specific topics and questions, others may be stronger in your weak areas and bring up ways of answering practice questions that you weren’t thinking of at the time. Another great thing about studying with a group is that you have the opportunity to relax and talk with your friends when you take breaks during the study session. It is also nice to have people around you who understand what you’re going through and share a lot of the same feelings that you have about taking the NCLEX exam.

Another important concern was when exactly to take the test. When I received my Authorization to Test (ATT) form, I debated between signing up for the first available test spot and taking my time to schedule an appointment. I decided to take my time and schedule the exam for a month or two after graduation. I wanted to make sure I felt fully prepared and didn’t want to be rushing into it. I think this decision helped me cut down on some of the stress I was feeling. Also, once I set the date it made me crack down on my studying even more because I knew the date was approaching.

When studying, my main tactic was to do numerous practice questions. I would go through a few practice questions, check my answers, and read the rationales. Then if I needed more information about that topic, I

would refer to the book chapters and read about the topic, such as a specific medication, disease process, or nursing considerations. With this strategy, I noticed that after doing more and more questions I would get better and better with thinking through the information and answering correctly. Additionally, using the test-taking strategies, I found myself able to answer the really difficult practice questions accurately. I really felt my confidence increasing. I wrote the test-taking strategies on a note pad so that as I first began doing practice questions I could refer to them. Having the test-taking strategies visually in front of me helped me learn to apply them to every practice question; soon I didn’t need them visually in front of me.

When it came to a week before the test, I continued to study as I had been. A few days before my scheduled date, I met with those left in my study group who hadn’t tested yet for some studying and for getting my fears off my chest. Every time I’d heard that another classmate had passed the NCLEX exam, it made me feel better about testing. The day before the test I decided to take everyone’s advice and to try to relax and not study. Originally I decided to go ahead and pamper myself for the day, although I did sneak in a few practice questions here and there. At this point, doing practice questions was practically a habit. I also took a break to spend time with friends and family.

My test was scheduled bright and early at 8:00 A.M. The night before, I made sure that I had all the proper paperwork and necessary items to test, such as my ID, packed and ready to go. I didn’t want to do any rushing around in the early morning. It was early to bed for me. I woke up and made sure to eat breakfast, but nothing too heavy. I didn’t want to have any reason to be uncomfortable while taking this test. I also made sure to wear comfortable clothes and decided to wear a few layers so that I could adjust for whatever temperature the testing center would be. I left my house plenty early so that I would not have to worry about traffic or other possible delays. I remember pulling up and even sitting in my car relaxing and listening to music to calm my nerves. I checked in early and made sure to smile brightly for that inopportune photo required of each test participant.

Once inside, I remembered a friend’s recommendation to take advantage of the ear plugs provided. I thought this was a good idea, especially considering how easily I can be distracted. There is also something provided to you to write on at your computer station. The very first thing that I did was write ABC’s, Maslow’s hierarchy, and my lab values. I wrote these down just as reminders to have by my side as a comfort, even though I had them memorized. Once I began my test, I realized that the ear plugs were uncomfortable probably because I have never used any; they were actually a distraction for me. I felt much better without them and it was plenty quiet; honestly, I was so focused on the questions I didn’t need them.

One reminder is to read the questions carefully and each option fully; remember, you cannot skip questions. That was one thing that was difficult for me because through nursing school I was definitely one to change my answers. Another important point besides reading very carefully is not taking too much time on each question. There will be questions on the test in which you do not know the answer. You have to apply the best strategy and select the best option available. Just remember to think positively and be confident. This test is passable and you are prepared.

When I left, I tried to think confidently, but I was worried. It was a difficult test to judge. I figured it was

over and I can't change it now, so thinking optimistically was my best option. I did feel confident, but waiting for the test results felt just as difficult as the test. They give you information at the testing center regarding how to check your results. I opted for the online option and checked it the minute I could. It shows your name and across the way "passed" in small letters on the screen. I was practically in tears I was so excited. I felt so proud the first time I was able to write "RN" behind my name instead of "GN" Even to this day I feel the pride and satisfaction of writing those letters behind my name.

Just remember to stay calm, prepare the best you can, and be confident and optimistic!

# Test-Taking Strategies

## I. PYRAMID TO SUCCESS (Box 5-1)

## II. HOW TO AVOID READING INTO THE QUESTION (Box 5-2)

### A. Pyramid points

1. Avoid asking yourself, “Well, what if ...?” because this will lead you right into the “forbidden” area, reading into the question.
2. Focus only on the information in the question, read every word, and make a decision about what the question is asking.
3. Look for the strategic words in the question, such as *immediate*, *initial*, *first*, *priority*, *side effect*, or *toxic effect*; strategic words make a difference with regard to what the question is asking.
4. In multiple-choice questions, multiple-response questions, or questions that require you to number in order of priority, read every choice or option presented before selecting answers.
5. Always use the process of elimination when choices or options are presented; after you have eliminated options, reread the question before selecting your final choice or choices.
6. With questions that require you to fill in the blank, focus on the information in the question and determine what the question is asking; if the question requires you to calculate a medication dose, an intravenous flow rate, or intake and output amounts, recheck your work in calculating and always use the on-screen calculator to verify the answer.
7. Avoid asking yourself the “forbidden” words, “Well, what if ...?”, when deciding on an answer to a question.

### Box 5-1 Pyramid to Success

- Avoid asking yourself, “Well, what if ...?” because this will lead you right into reading into the question.
- Focus only on the information in the question, read every word, and make a decision regarding what the question is asking.
- Look for the strategic words in the question; strategic words make a difference with regard to what the question is asking about.
- Always use the process of elimination when choices or options are presented; when you have eliminated options, reread the question before selecting your final choice or choices.
- Determine if the question is a positive or negative event query.
- Use all your nursing knowledge, your clinical experiences, and your test-taking skills and strategies to answer the question.

### Box 5-2 Practice Question: Avoiding the “What if ...” Syndrome and Reading into the Question

A nurse is caring for a hospitalized client with a diagnosis of congestive heart failure who suddenly complains of shortness of breath and dyspnea. The nurse takes which *immediate* action?

1. Calls the physician
2. Administers oxygen to the client
3. Elevates the head of the client’s bed
4. Prepares to administer furosemide (Lasix)

#### Answer: 3

**Test-Taking Strategy:** Now you may immediately think the client has developed pulmonary edema, a complication of congestive heart failure, and needs a diuretic. Although pulmonary edema is a complication of congestive heart failure, there is no information in the question that indicates the presence of pulmonary edema. The question simply states that the client suddenly complains of shortness of breath and dyspnea. Read the question carefully. Note the strategic word *immediate* and focus on the subject: the client’s complaints. Although the physician may need to be notified, this is not the immediate action. A physician’s prescription is needed to administer oxygen. Furosemide is a diuretic and may or may not be prescribed for the client. Because there is no information in the question that indicates the presence of pulmonary edema, option 3 is correct. The question is asking you for a nursing action, so that is what you need to look for as you eliminate the incorrect options. Use nursing knowledge and test-taking strategies to assist in answering the question. Remember to avoid the “What if ...?” syndrome and reading into the question.

**B. Ingredients of a question (Box 5-3)**

1. The ingredients of a question include the event, which is a client or clinical situation; the event query; and the options or answers.
2. The event provides you with the content about the client or clinical situation that you need to think about when answering the question.
3. The event query asks something specific about the content of the event.
4. The options are all the answers provided with the question.
5. In a multiple-choice question, there will be four options and you must select one; read every option carefully and think about the event and the event query as you use the process of elimination.
6. In a multiple-response question, there will be several options and you must select all options that apply to the event in the question; visualize the event and use your nursing knowledge and your clinical experiences to answer the question.
7. In a prioritizing (ordered response)/drag and drop question, you will be required to list in order of priority nursing interventions or other data; visualize the event and use your nursing knowledge and clinical experiences to answer the question.

**Box 5-3 Ingredients of a Question: Event, Event Query, and Options**

**Event:** A nurse is caring for a client with terminal cancer.

**Event Query:** The nurse considers which of the following when planning opioid pain relief?

**Options:**

1. Not all pain is real.
2. Opioid analgesics are highly addictive.
3. Opioid analgesics can cause tachycardia.
4. Around-the-clock dosing gives better pain relief than PRN dosing.

**Answer: 4**

**Test-Taking Strategy:** Focus on the client's diagnosis. Administering around-the-clock dosing provides increased pain relief and decreases stressors associated with pain, such as anxiety and fear. Option 1 is not of concern here. Opioid analgesics may be addictive, but this is not a concern for a client with terminal cancer. Not all opioid analgesics cause tachycardia.

**Box 5-4 Common Strategic Words**

|               |                                       |
|---------------|---------------------------------------|
| Best          | Initial                               |
| Early or late | Most appropriate or least appropriate |
| First         | Most likely or least likely           |
| Immediately   |                                       |

8. A fill-in-the-blank question will not contain options, and some picture or graphic (hot spot) questions and audio or video item formats may or may not contain options. A graphic option item will contain options in the form of a picture or graphic.
9. A chart exhibit question will most likely contain options; read the question carefully and all of the information in the chart or exhibit before selecting an answer.

**III. STRATEGIC WORDS (Boxes 5-4 and 5-5)**

- A. Strategic words focus your attention on a critical point to consider when answering the question and will assist you in eliminating the incorrect options.
- B. Some strategic words may indicate that all the options are correct and that it will be necessary to prioritize to select the correct option (Box 5-6).
- C. As you read the question, look for the strategic words; strategic words make a difference with regard to the focus of the question.

**Box 5-5 Practice Question: Strategic Words**

A nurse is caring for a client who just returned from the recovery room after undergoing abdominal surgery. The nurse monitors for which *early sign* of hypovolemic shock?

1. Sleepiness
2. Increased pulse rate
3. Increased depth of respiration
4. Increased orientation to surroundings

**Answer: 2**

**Test-Taking Strategy:** Note the strategic words *early sign*. Focusing on these strategic words, recall that cardiovascular changes occur early in hypovolemic shock. Sleepiness is expected in a client who just returned from surgery. Increased orientation to surroundings is expected and will occur as the effects of anesthesia resolve. Although increased depth of respirations occurs in hypovolemic shock, it is not an early sign. Rather, it occurs as the shock progresses. Remember to look for strategic words.

**Box 5-6 Common Strategic Words That Indicate the Need to Prioritize**

|                  |                                       |
|------------------|---------------------------------------|
| Best             | Most appropriate or least appropriate |
| Essential        | Most important                        |
| First            | Most likely or least likely           |
| Highest priority | Primary                               |
| Immediate        | Vital                                 |
| Initial          |                                       |
| Next             |                                       |

**IV. SUBJECT OF THE QUESTION** (Box 5-7)

- A. The subject of the question is the specific topic that the question is asking about.
- B. Identifying the subject of the question will assist in eliminating the incorrect options and direct you to selecting the correct option.

**V. POSITIVE AND NEGATIVE EVENT QUERIES**  
(Boxes 5-8 and 5-9)

- A. A positive event query uses strategic words that ask you to select an option that is correct; for example, the event query may read, "Which statement by a client *indicates an understanding* of the side effects of the prescribed medication?"

**Box 5-7 Subject of the Question**

A nurse is teaching a client in skeletal leg traction about measures to increase bed mobility. Which item would be *most helpful* for this client?

1. Television
2. Fracture bedpan
3. Overhead trapeze
4. Reading materials

**Answer: 3**

**Test-Taking Strategy:** Focus on the subject: to increase bed mobility. Also note the strategic words *most helpful*. The use of an overhead trapeze is extremely helpful in assisting a client to move about in bed and to get on and off the bedpan. Television and reading materials are helpful in reducing boredom and providing distraction. A fracture bedpan is useful in reducing discomfort with elimination. Remember to focus on the subject.

**Box 5-8 Practice Question:  
Positive Event Query**

A child with hemophilia is brought into the emergency department after being hit on the neck with a baseball. A nurse should immediately check the child for:

1. Airway obstruction
2. Factor VIII deficiency
3. Spontaneous hematuria
4. Headache and slurred speech

**Answer: 1**

**Test-Taking Strategy:** This question is an example of a positive event query question. Trauma to the neck may cause bleeding into the tissues of the neck, which may compromise the airway. Factor VIII deficiency is not a symptom of hemophilia, but rather a common form of the disease. Hematuria is a symptom of hemophilia, but it is not associated with neck injury. Headache and slurred speech are associated with head trauma and are not the priority in this situation. Use the ABCs—airway, breathing, and circulation—to answer this question. Remember that airway assessment is always a first priority.

- B. A negative event query uses strategic words that ask you to select an option that is an incorrect item or statement; for example, the event query may read, "Which statement by a client *indicates a need for further teaching* about the side effects of the prescribed medication?"

**VI. QUESTIONS THAT REQUIRE PRIORITIZING**

- A. Many questions in the examination will require you to use the skill of prioritizing nursing actions.
- B. Look for the strategic words in the question that indicate the need to prioritize (see Box 5-6).
- C. Remember that when a question requires prioritization, all options may be correct and you need to determine the correct order of action.
- D. Strategies to use to prioritize include the ABCs (airway, breathing, and circulation), Maslow's Hierarchy of Needs theory, and the steps of the nursing process.
- E. The ABCs (Box 5-10)
  1. Use the ABCs—airway, breathing, and circulation—when selecting an answer or determining the order of priority.
  2. Remember the order of priority—airway, breathing, and circulation.
  3. Airway is always the first priority.
- F. Maslow's Hierarchy of Needs theory (Box 5-11; Fig. 5-1)

**Box 5-9 Practice Question:  
Negative Event Query**

A nurse has reinforced discharge instructions to a client who has undergone a right mastectomy with axillary lymph node dissection. Which statement by the client indicates a *need for further instruction* regarding home care measures?

1. "It is all right to use a straight razor to shave under my arms."
2. "I need to be sure that I do not have blood pressures or blood drawn from my right arm."
3. "I should inform all of my other health care providers that I have had this surgical procedure."
4. "I need to be sure to wear thick mitt hand covers or use thick pot holders when I am cooking and touching hot pans."

**Answer: 1**

**Test-Taking Strategy:** This question is an example of a negative event query question. Note the strategic words *need for further instruction*. These strategic words indicate that you need to select an option that identifies an incorrect client statement. Recalling that edema and infection are the concerns with this client and that the client needs to be instructed in the measures that will avoid trauma to the affected arm will direct you to the correct option. Remember to watch for negative event queries.

1. According to Maslow's Hierarchy of Needs theory, physiological needs are the priority, followed by safety and security needs, love and belonging needs, self-esteem needs, and, finally, self-actualization needs; select the option or determine the order of priority by addressing physiological needs first.
2. When a physiological need is not addressed in the question or noted in one of the options, continue to use Maslow's Hierarchy of Needs theory as a guide and look for the option that addresses safety.

### Box 5-10 Practice Question: Use of the ABCs

A client with a diagnosis of cancer is receiving morphine sulfate for pain. A nurse employs which priority action in the care of the client?

1. Monitors stools
2. Encourages fluid intake
3. Monitors the urine output
4. Encourages the client to cough and breathe deeply

**Answer: 4**

**Test-Taking Strategy:** Use the ABCs—airway, breathing, and circulation—as a guide to direct you to the correct option. Recall that morphine sulfate suppresses the cough reflex and the respiratory reflex. Although options 1, 2, and 3 are components of the plan of care, the correct option addresses airway. Remember to use the ABCs—airway, breathing, and circulation—to prioritize.

### Box 5-11 Practice Question: Maslow's Hierarchy of Needs Theory

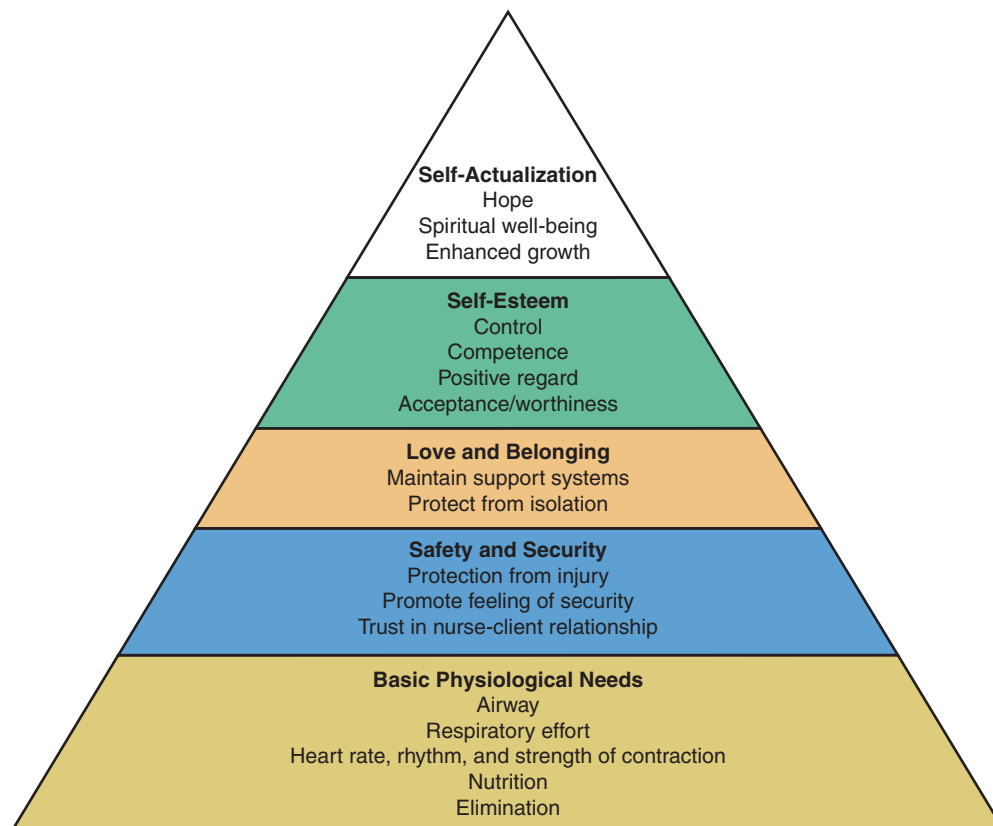

A nurse caring for a client experiencing dystocia determines that the *highest priority* is frequent:

1. Position changes and providing comfort measures
2. Explanations to family members about what is happening to the client
3. Monitoring for changes in the physical condition of the mother and fetus
4. Reinforcement of breathing techniques learned in childbirth preparatory classes

**Answer: 3**

**Test-Taking Strategy:** All the options are correct and would be implemented during the care of this client. Note the strategic words *highest priority*, however, and use Maslow's Hierarchy of Needs theory to prioritize, remembering that physiological needs come first. Doing so will direct you to option 3. Also, option 3 is the only option that addresses both the mother and the fetus. Remember to use Maslow's Hierarchy of Needs theory to prioritize.

Nursing Priorities From Maslow's Hierarchy

▲ **FIGURE 5-1** Use Maslow's hierarchy to establish priorities. (From Harkreader, H., Hogan, M.A., & Thobaben, M. [2007]. *Fundamentals of nursing: Caring and clinical judgment* [3rd ed.]. St. Louis: Saunders.)

**G. Steps of the nursing process**

1. Use the steps of the nursing process to prioritize.
2. The steps include assessment, analysis, planning, implementation, and evaluation and are followed in this order.
3. Assessment
  - a. Assessment questions address the process of gathering subjective and objective data relative to the client, confirming the data, and communicating and documenting the data.
  - b. Remember that assessment is the first step in the nursing process.
  - c. When you are asked to select your first, immediate, or initial nursing action, follow the steps of the nursing process to prioritize when selecting the correct option.
  - d. Look for strategic words in the options that reflect assessment (Box 5-12).
  - e. If an option contains the concept of assessment or the collection of client data, the best choice is to select that option (Box 5-13).

**Box 5-12 Assessment: Strategic Words**

|           |                    |
|-----------|--------------------|
| Ascertain | Gather             |
| Assess    | Identify           |
| Check     | Monitor            |
| Collect   | Observe            |
| Determine | Obtain information |
| Find out  | Recognize          |

**Box 5-13 Practice Question:  
The Nursing Process—Assessment**

A client who has had an application of a right long arm cast complains of pain at the wrist when the arm is passively moved. A nurse should *first*:

1. Elevate the arm.
2. Document the findings.
3. Medicate with an additional dose of an opioid.
4. Check for paresthesias and paralysis of the right arm.

**Answer: 4**

**Test-Taking Strategy:** Note the strategic word *first*. Use the steps of the nursing process to answer the question, remembering that assessment is the first step. The only option that addresses assessment is option 4. Options 1, 2, and 3 address the implementation step of the nursing process. Also, these options are inaccurate first actions. The arm in a cast should have already been elevated (option 1). The client may be experiencing compartment syndrome, a complication following trauma to the extremities and application of a cast. Additional data need to be collected to determine if this complication is present. Remember that assessment is the first step in the nursing process.

- f. If an assessment action is not one of the options, follow the steps of the nursing process as your guide to select your first, immediate, or initial action.
  - g. Possible exception to the guideline—if the question presents an emergency situation, read carefully; in an emergency situation, an intervention may be the priority.
4. Analysis (Box 5-14)
    - a. Analysis questions are the most difficult questions because they require understanding of the principles of physiological responses and require interpretation of the data based on assessment.
    - b. Analysis questions require critical thinking and determining the rationale for therapeutic prescriptions or interventions that may be addressed in the question.
    - c. Analysis questions may address the formulation of a nursing diagnosis and the communication and documentation of the results of the process of analysis.
  5. Planning (Box 5-15)
    - a. Planning questions require prioritizing nursing diagnoses, determining goals and outcome criteria for goals of care, developing the plan of care, and communicating and documenting the plan of care.

**Box 5-14 Practice Question:  
The Nursing Process—Analysis**

A nurse reviews the arterial blood gas results of a client and notes the following: pH 7.45,  $P_{CO_2}$  30 mm Hg, and  $HCO_3^-$  22 mEq/L. The nurse analyzes these results as indicating which condition?

1. Metabolic acidosis, compensated
2. Respiratory alkalosis, compensated
3. Metabolic alkalosis, uncompensated
4. Respiratory acidosis, uncompensated

**Answer: 2**

**Test-Taking Strategy:** The normal pH is 7.35 to 7.45. In a respiratory condition, an opposite effect will be seen between the pH and the  $P_{CO_2}$ . In this situation, the pH is at the high end of the normal value and the  $P_{CO_2}$  is low. In an alkalotic condition, the pH is elevated. The values identified in the question indicate a respiratory alkalosis. Compensation occurs when the pH returns to a normal value. Because the pH is in the normal range at the high end, compensation has occurred.

In a case of respiratory imbalance, you will find an opposite response between the pH and the  $P_{CO_2}$  as indicated in the question. You can eliminate options 1 and 3. Also, remember that the pH increases in an alkalotic condition and compensation occurs, as evidenced by a normal pH. Remember that analysis is the second step in the nursing process.

- b. Regarding nursing diagnoses, remember that actual client problems rather than at-risk for client problems will most likely be the priority.
6. Implementation (Box 5-16)
- a. Implementation questions address the process of organizing and managing care, counseling and teaching, providing care to achieve established goals, supervising and coordinating care, and communicating and documenting nursing interventions.

### Box 5-15 Practice Question: The Nursing Process—Planning

A nurse develops a plan of care for a client with a cataract. Which nursing diagnosis is the priority?

1. *Fear* related to loss of eyesight
2. *Risk for injury* related to decreased vision
3. *Disturbed sensory perception* (visual) related to ocular lens opacity
4. *Social isolation* related to decreased ability to mobilize in the community

**Answer: 3**

**Test-Taking Strategy:** This question relates to planning nursing care and asks you to identify the priority nursing diagnosis. Use Maslow's Hierarchy of Needs theory to answer the question. Remembering that physiological needs are the priority will direct you to option 3. Although *Risk for injury* is an at-risk rather than an actual problem, according to Maslow's Hierarchy of Needs theory, safety is the second priority. *Fear* and *Social isolation* are psychosocial needs and would be the last priorities in this situation. Remember that planning is the third step of the nursing process.

### Box 5-16 Practice Question: The Nursing Process—Implementation

A nurse is caring for a hospitalized client with angina pectoris who begins to experience chest pain. The nurse administers a nitroglycerin (Nitrostat) tablet sublingually as prescribed, but the pain is unrelieved. The nurse should take which action *next*?

1. Reposition the client.
2. Contact the physician.
3. Call the client's family.
4. Administer another nitroglycerin tablet.

**Answer: 4**

**Test-Taking Strategy:** Implementation questions address the process of organizing and managing care. This question also requires that you prioritize the nursing actions. Note the strategic word *next* and that the client is hospitalized. Recalling that the nurse would administer three nitroglycerin tablets 5 minutes apart from each other to relieve chest pain will assist in directing you to option 4. Remember that implementation is the fourth step of the nursing process.

- b. Focus on a nursing action rather than on a medical action when you are answering a question, unless the question is asking you what prescribed medical action is anticipated.
  - c. On the NCLEX-RN exam, the only client that you need to be concerned about is the client in the question that you are answering; avoid the "What if ...?" syndrome and remember that the client in the question on the computer screen is your only assigned client.
  - d. Answer the question from a textbook and ideal point of view; remember that the nurse has all the time and all of the equipment needed to care for the client readily available at the bedside.
  - e. Avoid the "What if ...?" syndrome and remember that you do not need to run to the treatment room to obtain, for example, sterile gloves because the sterile gloves will be at the client's bedside.
7. Evaluation (Box 5-17)
- a. Evaluation questions focus on comparing the actual outcomes of care with the expected outcomes and communicating and documenting findings.
  - b. These questions focus on assisting in determining the client's response to care and identifying factors that may interfere with achieving expected outcomes.
  - c. In an evaluation question, watch for negative event queries because they are frequently used in evaluation-type questions.

### Box 5-17 Practice Question: The Nursing Process—Evaluation

A nurse is monitoring the function of a client's chest tube drainage system. The nurse notes that the fluid in the water seal chamber is below the 2-cm mark. The nurse interprets that:

1. There is a leak in the system.
2. The client has a pneumothorax.
3. Suction should be added to the system.
4. Water should be added to the chamber.

**Answer: 4**

**Test-Taking Strategy:** Focus on the data in the question. It makes sense to add water to the chamber if the water level is too low. The water seal chamber should be filled to the 2-cm mark to provide an adequate water seal between the external environment and the client's pleural cavity. The water seal prevents air from reentering the pleural cavity. Because evaporation of water can occur, the nurse should remedy this problem by adding water until the level is again at the 2-cm mark. Options 1, 2, and 3 are incorrect interpretations. Remember that evaluation is the fifth step of the nursing process.

## VII. CLIENT NEEDS

### A. Safe and effective care environment

1. According to the National Council of State Boards of Nursing (NCSBN), these questions test the concepts that the nurse provides nursing care; collaborates with other health care team members to facilitate effective client care; and protects clients, significant others, and health care personnel from environmental hazards.
2. Focus on safety with these types of questions, and remember the importance of hand washing, call bells, bed positioning, appropriate use of side rails, asepsis, and use of standard and other precautions.

### B. Physiological integrity

1. The NCSBN indicates that these questions test the concepts that the nurse provides comfort and assistance in the performance of activities of daily living and provides care related to the administration of medications and parenteral therapies.
2. These questions also address the nurse's ability to reduce the client's potential for developing complications or health problems related to treatments, procedures, or existing conditions and providing care to clients with acute, chronic, or life-threatening physical health conditions.
3. Focus on Maslow's Hierarchy of Needs theory in these types of questions and remember that physiological needs are a priority and are addressed first.
4. Use the ABCs—airway, breathing, and circulation—and the steps of the nursing process when selecting an option addressing physiological integrity.

### C. Psychosocial integrity

1. The NCSBN notes that these questions test the concepts that the nurse provides nursing care that promotes and supports the emotional, mental, and social well-being of the client and significant others.
2. Content addressed in these questions relates to supporting and promoting the client's or significant others' ability to cope, adapt, or problem-solve in situations such as illnesses; disabilities; or stressful events such as abuse, neglect, or violence.
3. In this Client Needs category, you may be asked communication-type questions that relate to how you would respond to a client, a client's family member or significant other, or other health care team members.
4. Use therapeutic communication techniques to answer communication questions because of their effectiveness in the communication process.
5. Remember to select the option that focuses on the thoughts, feelings, concerns, anxieties, or fears of the client, client's family member, or significant other (Box 5-18).

### Box 5-18 Practice Question: Communication

A client scheduled for bowel surgery states to a nurse, "I'm not sure if I should have this surgery." Which response by the nurse is appropriate?

1. "It's your decision."
2. "Don't worry. Everything will be fine."
3. "Why don't you want to have this surgery?"
4. "Tell me what concerns you have about the surgery."

#### Answer: 4

**Test-Taking Strategy:** Use therapeutic communication techniques to answer communication questions and remember to focus on the client's thoughts, feelings, concerns, anxieties, and fears. Option 4 is the only option that addresses the client's concern. Option 1 is a blunt response and does not address the client's concern. Option 2 provides false reassurance. Option 3 can make the client feel defensive. Remember to use therapeutic communication techniques and focus on the client.

### D. Health promotion and maintenance

1. According to the NCSBN, these questions test the concepts that the nurse provides and assists in directing nursing care to promote and maintain health.
2. Content addressed in these questions relates to assisting the client and significant others during the normal expected stages of growth and development, and providing client care related to the prevention and early detection of health problems.
3. Use the Teaching and Learning theory if the question addresses client teaching, remembering that the client's willingness, desire, and readiness to learn is the first priority.
4. Watch for negative event queries because they are frequently used in questions that address Health Promotion and Maintenance and client education.

## VIII. ELIMINATING COMPARABLE OR ALIKE OPTIONS (Box 5-19)

- A. When reading the options, look for options that are comparable or alike.
- B. Comparable or alike options can be eliminated as possible answers.

## IX. ELIMINATE OPTIONS CONTAINING CLOSE-ENDED WORDS (Box 5-20)

- A. Some close-ended words include *all*, *always*, *every*, *must*, *none*, *never*, and *only*.
- B. Eliminate options that contain close-ended words because these words infer a fixed or extreme meaning; these types of options are usually incorrect.

### Box 5-19 Practice Question: Eliminate Comparable or Alike Options

A nurse is caring for a group of clients. On review of the clients' medical records, the nurse determines that which client is at risk for excess fluid volume?

1. The client on diuretics
2. The client with renal failure
3. The client with an ileostomy
4. The client on gastrointestinal suctioning

**Answer: 2**

**Test-Taking Strategy:** Focus on the subject of the question, the client at risk for excess fluid volume. Think about the pathophysiology associated with each condition identified in the options. The only client who retains fluid is the client with renal failure. The client on diuretics, the client with an ileostomy, and the client on gastrointestinal suctioning all lose fluid. Remember to eliminate comparable or alike options.

### Box 5-20 Practice Question: Eliminate Options That Contain Close-Ended Words

A client is to undergo a barium swallow and the nurse provides preprocedure instructions to the client. The nurse instructs the client to:

1. Avoid eating or drinking after midnight before the test.
2. Limit self to *only* two cigarettes on the morning of the test.
3. Have a clear liquid breakfast *only* on the morning of the test.
4. Take *all* routine medications with a glass of water on the morning of the test.

**Answer: 1**

**Test-Taking Strategy:** Note the close-ended words *only* in options 2 and 3 and *all* in option 4. Remember to eliminate options that contain close-ended words because these options are usually incorrect. Also, note that options 2, 3, and 4 are comparable or alike options in that they all involve taking in something on the morning of the test. Remember to eliminate options that contain close-ended words.

- C. Options that contain open-ended words, such as *may*, *usually*, *normally*, *commonly*, or *generally*, should be considered as possible correct options.

### X. LOOK FOR THE UMBRELLA OPTION (Box 5-21)

- A. When answering a question, look for the umbrella option.
- B. The umbrella option is one that is a broad or universal statement and that usually contains the concepts of the other options within it.
- C. The umbrella option will be the correct answer.

### Box 5-21 Practice Question: Look for the Umbrella Option

A client who is admitted to the hospital is diagnosed with urethritis caused by chlamydial infection. A nurse implements which of the following precautions to prevent contraction of the infection during care?

1. Enteric precautions
2. Contact precautions
3. Standard precautions
4. Wearing gloves and a mask

**Answer: 3**

**Test-Taking Strategy:** Focus on the client's diagnosis and recall that this infection is sexually transmitted. Also, note that option 3 is the umbrella option. Remember that the umbrella option is a broad or universal option that includes the concepts of the other options in it.

### Box 5-22 Practice Question: Use the Guidelines for Delegating and Assignment-Making

A nurse in charge of a long-term care facility is planning the client assignments for the day and *most appropriately* assigns which client to the nursing assistant?

1. A client on strict bedrest
2. A client with dyspnea who is receiving oxygen therapy
3. A client scheduled for transfer to the hospital for surgery
4. A client with a gastrostomy tube who requires tube feedings every 4 hours

**Answer: 1**

**Test-Taking Strategy:** Note that the question asks for the assignment to be delegated to the nursing assistant. When asked questions related to delegation, think about the role description of the employee and the needs of the client. A client with dyspnea who is receiving oxygen therapy, a client scheduled for transfer to the hospital for surgery, or a client with a gastrostomy tube who requires tube feedings every 4 hours has both physiological and psychosocial needs that require care by a licensed nurse. The nursing assistant has been trained to care for a client on bedrest. Remember to match the client's needs with the scope of practice of the health care provider.

### XI. USE THE GUIDELINES FOR DELEGATING AND MAKING ASSIGNMENTS (Box 5-22)

- A. You may be asked a question that will require you to decide how you will delegate a task or assign clients to other health care providers.
- B. Focus on the information in the question and what task or assignment is to be delegated.
- C. When you have determined what task or assignment is to be delegated, consider the client's needs and match the client's needs with the scope of practice of the health care providers identified in the question.

- D. The nurse practice act and any practice limitations define which aspects of care can be delegated and which must be performed by a registered nurse.
- E. Generally, noninvasive interventions, such as skin care, range-of-motion exercises, ambulation, grooming, and hygiene measures, can be assigned to a nursing assistant.
- F. A licensed practical nurse can perform the tasks that a nursing assistant can perform and can usually perform certain invasive tasks, such as dressings, suctioning, urinary catheterization, and administering medications orally or by the subcutaneous or intramuscular route; some piggyback intravenous medications may also be administered.
- G. A registered nurse can perform the tasks that a licensed practical nurse can perform and is responsible for assessment and planning care, analyzing client data, implementing and evaluating client care, supervising care, initiating teaching, and administering medications intravenously.

## XII. ANSWERING PHARMACOLOGY QUESTIONS

(Box 5-23)

- A. If you are familiar with the medication, use nursing knowledge to answer the question.
- B. Remember that the question will identify the generic name and the trade name of the medication.

### Box 5-23 Practice Question: Answering Pharmacology Questions

Quinapril hydrochloride (Accupril) is prescribed as adjunctive therapy in the treatment of heart failure. After administering the first dose, a nurse monitors which of the following *most closely*?

1. Weight
2. Urine output
3. Lung sounds
4. Blood pressure

**Answer: 4**

**Test-Taking Strategy:** Focus on the name of the medication and note the strategic words *most closely*. This tells you that all the options may be correct and that you must prioritize. Recall that the medication names of most angiotensin-converting enzyme (ACE) inhibitors end with “-pril” and that these medications are used to treat hypertension. Excessive hypotension (“first-dose syncope”) can occur in clients with heart failure or in clients who are severely salt-depleted or volume-depleted. Although weight, urine output, and lung sounds would be monitored, the nurse would *most closely* monitor the client’s blood pressure. Remember to use pharmacology guidelines to assist in answering questions about medications.

- C. If the question identifies a medical diagnosis, try to form a relationship between the medication and the diagnosis; for example, you can determine that cyclophosphamide (Cytosan) is an antineoplastic medication if the question refers to a client with breast cancer who is taking this medication.
  - D. Try to determine the classification of the medication being addressed to assist in answering the question. Identifying the classification will assist in determining a medication’s action or side effects or both; for example, diltiazem (*Cardizem*) is a cardiac medication.
  - E. Recognize the common side effects associated with each medication classification and relate the appropriate nursing interventions to each side effect; for example, if a side effect is hypertension, the associated nursing intervention would be to monitor the blood pressure.
  - F. Learn medications that belong to a classification by commonalities in their medication names; for example, medications that are xanthine bronchodilators end with “-line” (e.g., theophylline).
  - G. Look at the medication name and use medical terminology to assist in determining the medication action; for example, *Lopressor* lowers (*lo*) the blood pressure (*pressor*).
  - H. If the question requires a medication calculation, remember that a calculator is available on the computer; talk yourself through each step to be sure the answer makes sense, and recheck the calculation before answering the question, particularly if the answer seems like an unusual dosage.
- I. Pharmacology: Pyramid Points to remember
1. Generally, the client should not take an antacid with medication because the antacid will affect the absorption of the medication.
  2. Enteric-coated and sustained-release tablets should not be crushed; also, capsules should not be opened.
  3. The client should never adjust or change a medication dose or abruptly stop taking a medication.
  4. The nurse never adjusts or changes the client’s medication dosage and never discontinues a medication.
  5. The client needs to avoid taking any over-the-counter medications or any other medications, such as herbal preparations, unless they are approved for use by the health care provider.
  6. The client needs to avoid consuming alcohol.
  7. Medications are never administered if the order is difficult to read, is unclear, or identifies a medication dose that is not a normal one.

## UNIT II

# Issues in Nursing

# Cultural Diversity and Health Practices

## PYRAMID TERMS

**acculturation** Process of learning norms, beliefs, and behavioral expectations of a group other than one's own group.

**belief** A theory accepted as true by a culture.

**cultural assimilation** Process in which individuals from a minority group are absorbed by the dominant culture and take on the characteristics of the dominant culture.

**cultural competence** Acquisition of knowledge, understanding, and appreciation of a culture that facilitates provision of culturally appropriate health care.

**cultural diversity** Differences among groups of people that result from ethnic, racial, and cultural variables.

**cultural imposition** Tendency to impose one's own beliefs, values, and patterns of behavior on individuals from another culture.

**culture** Dynamic network of knowledge, beliefs, patterns of behavior, ideas, attitudes, values, and norms that are unique to a particular group of people.

**dominant culture** Group whose values prevail within a society.

**ethnic group** People within a culture who share characteristics based on race, religion, color, national origin, or language.

**ethnicity** An individual's identification of self as part of an ethnic group.

**ethnocentrism** An assumption of cultural superiority and an inability to accept the ways of another culture.

**minority group** Ethnic, cultural, racial, or religious group that constitutes less than a numerical majority of the population.

**race** A grouping of people based on biological similarities; members of a racial group have similar physical characteristics, such as blood group; facial features; and color of skin, hair, and eyes.

**racism** Discrimination directed toward individuals or groups who are perceived to be inferior.

**stereotyping** Expectation that all people within the same racial, ethnic, or cultural group act alike and share the same beliefs and attitudes.

**subculture** Social group within a culture that has distinctive characteristics, such as patterns of behavior or beliefs.

**values** Principles and standards that have meaning and worth to an individual, family, group, community, or culture.

## PYRAMID TO SUCCESS

Nurses often care for clients who come from ethnic, cultural, or religious backgrounds that are different from their own. Awareness of and sensitivity to the unique health and illness beliefs and practices of people of different backgrounds are essential for the delivery of safe and effective care. Acknowledgment and acceptance of cultural differences with a nonjudgmental attitude are essential to providing culturally sensitive care. The NCLEX-RN exam test plan is unique and individualized to the client's culture and beliefs. The nurse needs to avoid stereotyping and needs to be aware that there are several subcultures within cultures and there are several dialects within languages. In nursing practice, the nurse needs to assess the client's perceived needs before planning and implementing a plan of care. See Figure 6-1 for Giger and Davidhizar's Transcultural Assessment Model.

## CLIENT NEEDS

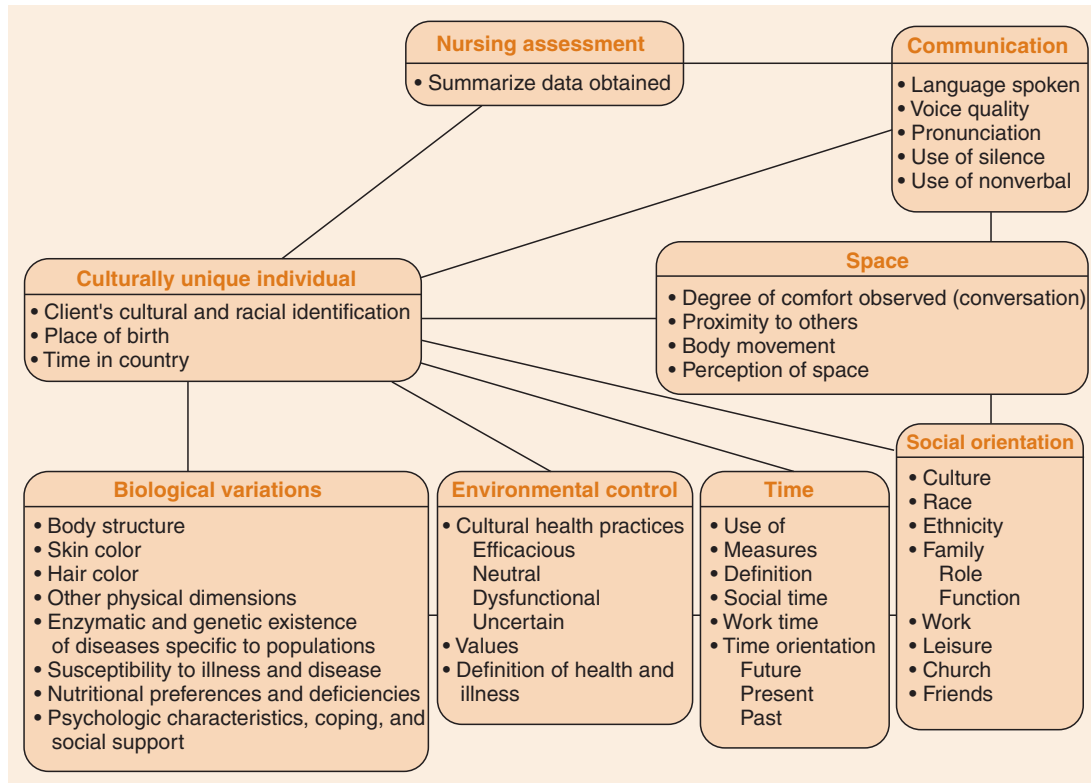

### Safe and Effective Care Environment

- Acting as a client advocate
- Ensuring ethical practices
- Ensuring legal rights and responsibilities
- Establishing priorities
- Maintaining confidentiality
- Providing continuity of care
- Respecting the client's control of personal environment and property
- Upholding client rights

### Health Promotion and Maintenance

- Considering cultural issues related to family systems and family planning
- Respecting cultural preferences and lifestyle choices
- Promoting health and wellness
- Preventing disease
- Providing health screening
- Identifying changes related to the aging process

▲ **FIGURE 6-1** Giger and Davidhizar's Transcultural Assessment Model. (From Giger, J., & Davidhizar, R. [2008]. *Transcultural nursing: Assessment and intervention* [5th ed.]. St. Louis: Mosby.)

## Psychosocial Integrity

Providing a therapeutic environment

Identifying clients who do not speak or understand English and determining how language needs will be met.

Assessing culture preferences and incorporating these preferences when planning and implementing care.

Respecting religious and spiritual influences on health (Box 6-1)

Identifying support systems

Identifying family dynamics as they relate to the client's culture

Assessing the use of effective coping mechanisms

Identifying end-of-life care issues

## Physiological Integrity

Identifying cultural differences for providing holistic client care

Identifying cultural issues related to alternative and complementary therapies

Identifying cultural issues related to receiving blood and blood products

Implementing therapeutic procedures considering cultural preferences

Providing nonpharmacological comfort interventions

Providing nutrition and oral hydration (see Box 6-1)

Providing palliative care

## I. AFRICAN AMERICANS

- A.** Description: Citizens or residents of the United States who may have origins in any of the black populations in Africa.
- B.** Communication
  1. Members are competent in standard English.
  2. Head nodding does not always mean agreement.
  3. Prolonged eye contact may be interpreted as rudeness or aggressive behavior.
  4. Nonverbal communication may be important.
  5. Personal questions asked on initial contact with a person may be viewed as intrusive.
- C.** Time orientation and personal space preferences
  1. Time orientation varies according to age, socio-economics, and **subcultures** and may include past, present, or future orientation.
  2. Members may be late for an appointment because relationships and events that are occurring may be deemed more important than being on time.
  3. Members are comfortable with close personal space when interacting with family and friends.
- D.** Social roles
  1. Large extended family networks are important; older adults are respected.
  2. Many households may be headed by a single-parent woman.
  3. Religious **beliefs** and church affiliation are sources of strength.

**Box 6-1 Religions and Dietary Preferences****Seventh Day Adventist (Church of God)**

Alcohol and caffeinated beverages are usually prohibited. Many are lacto-ovo vegetarians; those who eat meat avoid pork. Overeating is prohibited; 5 to 6 hours between meals without snacking is practiced.

**Buddhism**

Alcohol is usually prohibited. Many are lacto-ovo vegetarians. Some eat fish, and some avoid only beef.

**Roman Catholicism**

They avoid meat on Ash Wednesday and Fridays of Lent. They practice optional fasting during Lent season. Children, pregnant women, and ill individuals are exempt from fasting.

**Church of Jesus Christ of Latter-Day Saints (Mormon)**

Alcohol, coffee, and tea are usually prohibited. Consumption of meat is limited. The first Sunday of the month is optional for fasting.

**Hinduism**

Many are vegetarians; those who eat meat do not eat beef or pork. Fasting rituals vary. Children are not allowed to participate in fasting.

**Islam**

Pork, birds of prey, alcohol, and any meat product not ritually slaughtered are prohibited.

During the month of Ramadan, fasting occurs during the daytime.

**Jehovah's Witness**

Any foods to which blood has been added are prohibited. They can eat animal flesh that has been drained.

**Judaism**

Orthodox believers need to adhere to dietary kosher laws:

- Meats allowed include animals that are vegetable eaters, cloven-hoofed animals, and animals that are ritually slaughtered.
- Fish that have scales and fins are allowed.
- Any combination of meat and milk is prohibited.

During Yom Kippur, 24-hour fasting is observed. Pregnant women and seriously ill individuals are exempt from fasting.

During Passover, only unleavened bread is eaten.

**Pentecostal (Assembly of God)**

Alcohol is usually prohibited. Members avoid consumption of anything to which blood has been added. Some individuals avoid pork.

**Eastern Orthodox**

During Lent, all animal products, including dairy products, are forbidden. Fasting occurs during Advent. Exceptions from fasting include illness and pregnancy.

**E. Health and illness**

1. Religious **beliefs** profoundly affect ideas about health and illness.
2. Food preferences include such items as fried foods, chicken, pork, greens, and rice; some pregnant African-American women engage in pica.

**F. Health risks**

1. Sickle cell anemia
2. Hypertension
3. Heart disease
4. Cancer
5. Lactose intolerance
6. Diabetes mellitus
7. Obesity

**G. Interventions**

1. Assess each individual for cultural preferences because there are many individual and **subculture** variations.
2. Build a relationship based on trust.
3. Assess the meaning of the client's verbal and nonverbal behavior.
4. Be flexible and avoid rigidity in scheduling care.
5. Encourage family involvement.
6. Alternative modes of healing include herbs, prayer, and laying on of hands practices.

Learn about the cultures of clients with whom you will be working; also, ask clients about their health care practices and preferences.

**II. AMISH**

**A.** Description: The Amish are known for simple living, plain dress, and reluctance to adopt modern convenience and can be considered a distinct **ethnic group**; the various Amish church fellowships are Christian religious denominations that form a very traditional subgrouping of Mennonite churches. (See Box 6-2 for Amish communities.)

**B.** Cultural **beliefs** and preferences (Box 6-3)

Cultural beliefs and preferences vary depending on specific Amish community membership.

**C.** Interventions

1. Assess each individual for cultural preferences because there may be individual and group variations.
2. Speak to both the husband and the wife regarding health care decisions because they consider themselves partners in family life.

3. Health instructions must be given in simple, clear language.
4. Most Amish need to have church (bishop and community) permission to be hospitalized because the community will come together to help pay the costs.
5. Usually, Amish do not have health insurance because it is a “worldly product” and may show a lack of faith in God.

### Box 6-2 Amish Communities

#### Old Order Amish

Members live in rural communities in North America and are known for their plain dress and limited use of technology.

#### Amish Mennonites

This broad term is used for churches that split from the Old Order Amish; some have a lifestyle similar to the Old Order Amish, whereas others do not.

#### Beachy Amish

Members have fewer limits on the use of technology and do not shun those who join Mennonite churches.

#### New Order Amish

This is the least restrictive Amish group; the use of electricity in the home is permitted, and shunning is not practiced.

### Box 6-3 Amish Cultural Beliefs and Preferences

Amish maintain a culture distinct and separate from the non-Amish.

They usually speak a German dialect called Pennsylvania Dutch.

German language is usually used during worship; English is usually learned in school.

Men follow the laws of the Hebrew Scriptures with regard to beards (mustaches are not grown because of the long-perceived association of mustaches with the military).

Men usually dress in a plain, dark-colored suit; women usually wear a plain dress with long sleeves, bonnet, and apron.

Women are not allowed to hold positions of power in the congregational organization.

Marriage outside the faith is usually not allowed.

Family life has a patriarchal structure.

Although the roles of women are considered equally important to those of men, they are very unequal in terms of authority.

Unmarried women remain under the authority of their fathers.

Wives are submissive to their husbands.

Amish generally remain separate from the rest of the world, physically and socially.

They reject materialism and worldliness.

6. Barriers to modern health care include distance, lack of transportation, cost, and language (most do not understand scientific jargon).

 Be alert to cues regarding eye contact, personal space, time concepts, and understanding of the recommended plan of care.

### III. ASIAN AMERICANS

- A. Description: Americans of Asian descent; can include **ethnic groups** such as Chinese Americans, Filipino Americans, Indian Americans, Vietnamese Americans, Korean Americans, Japanese Americans and others whose national origin is from the Asian continent.
- B. Communication 
  1. Languages include Chinese, Japanese, Korean, Filipino, Vietnamese, and English.
  2. Silence is valued.
  3. Eye contact may be considered inappropriate or disrespectful.
  4. Criticism or disagreement is not expressed verbally.
  5. Head nodding does not always mean agreement.
  6. The word “no” may be interpreted as disrespect for others.
- C. Time orientation and personal space preferences
  1. Time orientation reflects respect for the past, but includes emphasis on the present and future.

2. Formal personal space is preferred except with family and close friends.
3. Members usually do not touch others during conversation.
4. For some **cultures**, touching is unacceptable between members of the opposite gender.
5. The head is considered to be sacred in some **cultures**; touching someone on the head may be disrespectful.

#### D. Social roles

1. Members are devoted to tradition.
2. Large extended-family networks are common.
3. Loyalty to immediate and extended family and honor are valued.
4. Family unit is structured and hierarchical.
5. Men have the power and authority, and women are expected to be obedient.
6. Education is viewed as important.
7. Religions include Taoism, Buddhism, Confucianism, Shintoism, Hinduism, Islam, and Christianity.
8. Social organizations are strong within the community.

#### E. Health and illness

1. Health is a state of physical and spiritual harmony with nature and a balance between positive and negative energy forces (yin and yang).
2. A healthy body may be viewed as a gift from the ancestors.
3. Illness may be viewed as an imbalance between yin and yang.
4. Yin foods are cold and yang foods are hot; one eats cold foods when one has a hot illness, and one eats hot foods when one has a cold illness.
5. Illness may also be attributed to prolonged sitting or lying or to overexertion.
6. Food preferences include raw fish, rice, and vegetables.

#### F. Health risks

1. Hypertension
2. Heart disease
3. Cancer
4. Lactose intolerance
5. Thalassemia

#### G. Interventions

1. Assess each individual for cultural preferences because there are many individual and **subculture** variations.
2. Be aware of and respect physical boundaries; request permission to touch the client before doing so.
3. Limit eye contact.
4. Avoid gesturing with hands.
5. If possible, a female client prefers a female health care provider.
6. Clarify responses to questions and expectations of the health care provider.

7. Be flexible and avoid rigidity in scheduling care.
8. Encourage family involvement.
9. Alternative modes of healing include herbs, acupuncture, restoration of balance with foods, massage, and offering of prayers and incense.

 If health care recommendations, interventions, or treatments do not fit within the client's cultural values, they will not be followed.

## IV. HISPANIC AND LATINO AMERICANS

**A.** Description: Americans of origins in Latin countries; Mexican Americans, Cuban Americans, Colombian Americans, Dominican Americans, Puerto Rican Americans, Spanish Americans, and Salvadoran Americans are some Hispanic and Latino American subgroups.

#### B. Communication

1. Languages include primarily English and Spanish.
2. Members tend to be verbally expressive, yet confidentiality is important.
3. Avoiding eye contact with a person in authority may indicate respect and attentiveness.
4. Direct confrontation is usually disrespectful and the expression of negative feelings may be impolite.
5. Dramatic body language, such as gestures or facial expressions, may be used to express emotion or pain.

#### C. Time orientation and personal space preferences

1. Members are usually oriented more to the present.
2. Members may be late for an appointment because relationships and events that are occurring are valued more than being on time.
3. Members are comfortable in close proximity with family, friends, and acquaintances.
4. Members are very tactile and use embraces and handshakes.
5. Members value the physical presence of others.
6. Politeness and modesty are important.

#### D. Social roles

1. The nuclear family is the basic unit; also, large, extended-family networks are common.
2. The extended family is highly regarded.
3. Needs of the family take precedence over the needs of an individual family member.
4. Depending on age and **acculturation** factors, men are usually the decision makers and wage earners, and women are the caretakers and homemakers.
5. Religion usually is Catholicism, but may vary depending on origin.
6. Members usually have strong church affiliations.
7. Social organizations are strong within the community.

**E. Health and illness**

1. Health may be viewed as a reward from God or a result of good luck.
2. Some members believe that health results from a state of physical and emotional balance.
3. Illness may be viewed by some members to be a result of God's punishment for sins.
4. Some members may adhere to nontraditional health measures such as folk medicine.

**F. Health risks**

1. Hypertension
2. Heart disease
3. Diabetes mellitus
4. Obesity
5. Lactose intolerance
6. Parasites

**G. Interventions**

1. Assess each individual for cultural preferences because there are many individual and **subculture** variations.
2. Allow time for the client to discuss treatment options with family members.
3. Protect privacy.
4. Offer to call clergy because of the significance of religious preferences related to illnesses.
5. Ask permission before touching a child when planning to examine or care for him or her.
6. Be flexible regarding time of arrival for appointments and avoid rigidity in scheduling care.
7. Alternative modes of healing include herbs, consultation with lay healers, restoration of balance with hot or cold foods, prayer, and religious medals.

 **Treat each client and individuals accompanying the client with respect and appreciate the differences and diversity of beliefs about health, illness, and treatment modalities.**

**V. NATIVE AMERICANS**

**A.** Description: term that the U.S. government uses to describe indigenous peoples from the regions of North America encompassed by the continental United States, including parts of Alaska and the island state of Hawaii; comprise a large number of distinct tribes, states, and **ethnic groups**, many of which survive as intact political communities.

**B. Communication**

1. There is much linguistic diversity, depending on origin.
2. Silence indicates respect for the speaker for some groups.
3. Some members may speak in a low tone of voice and expect others to be attentive.
4. Eye contact may be viewed as a sign of disrespect.
5. Body language is important.

**C. Time orientation and personal space preferences**

1. Members are oriented primarily to the present.
2. Personal space is important.
3. Members may lightly touch another person's hand during greetings.
4. Massage may be used for newborn to promote bonding between the infant and mother.
5. Some groups may prohibit touching of a dead body.

**D. Social roles**

1. Members are family oriented.
2. Basic family unit is the extended family, which often includes persons from several households.
3. In some groups, grandparents are viewed as family leaders.
4. Elders are honored.
5. Children are taught to respect traditions.
6. The father usually does all the work outside the home, and the mother assumes responsibility for domestic duties.
7. Sacred myths and legends provide spiritual guidance for some groups.
8. Most members adhere to some form of Christianity, and religion and healing practices are usually integrated.
9. Community social organizations are important.

**E. Health and illness**

1. Health is usually considered a state of harmony between the individual, family, and environment.
2. Some groups believe that illness is caused by supernatural forces and disequilibrium between the person and environment.
3. Traditional health and illness **beliefs** may continue to be observed by some groups, including natural and religious folk medicine tradition.
4. For some groups, food preferences include cornmeal, fish, game, fruits, and berries.

**F. Health risks**

1. Alcohol abuse
2. Obesity
3. Heart disease
4. Diabetes mellitus
5. Tuberculosis
6. Arthritis
7. Lactose intolerance
8. Gallbladder disease

**G. Interventions**

1. Assess each individual for cultural preferences because there may be individual variations.
2. Clarify communication.
3. Understand that the client may be attentive, even when eye contact is absent.
4. Be attentive to your own use of body language.
5. Obtain input from members of the extended family.
6. Encourage the client to personalize space in which health care is delivered; for example, encourage the client to bring personal items or objects to the hospital.

7. In the home, assess for the availability of running water, and modify infection control and hygiene practices as necessary.
8. Alternative modes of healing include herbs, restoration of balance between the person and the universe, and consultation with traditional healers.

 If language barriers pose a problem, seek a qualified medical interpreter; avoid using ancillary staff or family members as interpreters.

## VI. WHITE AMERICANS

**A.** Description: term used to include U.S. citizens or residents having origins in any of the original people of Europe, the Middle East, or North Africa; the term is interchangeable with Caucasian American.

### B. Communication

1. Languages include language of origin (e.g., Italian, Polish, French, Russian) and English.
2. Silence can be used to show respect or disrespect for another, depending on the situation.
3. Eye contact is usually viewed as indicating trustworthiness in most origins.

### **C.** Time orientation and personal space preferences

1. Members are usually future oriented.
2. Time is valued; members tend to be on time and to be impatient with people who are not on time.
3. Some members may tend to avoid close physical contact.

### D. Handshakes are usually used for formal greetings.

### **D.** Social roles

1. The nuclear family is the basic unit; the extended family is also important.
2. The man is usually the dominant figure, but a variation of gender roles exists within families and relationships.
3. Religions are varied, depending on origin.
4. Community social organizations are important.

### **E.** Health and illness

1. Health is usually viewed as an absence of disease or illness.
2. Many members usually have a tendency to be stoical when expressing physical concerns.
3. Members usually rely primarily on the modern Western health care delivery system.
4. Food preferences are based on origin; many members prefer items containing carbohydrates and red meat items.

### F. Health risks

1. Cancer
2. Heart disease
3. Diabetes mellitus
4. Obesity
5. Hypertension

## **G.** Interventions

1. Assess each individual for cultural preferences based on origin.
2. Build a relationship based on trust.
3. Assess the meaning of the client's verbal and nonverbal behavior.
4. Respect the client's personal space and time.
5. Be flexible and avoid rigidity in scheduling care.
6. Encourage family involvement.

## **VII. END-OF-LIFE CARE** (Box 6-4)

**A.** Christian Science religion is unlikely to use medical means to prolong life.

**B.** People in the Jewish faith generally oppose prolonging life after irreversible brain damage.

**C.** Eastern Orthodox religions, Muslims, and Orthodox Jews may prohibit, oppose, or discourage autopsy.

**D.** Muslims prohibit organ donation.

**E.** Amish permit organ donation with the exception of heart transplants (the heart is the soul of the body).

**F.** Buddhists in the United States encourage organ donation and consider it an act of mercy.

**G.** Mormon, Eastern Orthodox, Islamic, and Jewish (Conservative and Orthodox) faiths discourage, oppose, or prohibit cremation.

**H.** Hindus prefer cremation and cast the ashes in a holy river.

### **I.** Hispanic and Latino groups

1. The family generally makes decisions and may request to withhold the diagnosis or prognosis from the client.
2. Extended-family members often are involved in end-of-life care (pregnant women may be prohibited from caring for dying clients or attending funerals).
3. Several family members may be at the dying client's bedside.
4. Vocal expression of grief and mourning are acceptable and expected.
5. Members refuse procedures that alter the body, such as organ donation or autopsy.
6. Dying at home may be considered bad luck.

### **J.** African Americans

1. Members discuss issues with the spouse or older family member (elders are held in high respect).
2. Family is highly valued and is central to the care of terminally ill members.
3. Open displays of emotion are common and accepted.
4. Organ and blood donation usually are not allowed.
5. Members prefer to die at home.

### **K.** Asian Americans

1. Family members may make decisions about care and often do not tell the client the diagnosis or prognosis.

**Box 6-4 Religion and End-of-Life Care****Christianity****Catholic and Orthodox**

A priest anoints the sick.

Other sacraments before death include reconciliation and holy communion.

**Protestant**

No last rites are provided (anointing of the sick is accepted by some groups).

Prayers are given to offer comfort and support.

**Church of Jesus Christ of Latter-Day Saints (Mormons)**

A sacrament may be administered if the client requests.

**Jehovah's Witness**

Members do not believe in sacraments.

Members are excommunicated if they receive a blood transfusion.

**Amish**

Funerals are conducted in the home without a eulogy, flower decorations, or any other display; caskets are plain and simple, without adornment.

At death, a woman is usually buried in her bridal dress.

One is believed to live on after death, either with eternal reward in heaven or punished in hell.

**Islam**

Second-degree male relatives such as cousins or uncles should be the contact person and determine whether the client or family should be given information about the client.

The client may choose to face Mecca (west or southwest in the United States).

The head should be elevated above the body.

Discussions about death usually are not welcomed.

Stopping medical treatment is against the will of Allah (Arabic word for God).

Grief may be expressed through slapping or hitting the body.

If possible, only a same-gender Muslim should handle the body after death; if not possible, non-Muslims should wear gloves so as not to touch the body.

**Judaism**

Prolongation of life is important (a client on life support must remain so until death).

A dying person should not be left alone (a rabbi's presence is desired).

Autopsy and cremation are forbidden.

**Hinduism**

Rituals include tying a thread around the neck or wrist of the dying person, sprinkling the person with special water, and placing a leaf of basil on their tongue.

After death, the sacred threads are not removed, and the body is not washed.

**Buddhism**

A shrine to Buddha may be placed in the client's room.

Time for meditation at the shrine is important and should be respected.

Clients may refuse medications that may alter their awareness (e.g., opioids).

After death, a monk may recite prayers for 1 hour (need not be done in the presence of the body).

2. Dying at home may be considered bad luck.
3. Organ donation is usually not allowed.

**L. Native Americans**

1. Family meetings may be held to make decisions about end-of-life and the type of treatments that should be pursued.
2. Some groups avoid contact with the dying (may prefer to die in the hospital).

Provide individualized end-of-life care to client and families.

**VIII. COMPLEMENTARY AND ALTERNATIVE MEDICINE (CAM)****A. Description**

1. Therapies are used in addition to conventional treatment to provide healing resources and focus on the mind-body connection.
2. High-risk therapies (therapies that are invasive) and low-risk therapies (those that are noninvasive) are included in CAM.
3. The National Center for Complementary and Alternative Medicine (NCCAM) has proposed

**Box 6-5 Categories of Complementary and Alternative Medicine (CAM)**

Whole medical systems

Mind-body medicine

Biologically based practices

Manipulative and body-based practices

Energy medicine

a classification system that includes five categories of complementary and alternative types of therapy (Box 6-5).

**B. Whole medical systems**

1. Traditional Chinese medicine (TCM): Focuses on restoring and maintaining a balanced flow of vital energy; interventions include acupressure, acupuncture, herbal therapies, diet, meditation, tai chi, and qi gong (exercise that focuses on breathing, visualization, and movement).
2. Ayurveda: Focuses on the balance of mind, body, and spirit; interventions include diet, medicinal herbs, detoxification, massage, breathing exercises, meditation, and yoga.

**Box 6-6 Biologically Based Practices****Aromatherapy**

The use of topical or inhaled oils (plant extracts) that promote and maintain health

**Herbal Therapies**

The use of herbs derived mostly from plant sources that maintain and restore balance and health

**Macrobiotic Diet**

Diet high in whole-grain cereals, vegetables, beans, sea vegetables, and vegetarian soups

Elimination of meat, animal fat, eggs, poultry, dairy products, sugars, and artificially produced food from the diet

**Orthomolecular Therapy**

Focus on nutritional balance, including use of vitamins, essential amino acids, essential fats, and minerals

3. Homeopathy: Focuses on healing and interventions consisting of small doses of specially prepared plant and mineral extracts that assist in the innate healing process of the body.
  4. Naturopathy: Focuses on enhancing the natural healing responses of the body; interventions include nutrition, herbology, hydrotherapy, acupuncture, physical therapies, and counseling.
- C. Mind-body medicine**
1. Mind-body medicine focuses on the interactions among the brain, mind, body, and behavior and on the powerful ways in which emotional, mental, social, spiritual, and behavioral factors can directly affect health.
  2. Interventions include biofeedback, hypnosis, relaxation therapy, meditation, visual imagery, yoga, tai chi, qi gong, cognitive-behavioral therapies, group supports, autogenic training, and spirituality.
- D. Biologically based practices (Box 6-6)**
1. Biologically based therapies in CAM use substances found in nature, such as herbs, foods, and vitamins.
  2. Therapies include botanicals, prebiotics and probiotics, whole-food diets, functional foods, animal-derived extracts, vitamins, minerals, fatty acids, amino acids, and proteins.
- E. Manipulative and body-based practices**
1. Interventions involve manipulation and movement of the body by a therapist.
  2. Interventions include practices such as chiropractic and osteopathic manipulation, massage therapy, and reflexology.
- F. Energy medicine**
1. Energy therapies focus on energy originating within the body or on energy from other sources.
  2. Interventions include sound energy therapy, light therapy, acupuncture, qi gong, reiki and johre, therapeutic touch, intercessory prayer, whole medical systems, and magnetic therapy.

**Box 6-7 Commonly Used Herbs and Health Products**

*Aloe*: Anti-inflammatory and antimicrobial effect; accelerates wound healing

*Angelica*: Antispasmodic and vasodilator; balances the effects of estrogen

*Bilberry*: Improves microcirculation in the eyes

*Black cohosh*: Produces estrogen-like effects

*Cat's claw*: Antioxidant; stimulates the immune system, lowers blood pressure

*Chamomile*: Antispasmodic and anti-inflammatory; produces mild sedative effect

*Dehydroepiandrosterone (DHEA)*: Converts to androgens and estrogen; slows the effects of aging; used for erectile dysfunction

*Echinacea*: Stimulates immune system

*Evening primrose*: Assists with metabolism of fatty acid

*Feverfew*: Anti-inflammatory; used for migraine headaches, arthritis, and fever

*Garlic*: Antioxidant; used to lower cholesterol levels

*Ginger*: Antiemetic; used for nausea and vomiting

*Ginkgo biloba*: Antioxidant; used to improve memory

*Ginseng*: Increases physical endurance and stamina; used for stress and fatigue

*Glucosamine*: Amino acid that assists in the synthesis of cartilage

*Goldenseal*: Anti-inflammatory and antimicrobial used to stimulate the immune system; has an anticoagulant effect and may increase blood pressure

*Kava*: Antianxiety and skeletal muscle relaxant; produces a sedative effect

*Melatonin*: A hormone that regulates sleep; used for insomnia

*Milk thistle*: Antioxidant; stimulates the production of new liver cells, reduces liver inflammation; used for liver and gallbladder disease

*Peppermint oil*: Antispasmodic; used for irritable bowel syndrome

*St. John's wort*: Antibacterial, antiviral, antidepressant

*Saw palmetto*: Antiestrogen activity; used for urinary tract infections and benign prostatic hypertrophy

*Valerian*: Used to treat nervous disorders such as anxiety, restlessness, and insomnia

*Zinc*: Antiviral; stimulates the immune system

**IX. HERBAL THERAPIES (Box 6-7)**

- A.** Herbal therapy is the use of herbs (plant or a plant part) for the therapeutic value on health.
- B.** Some herbs have been determined to be safe, but some herbs, even in small amounts, can be toxic.
- C.** If the client is taking prescription medications, the client should consult with the health care provider regarding the use of herbs because serious herb-medication interactions can occur.
- D.** Client teaching points
  1. Discuss herbal therapies with the health care provider before use.

2. Contact the physician if any side effects of the herbal substance occur.
3. Contact the health care provider before stopping the use of a prescription medication.
4. Avoid using herbs to treat a serious medical condition such as heart disease.
5. Avoid taking herbs if pregnant or attempting to get pregnant or if nursing.
6. Do not give herbs to infants or young children.
7. Purchase herbal supplements only from a reputable manufacturer; the label should contain the scientific name of the herb, name and address of the manufacturer, batch or lot number, date of manufacture, and expiration date.
8. Adhere to the recommended dose; if herbal preparations are taken in high doses, they can be toxic.
9. Moisture, sunlight, and heat may alter the components of herbal preparations.
10. If surgery is planned, the herbal therapy may need to be discontinued 2 to 3 weeks before surgery.

 Some herbs have been determined to be safe, but some herbs, even in small amounts, can be toxic. Inform the client to discuss herbal therapies with the health care provider before use.

## X. LOW-RISK THERAPIES

- A. Low-risk therapies are therapies that have no adverse effects and, when implementing care, can be used by the nurse who has training and experience in their use.
- B. Common low-risk therapies
  1. Meditation
  2. Relaxation techniques
  3. Imagery
  4. Music therapy
  5. Massage
  6. Touch
  7. Laughter and humor
  8. Spiritual measures, such as prayer

## MORE QUESTIONS ON THE CD!

### Practice Questions

1. An ambulatory care nurse is discussing preoperative procedures with a Japanese American client who is scheduled for surgery the following week. During the discussion, the client continually smiles and nods the head. The nurse interprets this nonverbal behavior as:
  1. Reflecting a cultural value
  2. An acceptance of the treatment
  3. The client is agreeable to the required procedures.
  4. The client understands the preoperative procedures.
2. When communicating with a client who speaks a different language, the best practice for a nurse is to:
  1. Speak loudly and slowly.
  2. Stand close to the client and speak loudly.
  3. Arrange for an interpreter when communicating with the client.
  4. Speak to the client and family together to increase the chances that the topic will be understood.
3. A nurse educator is providing in-service education to the nursing staff regarding transcultural nursing care; a staff member asks the nurse educator to describe the concept of acculturation. Which of the following is the appropriate response?
  1. "It is a subjective perspective of the person's heritage and a sense of belonging to a group."
  2. "It is a process of learning a different culture to adapt to a new or changing environment."
  3. "It is a group of individuals in a society who are culturally distinct and have a unique identity."
  4. "It is a group that shares some of the characteristics of the larger population group of which it is a part."
4. A nurse is providing discharge instructions to a Chinese-American client regarding prescribed dietary modifications. During the teaching session, the client continuously turns away from the nurse. The nurse should implement which appropriate action?
  1. Continue with the instructions, verifying client understanding.
  2. Walk around the client so that the nurse constantly faces the client.
  3. Give the client a dietary booklet and return later to continue with the instructions.
  4. Tell the client about the importance of the instructions for the maintenance of health care.
5. A nurse educator asks a student to list the five categories of complementary and alternative medicine (CAM), developed by the National Center for Complementary and Alternative Medicine (NCCAM). Which of the following, if stated by the nursing student, would indicate an understanding of the five categories of CAM?
  1. Herbology, hydrotherapy, acupuncture, nutrition, and chiropractic care
  2. Mind-body medicine, traditional Chinese medicine, homeopathy, naturopathy, and healing touch
  3. Biologically based practices, body-based practices, magnetic therapy, massage therapy, and aromatherapy
  4. Whole medical systems, mind-body medicine, biologically based practices, manipulative and body-based practices, and energy medicine

6. Which of the following clients has the lowest risk of obesity and diabetes mellitus?
  1. A 45-year-old Native-American man
  2. A 23-year-old Asian-American woman
  3. A 35-year-old Hispanic-American man
  4. A 40-year-old African-American woman
  
7. A nurse is preparing a plan of care for a client who is a Jehovah's Witness. The client has been told that surgery is necessary. The nurse considers the client's religious preferences in developing the plan of care and documents that:
  1. Religious sacraments are important.
  2. Medication administration is not allowed.
  3. Surgery is prohibited in this religious group.
  4. The administration of blood and blood products is forbidden.
  
8. Which of the following meal trays would be appropriate for a nurse to deliver to a client of Orthodox Judaism faith who follows a kosher diet?
  1. Pork roast, rice, vegetables, mixed fruit, milk
  2. Crab salad on a croissant, vegetables with dip, potato salad, milk
  3. Sweet and sour chicken with rice and vegetables, mixed fruit, juice
  4. Fettuccini Alfredo with shrimp and vegetables, salad, mixed fruit, iced tea
  
9. An Asian-American client is experiencing a fever. A nurse recognizes that the client is likely to self-treat the disorder with:
  1. Magnetic therapy
  2. Intercessory prayer
  3. Foods considered to be yin
  4. Foods considered to be yang
  
10. The role of a nurse regarding complementary and alternative medicine (CAM) should include:
  1. Advising the client about "good" versus "bad" therapies
  2. Recommending herbal remedies that the client should use
  3. Discouraging the client from using any alternative therapies
  4. Educating the client about therapies that he or she is using or is interested in using
  
11. An antihypertensive medication has been prescribed for a client with hypertension. The client tells a clinic nurse that she would like to take an herbal substance to help lower her blood pressure. The nurse should take which appropriate action?
  1. Tell the client that herbal substances are not safe and should never be used.
  2. Encourage the client to discuss the use of an herbal substance with the physician.
  3. Teach the client how to take her blood pressure so that it can be monitored closely.
  4. Tell the client that if she takes the herbal substance she will need to have her blood pressure checked frequently.

### Alternate Item Format: Multiple Response

12. A nurse describes low-risk therapies to a client and includes which of the following in the discussion? **Select all that apply.**
  - 1. Herbs
  - 2. Prayer
  - 3. Touch
  - 4. Massage
  - 5. Relaxation
  - 6. Acupuncture

## ANSWERS

### 1. 1

**Rationale:** Nodding or smiling by a Japanese-American client may reflect only the cultural value of interpersonal harmony. This nonverbal behavior may not be an indication of agreement with the speaker, an acceptance of the treatment, or an understanding of the procedure.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 2 and 3 first because they are comparable or alike. From the remaining options, select option 1 because it is characteristic of Asian-American cultures. In addition, option 4 is an incorrect interpretation of the client's nonverbal behavior. Review the cultural characteristics of the Japanese-American population if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Fundamental Skills—Cultural Diversity

**Reference:** Giger, J., & Davidhizar, R. (2008). *Transcultural nursing assessment and intervention* (5th ed., p. 15). St. Louis: Mosby.

### 2. 3

**Rationale:** Arranging for an interpreter would be the best practice when communicating with a client who speaks a different language. Options 1 and 2 are inappropriate and are ineffective ways in which to communicate. Option 4 is inappropriate because it violates privacy and does not ensure correct translation.

**Test-Taking Strategy:** Note the strategic words *best practice* in the question. Eliminate option 4 first because it violates the client's right to privacy. Next, eliminate options 1 and 2 noting the word *loudly* in these options and because they are

nontherapeutic actions. Review the best communication techniques for a client who speaks a different language if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Fundamental Skills—Cultural Diversity

**References:** Jarvis, C. (2008). *Physical examination and health assessment* (5th ed., pp. 71–72). St. Louis: Saunders.

Lewis, S., Heitkemper, M., Dirksen, S., & Bucher, L. (2007). *Medical-surgical nursing: Assessment and management of clinical problems* (7th ed., p. 36). St. Louis: Mosby.

### 3. 2

**Rationale:** Acculturation is a process of learning a different culture to adapt to a new or changing environment. Option 1 describes ethnic identity. Option 3 describes an ethnic group. Option 4 describes a subculture.

**Test-Taking Strategy:** Focus on the subject, acculturation. Think about the definition of acculturation to help direct you to option 2. Review the definition of acculturation if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Cultural Diversity

**Reference:** Jarvis, C. (2008). *Physical examination and health assessment* (5th ed., p. 40). St. Louis: Saunders.

### 4. 1

**Rationale:** Most Chinese Americans maintain a formal distance with others, which is a form of respect. Many Chinese Americans are uncomfortable with face-to-face communications, especially when eye contact is direct. If the client turns away from the nurse during a conversation, the most appropriate action is to continue with the conversation. Walking around to the client so that the nurse faces the client is in direct conflict with the cultural practice. The client may consider it a rude gesture if the nurse returns later to continue with the explanation. Telling the client about the importance of the instructions for the maintenance of health care may be viewed as degrading.

**Test-Taking Strategy:** Eliminate options 3 and 4 first because these actions are nontherapeutic. To select from the remaining options, think about the cultural practices of Chinese Americans and recall that direct eye contact is uncomfortable for the client. Option 1 is the appropriate action. If you had difficulty with this question, review the communication practices of this cultural group.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Cultural Diversity

**Reference:** Jarvis, C. (2008). *Physical examination and health assessment* (5th ed., p. 73). St. Louis: Saunders.

### 5. 4

**Rationale:** The five categories of complementary and alternative medicine (CAM) include whole medical systems, mind-body medicine, biologically based practices, manipulative and body-based practices, and energy medicine. The other options contain therapies within each category of CAM.

**Test-Taking Strategy:** Focus on the subject of the question. Noting that the question asks about categories, not therapies, will assist in directing you to option 4. Review the categories of CAM if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Cultural Diversity

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 774). St. Louis: Mosby.

### 6. 2

**Rationale:** From the options provided, Asian Americans have the lowest risk of obesity and diabetes mellitus. Because of their health and dietary practices, Native Americans, African Americans, and Hispanic Americans have a high risk of obesity and diabetes mellitus.

**Test-Taking Strategy:** Note the strategic words *lowest risk*, *obesity*, and *diabetes mellitus*. Think about the health and dietary practices of each cultural group to direct you to option 2. If you had difficulty with this question, review the characteristics of the Asian-American culture.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Cultural Diversity

**Reference:** Lewis, S., Heitkemper, M., Dirksen, S., & Bucher, L. (2007). *Medical-surgical nursing: Assessment and management of clinical problems* (7th ed., p. 972). St. Louis: Mosby.

### 7. 4

**Rationale:** Among Jehovah's Witnesses, surgery is not prohibited, but the administration of blood and blood products is forbidden. This religious group does not believe in sacraments. Administration of medication is an acceptable practice except if the medication is derived from blood products.

**Test-Taking Strategy:** Focus on the religious group addressed in the question. Remember that the administration of blood and any associated blood products is forbidden in Jehovah's Witnesses. Review the characteristics of this religious group if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Fundamental Skills—Cultural Diversity

**Reference:** Lewis, S., Heitkemper, M., Dirksen, S., & Bucher, L. (2007). *Medical-surgical nursing: Assessment and management of clinical problems* (7th ed., p. 32). St. Louis: Mosby.

### 8. 3

**Rationale:** Orthodox Judaism believers adhere to dietary kosher laws. In this religion, the dairy-meat combination is unacceptable. Only fish that have scales and fins are allowed; meats that are allowed include animals that are vegetable eaters, cloven-hoofed, and ritually slaughtered.

**Test-Taking Strategy:** Use the process of elimination, recalling that the dairy-meat combination is unacceptable in this religious group. Eliminate option 1 because this option contains pork roast and milk. Next eliminate options 2 and 4 because both options contain shell fish. Review the dietary rules of this religious group if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Cultural Diversity

**References:** Giger, J., & Davidhizar, R. (2008). *Transcultural nursing assessment and intervention* (5th ed., p. 609). St. Louis: Mosby.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 457). St. Louis: Mosby.

### 9. 3

**Rationale:** In the Asian-American culture, health is believed to be a state of physical and spiritual harmony with nature and a balance between positive and negative energy forces (yin and yang). Yin foods are cold and yang foods are hot. Cold foods are eaten when one has a hot illness (fever), and hot foods are eaten when one has a cold illness. Options 1 and 2 are not health practices specifically associated with the Asian-American culture or the yin and yang theory.

**Test-Taking Strategy:** Focus on the client's culture and the client's diagnosis, fever. Remember that cold foods (yin foods) are eaten when one has a hot illness, and hot foods (yang foods) are eaten when one has a cold illness. If you are unfamiliar with the yin and yang theory and the health practices of the Asian-American culture, review this information.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Fundamental Skills—Cultural Diversity

**References:** Giger, J., & Davidhizar, R. (2008). *Transcultural nursing assessment and intervention* (5th ed., p. 460). St. Louis: Mosby.

Jarvis, C. (2008). *Physical examination and health assessment* (5th ed., p. 45). St. Louis: Saunders.

### 10. 4

**Rationale:** Complementary (alternative) therapies include a wide variety of treatment modalities that are used in addition to conventional therapy to treat a disease or illness. Educating the client about therapies that he or she uses or is interested in using is the nurse's role. Options 1, 2, and 3 are inappropriate actions for the nurse to take.

**Test-Taking Strategy:** Use therapeutic communication techniques. Eliminate options 1, 2, and 3 because they are nontherapeutic. Recommending an herbal remedy or discouraging a client from doing something is not within the role practices of the nurse. Additionally, it is nontherapeutic to advise a client to do something. Option 4 is the only option that is appropriate and therapeutic. Review therapeutic communication techniques and the nurse's role in educating clients about alternative therapies if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Cultural Diversity

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 772). St. Louis: Mosby.

### 11. 2

**Rationale:** Although herbal substances may have some beneficial effects, not all herbs are safe to use. Clients who are being treated with conventional medication therapy should be encouraged to avoid herbal substances with similar pharmacological effects because the combination may lead to an excessive reaction or to unknown interaction effects. The nurse would advise the client to discuss the use of the herbal substance with the physician. Options 1, 3, and 4 are inappropriate nursing actions.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 1 first because of the close-ended word *never*. Next, eliminate options 3 and 4 because they are comparable or alike and relate to blood pressure monitoring. Review the limitations associated with the use of herbal substances if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Cultural Diversity

**References:** Lewis, S., Heitkemper, M., Dirksen, S., & Bucher, L. (2007). *Medical-surgical nursing: Assessment and management of clinical problems* (7th ed., p. 101). St. Louis: Mosby.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., pp. 781–783). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 12. 2, 3, 4, 5

**Rationale:** Low-risk therapies are therapies that have no adverse effects and, when implementing care, can be used by a nurse who has training and experience in their use. Low-risk therapies include meditation, relaxation techniques, imagery, music therapy, massage, touch, laughter and humor, and spiritual measures, such as prayer. The other options are not considered low-risk therapies.

**Test-Taking Strategy:** Focus on the strategic words *low-risk*. Recalling that low-risk therapies are therapies that are noninvasive and that have no adverse effects and can be used by a nurse who has training and experience will direct you to the correct options. Review complementary and alternative medicine (CAM) and low-risk therapies if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Cultural Diversity

**References:** Lewis, S., Heitkemper, M., Dirksen, S., & Bucher, L. (2007). *Medical-surgical nursing: Assessment and management of clinical problems* (7th ed., pp. 97–98). St. Louis: Mosby.

# Ethical and Legal Issues

## PYRAMID TERMS

**advance directive** Written document recognized by state law that provides directions concerning the provision of care when a client is unable to make his or her own treatment choices; the two basic types of advance directives include living wills and durable powers of attorney.

**advocacy** Acting on the behalf of the client and protecting the client's rights to make his or her own decisions.

**confidentiality/information security** In the health care system, refers to the protection of privacy of the client's personal health information.

**consent** Voluntary act whereby a person agrees to allow someone else to do something.

**ethics** The ideals of right and wrong; guiding principles that individuals may use to make decisions.

**HIPAA (Health Insurance Portability and Accountability Act)** Federal law that establishes standards for the privacy and security of health information and a standard for electronic data interchange of health information.

**informed consent** A client's understanding of the reason for the proposed intervention, with its benefits and risks, and agreement with the treatment by signing a consent form.

**law** A system composed of general rules governing conduct and the procedures for resolving disputes when rules are not followed.

**malpractice** Type of negligence; failure to meet the standards of acceptable care, which results in harm to another person.

**negligence** Conduct that falls below a standard of care; failure to meet a client's needs either willfully or by omission or failure to act.

**Patient's Bill of Rights** The rights and responsibilities of clients receiving care.

**values** Beliefs and attitudes that may influence behavior and the process of decision making.

laws, and guidelines related to providing safe and quality care to clients. In the Pyramid to Success, focus on ethical practices; the nurse practice act and client's rights, particularly confidentiality, information security, and informed consent; advocacy, documentation, and advance directives; and cultural, religious, and spiritual issues. Knowledgeable use of information technology, such as an electronic health record, is also an important role of the nurse.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Acting as an advocate
- Advance directives documents
- Confidentiality and information security issues related to the client's health care
- Ensuring client rights
- Establishing priorities
- Ethical practice in health care
- Issues surrounding informed consent
- Legal responsibilities and information technology related to client care
- Quality improvement procedures
- Resource management
- Use of information technology

### Health Promotion and Maintenance

- Developmental stages and transitions
- High-risk behaviors of the client
- Lifestyle choices of the client

### Psychosocial Integrity

- Abuse and neglect issues
- Available support systems
- Chemical or other dependencies
- Coping mechanisms
- Cultural, spiritual, and religious issues
- End-of-life care and grief and loss

## PYRAMID TO SUCCESS

Across all settings in the practice of nursing, nurses frequently are confronted with ethical and legal issues related to client care. The professional nurse has the responsibility to be aware of the ethical principles,

## Physiological Integrity

Alterations in body systems  
Palliative and comfort care for the client  
Unexpected responses to therapies

### I. ETHICS

- A. Description: The branch of philosophy concerned with the distinction between right and wrong based on a body of knowledge, not based only on opinions
- B. Morality: Behavior in accordance with customs or tradition, usually reflecting personal or religious beliefs
- C. Ethical principles: Codes that direct or govern nursing actions (Box 7-1)
- D. **Values:** Beliefs and attitudes that may influence behavior and the process of decision making
- E. **Values clarification:** Process of analyzing one's own **values** to understand oneself more completely regarding what is truly important
- F. Ethical codes
  1. Ethical codes provide broad principles for determining and evaluating client care.
  2. These codes are not legally binding, but the board of nursing has authority in most states to reprimand nurses for unprofessional conduct that results from violation of the ethical codes.
  3. Specific ethical codes are as follows:
    - a. The Code for Nurses developed by the International Council of Nurses
    - b. American Nurses Association Code of Ethics (Box 7-2)
- G. Ethical dilemma
  1. An ethical dilemma occurs when there is a conflict between two or more ethical principles.
  2. No correct decision exists, and the nurse must make a choice between two alternatives that are equally unsatisfactory.

### Box 7-1 Ethical Principles

|                |   |
|----------------|---|
| Autonomy       | Respect for an individual's right to self-determination   |
| Nonmaleficence | The obligation to do or cause no harm to another  |
| Beneficence    | The duty to do good to others and to maintain a balance between benefits and harms; paternalism is an undesirable outcome of beneficence, in which the health care provider decides what is best for the client and encourages the client to act against his or her own choices |
| Justice        | The equitable distribution of potential benefits and tasks determining the order in which clients should be cared for   |
| Veracity       | The obligation to tell the truth  |
| Fidelity       | The duty to do what one has promised  |

3. Such dilemmas may occur as a result of differences in cultural or religious beliefs.
4. Ethical reasoning is the process of thinking through what one should do in an orderly and systematic manner to provide justification for actions based on principles; the nurse should gather all information to determine if an ethical dilemma exists, examine his or her own values, verbalize the problem, consider possible courses of action, negotiate the outcome, and evaluate the action taken.

### H. Advocate

1. An advocate is a person who speaks up for or acts on the behalf of the client, protects the client's right to make his or her own decisions, and upholds the principle of fidelity.

### Box 7-2 American Nurses Association Code of Ethics

The nurse, in all professional relationships, practices with compassion and respect for the inherent dignity, worth, and uniqueness of every individual, unrestricted by considerations of social or economic status, personal attributes, or the nature of health problems.

The nurse's primary commitment is to the client, whether an individual, family, group, or community.

The nurse promotes, advocates for, and strives to protect the health, safety, and rights of the client.

The nurse is responsible and accountable for individual nursing practice and determines the appropriate delegation of tasks consistent with the nurse's obligation to provide optimum client care.

The nurse owes the same duties to self as to others, including the responsibility to preserve integrity and safety, to maintain competence, and to continue personal and professional growth.

The nurse participates in establishing, maintaining, and improving health care environments and conditions of employment conducive to the provision of quality health care and consistent with the values of the profession through individual and collective action.

The nurse participates in the advancement of the profession through contributions to practice, education, administration, and knowledge development.

The nurse collaborates with other health professionals and the public in promoting community, national, and international efforts to meet health needs.

The profession of nursing, as represented by associations and their members, is responsible for articulating nursing values, for maintaining the integrity of the profession and its practice, and for shaping social policy.

From American Nurses Association. (2001). *Code of ethics for nurses with interpretive statements*. Washington, DC: American Nurses Publishing. Web site: <http://nursingworld.org/MainMenuCategories/ThePracticeofProfessionalNursing/EthicsStandards/CodeofEthics.aspx>. © 2001 By American Nurses Association. Reprinted with permission. All rights reserved.

2. An advocate represents the client's viewpoint to others.
3. An advocate avoids letting personal **values** influence **advocacy** for the client and supports the client's decision, even when it conflicts with the advocate's own preferences or choices.

#### I. **Ethics** committees

1. **Ethics** committees take a multidisciplinary approach to facilitate dialogue regarding ethical dilemmas.
2. These committees develop and establish policies and procedures to facilitate the prevention and resolution of dilemmas.

 An important nursing responsibility is to act as a client advocate and protect the client's rights.

## II. REGULATION OF NURSING PRACTICE

### A. Nurse practice act

1. A nurse practice act is a series of statutes that have been enacted by each state legislature to regulate the practice of nursing in that state.
2. Nurse practice acts set educational requirements for the nurse, distinguish between nursing practice and medical practice, and define the scope of nursing practice.
3. Additional issues covered by nurse practice acts include licensure requirements for protection of the public, grounds for disciplinary action, rights of the nurse licensee if a disciplinary action is taken, and related topics.
4. All nurses are responsible for knowing the provisions of the act of the state or province in which they work.

### B. Standards of care

1. Standards of care are guidelines that identify what the client can expect to receive in terms of nursing care.
2. The guidelines determine whether nurses have performed duties in an appropriate manner.
3. If a nurse does not perform duties within accepted standards of care, the nurse places himself or herself in jeopardy of legal action.
4. If a nurse is named as a defendant in a **mal-practice** lawsuit and proceedings show that the nurse followed neither the accepted standards of care outlined by the state or province nurse practice act nor the policies of the employing institution, the nurse's legal liability is clear; he or she is liable.

### C. Employee guidelines

1. Respondent superior: The employer is held liable for any negligent acts of an employee if the alleged negligent act occurred during the employment relationship and was within the scope of the employee's responsibilities.

### 2. Contracts

- a. Nurses are responsible for carrying out the terms of a contractual agreement with the employing agency and the client.
- b. The nurse-employee relationship is governed by established employee handbooks and client care policies and procedures that create obligations, rights, and duties between those parties.

### 3. Institutional policies

- a. Written policies and procedures of the employing institution detail how nurses are to perform their duties.
- b. Policies and procedures are usually specific and describe the expected behavior on the part of the nurse.
- c. Although policies are not **laws**, courts generally rule against nurses who violate policies.
- d. If the nurse practices nursing according to client care policies and procedures established by the employer, functions within the job responsibility, and provides care consistently in a non-negligent manner, the nurse minimizes the potential for liability.

 The nurse must follow the guidelines identified in the nurse practice act and agency policies and procedures when delivering client care.

### D. Hospital staffing

1. Charges of abandonment may be made against nurses who "walk out" when staffing is inadequate.
2. Nurses in short staffing situations are obligated to make a report to the nursing administration.

### E. Floating

1. Floating is an acceptable, legal practice used by health care facilities to alleviate understaffing and overstaffing.
2. Legally, a nurse cannot refuse to float unless a union contract guarantees that nurses can work only in a specified area or the nurse can prove lack of knowledge for the performance of assigned tasks.
3. Nurses in a floating situation must not assume responsibility beyond their level of experience or qualification.
4. Nurses who float should inform the supervisor of any lack of experience in caring for the type of clients on the new nursing unit.
5. The nurse should request and be given orientation to the new unit.

### F. Disciplinary action

1. Boards of nursing may deny, revoke, or suspend any license to practice as a registered nurse, according to their statutory authority.
2. Some causes for disciplinary action are as follows:

- a. Unprofessional conduct
- b. Conduct that could affect the health and welfare of the public adversely
- c. Breach of client **confidentiality**
- d. Failure to use sufficient knowledge, skills, or nursing judgment
- e. Physically or verbally abusing a client
- f. Assuming duties without sufficient preparation
- g. Knowingly delegating to unlicensed personnel nursing care that places the client at risk for injury
- h. Failure to maintain an accurate record for each client
- i. Falsifying a client's record
- j. Leaving a nursing assignment without properly notifying appropriate personnel

### III. LEGAL LIABILITY

#### A. Laws

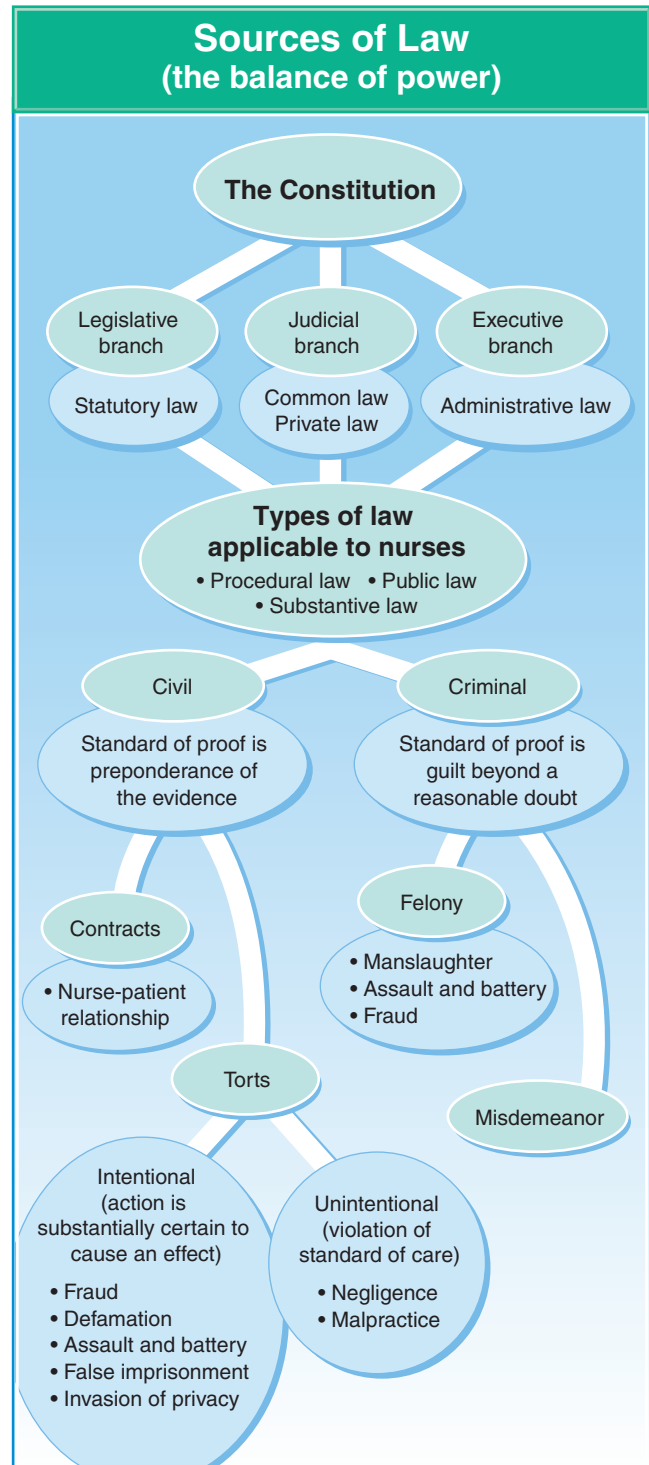

1. Nurses are governed by civil and criminal **law** in roles as providers of services, employees of institutions, and private citizens.
2. A nurse has a personal and legal obligation to provide a standard of client care expected of a reasonably competent professional nurse.
3. Professional nurses are held responsible (liable) for harm resulting from their negligent acts or their failure to act.

#### B. Types of **laws** (Box 7-3; Fig. 7-1)

#### C. **Negligence** and **malpractice** (Box 7-4)

1. **Negligence** is conduct that falls below the standard of care.
2. **Negligence** can include acts of commission and acts of omission.

3. A nurse who does not meet appropriate standards of care may be held liable.
4. **Malpractice** is **negligence** on the part of a nurse.
5. **Malpractice** is determined if the nurse owed a duty to the client and did not carry out the duty and the client was injured because the nurse failed to perform the duty.

#### Box 7-3 Types of Law

##### Contract Law

Contract law is concerned with enforcement of agreements among private individuals.

##### Civil Law

Civil law is concerned with relationships among persons and the protection of a person's rights. Violation may cause harm to an individual or property, but no grave threat to society exists.

##### Criminal Law

Criminal law is concerned with relationships between individuals and governments, and with acts that threaten society and its order; a crime is an offense against society that violates a law and is defined as a misdemeanor (less serious nature) or felony (serious nature).

##### Tort Law

A tort is a civil wrong, other than a breach in contract, in which the law allows an injured person to seek damages from a person who caused the injury.

▲ **FIGURE 7-1** Sources of law for nursing practice. (From Harkreader, H., & Hogan, M.A. [2007]. *Fundamentals of nursing: Caring and clinical judgment*. [3rd ed.]. St. Louis: Saunders.)

**Box 7-4 Negligent Acts**

Medication errors that result in injury to the client  
 Intravenous administration errors such as incorrect flow rates or failure to monitor a flow rate that results in injury to the client  
 Falls that occur as a result of failure to provide safety to the client  
 Failure to use sterile technique when indicated  
 Failure to check equipment for proper functioning  
 Burns sustained by the client as a result of failure to monitor bath temperature or equipment  
 Failure to monitor a client's condition  
 Failure to report changes in the client's condition to the physician  
 Failure to provide a complete report to the oncoming nursing staff

Modified from Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed.). St. Louis: Mosby.

6. Proof of liability
  - a. Duty: At the time of injury, a duty existed between the plaintiff and the defendant.
  - b. Breach of duty: The defendant breached duty of care to the plaintiff.
  - c. Proximate cause: The breach of the duty was the legal cause of injury to the client.
  - d. Damage or injury: The plaintiff experienced injury or damages or both and can be compensated by **law**.

 **The nurse must meet appropriate standards of care when delivering care to the client; otherwise the nurse would be held liable if the client is harmed.**

- D. Professional liability insurance
  1. Nurses need their own liability insurance for protection against **malpractice** lawsuits.
  2. Having their own insurance provides nurses protection as individuals; this allows a nurse to have an attorney present who has only the nurse's interests in mind.
- E. Good Samaritan **laws**
  1. State legislatures pass Good Samaritan **laws**, which may vary from state to state.
  2. These **laws** encourage health care professionals to assist in emergency situations and limit liability and offer legal immunity for persons helping in an emergency, provided that they give reasonable care.
  3. Immunity from suit applies only when all conditions of the state **law** are met, such as the health care provider receives no compensation for the care provided and the care given is not intentionally negligent.

- F. Controlled substances
  1. The nurse should adhere to facility policies and procedures concerning administration of controlled substances, which are governed by federal and state **laws**.

2. Controlled substances must be kept locked securely, and only authorized personnel should have access to them.

**IV. COLLECTIVE BARGAINING**

- A. Collective bargaining is a formalized decision-making process between representatives of management and representatives of labor to negotiate wages and conditions of employment.
- B. When collective bargaining breaks down because the parties cannot reach an agreement, the employees usually call a strike.
- C. Striking presents a moral dilemma to many nurses because nursing practice is a service to people.
- D. The United American Nurses (UAN) is an affiliate of the American Federation of Labor and Congress of Industrial Organizations (AFL-CIO) and the American Nurses Association. UAN staff nurses set the standard for RNs in organizing, collective bargaining, and contracts. Additional information can be obtained at <http://www.uannurse.org>.

**V. LEGAL RISK AREAS**

- A. Assault
  1. Assault occurs when a person puts another person in fear of a harmful or offensive contact.
  2. The victim fears and believes that harm will result because of the threat.
- B. Battery is an intentional touching of another's body without the other's **consent**.
- C. Invasion of privacy includes violating **confidentiality**, intruding on private client or family matters, and sharing client information with unauthorized persons.
- D. False imprisonment
  1. False imprisonment occurs when a client is not allowed to leave a health care facility when there is no legal justification to detain the client.
  2. False imprisonment occurs when restraining devices are used without an appropriate clinical need.
  3. A client can sign an Against Medical Advice form when the client refuses care and is competent to make decisions.
  4. The nurse should document circumstances in the medical record to avoid allegations by the client that cannot be defended.
- E. Defamation is a false communication that causes damage to someone's reputation, either in writing (libel) or verbally (slander).
- F. Fraud results from a deliberate deception intended to produce unlawful gains.

**VI. CLIENT'S RIGHTS**

- A. Description
  1. The client's rights document, also called the **Patient's Bill of Rights**, reflects acknowledgment

**Box 7-5 Patient's Rights When Hospitalized**

Right to considerate and respectful care  
 Right to be informed about diagnosis, possible treatments, likely outcome, and to discuss this information with the physician  
 Right to know the names and roles of the persons who are involved in care  
 Right to consent or refuse a treatment  
 Right to have an advance directive  
 Right to privacy  
 Right to expect that medical records are confidential  
 Right to review the medical record and to have information explained  
 Right to expect that the hospital will provide necessary health services  
 Right to know if the hospital has relationships with outside parties that may influence treatment or care  
 Right to consent or refuse to take part in research  
 Right to be told of realistic care alternatives when hospital care is no longer appropriate  
 Right to know about hospital rules that affect treatment, and about charges and payment methods

From Christensen, B., & Kockrow, E. (2006). *Foundations of nursing* (5th ed.). St. Louis: Mosby; and modified from American Hospital Association (1992). *A patient's bill of rights*. [http://www.patienttalk.info/AHA-Patient\\_Bill\\_of\\_Rights.htm](http://www.patienttalk.info/AHA-Patient_Bill_of_Rights.htm).

**Box 7-6 Laws and Standards****American Hospital Association**

Issued Patient's Bill of Rights

**American Nurses Association**

Developed the Code for Nurses, which defines the nurse's responsibility for upholding the client's rights

**Mental Health Systems Act**

Developed rights for mentally ill clients

**The Joint Commission**

Developed policy statements on the rights of mentally ill individuals

of a client's right to participate in her or his health care with an emphasis on client autonomy.

2. The document provides a list of the rights of the client and responsibilities that the hospital cannot violate (Box 7-5).
  3. The client's rights protect the client's ability to determine the level and type of care received; all health care agencies are required to have a Client's Bill of Rights posted in a visible area.
  4. Several **laws** and standards pertain to client's rights (Box 7-6).
- B. Rights for the mentally ill (Box 7-7)**
1. The Mental Health Systems Act created rights for mentally ill people.
  2. The Joint Commission has developed policy statements on the rights of mentally ill people.

**Box 7-7 Rights for the Mentally Ill**

Right to be treated with dignity and respect  
 Right to communicate with persons outside the hospital  
 Right to keep clothing and personal effects with them  
 Right to religious freedom  
 Right to be employed  
 Right to manage property  
 Right to execute wills  
 Right to enter into contractual agreements  
 Right to make purchases  
 Right to education  
 Right to habeas corpus (written request for release from the hospital)  
 Right to an independent psychiatric examination  
 Right to civil service status, including the right to vote  
 Right to retain licenses, privileges, or permits  
 Right to sue or be sued  
 Right to marry or divorce  
 Right to treatment in the least restrictive setting  
 Right not to be subject to unnecessary restraints  
 Right to privacy and confidentiality  
 Right to informed consent  
 Right to treatment and to refuse treatment  
 Right to refuse participation in experimental treatments or research

Modified from Stuart, G., & Laraia, M. (2009). *Principles and practice of psychiatric nursing* (9th ed.). St. Louis: Mosby.

3. Psychiatric facilities are required to have a client's bill of rights posted in a visible area.
- C. Organ donation and transplantation**
1. A client has the right to decide to become an organ donor and a right to refuse organ transplantation as a treatment option.
  2. An individual who is at least 18 years old may indicate a wish to become a donor on his or her driver's license (state-specific) or in an **advance directive**.
  3. The Uniform Anatomical Gift Act provides a list of individuals who can provide **informed consent** for the donation of a deceased individual's organs.
  4. The United Network for Organ Sharing sets the criteria for organ donations.
  5. Some organs, such as the heart, lungs, and liver, can be obtained only from a person who is on mechanical ventilation and has suffered brain death, whereas other organs or tissues can be removed several hours after death.
  6. A donor must be free of infectious disease and cancer.
  7. Requests to the deceased's family for organ donation usually are done by the physician or nurse specially trained for making such requests.
  8. Donation of organs does not delay funeral arrangements, no obvious evidence that the organs were removed from the body shows when the body is dressed, and the family incurs no cost for removal of the organs donated.

- D. Religious beliefs: Organ donation and transplantation**
1. Catholic Church: Organ donation and transplants are acceptable.
  2. Orthodox Church: Church discourages organ donation.
  3. Islam (Muslim) beliefs: Body parts may not be removed or donated for transplantation.
  4. Jehovah's Witness: An organ transplant may be accepted, but the organ must be cleansed with a nonblood solution before transplantation.
  5. Orthodox Judaism
    - a. All body parts removed during autopsy must be buried with the body because it is believed that the entire body must be returned to the earth; organ donation may not be considered by family members.
    - b. Organ transplantation may be allowed with the rabbi's approval.
  6. Refer to Chapter 6 for additional information regarding end-of-life-care.

## VII. INFORMED CONSENT

### A. Description

1. **Informed consent** is the client's approval (or that of the client's legal representative) to have his or her body touched by a specific individual.
2. **Consents**, or releases, are legal documents that indicate the client's permission to perform surgery, perform a treatment or procedure, or give information to a third party.
3. There are different types of **consents** (Box 7-8).
4. **Informed consent** indicates the client's participation in the decision regarding health care.
5. The client must be informed, in understandable terms, of the risks and benefits of the surgery or treatment, what the consequences are for not having the surgery or procedure performed, treatment options, and the name of the health care provider performing the surgery or procedure.
6. A client's questions about the surgery or procedure must be answered before signing the **consent**.
7. A **consent** must be signed freely by the client without threat or pressure and must be witnessed (witness must be an adult).
8. A client who has been medicated with sedating medications or any other medications that can affect the client's cognitive abilities should not be asked to sign a **consent**.
9. Legally, the client must be mentally and emotionally competent to give **consent**.
10. If a client is declared mentally or emotionally incompetent, the next of kin, appointed guardian (appointed by the court), or durable power of attorney has legal authority to give **consent** (Box 7-9).

### Box 7-8 Types of Consents

#### Admission Agreement

Admission agreements are obtained at the time of admission and identify the health care agency's responsibility to the client.

#### Immunization Consent

An immunization consent may be required before the administration of certain immunizations; the consent indicates that the client was informed of the benefits and risks of the immunization.

#### Blood Transfusion Consent

A blood transfusion consent indicates that the client was informed of the benefits and risks of the transfusion. Some clients hold religious beliefs that would prohibit them from receiving a blood transfusion, even in a life-threatening situation.

#### Surgical Consent

Surgical consent is obtained for all surgical or invasive procedures or diagnostic tests that are invasive. The physician, surgeon, or anesthesiologist who performs the operative or other procedure is responsible for explaining the procedure, its risks and benefits, and possible alternative options.

#### Research Consent

The research consent obtains permission from the client regarding participation in a research study. The consent informs the client about the possible risks, consequences, and benefits of the research.

#### Special Consents

Special consents are required for the use of restraints, photographing the client, disposal of body parts during surgery, donating organs after death, or performing an autopsy.

### Box 7-9 Mentally or Emotionally Incompetent Clients

Declared incompetent

Unconscious

Under the influence of chemical agents such as alcohol or drugs

Chronic dementia or other mental deficiency that impairs thought processes and ability to make decisions

11. A competent client older than 18 years of age must sign the **consent**.
12. In most states, when a nurse is involved in the **informed consent** process, the nurse is witnessing only the signature of the client on the **informed consent** form.
13. An **informed consent** can be waived for urgent medical or surgical intervention as long as institutional policy so indicates.

14. A client has the right to refuse information and waive the **informed consent** and undergo treatment, but this decision must be documented in the medical record.
15. A client may withdraw **consent** at any time.

 An informed consent is a legal document, and the client must be informed, in understandable terms, of the risks and benefits of surgery, treatments, procedures, and plan of care. The client needs to be a participant in decisions regarding health care.

#### B. Minors

1. A minor is a client under legal age as defined by state statute (usually younger than 18 years).
2. A minor may not give legal **consent**, and **consent** must be obtained from a parent or the legal guardian.
3. Parental or guardian **consent** should be obtained before treatment is initiated for a minor except in the following cases: in an emergency; in situations in which the **consent** of the minor is sufficient, including treatment related to substance abuse, treatment of a sexually transmitted infection, human immunodeficiency virus (HIV) testing and acquired immunodeficiency syndrome (AIDS) treatment, birth control services, pregnancy, or psychiatric services; the minor is an emancipated minor; or a court order or other legal authorization has been obtained.

#### C. Emancipated minor

1. An emancipated minor has established independence from his or her parents through marriage, pregnancy, service in the armed forces, or by a court order.
2. An emancipated minor is considered legally capable of signing an **informed consent**.

### VIII. HEALTH INSURANCE PORTABILITY AND ACCOUNTABILITY ACT

#### A. Description

1. The **Health Insurance Portability and Accountability Act (HIPAA)** describes how personal health information (PHI) may be used and how the client can obtain access to the information.
2. PHI includes individually identifiable information that relates to the client's past, present, or future health; treatment; and payment for health care services.
3. The act requires health care agencies to keep PHI private, provides information to the client about the legal responsibilities regarding privacy, and explains the client's rights with respect to PHI.
4. The client has various rights as a consumer of health care under **HIPAA**, and any client requests may need to be placed in writing; a fee may be attached to certain client requests.

5. The client may file a complaint if the client believes that privacy rights have been violated.
- B.** Client's rights include the right to do the following:
1. Inspect a copy of PHI.
  2. Ask the health care agency to amend the PHI that is contained in a record if the PHI is inaccurate.
  3. Request a list of disclosures made regarding the PHI as specified by **HIPAA**.
  4. Request to restrict how the health care agency uses or discloses PHI regarding treatment, payment, or health care services, unless information is needed to provide emergency treatment.
  5. Request that the health care agency communicates with the client in a certain way or at a certain location; the request must specify how or where the client wishes to be contacted.
  6. Request a paper copy of the **HIPAA** notice.

#### C. Health care agency use and disclosure of PHI

1. The health care agency obtains PHI in the course of providing or administering health insurance benefits.
2. Use or disclosure of PHI may be done for the following:
  - a. Health care payment purposes
  - b. Health care operations purposes
  - c. Treatment purposes
  - d. Providing information about health care services
  - e. Data aggregation purposes to make health care benefit decisions
  - f. Administering health care benefits
3. There are additional uses or disclosures of PHI (Box 7-10)

### IX. CONFIDENTIALITY AND INFORMATION SECURITY

#### A. Description

1. In the health care system, confidentiality refers to the protection of privacy of the client's PHI.
2. Clients have a right to privacy in the health care system.
3. A special relationship exists between the client and nurse, in which information discussed is not shared with a third party who is not directly involved in the client's care.
4. Violations of privacy occur in various ways (Box 7-11).

#### B. Nurse's responsibility

1. Nurses are bound to protect client **confidentiality** by most nurse practice acts, by ethical principles and standards, and by institutional and agency policies and procedures.
2. Disclosure of confidential information exposes the nurse to liability for invasion of the client's privacy.
3. The nurse needs to protect the client from indiscriminate disclosure of health care information that may cause harm (Box 7-12).

### Box 7-10 Uses or Disclosures of Personal Health Information

Compliance with legal proceedings or for limited law enforcement purposes

To a family member or significant other in a medical emergency

To a personal representative appointed by the client or designated by law

For research purposes in limited circumstances

To a coroner, medical examiner, or funeral director about a deceased person

To an organ procurement organization in limited circumstances

To avert a serious threat to the client's health or safety or the health or safety of others

To a governmental agency authorized to oversee the health care system or government programs

To the Department of Health and Human Services for the investigation of compliance with the Health Insurance Portability and Accountability Act or to fulfill another lawful request

To federal officials for lawful intelligence or national security purposes

To protect health authorities for public health purposes

To appropriate military authorities if a client is a member of the armed forces

In accordance with a valid authorization signed by the client

Modified from U.S. Department of Health and Human Services Office for Civil Rights. <http://www.hhs.gov/ocr/privacy/hipaa/understanding/consumers/index.html>.

### Box 7-11 Violations and Invasion of Client Privacy

Taking photographs of the client

Release of medical information to an unauthorized person, such as a member of the press, family, friend, or neighbor of the client, without the client's permission

Use of the client's name or picture for the health care agency's sole advantage

Intrusion by the health care agency regarding the client's affairs

Publication of information about the client

Publication of embarrassing facts

Public disclosure of private information

Leaving the curtains or room door open while a treatment or procedure is being performed

Allowing individuals to observe a treatment or procedure without the client's consent

Leaving a confused or agitated client sitting in the nursing unit hallway

Interviewing a client in a room with only a curtain between clients or where conversation can be overheard

Accessing medical records when unauthorized to do so

### Box 7-12 Maintenance of Confidentiality

Not discussing client issues with other clients or staff uninvolved in the client's care

Not sharing health care information with others without the client's consent (includes family members or friends of the client)

Keeping all information about a client private, and not revealing it to someone not directly involved in care

Discussing client information only in private and secluded areas

Protecting the medical record from all unauthorized readers

#### C. Medical records

1. Medical records are confidential.
2. The client has the right to read the medical record and have copies of the record.
3. Only staff members directly involved in care have legitimate access to a client's record; these may include physicians and nurses caring for the client, technicians, therapists, social workers, unit secretaries, client advocates, administrators (e.g., for statistical analysis, staffing, quality care review). Others must ask permission from the client to review a record.

4. The medical record is sent to the records or the health information department after discharge of the client from the health care facility.

#### D. Information technology/computerized medical records

1. Health care employees should have access only to the client's records in the nursing unit or work area.
2. **Confidentiality/information security** can be protected by the use of special computer access codes to limit what employees have access to in computer systems.
3. The use of a password or identification code is needed to enter and sign off a computer system.
4. A password or identification code should never be shared with another person.
5. Personal passwords should be changed periodically to prevent unauthorized computer access.

#### E. When conducting research, any information provided by the client is not to be reported in any manner that identifies the client and is not to be made accessible to anyone outside the research team.

 The nurse must always protect client confidentiality.

### X. LEGAL SAFEGUARDS

#### A. Risk management

1. Risk management is a planned method to identify, analyze, and evaluate risks, followed by a plan for reducing the frequency of accidents and injuries.
2. Programs are based on a systematic reporting system for incidents or unusual occurrences.

**Box 7-13 Incidents That Need to Be Reported**

Accidental omission of prescribed therapies  
 Circumstances that led to injury or a risk for client injury  
 Client falls  
 Medication administration errors  
 Needle-stick injuries  
 Procedure-related or equipment-related accidents  
 A visitor injury that occurred in the health care agency premises  
 A visitor who exhibits symptoms of a communicable disease

- B.** Incident reports (Box 7-13)
1. The incident report is used as a means of identifying risk situations and improving client care.
  2. Follow specific documentation guidelines.
  3. Fill out the report completely, accurately, and factually.
  4. The report form should not be copied or placed in the client's record.
  5. Make no reference to the incident report form in the client's record.
  6. The report is not a substitute for a complete entry in the client's record regarding the incident.
  7. If a client injury or error in care occurred, assess the client frequently.
- C.** Safeguarding valuables
1. Client's valuables should be given to a family member or secured for safekeeping in a stored and locked designated location, such as the agency's safe; the location of the client's valuables should be documented per agency policy.
  2. Many health care agencies require a client to sign a release to free the agency of the responsibility for lost valuables.
  3. A client's wedding band can be taped in place unless a risk exists for swelling of the hands or fingers.
  4. Religious items, such as medals or scapulars, may be pinned to the client's gown if allowed by agency policy.
- D.** Physicians' prescriptions
1. A nurse is obligated to carry out a physician's prescription (order) except when the nurse believes a prescription to be inappropriate or inaccurate.
  2. A nurse carrying out an inaccurate prescription may be legally responsible for any harm suffered by the client.
  3. The nurse should clarify with the physician an unclear or inappropriate prescription.
  4. If no resolution occurs regarding the prescription in question, the nurse should contact the nurse manager or supervisor.
  5. The nurse should follow specific guidelines for telephone prescriptions (Box 7-14).
  6. The nurse should ensure that all components of a medication prescription are documented (Box 7-15).

**Box 7-14 Telephone Prescriptions (Orders)**

Date and time the entry.  
 Repeat the order to the physician, and record the order.  
 Sign the order; begin with "t.o." (telephone order), write the physician's name, and sign the order.  
 If another nurse witnessed the order, that nurse's signature follows.  
 The physician needs to countersign the order within a timeframe according to agency policy.

**Box 7-15 Components of a Medication Prescription (Order)**

Date and time order was written  
 Medication name  
 Medication dosage  
 Route of administration  
 Frequency of administration  
 Physician's or health care provider's signature

**Box 7-16 Documentation Guidelines: Narrative and Information Technology**

Use a black-colored ink pen for narrative documentation.  
 Date and time entries.  
 Provide objective, factual, and complete documentation.  
 Document care, medications, treatments, and procedures as soon as possible after completion.  
 Document client responses to interventions.  
 Document consent for or refusal of treatments.  
 Document calls made to other health care providers.  
 Do not document for others or change documentation for other individuals.  
 Sign and title each entry.  
 Use quotes as appropriate for subjective data.  
 Use correct spelling, grammar, and punctuation.  
 Avoid unacceptable abbreviations.  
 Avoid judgmental or evaluative statements, such as "uncooperative client."  
 Do not leave blank spaces on documentation forms.  
 Follow agency policies when an error is made (draw one line through the error, initial, and date).  
 Follow agency guidelines regarding late entries.  
 Use only the user identification code, name, or password for computerized documentation.  
 Never lend access identification computer codes to another person; change password at regular intervals.  
 Maintain privacy and confidentiality of documented information printed from the computer.

**E.** Documentation

1. Documentation is legally required by accrediting agencies, state licensing **laws**, and state nurse and medical practice acts.
2. The nurse should follow agency guidelines and procedures (Box 7-16).

- F. Client and family teaching**
1. Provide complete instructions in a language that the client or family can understand.
  2. Document client and family teaching, what was taught, evaluation of understanding, and who was present during the teaching.
  3. Inform the client of what could happen if information shared during teaching is not followed.

 The nurse should never carry out a prescription (order) if it is unclear or inappropriate. The physician should be contacted immediately.

## XI. ADVANCE DIRECTIVES

### A. Patient Self-Determination Act

1. The Patient Self-Determination Act is a **law** that indicates clients must be provided with information about their rights to identify written directions about the care that they wish to receive in the event that they become incapacitated and are unable to make health care decisions.
2. On admission to a health care facility, the client is asked about the existence of an **advance directive**, and if one exists, it must be documented and included as part of the medical record; if the client signs an **advance directive** at the time of admission, it must be documented in the client's medical record.
3. The two basic types of **advance directives** include living wills and durable powers of attorney.
  - a. Living will: lists the medical treatment that a client chooses to omit or refuse if the client becomes unable to make decisions and is terminally ill.
  - b. Durable powers of attorney: appoints a person (health care proxy) chosen by the client to make health care decisions on the client's behalf when the client can no longer make decisions.

### B. Do not resuscitate (DNR) orders

1. The DNR is an order written by a physician when a client has indicated a desire to be allowed to die if the client suffers cardiac or respiratory arrest.
2. The client or his or her legal representative must provide **informed consent** for the DNR status.
3. The DNR order must be defined clearly so that other treatment, not refused by the client, will be continued.
4. The DNR order must be reviewed regularly according to agency policy.
5. All health care personnel must know whether a client has a DNR order.
6. If a client does not have a DNR order, health care personnel need to make every effort to revive the client.
7. DNR protocols may vary state to state, and it is important for the nurse to know his or her state's protocols.

### C. The nurse's role

1. Discussing **advance directives** with the client opens the communication channel to establish what is important to the client and what the client may view as promoting life versus prolonging dying.
2. The nurse needs to ensure that the client has been provided with information about the right to identify written directions about the care that the client wishes to receive.
3. On admission to a health care facility, the nurse determines whether an **advance directive** exists and ensures that it is part of the medical record.
4. The nurse ensures that the physician is aware of the presence of an **advance directive**.
5. All health care workers need to follow the directions of an **advance directive** to be safe from liability.
6. Some agencies have specific policies that prohibit a nurse from signing as a witness to a legal document, such as a living will.
7. If allowed by the agency, when a nurse acts as a witness to a legal document, the nurse must document the event and the factual circumstances surrounding the signing in the medical record; documentation as a witness should include who was present, any significant comments by the client, and the nurse's observations of the client's conduct during this process.

## XII. REPORTING RESPONSIBILITIES

- A. Nurses are required to report certain communicable diseases or criminal activities such as child or elder abuse or domestic violence; dog bite, gunshot, or stab wounds, assaults, and homicides; and suicides to the appropriate authorities.**
- B. Impaired nurse**
1. If a nurse suspects that a co-worker is abusing chemicals and potentially jeopardizing a client's safety, the nurse must report the individual to the nursing administration in a confidential manner. (Client safety is always the first priority.)
  2. Nursing administration notifies the board of nursing regarding the nurse's behavior.
- C. Occupational Safety and Health Act (OSHA)**
1. OSHA requires that an employer provide a safe workplace for employees according to regulations.
  2. Employees can confidentially report working conditions that violate regulations.
  3. An employee who reports unsafe working conditions cannot be retaliated against by the employer.
- D. Sexual harassment**
1. Sexual harassment is prohibited by state and federal **laws**.
  2. Sexual harassment includes unwelcome conduct of a sexual nature.
  3. Follow agency policies and procedures to handle reporting a concern or complaint.

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 13.** A nurse hears a client calling out for help, hurries down the hallway to the client's room, and finds the client lying on the floor. The nurse performs a thorough assessment, assists the client back to bed, notifies the physician of the incident, and completes an incident report. Which of the following should the nurse document on the incident report?
1. The client fell out of bed.
  2. The client climbed over the side rails.
  3. The client was found lying on the floor.
  4. The client became restless and tried to get out of bed.
- 14.** A client is brought to the emergency department by emergency medical services (EMS) after being hit by a car. The name of the client is unknown, and the client has sustained a severe head injury and multiple fractures and is unconscious. An emergency craniotomy is required. Regarding informed consent for the surgical procedure, which of the following is the best action?
1. Obtain a court order for the surgical procedure.
  2. Ask the EMS team to sign the informed consent.
  3. Transport the victim to the operating room for surgery.
  4. Call the police to identify the client and locate the family.
- 15.** A nurse has just assisted a client back to bed after a fall. The nurse and physician have assessed the client and have determined that the client is not injured. After completing the incident report, the nurse implements which action next?
1. Reassess the client.
  2. Conduct a staff meeting to describe the fall.
  3. Document in the nurse's notes that an incident report was completed.
  4. Contact the nursing supervisor to update information regarding the fall.
- 16.** A registered nurse arrives at work and is told to report (float) to the intensive care unit (ICU) for the day because the ICU is understaffed and needs additional nurses to care for the clients. The nurse has never worked in the ICU. The nurse should take which action first?
1. Call the hospital lawyer.
  2. Refuse to float to the ICU.
  3. Call the nursing supervisor.
  4. Report to the ICU and identify tasks that can be performed safely.
- 17.** A nurse who works on the night shift enters the medication room and finds a co-worker with a tourniquet wrapped around the upper arm. The co-worker is about to insert a needle, attached to a syringe containing a clear liquid, into the antecubital area. The appropriate initial action by the nurse is which of the following?
1. Call security.
  2. Call the police.
  3. Call the nursing supervisor.
  4. Lock the co-worker in the medication room until help is obtained.
- 18.** A hospitalized client tells the nurse that a living will is being prepared and that the lawyer will be bringing the will to the hospital today for witness signatures. The client asks the nurse for assistance in obtaining a witness to the will. The appropriate response to the client is which of the following?
1. "I will sign as a witness to your signature."
  2. "You will need to find a witness on your own."
  3. "Whoever is available at the time will sign as a witness for you."
  4. "I will call the nursing supervisor to seek assistance regarding your request."
- 19.** A nurse has made an error in a narrative documentation of an assessment finding on a client and obtains the client's record to correct the error. The nurse corrects the error by:
1. Documenting a late entry into the client's record
  2. Trying to erase the error for space to write in the correct data
  3. Using whiteout to delete the error to write in the correct data
  4. Drawing one line through the error, initialing and dating the line, and then documenting the correct information
- 20.** A nurse employed in a hospital is waiting to receive a report from the laboratory via the facsimile (fax) machine. The fax machine activates and the nurse expects the report, but instead receives a sexually oriented photograph. The appropriate initial nursing action is to:
1. Call the police.
  2. Cut up the photograph and throw it away.
  3. Call the nursing supervisor and report the incident.
  4. Call the laboratory and ask for the individual's name who sent the photograph.
- 21.** A nursing instructor delivers a lecture to nursing students regarding the issue of client's rights and asks a nursing student to identify a situation that represents an example of invasion of client

privacy. Which of the following, if identified by the student, indicates an understanding of a violation of this client right?

1. Performing a procedure without consent
  2. Threatening to give a client a medication
  3. Telling the client that he or she cannot leave the hospital
  4. Observing care provided to the client without the client's permission
- 22.** Nursing staff members are sitting in the lounge taking their morning break. A nursing assistant tells the group that she thinks that the unit secretary has acquired immunodeficiency syndrome (AIDS) and proceeds to tell the nursing staff that the secretary probably contracted the disease from her husband, who is supposedly a drug addict. Which legal tort has the nursing assistant violated?
1. Libel
  2. Slander
  3. Assault
  4. Negligence
- 23.** An 87-year-old woman is brought to the emergency department for treatment of a fractured arm. On physical assessment, the nurse notes old and new ecchymotic areas on the client's chest and legs and asks the client how the bruises were sustained. The client, although reluctant, tells the nurse in confidence that her son frequently hits her if supper is not prepared on time when he arrives home from work. Which of the following is the appropriate nursing response?
1. "Oh, really. I will discuss this situation with your son."
  2. "This is a legal issue, and I must tell you that I will need to report it."
  3. "Let's talk about the ways you can manage your time to prevent this from happening."
  4. "Do you have any friends that can help you out until you resolve these important issues with your son?"

- 24.** A nurse calls the physician regarding a new medication prescription because the dosage prescribed is higher than the recommended dosage. The nurse is unable to locate the physician, and the medication is due to be administered. Which action should the nurse implement?
1. Contact the nursing supervisor.
  2. Administer the dose prescribed.
  3. Hold the medication until the physician can be contacted.
  4. Administer the recommended dose until the physician can be located.

### Alternate Item Format: Prioritizing (Ordered Response)

- 25.** A client involved in a head-on automobile crash has awakened from a coma and asks for her husband, who was killed in the same accident. The family does not want the client to know at this time that her husband has died. The family wants all nursing staff to tell the client that the husband was taken by helicopter to another hospital, has a head injury, and is in the intensive care unit (ICU). Because the American Nurses Association Code of Ethics requires the nurse to preserve integrity, but the nurse wants to follow the family's instruction, the nurse faces an ethical dilemma. Number in order the steps for systematic processing of the ethical dilemma. (Number 1 is the first step, and number 6 is the last step.)
- \_\_\_ Evaluate the action.
  - \_\_\_ Verbalize the problem.
  - \_\_\_ Negotiate the outcome.
  - \_\_\_ Consider possible courses of action.
  - \_\_\_ Gather all of the information relevant to the case.
  - \_\_\_ Examine and determine one's own values on the issues.

## ANSWERS

### 13. 3

**Rationale:** The incident report should contain the client's name, age, and diagnosis. The report should contain a factual description of the incident, any injuries experienced by those involved, and the outcome of the situation. Option 3 is the only option that describes the facts as observed by the nurse. Options 1, 2, and 4 are interpretations of the situation and are not factual information as observed by the nurse.

**Test-Taking Strategy:** Use the process of elimination and read the information contained in the question to select the correct option. Remember to focus on factual information when

documenting, and avoid including interpretations. This will direct you to option 3. Review documentation principles related to incident reports if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Communication and Documentation

**Content Area:** Leadership and Management—Ethical/Legal

**References:** Cherry, B., & Jacob, S. (2008). *Contemporary nursing: Issues, trends & management* (4th ed., pp. 171–172). St. Louis: Mosby.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., pp. 336–337). St. Louis: Mosby.

**14. 3**

**Rationale:** Generally, there are two situations in which informed consent of an adult client is not needed. One is when an emergency is present and delaying treatment for the purpose of obtaining informed consent would result in injury or death to the client. The second is when the client waives the right to give informed consent. Option 1 will delay emergency treatment, and option 2 is inappropriate. Although option 4 may be pursued, it is not the best action.

**Test-Taking Strategy:** Use the process of elimination. Recalling that when an emergency is present and a delay in treatment for the purpose of obtaining informed consent could result in injury or death will direct you to option 3. Review the issues surrounding informed consent if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Ethical/Legal

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 2191). St. Louis: Saunders.

**15. 1**

**Rationale:** After a client's fall, the nurse must frequently reassess the client because potential complications do not always appear immediately after the fall. The client's fall should be treated as private information and shared on a "need to know" basis. Communication regarding the event should involve only the individuals participating in the client's care. An incident report is a problem-solving document; however, its completion is not documented in the nurse's notes. If the nursing supervisor has been made aware of the incident, the supervisor will contact the nurse if status update is desired.

**Test-Taking Strategy:** Focus on the data in the question and the strategic word *next*. Using the steps of the nursing process will direct you to option 1. Remember that assessment is the first step. Review guidelines related to incident reports and care to the client after sustaining a fall if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Ethical/Legal

**References:** Ackley, B., Ladwig, G., Swan, B., & Tucker, S. (2008). *Evidence-based nursing care guidelines: Medical-surgical interventions* (pp. 340–341). St. Louis: Mosby.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., pp. 336–337, 403). St. Louis: Mosby.

Zerwekh, J., & Claborn, J. (2009). *Nursing today: Transition and trends* (6th ed., pp. 459–460). St. Louis: Saunders.

**16. 4**

**Rationale:** Floating is an acceptable legal practice used by hospitals to solve understaffing problems. Legally, a nurse cannot refuse to float unless a union contract guarantees that nurses can work only in a specified area or the nurse can prove the lack of knowledge for the performance of assigned tasks. When encountering this situation, the nurse should set priorities and identify potential areas of harm to the client. The nursing supervisor is called if the nurse is expected to perform tasks that he or she cannot safely perform. Calling the hospital lawyer is a premature action.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic word *first*. Eliminate option 2 first because of the word *refuse*. Next, eliminate options 1 and 3 because they are premature actions. Review nursing responsibilities related to floating if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Ethical/Legal

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., pp. 335–336). St. Louis: Mosby.

**17. 3**

**Rationale:** Nurse practice acts require reporting impaired nurses. The board of nursing has jurisdiction over the practice of nursing and may develop plans for treatment and supervision of the impaired nurse. This incident needs to be reported to the nursing supervisor, who will then report to the board of nursing and other authorities, such as the police, as required. The nurse may call security if a disturbance occurs, but no information in the question supports this need, and so this is not the initial action. Option 4 is an inappropriate and unsafe action.

**Test-Taking Strategy:** Note the strategic words *initial action*. Eliminate option 4 first because this is an inappropriate and unsafe action. Recall the lines of organizational structure to assist in directing you to option 3. If you had difficulty with this question, review the nurse's responsibilities when substance abuse is suspected or occurs in the workplace.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Ethical/Legal

**References:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., pp. 8–9). St. Louis: Mosby.

Zerwekh, J., & Claborn, J. (2009). *Nursing today: Transition and trends* (6th ed., pp. 430–431). St. Louis: Saunders.

**18. 4**

**Rationale:** Living wills are required to be in writing and signed by the client. The client's signature must be witnessed by specified individuals or notarized. Laws and guidelines regarding living wills vary from state to state, and it is the responsibility of the nurse to know the laws. Many states prohibit any employee, including a nurse of a facility where the client is receiving care, from being a witness. Option 2 is nontherapeutic and not a helpful response. The nurse should seek the assistance of the nursing supervisor.

**Test-Taking Strategy:** Note the strategic word *appropriate*. Options 1 and 3 are comparable or alike and should be eliminated first. Option 2 is eliminated because it is a nontherapeutic response. Review legal implications associated with living wills if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Ethical/Legal

**References:** Cherry, B., & Jacob, S. (2008). *Contemporary nursing issues: Trends and management* (4th ed., pp. 176–177). St. Louis: Mosby.

Tomey, A. (2009). *Guide to nursing management and leadership* (8th ed., p. 497). St. Louis: Mosby.

**19. 4**

**Rationale:** If the nurse makes an error in narrative documentation in the client's record, the nurse should follow agency policies to correct the error. This includes drawing one line through the error, initialing and dating the line, and then documenting the correct information. A late entry is used to document additional information not remembered at the initial time of documentation. Erasing data from the client's record and the use of whiteout are prohibited.

**Test-Taking Strategy:** Use the process of elimination and principles related to documentation. Recalling that alterations to a client's record are to be avoided will assist in eliminating options 2 and 3. From the remaining options, focusing on the subject of the question and using knowledge regarding the principles related to documentation will direct you to option 4. Review the principles and guidelines related to documentation if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Communication and Documentation

**Content Area:** Leadership and Management—Ethical/Legal

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 388). St. Louis: Mosby.

**20. 3**

**Rationale:** Sexual harassment in the workplace is prohibited by state and federal laws. Sexually suggestive jokes, touching, pressuring a co-worker for a date, and open displays of or transmitting sexually oriented photographs or posters are examples of conduct that could be considered sexual harassment by another worker. If the nurse believes that he or she is being subjected to unwelcome sexual conduct, these concerns should be reported to the nursing supervisor immediately. Option 1 is unnecessary at this time. Options 2 and 4 are inappropriate initial actions.

**Test-Taking Strategy:** Note the strategic word *initial*. Remember that using the organizational channels of communication is best. This will assist in directing you to option 3. Review nursing responsibilities when sexual harassment occurs in the workplace if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Ethical/Legal

**Reference:** Tomey, A. (2009). *Guide to nursing management and leadership* (8th ed., pp. 164–166). St. Louis: Mosby.

**21. 4**

**Rationale:** Invasion of privacy occurs with unreasonable intrusion into an individual's private affairs. Performing a procedure without consent is an example of battery. Threatening to give a client a medication constitutes assault. Telling the client that the client cannot leave the hospital constitutes false imprisonment.

**Test-Taking Strategy:** The strategic words in the question are *invasion of client privacy*. Focus on these strategic words to direct you to option 4. If you had difficulty with this question, review the situations that include invasion of privacy.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Caring

**Content Area:** Leadership and Management—Ethical/Legal

**References:** Cherry, B., & Jacob, S. (2008). *Contemporary nursing issues: Trends and management* (4th ed., pp. 175–176). St. Louis: Mosby.

Zerwekh, J., & Claborn, J. (2009). *Nursing today: Transition and trends* (6th ed., p. 424). St. Louis: Saunders.

**22. 2**

**Rationale:** Defamation is a false communication or a careless disregard for the truth that causes damage to someone's reputation, either in writing (libel) or verbally (slander). An assault occurs when a person puts another person in fear of a harmful or an offensive contact. Negligence involves the actions of professionals that fall below the standard of care for a specific professional group.

**Test-Taking Strategy:** Focus on the data in the question and eliminate options 3 and 4 first because their definitions are unrelated to the data. Recalling that slander constitutes verbal defamation will direct you to option 2 from the remaining options. Review the definitions of libel, slander, assault, and negligence if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Ethical/Legal

**Reference:** Cherry, B., & Jacob, S. (2008). *Contemporary nursing issues: Trends and management* (4th ed., p. 174). St. Louis: Mosby.

**23. 2**

**Rationale:** The nurse must report situations related to child or elder abuse, gunshot wounds and other criminal acts, and certain infectious diseases. Confidential issues are not to be discussed with nonmedical personnel or the client's family or friends without the client's permission. Clients should be assured that information is kept confidential, unless it places the nurse under a legal obligation. Options 1, 3, and 4 do not address the legal implications of the situation and do not ensure a safe environment for the client.

**Test-Taking Strategy:** Focus on the data in the question and note that an 87-year-old woman is receiving physical abuse by her son. Recall the nursing responsibilities related to client safety and reporting obligations. Options 1, 3, and 4 should be eliminated because they are comparable or alike in that they do not protect the client from injury. Review the nursing responsibilities related to reporting obligations if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Ethical/Legal

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., pp. 562–563). St. Louis: Mosby.

**24. 1**

**Rationale:** If the physician writes a prescription that requires clarification, the nurse's responsibility is to contact the physician. If there is no resolution regarding the prescription because the physician cannot be located or because the prescription remains as it was written after talking with the physician, the nurse should contact the nurse manager or nursing supervisor for further clarification as to what the next step should be. Under no circumstances should the nurse proceed to carry out the prescription until obtaining clarification.

**Test-Taking Strategy:** Use the process of elimination and eliminate options 2 and 4 first because they are comparable or alike and are unsafe actions. Holding the medication can result in client injury. The nurse needs to take action. Option 1 clearly identifies the required action in this situation. Review nursing responsibilities related to the physician's prescriptions if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Ethical/Legal

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 336). St. Louis: Mosby.

### ALTERNATE ITEM FORMAT: PRIORITIZING (ORDERED RESPONSE)

#### 25. 6, 3, 5, 4, 1, 2

**Rationale:** Ethical reasoning is the process of thinking through what one ought to do in an orderly and systematic manner to provide justification for actions based on principles. First, the nurse determines whether or not the issue involves an ethical dilemma and gathers information that is relevant to the case. Next, the nurse undertakes personal value clarification and identifies his or her own values regarding the issue. Third, the nurse verbalizes the problem in a simple sentence. Fourth, the

nurse considers possible courses of action. In this case, the nurse may choose to seek the counsel of the agency's ethicist regarding the issue. Fifth, the nurse negotiates the outcome by developing a confidence in her or his own point of view with deep respect for the opinions of others. In this case, the nurse may negotiate with the family to determine a course of action that would allow the nurse to preserve integrity and yet allow the family to determine when the client should be informed of the tragic loss. Finally, the nurse evaluates the action.

**Test-Taking Strategy:** Use the steps of the nursing process to assist in answering the question. Assessment is the first step; the nurse gathers information about the case and examines this information in terms of his or her own values. Next, the nurse analyzes the data and defines the problem. This is followed by planning and determining possible courses of action. Then the nurse negotiates the course of action with the family, and afterward implements it. Finally the nurse evaluates the action. Review the procedure for the systematic processing of an ethical dilemma if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Ethical/Legal

**Reference:** Cherry, B., & Jacob, S. (2008). *Contemporary nursing issues: Trends and management* (4th ed., pp. 188–189). St. Louis: Mosby.

# Leadership, Delegating, and Prioritizing Client Care

## PYRAMID TERMS

**accountability** Moral concept that involves acceptance by a professional nurse of the consequences of a decision or action.

**authority** Legitimate power or official right to act.

**case management** Health care delivery strategy that supports managed care; it is an interdisciplinary health care delivery approach that provides comprehensive client care using available resources to promote quality and cost-effective care.

**critical pathway** Clinical management care plan for providing client-centered care and for planning and monitoring the client's progress within an established time frame; multidisciplinary collaboration and teamwork ensure shared decision making and quality client care.

**delegation** Process of transferring a selected nursing task in a situation to an individual who is competent to perform that specific task.

**disaster** Any human-made or natural event that causes destruction and devastation that cannot be alleviated without assistance; internal disasters are events that occur within a health care agency, whereas external disasters are events that occur outside the health care agency.

**emergency response plan** A health care agency's preparedness and response plan in the event of a disaster.

**evidence-based practice** Approach to client care in which the nurse integrates the client's preferences, clinical expertise, and the best research evidence to deliver quality care.

**leadership** Interpersonal process that involves influencing others (followers) to achieve goals.

**management** Accomplishment of tasks or goals by oneself or by directing others.

**prioritizing** Deciding which needs or problems require immediate action and which ones could tolerate a delay in action until a later time because they are not urgent.

**quality improvement** Also known as performance improvement, focuses on processes or systems that significantly contribute to client safety and effective client care outcomes; criteria are used to monitor outcomes of care and to determine the need for change to improve the quality of care.

**triage** Classifying procedure that ranks clients according to their need for medical care.

## PYRAMID TO SUCCESS

A professional nurse is a leader and a manager. As described in the NCLEX-RN exam test plan, a professional nurse needs to provide integrated, cost-effective care to clients by coordinating, supervising, and collaborating or consulting with members of the multidisciplinary health care team. A primary Pyramid Point focuses on the skills required to prioritize client care activities. Pyramid Points also focus on concepts of management, case management, quality improvement, the process of delegation, an emergency response plan, and triaging clients.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Case management concepts
- Consulting or collaborating with members of the health care team
- Delegating client care activities and providing continuity of care
- Emergency response plan
- Establishing priorities related to client care activities
- Leadership and management skills
- Quality improvement
- Supervising the delivery of client care
- Triaging clients

### Health Promotion and Maintenance

- Client's ability to perform self-care
- Disease prevention measures and health and wellness
- Health promotion programs
- Health screening
- Performing physical assessment techniques

### Psychosocial Integrity

- Available support systems
- Cultural, spiritual, and religious issues
- Therapeutic interactions with others

## Physiological Integrity

Ensuring that palliative and comfort care is provided to the client

Ensuring that emergencies are handled using a prioritization procedure

Potential for alterations in body systems

Unexpected responses to therapy

### I. HEALTH CARE DELIVERY SYSTEMS

#### A. Managed care

1. Managed care is a broad term used to describe strategies used in the health care delivery system that reduce the costs of health care.
2. Client care is outcome driven and is managed by a **case management** process.
3. Managed care emphasizes the promotion of health, client education and responsible self-care, early identification of disease, and the use of health care resources.

#### B. Case management

1. **Case management** is a health care delivery strategy that supports managed care; it uses an interdisciplinary health care delivery approach that provides comprehensive client care throughout the client's illness using available resources to promote high-quality and cost-effective care.
2. **Case management** includes assessment and development of a plan of care, coordination of all services, referral, and follow-up.
3. **Critical pathways** are used, and variation analysis is conducted.

 **Case management involves consultation and collaboration with an interdisciplinary health care team.**

#### C. Case manager

1. A case manager is a professional nurse who assumes responsibility for coordinating the client's care at admission and after discharge.
2. The case manager establishes a plan of care with the client, coordinates any consultations and referrals, and facilitates discharge.

#### D. Critical pathway

1. A **critical pathway** is a clinical **management** care plan for providing client-centered care and for planning and monitoring the client's progress within an established time frame; multidisciplinary collaboration and teamwork ensure shared decision making and quality client care.
2. All members of the health care team work with one plan to achieve the same client outcomes.
3. The goal of a **critical pathway** is to anticipate and recognize negative variance (i.e., problematic

differences) early so that appropriate action can be taken and positive client outcomes can result.

#### 4. Variation analysis

- a. Actual deviations or detours from a **critical pathway** are variances.
- b. Positive variance occurs when a client achieves maximum benefit and is discharged earlier than anticipated on the **critical pathway**.
- c. Negative variance occurs when untoward events prevent a timely discharge and the length of hospital stay is longer than planned for a client on a specific **critical pathway**.
- d. Variation analysis is a continuous process that the case manager and other caregivers conduct by comparing the specific client outcomes with the expected outcomes described on the **critical pathway**.
- e. Accurate monitoring of the **critical pathway** with variation analysis can estimate the financial impact of actual client outcomes on the health care facility, especially when the client is not achieving expected outcomes.
- f. If the variance is predictable, negotiation with health care insurers for cost coverage of an additional length of health care facility stay can maximize client care revenues.
- g. If the variance is not predicted and additional cost coverage is not negotiated with health care insurers, the hospital may not be reimbursed for a longer period of client care.

#### E. CareMaps

1. A CareMap is a model for a **critical pathway**.
2. The CareMap incorporates day-to-day expected client outcomes and outcomes anticipated at discharge or at the end of a treatment phase.
3. The CareMap outlines clinical assessments, treatments and procedures, dietary interventions, activity and exercise therapies, client education, and discharge planning.

#### F. Nursing care plan

1. A nursing care plan is a written guideline and communication tool that identifies the client's pertinent assessment data, problems and nursing diagnoses, goals, interventions, and expected outcomes.
2. The plan enhances continuity of care by identifying specific nursing actions necessary to achieve the goals of care.
3. The client and family are involved in developing the plan of care, and the plan identifies short-term and long-term goals.
4. Client problems, goals, interventions, and expected outcomes are documented in the care plan, which provides a framework for evaluation of the client's response to nursing actions.

## II. NURSING DELIVERY SYSTEMS

### A. Functional nursing

1. Functional nursing involves a task approach to client care, with tasks being delegated by the charge nurse to individual members of the team.
2. This type of system is task-oriented, and the team member focuses on the delegated task rather than the total client; this results in fragmentation of care and lack of **accountability** by the team member.

### B. Team nursing

1. The team generally is led by a registered nurse (team leader) who is responsible for assessing, developing nursing diagnoses, planning, and evaluating each client's plan of care.
2. The team leader determines the work assignment; each staff member works fully within the realm of his or her educational and clinical expertise and job description.
3. Each staff member is accountable for client care and outcomes of care delivered in accordance with the licensing and practice scope as determined by health care agency policy and state law.
4. Modular nursing is similar to team nursing, but takes into account the structure of the unit; the unit is divided into modules allowing nurses to care for a group of clients who are geographically close by.

### C. Relationship-based practice (primary nursing)

1. Relationship-based practice (primary nursing) is concerned with keeping a nurse at the bedside, actively involved in client care, while planning goal-directed, individualized care.
2. One (primary) nurse is responsible for managing and coordinating the client's care while in the hospital and for discharge, and an associate nurse cares for the client when the primary nurse is off-duty.

### D. Client-focused care

1. This is also known as the total care or case method; a registered nurse assumes total responsibility for planning and delivering care to a client.
2. The client may have different nurses assigned during a 24-hour period; however, the nurse provides all necessary care needed for the assigned time period.

## III. PROFESSIONAL RESPONSIBILITIES

### A. Accountability

1. The process in which individuals have an obligation (or duty) to act and are answerable for their actions
2. Involves assuming only the responsibilities that are within one's scope of practice and not assuming responsibility for activities in which competence has not been achieved

3. Involves admitting mistakes rather than blaming others and evaluating the outcomes of one's own actions
4. Includes a responsibility to the client to be competent, providing nursing care in accordance with standards of nursing practice and adhering to the professional ethics codes

 **Accountability is accepting responsibility for one's actions. A nurse is always responsible for his or her actions when providing care to a client.**

### B. Leadership and management

1. **Leadership** is the interpersonal process that involves influencing others (followers) to achieve goals.
  2. **Management** is the accomplishment of tasks or goals by oneself or by directing others.
- C. Theories of leadership and management (Box 8-1)**
- D. Leader and manager approaches**
1. Autocratic
    - a. The leader or manager is focused and maintains strong control, makes decisions, and addresses all problems.
    - b. The leader or manager dominates the group and commands rather than seeks suggestions or input.
  2. Democratic
    - a. This is also called participative.
    - b. It is based on the belief that every group member should have input into the development of goals and problem solving.
    - c. A democratic leader or manager acts primarily as a facilitator and resource person and is concerned for each member of the group.
    - d. The democratic style is a more "talk with the members" style and much less authoritarian than the autocratic style.

### Box 8-1 Theories of Leadership and Management

*Charismatic:* Based on personal beliefs and characteristics

*Quantum:* Based on the concepts of chaos theory; maintaining a balance between tension and order prevents an unstable environment and promotes creativity

*Relational:* Based on collaboration and teamwork

*Servant:* Based on a desire to serve others; the leader emerges when another's needs assume priority

*Shared:* Based on the belief that several individuals share the responsibility for achieving the health care agency's goals

*Transactional:* Based on the principles of social-exchange theory

*Transformational:* Based on the individual's commitment to the health care agency's vision and focuses on promoting change

3. Laissez-faire
    - a. A laissez-faire leader or manager assumes a passive, nondirective, and inactive approach and relinquishes part or all of the responsibilities to the members of the group.
    - b. Decision making is left to the group, with the laissez-faire leader or manager providing little, if any, guidance, support, or feedback.
  4. Situational
    - a. Situational style uses a combination of styles based on the current circumstances and events.
    - b. Situational styles are assumed according to the needs of the group and the tasks to be achieved.
  5. Bureaucratic
    - a. The leader or manager believes that individuals are motivated by external forces.
    - b. The leader/manager relies on organizational policies and procedures for decision making.
- E.** Effective leader and manager behaviors (Box 8-2)
- F.** Effective leader and manager qualities (Box 8-3)
- G.** Functions of **management** (Box 8-4)

### Box 8-2 Effective Leader and Manager Behaviors

Treats employees as unique individuals  
 Inspires employees and stimulates critical thinking  
 Shows employees how to think about old problems in new ways  
 Is visible to employees; is flexible; and provides guidance, assistance, and feedback  
 Communicates a vision, establishes trust, and empowers employees  
 Motivates employees to achieve goals

Modified from Huber, D. (2010). *Leadership and nursing care management* (4th ed.). St. Louis: Saunders.

### Box 8-3 Effective Leader and Manager Qualities

Effective communicator  
 Credible  
 Critical thinker  
 Initiator of action  
 Risk taker  
 Is persuasive and influences employees

### Box 8-4 Functions of Management

**Planning:** Determining objectives and identifying methods that lead to achievement of objectives  
**Organizing:** Using resources (human and material) to achieve predetermined outcomes  
**Directing:** Guiding and motivating others to meet expected outcomes  
**Controlling:** Using performance standards as criteria for measuring success and taking corrective action

- H. Problem-solving process and decision making
  1. Problem solving involves obtaining information and using it to reach an acceptable solution to a problem.
  2. Decision making involves identifying a problem and deciding which alternatives can best achieve objectives.
  3. Steps of the problem-solving process are similar to the steps of the nursing process (Table 8-1).
- I. Types of managers
  1. Frontline manager
    - a. Frontline managers function in supervisory roles closely identified with the actual delivery of client care.
    - b. Frontline roles include charge nurse, team leader, and client care coordinator.
    - c. Frontline managers coordinate the activity of all staff who provide client care and supervise team members during the manager's period of **accountability**.
  2. Middle manager
    - a. Middle manager roles include unit manager and supervisor.
    - b. A middle manager's responsibilities include supervising staff, preparing budgets, preparing work schedules, writing and implementing policies that guide client care and unit operations, and maintaining the quality of client services.
  3. Nurse executive
    - a. A nurse executive is a top-level nurse manager and may be the director of nursing services or the vice-president for client care services.
    - b. The nurse executive supervises numerous departments and works closely with the administrative team of the organization.
    - c. The nurse executive ensures that all client care provided by nurses is consistent with the objectives of the health care organization.

## IV. POWER

- A.** Power is the ability to do or act to achieve desired results.

**TABLE 8-1** Similarities of the Problem-Solving Process and the Nursing Process

| Problem-Solving Process                                     | Nursing Process |
|---|-----------------|
| Identifying a problem and collecting data about the problem | Assessment      |
| Determining the exact nature of the problem                 | Analysis        |
| Deciding on a plan of action                                | Planning        |
| Carrying out the plan                                       | Implementation  |
| Evaluating the plan   | Evaluation      |

**Box 8-5 Types of Power**

*Reward:* Ability to provide incentives

*Coercive:* Ability to punish

*Referent:* Based on attraction

*Expert:* Based on having an expert knowledge base and skill level

*Legitimate:* Based on a position in society

*Personal:* Derived from a high degree of self-confidence

*Informational:* When one person provides explanations why another should behave in a certain way

- B. Powerful people are able to modify behavior and influence others to change, even when others are resistant to change.
-  C. Effective nurse leaders use power to improve the delivery of care and to enhance the profession.
- D. Power that is effective is power that is shared.
- E. There are different types of power (Box 8-5).

**V. EMPOWERMENT**

- A. Empowerment is an interpersonal process of enabling others to do for themselves.
- B. Empowerment occurs when individuals are able to influence what happens to them more effectively.
- C. Empowerment involves open communication, mutual goal setting, and decision making.
- D. Nurses can empower clients through teaching and advocacy.

**VI. FORMAL ORGANIZATIONS**

- A. An organization's mission statement communicates in broad terms its reason for existence; the geographic area that the organization serves; and attitudes, beliefs, and values from which the organization functions.
- B. Goals and objectives are measurable activities specific to the development of designated services and programs of an organization.
- C. The organizational chart depicts and communicates how activities are arranged, how **authority** relationships are defined, and how communication channels are established.
- D. Policies, procedures, and protocols
  1. Policies are guidelines that define the organization's standpoint on courses of action.
  2. Procedures are based on policy and define methods for tasks.
  3. Protocols prescribe a specific course of action for a specific type of client or problem.
- E. Centralization is the making of decisions by a few individuals at the top of the organization or by managers of a department or unit, and decisions are communicated thereafter to the employees.

- F. Decentralization is the distribution of **authority** throughout the organization to allow for increased responsibility and **delegation** in decision making.

 A nurse must follow policies, procedures, and protocols of the health care agency in which he or she is employed.

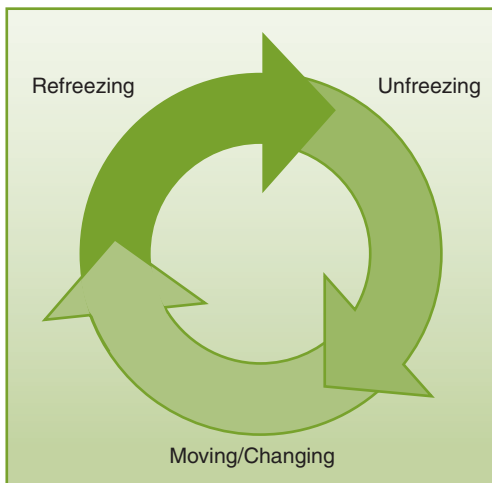

**VII. EVIDENCE-BASED PRACTICE**

- A. **Evidence-based practice** is an approach to client care in which the nurse integrates the client's preferences, clinical expertise, and the best research evidence to deliver quality care.
- B. Determining the client's personal, social, cultural, and religious preferences ensures individualization and is a component of implementing evidence-based practice.
- C. A nurse needs to be an observer and identify and question situations that require change or result in a less than desirable outcome.
- D. Use of information technology such as online resources, including research publications, provides current research findings related to areas of practice.
- E. The nurse needs to follow **evidence-based practice** protocols developed by the institution and question the rationale for nursing approaches identified in the protocols as necessary.

 Evidence-based practice requires that a nurse base nursing practice on evidence from clinical research studies. The nurse should also be alert to clinical issues that warrant investigation and develop a researchable problem about the issue.

**VIII. QUALITY IMPROVEMENT**

- A. Also known as performance improvement, **quality improvement** focuses on processes or systems that significantly contribute to client safety and effective client care outcomes; criteria are used to monitor outcomes of care and to determine the need for change to improve the quality of care.
- B. **Quality improvement** processes or systems may be named quality assurance, continuous quality **management**, or continuous **quality improvement**.
- C. When **quality improvement** is part of the philosophy of a health care agency, every staff member becomes involved in ways to improve client care and outcomes.
- D. A retrospective ("looking back") audit is an evaluation method used to inspect the medical record after the client's discharge for documentation of compliance with the standards.
- E. A concurrent ("at the same time") audit is an evaluation method used to inspect compliance of nurses with predetermined standards and criteria

▲ **FIGURE 8-1** Elements of a successful change. (From Huber, D. [2010]. *Leadership and nursing care management* [4th ed.]. St. Louis: Saunders.)

while the nurses are providing care during the client's stay.

- F. Peer review is a process in which nurses employed in an organization evaluate the quality of nursing care delivered to the client.
- G. The **quality improvement** process is similar to the nursing process and involves a multidisciplinary approach.
- H. An outcome describes the most positive response to care; comparison of client responses to the expected outcomes indicates whether the interventions are effective, whether the client has progressed, how well standards are met, and whether changes are necessary.
- I. A nurse is responsible for recognizing trends in nursing practice, identifying recurrent problems, and initiating opportunities to improve the quality of care.

⚠ **Quality improvement processes improve the quality of care delivery to clients and the safety of health care agencies.**

## IX. CHANGE PROCESS

- A. Change is a dynamic process that leads to an alteration in behavior.
  1. Lewin's basic concept of the change process includes three elements for successful change: unfreezing, moving and changing, and refreezing (Fig. 8-1).
    - a. Unfreezing is the first phase of the process, during which the problem is identified and individuals involved gather facts and evidence supporting a basis for change.
    - b. During the moving and changing phase, change is planned and implemented.
    - c. Refreezing is the last phase of the process, during which the change becomes stabilized.

## PRIORITY NURSING ACTIONS!

### Order of Priority in Assessing a Group of Clients

A nurse is assigned to the following clients. The order of priority in assessing the clients is as follows:

1. A client with heart failure who has a 4-lb weight gain since yesterday and is experiencing shortness of breath
2. A 24-hour postoperative client who had a wedge resection of the lung and has a closed chest tube drainage system
3. A client admitted to the hospital for observation who has absent bowel sounds
4. A client who is undergoing surgery for a hysterectomy on the following day

The nurse determines the order of priority by considering the needs of the client. The nurse also uses guidelines for prioritizing, such as the ABCs (airway, breathing, and circulation), Maslow's Hierarchy of Needs theory, and the steps of the nursing process. Clients 1 and 2 have conditions that relate to the respiratory system or cardiac system (client 1). These clients are the high priorities. Client 1 is the first priority because this client is experiencing shortness of breath (life-threatening). There is no indication that client 2 is experiencing any difficulty. Because client 4 is scheduled for surgery on the following day, this client would be the last priority (low priority), and the nurse would assess this client and prepare this client for surgery after other clients are assessed. Because absent bowel sounds could be an indication of a bowel obstruction (intermediate priority), this client would be priority 3.

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 307). St. Louis: Mosby.

2. **Leadership** style influences the approach to initiating the change process. (See Priority Nursing Actions.)
- B. Types of change
    1. Planned change: A deliberate effort to improve a situation
    2. Unplanned change: Change that is unpredictable but is beneficial and may go unnoticed
  - C. Resistance to change (Box 8-6)
    1. Resistance to change occurs when an individual rejects proposed new ideas without critically thinking about the proposal.
    2. Change requires energy.
    3. The change process does not guarantee positive outcomes.
  - D. Overcoming barriers
    1. Create a flexible and adaptable environment.
    2. Encourage the people involved to plan and set goals for change.
    3. Include all involved in the plan for change.
    4. Focus on the benefits of the change in relation to improvement of client care.

**Box 8-6 Reasons for Resisting Change****Conformity**

One goes along with others to avoid conflict.

**Dissimilar Beliefs and Values**

Differences can impede positive change.

**Habit**

Routine, set behaviors are often hard to change.

**Secondary Gains**

Benefits or payoff are present, so there is no incentive to change.

**Threats to Satisfying Basic Needs**

Change may be perceived as a threat to self-esteem, security, or survival.

**Fear**

One fears failure or has fear of the unknown.

5. Delineate the drawbacks from failing to make the change in relation to client care.
6. Evaluate the change process on an ongoing basis, and keep everyone informed of the progress.
7. Provide positive feedback to all involved.
8. Commit to the time it takes to change.

**X. CONFLICT**

**A.** Conflict arises from a perception of incompatibility or difference in beliefs, attitudes, values, goals, priorities, or decisions.

**B.** Types of conflict

1. Intrapersonal: Occurs within a person
2. Interpersonal: Occurs between and among clients, nurses, or other staff members
3. Organizational: Occurs when an employee confronts the policies and procedures of the organization

**C.** Modes of conflict resolution

1. Avoidance
  - a. Avoiders are unassertive and uncooperative.
  - b. Avoiders do not pursue their own needs, goals, or concerns, and they do not assist others to pursue theirs.
  - c. Avoiders postpone dealing with the issue.
2. Accommodation
  - a. Accommodators neglect their own needs, goals, or concerns (unassertive) while trying to satisfy those of others.
  - b. Accommodators obey and serve others and often feel resentment and disappointment because they “get nothing in return.”
3. Competition
  - a. Competitors pursue their own needs and goals at the expense of others.
  - b. Competitors also may stand up for rights and defend important principles.

4. Compromise
  - a. Compromisers are assertive and cooperative.
  - b. Compromisers work creatively and openly to find the solution that most fully satisfies all important goals and concerns to be achieved.

**XI. ROLES OF HEALTH CARE TEAM MEMBERS****A.** Nurse roles are as follows:

1. Promote health and prevent disease
2. Provide comfort and care to clients
3. Make decisions
4. Act as client advocate
5. Lead and manage the nursing team
6. Serve as case manager
7. Function as a rehabilitator
8. Communicate effectively
9. Educate clients, families, and communities and health care team members
10. Act as a resource person
11. Allocate resources in a cost-effective manner

**B.** Physician: A physician diagnoses and treats disease.**C.** Physician assistant

1. A physician assistant acts to a limited extent in the role of the physician during the physician's absence
2. The physician assistant conducts physical examinations, performs diagnostic procedures, assists in the operating room and emergency department, and performs treatments.
3. Certified and licensed physician assistants in some states have prescriptive powers.

**D.** Physical therapist: A physical therapist assists in examining, testing, and treating physically disabled clients.**E.** Occupational therapist: An occupational therapist develops adaptive devices that help chronically ill or handicapped clients perform activities of daily living.**F.** Respiratory therapist: A respiratory therapist delivers treatments designed to improve the client's ventilation and oxygenation status.**G.** Nutritionist: A nutritionist or dietitian assists in planning dietary measures to improve or maintain a client's nutritional status.**H.** Continuing care nurse: This nurse coordinates discharge plans for the client.**I.** Assistive personnel, including nursing assistants, unlicensed personnel, and client care technicians, help a registered nurse with specified tasks and functions.**J.** Pharmacist: A pharmacist formulates and dispenses medications.**K.** Social worker: A social worker counsels clients and families about home care services and assists the continuing care nurse with planning discharge.**L.** Chaplain: A chaplain offers spiritual support and guidance to clients and families.

- M. Administrative staff: Administrative or support staff members organize and schedule diagnostic tests and procedures and arrange for services needed by the client and family.

## XII. HEALTH CARE TEAM COLLABORATION

- A. Client care planning can be accomplished through referrals to or consultations or collaborations with other health care specialists and through client care conferences, which involve members from all health care disciplines. This approach helps ensure continuity of care.
- B. Reports
  1. Reports should be factual, accurate, current, complete, and organized.
  2. Reports should include essential background information, subjective data, objective data, any changes in the client's status, nursing diagnoses, treatments and procedures, medication administration, client teaching, discharge planning, family information, the client's response to treatments and procedures, and the client's priority needs.
  3. Change of shift report
    - a. The report facilitates continuity of care among nurses who are responsible for a client.
    - b. The report may be written, oral, audiotaped, or provided during walking rounds at the client's bedside.
    - c. The report describes the client's health status and informs the nurse on the next shift about the client's needs and priorities for care.
  4. Telephone reports
    - a. Purposes include informing a physician of a client's change in status, communicating information about a client's transfer to or from another unit or facility, and obtaining results of laboratory or diagnostic tests.
    - b. The telephone report should be documented and should include when the call was made, who made the call, who was called, to whom information was given, what information was given, and what information was received.
  5. Transfer reports
    - a. Transferring nurse reports provide continuity of care and may be given by telephone or in person (Box 8-7).
    - b. Receiving nurse should repeat transfer information to ensure client safety and ask questions to clarify information about the client's status.

## XIII. CONSULTATION WITH THE HEALTH CARE TEAM

- A. Consultation is a process in which a specialist is sought to identify methods of care or treatment plans to meet the needs of a client.

### Box 8-7 Transfer Reports

Client's name, age, physician, and diagnoses  
 Current health status and plan of care  
 Client's needs and priorities for care  
 Any assessments or interventions that need to be performed after transfer, such as laboratory tests, medication administration, or dressing changes  
 Need for any special equipment  
 Additional considerations such as allergies, resuscitation status, precautionary considerations, or family issues

### Box 8-8 Discharge Teaching

How to administer prescribed medications  
 Side effects of medications that need to be reported to the physician  
 Prescribed dietary and activity measures  
 Complications of the medical condition that need to be reported to the physician  
 How to perform prescribed treatments  
 How to use special equipment prescribed for the client  
 Schedule for home care services that are planned  
 How to access available community resources  
 When to obtain follow-up care

- B. Consultation is needed when a nurse encounters a problem that cannot be solved using nursing knowledge, skills, and available resources.
- C. Consultation also is needed when the exact problem remains unclear; a consultant can objectively and more clearly assess and identify the exact nature of the problem.
- D. Rapid response teams are being developed within hospitals to provide nursing staff with internal consultative services provided by expert clinicians.
- E. Rapid response teams are used to assist nursing staff with early detection and resolution of client problems.

## XIV. DISCHARGE PLANNING

- A. Discharge planning begins when the client is admitted to the hospital or health care facility.
- B. Discharge planning is a multidisciplinary process that ensures that the client has a plan for continuing care after leaving the health care facility and assists in the client's transition from one environment to another.
- C. All caregivers need to be involved in discharge planning, and referrals to other health care professionals or agencies may be needed. A physician's prescription may be needed for the referral, and the referral needs to be approved by the client's health care insurer.
- D. A nurse should anticipate the client's discharge needs and make the referral as soon as possible (involving the client and family in the referral process).
- E. The nurse needs to educate the client and family regarding care at home (Box 8-8).

## XV. DELEGATION AND ASSIGNMENTS

### A. Delegation

1. **Delegation** is a process of transferring performance of a selected nursing task in a situation to an individual who is competent to perform that specific task.
2. **Delegation** involves achieving outcomes and sharing activities with other individuals who have the **authority** to accomplish the task.
3. The nurse practice act and any practice limitations define which aspects of care can be delegated and which must be performed by a registered nurse.
4. Even though a task may be delegated to someone, the nurse who delegates maintains **accountability** for the task.
5. Only the task, not the ultimate **accountability**, may be delegated to another.
6. The five rights of delegation include the right task, right circumstances, right person, right direction/communication, and right supervision/evaluation.

 **Delegate only tasks for which you are responsible. A nurse who delegates is accountable for the task; the person who assumes responsibility for the task is also accountable.**

### B. Principles and guidelines of delegating (Box 8-9)

#### C. Assignments

1. Assignment is transferring performance of client care activities to specific staff members.
2. Guidelines for client care assignments
  - a. Always ensure client safety.
  - b. Be aware of individual variations in work abilities.
  - c. Determine which tasks can be delegated and to whom.
  - d. Match the task to the delegatee based on the nurse practice act and appropriate position descriptions.
  - e. Provide directions that are clear, concise, accurate, and complete.

- f. Validate the delegatee's understanding of the directions.
- g. Communicate a feeling of confidence to the delegatee, and provide feedback promptly after the task is performed.
- h. Maintain continuity of care as much as possible when assigning client care.

## XVI. TIME MANAGEMENT

### A. Description

1. Time **management** is a technique designed to assist in completing tasks within a definite time period.
2. Learning how, when, and where to use one's time and establishing personal goals and time frames are part of time **management**.
3. Time **management** requires an ability to anticipate the day's activities, to combine activities when possible, and not to be interrupted by nonessential activities.
4. Time **management** involves efficiency in completing tasks as quickly as possible and effectiveness in deciding on the most important task to do (i.e., **prioritizing**) and doing it correctly.

### B. Principles and guidelines

1. Identify tasks, obligations, and activities and write them down.
2. Organize the work day; identify which tasks must be completed in specified time frames.
3. Prioritize client needs according to importance.
4. Anticipate the needs of the day and provide time for unexpected and unplanned tasks that may arise.
5. Focus on beginning the daily tasks, working on the most important first while keeping goals in mind; look at the final goal for the day, which helps in the breakdown of tasks into manageable parts.
6. Begin client rounds at the beginning of the shift, collecting data on each assigned client.
7. Delegate tasks when appropriate.
8. Keep a daily hour-by-hour log to assist in providing structure to the tasks that must be

### Box 8-9 Principles and Guidelines of Delegating

- Delegate the right task to the right delegatee. Be familiar with the experience of the delegates, their scopes of practice, their job descriptions, agency policy and procedures, and the state nurse practice act.
- Provide clear directions about the task and ensure that the delegatee understands the expectations.
- Determine the degree of supervision that may be required.
- Provide the delegatee with the authority to complete the task; provide a deadline for completion of the task.
- Evaluate the outcome of care that has been delegated.
- Provide feedback to the delegatee regarding his or her performance.
- *Generally*, noninvasive interventions, such as skin care, range-of-motion exercises, ambulation, grooming, and hygiene measures, can be assigned to a nursing assistant.
- *Generally*, a licensed practical nurse (LPN) or licensed vocational nurse (LVN) can perform not only the tasks that a nursing assistant can perform, but also certain invasive tasks, such as dressing changes, suctioning, urinary catheterization, and medication administration (oral, subcutaneous, and intramuscular), according to the education and job description of the LPN or LVN.
- A registered nurse can perform the tasks that an LPN or LVN can perform and is responsible for assessment and planning care, initiating teaching, and administering medications intravenously.

- accomplished, and cross tasks off the list as they are accomplished.
9. Use health care agency resources wisely, anticipating resource needs, and gather the necessary supplies before beginning the task.
  10. Organize paperwork and continuously document task completion and necessary client data throughout the day (i.e., documentation should be concurrent with completion of a task or observation of pertinent client data).
  11. At the end of the day, evaluate the effectiveness of time **management**.
- C. Setting priorities for client teaching
    1. Determine client's immediate learning needs.
    2. Review the learning objectives established for the client.
    3. Determine what the client perceives as important.
    4. Assess the client's anxiety level and the time available to teach.
  - D. **Prioritizing** when caring for a group of clients
    1. Identify the problems of each client.
    2. Review nursing diagnoses.
    3. Determine which client problems are most urgent based on basic needs, the client's changing or unstable status, and complexity of the client's problems.
    4. Anticipate the time that it may take to care for the priority needs of the clients.
    5. Combine activities, if possible, to resolve more than one problem at a time.
    6. Involve the client in his or her care as much as possible. (See Priority Nursing Actions.)

## XVII. PRIORITIZING CARE

A. **Prioritizing** is deciding which needs or problems require immediate action and which ones could tolerate a delay in response until a later time because they are not urgent.

B. Guidelines for **prioritizing** (Box 8-10)

### Box 8-10 Guidelines for Prioritizing

- The nurse and the client mutually rank the client's needs in order of importance based on the client's preferences and expectations, safety, and physical and psychological needs; what the client sees as his or her priority needs may be different from what the nurse sees as the priority needs.
- Priorities are classified as high, intermediate, or low.
- Client needs that are life-threatening or that could result in harm to the client if they are left untreated are high priorities.
- Nonemergency and non-life-threatening client needs are intermediate priorities.
- Client needs that are not related directly to the client's illness or prognosis are low priorities.
- When providing care, the nurse needs to decide which needs or problems require immediate action and which ones could be delayed until a later time because they are not urgent.
- The nurse considers client problems that involve actual or life-threatening concerns before potential health-threatening concerns.
- When prioritizing care, the nurse must consider time constraints and available resources.
- Problems identified as important by the client must be given high priority.
- The nurse can use the ABCs—airway, breathing, and circulation—as a guide when determining priorities; client needs related to maintaining a patent airway are always the priority.
- The nurse can use Maslow's Hierarchy of Needs theory as a guide to determine priorities and to identify the levels of physiological needs, safety, love and belonging, self-esteem, and self-actualization (basic needs are met before moving to other needs in the hierarchy).
- The nurse can use the steps of the nursing process as a guide to determine priorities, remembering that assessment is the first step of the nursing process.

### PRIORITY NURSING ACTIONS!

#### Triaging Clients at the Site of an Accident

A nurse is the first responder at the scene of a school bus accident. The nurse triages the victims from highest to lowest priority as follows:

1. Confused child with bright red blood pulsating from a leg wound
2. Child with a closed head wound and multiple compound fractures of the arms and legs
3. Child with a simple fracture of the arm complaining of abdominal pain
4. Sobbing child with several minor lacerations on the face, arms, and legs

Triage systems identify which victims are the priority and should be treated first. Rankings are based on immediacy of needs, including victims with immediate threat to life requiring immediate treatment (emergent), victims whose injuries are not life-threatening provided that they are treated within 1 to 2 hours (urgent), and victims with sustained local injuries who do not have immediate complications and can wait several hours for medical treatment (nonurgent). Victim 1 has a wound that is pulsating bright red blood; this indicates arterial puncture. The child is also confused, which indicates the presence of hypoxia and shock (emergent). Victim 2 has sustained multiple trauma, so this victim is also classified as emergent and would require immediate treatment; however, victim 1 is the higher priority because of the arterial puncture. Victim 3 sustained injuries that are not life-threatening provided that the injuries can be treated in 1 to 2 hours (urgent). Victim 4 sustained minor injuries that can wait several hours for treatment (nonurgent).

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 854, 849). St. Louis: Saunders.

Stanhope, M., & Lancaster, J. (2008). *Public health nursing: population-centered health care in the community* (7th ed., p. 468). St. Louis: Mosby.

 Use the ABCs (airway, breathing, and circulation), Maslow's Hierarchy of Needs theory, and the steps of the nursing process (assessment is first) to prioritize.

## XVIII. DISASTERS AND EMERGENCY RESPONSE PLAN

### A. Description

1. A **disaster** is any human-made or natural event that causes destruction and devastation that cannot be alleviated without assistance (Box 8-11).
2. Internal **disasters** are **disasters** that occur within a health care agency (e.g., health care agency fire, structural collapse, radiation spill), whereas external **disasters** are **disasters** that occur outside the health care agency (e.g., mass transit accident that could send hundreds of victims to emergency departments).
3. An **emergency response plan** is a formal plan of action for coordinating the response of the health care agency staff in the event of a **disaster** in the health care agency or surrounding community.

### B. American Red Cross (ARC)

1. The ARC has been given **authority** by the federal government to provide **disaster** relief.
2. All ARC **disaster** relief assistance is free, and local offices are located across the United States.

3. The ARC participates with the government in developing and testing community **disaster** plans.
4. The ARC identifies and trains personnel for emergency response.
5. The ARC works with businesses and labor organizations to identify resources and individuals for **disaster** work.
6. The ARC educates the public about ways to prepare for a **disaster**.
7. The ARC operates shelters, provides assistance to meet immediate emergency needs, and provides **disaster** health services, including crisis counseling.
8. The ARC handles inquiries from family members.
9. The ARC coordinates relief activities with other agencies.
10. Nurses are involved directly with the ARC and assume functions such as managers, supervisors, and educators of first aid; they also participate in **emergency response plans** and **disaster** relief programs and provide services, such as blood collection drives and immunization programs.

### C. Phases of **disaster** management

1. The Federal Emergency Management Agency (FEMA) identifies four **disaster management** phases: mitigation, preparedness, response, and recovery (Box 8-12).
2. Mitigation encompasses the following:
  - a. Actions or measures that can prevent the occurrence of a **disaster** or reduce the damaging effects of a **disaster**
  - b. Determination of the community hazards and community risks (actual and potential threats) before a **disaster** occurs
  - c. Awareness of available community resources and community health personnel to facilitate mobilization of activities and minimize chaos and confusion if a **disaster** occurs
  - d. Determination of the resources available for care to infants, older adults, disabled individuals, and individuals with chronic health problems
3. Preparedness encompasses the following:
  - a. Plans for rescue, evacuation, and caring for **disaster** victims

### Box 8-11 Types of Disasters

#### Human-Made Disasters

Dam failures resulting in flooding  
 Hazardous substance accidents such as pollution, chemical spills, or toxic gas leaks  
 Accidents involving release of radioactive material  
 Resource shortages such as food, water, and electricity  
 Structural collapse, fire, or explosions  
 Terrorist attacks such as bombing, riots, and bioterrorism  
 Mass transportation accidents

#### Natural Disasters

Blizzards  
 Communicable disease epidemics  
 Cyclones  
 Droughts  
 Earthquakes  
 Floods  
 Forest fires  
 Hailstorms  
 Hurricanes  
 Landslides  
 Mudslides  
 Tidal waves  
 Tornadoes  
 Volcanic eruptions

### Box 8-12 Federal Emergency Management Agency (FEMA): Four Disaster Management Phases

Mitigation  
 Preparedness  
 Response  
 Recovery

- b. Plans for training **disaster** personnel and gathering resources, equipment, and other materials needed for dealing with the **disaster**
  - c. Identification of specific responsibilities for various emergency response personnel
  - d. Establishment of a community **emergency response plan** and an effective public communication system
  - e. Development of an emergency medical system and a plan for activation
  - f. Verification of proper functioning of emergency equipment
  - g. Collection of anticipatory provisions and creation of a location for providing food, water, clothing, shelter, other supplies, and needed medicine
  - h. Inventory of supplies on a regular basis and replenishment of outdated supplies
  - i. Practice of community **emergency response plans** (mock **disaster** drills)
4. Response encompasses the following:
    - a. Putting **disaster** planning services into action and the actions taken to save lives and prevent further damage
    - b. Primary concerns include safety, physical health, and mental health of victims and members of the **disaster** response team
  5. Recovery encompasses the following:
    - a. Actions taken to return to a normal situation after the **disaster**
    - b. Preventing debilitating effects and restoring personal, economic, and environmental health and stability to the community
- D. Levels of **disaster****
1. FEMA identifies three levels of **disaster** with FEMA response (Box 8-13).
2. When a federal emergency has been declared, the federal response plan may take effect and activate emergency support functions.
  3. The emergency support functions of the ARC include performing emergency first aid, sheltering, feeding, providing a **disaster** welfare information system, and coordinating bulk distribution of emergency relief supplies.
  4. **Disaster** medical assistant teams (teams of specially trained personnel) can be activated and sent to a **disaster** site to provide **triage** and medical care to victims until they can be evacuated to a hospital.
- E. Nurse's role in **disaster** planning**
1. Personal and professional preparedness
    - a. Make personal and family preparations (Box 8-14).
    - b. Be aware of the **disaster** plan at the place of employment and in the community.
    - c. Maintain certification in **disaster** training and in cardiopulmonary resuscitation.
    - d. Participate in mock **disaster** drills, including a bomb threat drill.
    - e. Prepare professional emergency response items, such as a copy of nursing license, personal health care equipment such as a stethoscope, cash, warm clothing, record-keeping materials, and other nursing care supplies.

### Box 8-13 Federal Emergency Management Agency (FEMA) Levels of Disaster

#### Level III Disaster

Minor disaster that involves a minimal level of damage, but could result in a presidential declaration of an emergency

#### Level II Disaster

Moderate disaster that is likely to result in a presidential declaration of an emergency, with moderate federal assistance

#### Level I Disaster

Massive disaster that involves significant damage and results in a presidential disaster declaration, with major federal involvement and full engagement of federal, regional, and national resources

### Box 8-14 Emergency Plans and Supplies

- Plan a meeting place for family members.  
Identify where to go if an evacuation is necessary.  
Determine when and how to turn off water, gas, and electricity at main switches.  
Locate the safe spots in the home for each type of disaster.  
Replace water supply every 3 months and food supply every 6 months.  
Include the following supplies:
- A 3-day supply of water (1 gallon per person per day)
  - A 3-day supply of nonperishable food
  - Clothing and blankets
  - First-aid kit
  - Adequate supply of prescription medication
  - Battery-operated radio
  - Flashlight and batteries
  - Credit card, cash, or traveler's checks
  - Extra set of car keys and a full tank of gas in the car
  - Sanitation supplies for washing, toileting, and disposing of trash
  - Extra pair of eyeglasses
  - Special items for infants, older adults, or disabled individuals
  - Items needed for a pet such as food, water, and leash
  - Important documents in a waterproof case

2. **Disaster** response
  - a. In the health care agency setting, if a **disaster** occurs, the agency **disaster** preparedness plan (**emergency response plan**) is activated immediately, and a nurse responds by following the directions identified in the plan.
  - b. In the community setting, if a nurse is the first responder to a **disaster**, the nurse cares for the victims by attending to the victims with life-threatening problems first; when rescue workers arrive at the scene, immediate plans for **triage** should begin.

 In the event of a disaster, activate the emergency response plan immediately.

#### F. Triage

1. In a **disaster** or war, **triage** consists of brief assessment of victims that allows a nurse to classify victims according to the severity of the injury, urgency of treatment, and place for treatment.
2. In an emergency department, **triage** consists of brief assessment of clients that allows a nurse to classify clients according to their need for care and establishing priorities of care; the type of illness or injury, the severity of the problem, and the resources available govern the process.

G. Three-tier system (commonly used in health care agencies) (Box 8-15).

#### H. Emergency department **triage** system

1. A commonly used rating system in an emergency department is a three-tier system that uses the categories of emergent, urgent, and nonurgent; these categories may be identified by color coding or numbers (Box 8-16).
2. A nurse needs to be familiar with the **triage** system of the health care agency.
3. When caring for a client who has died, the nurse needs to recognize the importance of family and religious rituals and provide support to loved ones.
4. Organ donation procedures of the health care agency need to be addressed if appropriate.

 Think survivability. If you are the first responder to a scene of a disaster, such as a train crash, the priority victim is the one whose life can be saved.

#### Box 8-15 Three-Tier System (Commonly Used in Health Care Agencies)

1. Life-threatening (emergent): Victim has life-threatening injuries, but they are readily correctable.
2. Urgent: Victim must be treated within 1 to 2 hours.
3. Delayed (nonurgent): Victim has no injury, is noncritical, or is ambulatory.

#### I. Client assessment in the emergency department

1. Primary assessment
  - a. The purpose of primary assessment is to identify any client problem that poses an immediate or potential threat to life.
  - b. A nurse gathers information primarily through objective data and, on finding any abnormalities, immediately initiates interventions.
  - c. The nurse uses the ABCs—airway, breathing, and circulation—as a guide in assessing a client's needs and assesses a client who has sustained a traumatic injury for signs of a head injury or cervical spine injury.
2. Secondary assessment
  - a. A nurse performs secondary assessment after the primary assessment and after treatment for any primary problems identified.
  - b. Secondary assessment identifies any other life-threatening problems that a client might be experiencing.
  - c. The nurse obtains subjective and objective data, including a history, general overview, vital sign measurements, neurological assessment, pain assessment, and complete or focused physical assessment.

#### Box 8-16 Emergency Department Triage

##### Emergent (Red): Priority 1 (Highest)

This classification is assigned to clients who have life-threatening injuries and need immediate attention and continuous evaluation, but have a high probability for survival when stabilized.

Such clients include trauma victims, clients with chest pain, clients with severe respiratory distress or cardiac arrest, clients with limb amputation, clients with acute neurological deficits, and clients who have sustained chemical splashes to the eyes.

##### Urgent (Yellow): Priority 2

This classification is assigned to clients who require treatment and whose injuries have complications that are not life-threatening, provided that they are treated within 1 to 2 hours; these clients require continuous evaluation every 30 to 60 minutes thereafter.

Such clients include clients with a simple fracture, asthma without respiratory distress, fever, hypertension, abdominal pain, or a renal stone.

##### Nonurgent (Green): Priority 3

This classification is assigned to clients with local injuries who do not have immediate complications and who can wait several hours for medical treatment; these clients require evaluation every 1 to 2 hours thereafter.

Such clients include clients with conditions such as a minor laceration, sprain, or cold symptoms.

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 26.** A nurse is assigned to care for four clients. In planning client rounds, which client should the nurse assess first?
1. A client scheduled for a chest x-ray
  2. A client requiring daily dressing changes
  3. A postoperative client preparing for discharge
  4. A client receiving nasal oxygen who had difficulty breathing during the previous shift
- 27.** A nurse employed in an emergency department is assigned to triage clients coming to the emergency department for treatment on the evening shift. The nurse should assign highest priority to which of the following clients?
1. A client complaining of muscle aches, a headache, and malaise
  2. A client who twisted her ankle when she fell while rollerblading
  3. A client with a minor laceration on the index finger sustained while cutting an eggplant
  4. A client with chest pain who states that he just ate pizza that was made with a very spicy sauce
- 28.** A new nursing graduate is attending an agency orientation regarding the nursing model of practice implemented in the health care facility. The nurse is told that the nursing model is a team nursing approach. The nurse understands that planning care delivery will be based on which characteristic of this type of nursing model of practice?
1. A task approach method is used to provide care to clients.
  2. Managed care concepts and tools are used in providing client care.
  3. A single registered nurse is responsible for providing care to a group of clients.
  4. A registered nurse leads nursing personnel in providing care to a group of clients.
- 29.** A registered nurse has received the assignment for the day shift. After making initial rounds and checking all of the assigned clients, which client will the registered nurse plan to care for first?
1. A client who is ambulatory
  2. A client scheduled for physical therapy at 1 PM
  3. A client with a fever who is diaphoretic and restless
  4. A postoperative client who has just received pain medication
- 30.** A nurse is giving a bed bath to an assigned client when a nursing assistant enters the client's room and tells the nurse that another assigned client is in pain and needs pain medication. The appropriate nursing action is which of the following?
1. Finish the bed bath and then administer the pain medication to the other client.
  2. Ask the nursing assistant to find out when the last pain medication was given to the client.
  3. Ask the nursing assistant to tell the client in pain that medication will be administered as soon as the bed bath is complete.
  4. Cover the client, raise the side rails, tell the client that you will return shortly, and administer the pain medication to the other client.
- 31.** A nurse manager has implemented a change in the method of the nursing delivery system from functional to team nursing. A nursing assistant is resistant to the change and is not taking an active part in facilitating the process of change. Which of the following is the best approach in dealing with the nursing assistant?
1. Ignore the resistance.
  2. Exert coercion with the nursing assistant.
  3. Provide a positive reward system for the nursing assistant.
  4. Confront the nursing assistant to encourage verbalization of feelings regarding the change.
- 32.** A registered nurse is planning the client assignments for the day. Which of the following is the most appropriate assignment for a nursing assistant?
1. A client requiring a colostomy irrigation
  2. A client receiving continuous tube feedings
  3. A client who requires urine specimen collections
  4. A client with difficulty swallowing food and fluids
- 33.** A new unit nurse manager is holding her first staff meeting. The manager greets the staff and comments that she has been employed to bring about quality improvement. The manager provides a plan that she developed and a list of tasks and activities for which each staff member must volunteer to perform. In addition, she instructs staff members to report any problems directly to her. What type of leadership style do the new manager's characteristics suggest?
1. Autocratic
  2. Situational
  3. Democratic
  4. Laissez-faire
- 34.** A registered nurse employed in a long-term care facility is planning assignments for the clients on a nursing unit. The registered nurse needs to assign four clients and has a licensed practical (vocational) nurse and three nursing assistants on a

nursing team. Which of the following clients would the registered nurse most appropriately assign to the licensed practical (vocational) nurse?

1. A client who requires a bed bath
2. An older client requiring frequent ambulation
3. A client who requires a 24-hour urine collection
4. A client requiring abdominal wound irrigations and dressing changes every 3 hours

### Alternate Item Format: Chart/Exhibit and Prioritizing (Ordered Response)

- 35.** A home health care nurse is planning client visits and nursing activities for the day. The nurse begins the visits at 9 AM. All clients live within a 5-mile radius. List in order of priority how the nurse should plan the order of the assignments for the day. (Number 1 is the first client or nursing activity for the day and number 6 is the last.)

#### CHART/EXHIBIT

##### CLIENT ASSIGNMENT AND NURSING ACTIVITIES

- A client requiring admission
- A client being visited by the home health aide at 10:30 AM
- A client requiring supervision of the dressing change
- The first dressing change for a client requiring twice-daily dressing changes
- A client with diabetes mellitus who needs a fasting blood glucose level drawn
- The second dressing change for a client requiring twice-daily dressing changes

## ANSWERS

### 26. 4

**Rationale:** Airway is always the highest priority, and the nurse would attend to the client who has been experiencing an airway problem first. The clients described in options 1, 2, and 3 have needs that would be identified as intermediate priorities.

**Test-Taking Strategy:** Use Maslow's Hierarchy of Needs theory and the ABCs—airway, breathing, and circulation—to answer the question. Remember that airway is always the highest priority. This will direct you to option 4. Review principles related to prioritizing if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership and Management—Delegating/Prioritizing

**References:** Jarvis, C. (2008). *Physical examination and health assessment* (5th ed., p. 6). St. Louis: Saunders.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 307). St. Louis: Mosby.

### 27. 4

**Rationale:** In an emergency department, triage involves brief client assessment to classify clients according to their need for care and includes establishing priorities of care. The type of illness or injury, the severity of the problem, and the resources available govern the process. Clients with trauma, chest pain, severe respiratory distress or cardiac arrest, limb amputation, and acute neurological deficits, or who have sustained chemical splashes to the eyes are classified as emergent and are the number 1 priority. Clients with conditions such as a simple fracture, asthma without respiratory distress, fever, hypertension, abdominal pain, or a renal stone have urgent needs and are classified as a number 2 priority. Clients with

conditions such as a minor laceration, sprain, or cold symptoms are classified as nonurgent and are a number 3 priority.

**Test-Taking Strategy:** Note the strategic words *highest priority*. Use the ABCs—airway, breathing, and circulation—to direct you to option 4. A client experiencing chest pain is always classified as priority number 1 until a myocardial infarction has been ruled out. Review the triage classification system commonly used in a hospital emergency department if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Delegating/Prioritizing

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 2194). St. Louis: Saunders.

Zerwekh, J., & Claborn, J. (2009). *Nursing today: Transition and trends* (6th ed., pp. 577–579). St. Louis: Saunders.

### 28. 4

**Rationale:** In team nursing, nursing personnel are led by a registered nurse leader in providing care to a group of clients. Option 1 identifies functional nursing. Option 2 identifies a component of case management. Option 3 identifies primary nursing (relationship-based practice).

**Test-Taking Strategy:** The subject of the question relates to team nursing. Keep this subject in mind and use the process of elimination. Option 4 is the only option that identifies the concept of a team approach. Review the various types of nursing delivery systems if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership and Management—Delegating/Prioritizing

**Reference:** Zerwekh, J., & Claborn, J. (2009). *Nursing today: Transition and trends* (6th ed., pp. 323–324). St. Louis: Saunders.

### 29. 3

**Rationale:** The registered nurse would plan to care for the client who has a fever and is diaphoretic and restless first because this client's needs are the priority. Waiting for pain medication to take effect before providing care to the postoperative client is best. The client who is ambulatory and the client scheduled for physical therapy later in the day do not have priority needs related to care.

**Test-Taking Strategy:** Note the strategic words *care for first* and use principles related to prioritizing. Noting the words *diaphoretic* and *restless* will assist in directing you to this option. Review the principles related to prioritizing if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership and Management—Delegating/Prioritizing

**References:** Cherry, B., & Jacob, S. (2008). *Contemporary nursing issues: Trends and management* (4th ed., p. 498). St. Louis: Mosby.

Zerwekh, J., & Claborn, J. (2009). *Nursing today: Transition and trends* (6th ed., pp. 32–33). St. Louis: Saunders.

### 30. 4

**Rationale:** The nurse is responsible for the care provided to assigned clients. The appropriate action in this situation is to provide safety to the client who is receiving the bed bath and prepare to administer the pain medication. Options 1 and 3 delay the administration of medication to the client in pain. Option 2 is not a responsibility of the nursing assistant.

**Test-Taking Strategy:** Use the process of elimination and principles related to priorities of care. Options 1 and 3 delay the administration of pain medication, and option 2 is not a responsibility of the nursing assistant. The appropriate action is to plan to administer the medication. Review principles related to priorities of care if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Delegating/Prioritizing

**Reference:** Zerwekh, J., & Claborn, J. (2009). *Nursing today: Transition and trends* (6th ed., p. 317). St. Louis: Saunders.

### 31. 4

**Rationale:** Confrontation is an important strategy to meet resistance head on. Face-to-face meetings to confront the issue at hand will allow verbalization of feelings, identification of problems and issues, and development of strategies to solve the problem. Option 1 will not address the problem. Option 2 may produce additional resistance. Option 3 may provide a temporary solution to the resistance, but will not address the concern specifically.

**Test-Taking Strategy:** Use the process of elimination. Options 1 and 2 can be eliminated first because of the words *ignore* in option 1 and *coercion* in option 2. From the remaining options, select option 4 over option 3 because this option specifically addresses the subject and would provide problem-solving

measures. If you had difficulty with this question, review the strategies associated with dealing with resistance to change.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Delegating/Prioritizing

**References:** Marriner-Tomey, A. (2009). *Guide to nursing management and leadership* (8th ed., pp. 326–327). St. Louis: Mosby.

Zerwekh, J., & Claborn, J. (2009). *Nursing today: Transition and trends* (6th ed., pp. 213, 218). St. Louis: Saunders.

### 32. 3

**Rationale:** The nurse must determine the most appropriate assignment based on the skills of the staff member and the needs of the client. In this case, the most appropriate assignment for a nursing assistant would be to care for the client who requires urine specimen collections. The nursing assistant is skilled in this procedure. Colostomy irrigations and tube feedings are not performed by unlicensed personnel. The client with difficulty swallowing food and fluids is at risk for aspiration.

**Test-Taking Strategy:** Note the strategic words *most appropriate*, and note the subject, an assignment to a nursing assistant. Eliminate option 4 first because of the words *difficulty swallowing*. Next, eliminate options 1 and 2 because they are comparable or alike and are both invasive procedures. Review the principles of delegation and tasks and activities that can be assigned to a nursing assistant if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership and Management—Delegating/Prioritizing

**References:** Cherry, B., & Jacob, S. (2008). *Contemporary nursing issues: Trends and management* (4th ed., p. 80). St. Louis: Mosby.

Marriner-Tomey, A. (2009). *Guide to nursing management and leadership* (8th ed., p. 54). St. Louis: Mosby.

### 33. 1

**Rationale:** The autocratic leader is focused, maintains strong control, makes decisions, and addresses all problems. The autocrat dominates the group and commands, rather than seeks suggestions or input. In this situation, the manager addresses a problem (quality improvement) with the staff, designs a plan without input, and wants all problems reported directly back to her. A situational leader will use a combination of styles, depending on the needs of the group and the tasks to be achieved. The situational leader would work with the group to validate that the information that the leader gained as a new employee was accurate and that a problem existed. Then, the leader would take the time to get to know the group and determine which approach to change (if needed) would work best according to the needs of the group and the nature and substance of the change that was required. A democratic leader is participative and would likely meet with each staff person individually to determine the staff member's perception of the problem. The democratic leader would also speak with the staff about any issues and ask the staff for input with developing a plan. A laissez-faire leader is passive and nondirective. The

laissez-faire leader would state what the problem was and inform the staff that the staff needed to come up with a plan to “fix it.”

**Test-Taking Strategy:** Focus on the data in the question and note the strategic words *provides a plan that she developed, each staff member must volunteer to perform, and instructs staff members to report any problems directly to her*. Remember that autocratic managers take control and dominate. Review the various types of leadership styles if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership and Management—Delegating/Prioritizing

**References:** Cherry, B., & Jacob, S. (2008). *Contemporary nursing issues: Trends and management* (4th ed., p. 336). St. Louis: Mosby.

Marriner-Tomey, A. (2009). *Guide to nursing management and leadership* (8th ed., p. 183). St. Louis: Mosby.

#### 34. 4

**Rationale:** When delegating nursing assignments, the nurse needs to consider the skills and educational level of the nursing staff. Collecting a 24-hour urine sample, giving a bed bath, and assisting with frequent ambulation can be provided most appropriately by the nursing assistant. The licensed practical (vocational) nurse is skilled in wound irrigations and dressing changes and most appropriately would be assigned to the client who needs this care.

**Test-Taking Strategy:** Focus on the subject, assignment to a licensed practical/vocational nurse. Recall that education and job position as described by the nurse practice act and employee guidelines need to be considered when delegating activities and making assignments. Options 1, 2, and 3 can be eliminated because they are noninvasive tasks that a nursing assistant can perform. If you had difficulty with this question, review the principles of delegation and assignment making and the tasks and activities that can be assigned to licensed and unlicensed personnel.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership and Management—Delegating/Prioritizing

**Reference:** Cherry, B., & Jacob, S. (2008). *Contemporary nursing issues: Trends and management* (4th ed., pp. 406–407). St. Louis: Mosby.

### ALTERNATE ITEM FORMAT: CHART/EXHIBIT AND PRIORITIZING (ORDERED RESPONSE)

#### 35. 5, 3, 4, 2, 1, 6

**Rationale:** The nurse would plan to visit the client with diabetes mellitus first and draw the fasting blood glucose level because this client needs to remain NPO until the blood is drawn. This client also would be unable to take any medication, such as insulin, until the blood is drawn. The nurse would plan to see the client requiring twice-daily dressing changes next because the dressing changes should be spaced as far apart as possible. The nurse then would plan to see the client being visited by the home health aide and provide instructions and directions to the home health aide regarding care to the client. The nurse then would visit the client requiring supervision of the dressing change and would perform the admission next because that may take more time than the other clients. The nurse then would return to the client requiring the second twice-daily dressing change.

**Test-Taking Strategy:** Note the needs of the clients and the role of the nurse in caring for each of the clients. Noting that the client with diabetes mellitus needs to remain NPO until the blood is drawn will assist in determining that this client needs to be visited first. Noting that the client requiring twice-daily dressing changes will need to be visited twice will assist in determining the next and last client visit of the day, because dressing changes should be spaced as far apart as possible. Next, note that the home health aide will be with the client at 10:30 AM; this client will be seen next. From the remaining clients, select the client requiring a supervised dressing change to be seen next because the client admission may take time. If you had difficulty with this question, review the process of planning care and time management.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership and Management—Delegating/Prioritizing

# UNIT III

# Nursing Sciences

# Fluids and Electrolytes

## PYRAMID TERMS

**calcium** A mineral element needed for the process of bone formation, coagulation of blood, excitation of cardiac and skeletal muscle, maintenance of muscle tone, conduction of neuromuscular impulses, and the synthesis and regulation of the endocrine and exocrine glands. The normal adult level is 8.6 to 10 mg/dL.

**fluid volume deficit** Dehydration in which the fluid intake of the body is not sufficient to meet the fluid needs of the body.

**fluid volume excess** Fluid intake or fluid retention that exceeds the fluid needs of the body. Also called *overhydration* or *fluid overload*.

**homeostasis** The tendency of biological systems to maintain relatively constant conditions in the internal environment while continuously interacting with and adjusting to changes originating within or outside the system.

**hypercalcemia** A serum calcium level that exceeds 10 mg/dL.

**hypocalcemia** A serum calcium level less than 8.6 mg/dL.

**hyperkalemia** A serum potassium level that exceeds 5.1 mEq/L.

**hypokalemia** A serum potassium level less than 3.5 mEq/L.

**hypermagnesemia** A serum magnesium level that exceeds 2.6 mg/dL.

**hypomagnesemia** A serum magnesium level less than 1.6 mg/dL.

**hypernatremia** A serum sodium level that exceeds 145 mEq/L.

**hyponatremia** A serum sodium level less than 135 mEq/L.

**hyperphosphatemia** A serum phosphorus level that exceeds 4.5 mg/dL.

**hypophosphatemia** A serum phosphorus level less than 2.7 mg/dL.

**magnesium** Concentrated in the bone, cartilage, and within the cell itself; required for the use of adenosine triphosphate as a source of energy. It is necessary for the action of numerous enzyme systems such as carbohydrate metabolism, protein synthesis, nucleic acid synthesis, and contraction of muscular tissue. It also regulates neuromuscular activity and the clotting mechanism. The normal adult level is 1.6 to 2.6 mg/dL.

**potassium** A principal electrolyte of intracellular fluid and the primary buffer within the cell itself. It is needed for nerve

conduction, muscle function, acid-base balance, and osmotic pressure. Along with calcium and magnesium, potassium controls the rate and force of contraction of the heart and thus cardiac output. The normal adult level is 3.5 to 5.1 mEq/L.

**phosphorus** Needed for generation of bony tissue. It functions in the metabolism of glucose and lipids, in the maintenance of acid-base balance, and in the storage and transfer of energy from one site in the body to another. Phosphorus levels are evaluated in relation to calcium levels because of their inverse relationship; when calcium levels are decreased, phosphorus levels are increased, and when phosphorus levels are decreased, calcium levels are increased. The normal adult level is 2.7 to 4.5 mg/dL.

**sodium** An abundant electrolyte that maintains osmotic pressure and acid-base balance and transmits nerve impulses. The normal adult level is 135 to 145 mEq/L.

## THE PYRAMID TO SUCCESS

Pyramid Points focus primarily on the assessment of a fluid and electrolyte imbalance, interventions, and evaluating the expected outcomes. Fluids and electrolytes constitute a content area that is sometimes complex and difficult to understand. The nurse must understand cell functions and properties and the concepts related to body fluids as outlined in this chapter. Pyramid Points focus on the common fluid and electrolyte disturbances. As you review this content, focus on the Pyramid Points related to the causes, assessment findings, and related treatments. In any fluid or electrolyte imbalance, nursing interventions include monitoring significant laboratory results and monitoring the client's cardiovascular, respiratory, gastrointestinal, neuromuscular, renal, integumentary, and central nervous system status.

## CLIENT NEEDS

### Safe and Effective Care Environment

Consulting with members of the health care team  
Establishing priorities for care

Maintaining standard, transmission-based, and other precautions to prevent transmission of infection to self and others

Handling hazardous and infectious materials to prevent injury to health care personnel and others

Maintaining medical and surgical asepsis and preventing infection in the client when samples for laboratory studies are obtained or when intravenous (IV) solutions are administered

Preventing accidents and ensuring safety of the client when an imbalance exists, particularly when changes in cardiovascular, respiratory, gastrointestinal, neuromuscular, renal, or central nervous systems occur, or when the client is at risk for complications such as seizures, respiratory depression, or dysrhythmias

### Health Promotion and Maintenance

Implementing health screening and monitoring for the potential risk for a fluid and electrolyte imbalance

Performing physical assessment techniques

Providing education related to medication and diet management

Providing education related to the potential risk for a fluid and electrolyte imbalance, measures to prevent an imbalance, signs and symptoms of an imbalance, and actions to take if signs and symptoms develop

### Psychosocial Integrity

Providing reassurance to the client who is experiencing a fluid or electrolyte imbalance

Providing support and continuously informing the client of the purposes for prescribed interventions

### Physiological Integrity

Identifying clients who are at risk for a fluid or electrolyte imbalance

Monitoring laboratory values

Assisting in managing emergencies

Monitoring for complications related to the imbalance

Assessing for expected and unexpected responses to therapeutic interventions and documenting findings

## I. CONCEPTS OF FLUID AND ELECTROLYTE BALANCE

### A. Electrolytes

1. Description: A substance that is dissolved in solution and some of its molecules split or dissociate into electrically charged atoms or ions (Box 9-1)

2. Measurement

a. The metric system is used to measure volumes of fluids—liters (L) or milliliters (mL).

b. The unit of measure that expresses the combining activity of an electrolyte is the milliequivalent (mEq).

### Box 9-1 Properties of Electrolytes and Their Components

#### Atom

An atom is the smallest part of an element that still has the properties of the element.

The atom is composed of particles known as the *proton* (positive charge), *neutron* (neutral), and *electron* (negative charge).

Protons and neutrons are in the nucleus of the atom; therefore the nucleus is positively charged.

Electrons carry a negative charge and revolve around the nucleus.

As long as the number of electrons is the same as the number of protons, the atom has no net charge; that is, it is neither positive nor negative.

Atoms that gain, lose, or share electrons are no longer neutral.

#### Molecule

A molecule is two or more atoms that combine to form a substance.

#### Ion

An ion is an atom that carries an electrical charge because it has gained or lost electrons.

Some ions carry a negative electrical charge and some carry a positive charge.

#### Cation

A cation is an ion that carries a positive charge and has given away or lost electrons.

The result is fewer electrons than protons, and the result is a positive charge.

#### Anion

An anion is an ion that has gained electrons and therefore carries a negative charge.

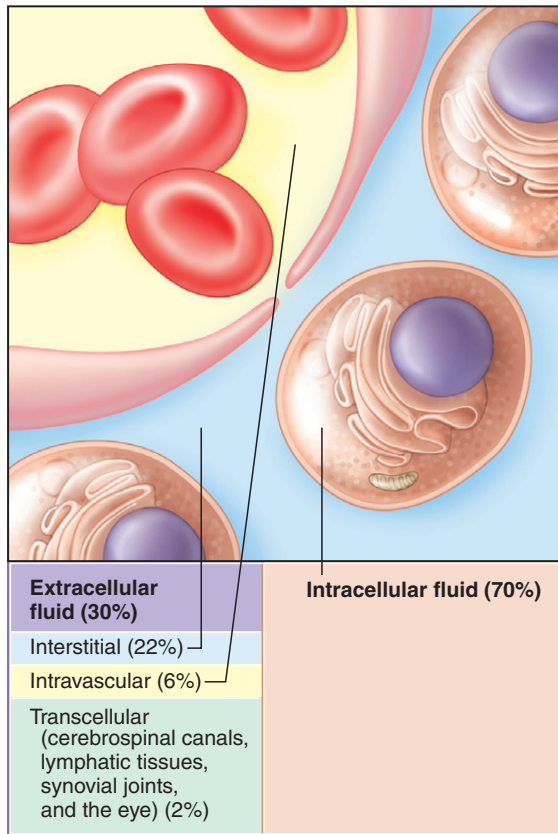

When an ion has gained or taken on electrons, it assumes a negative charge and the result is a negatively charged ion.

- c. One milliequivalent (1 mEq) of any cation always reacts chemically with 1 mEq of an anion.
- d. Milliequivalents provide information about the number of anions or cations available to combine with other anions or cations.

### B. Body fluid compartments (Fig. 9-1)

#### 1. Description

- a. Fluid in each of the body compartments contains electrolytes.
- b. Each compartment has a particular composition of electrolytes, which differs from that of other compartments.
- c. To function normally, body cells must have fluids and electrolytes in the right compartments and in the right amounts.
- d. Whenever an electrolyte moves out of a cell, another electrolyte moves in to take its place.

▲ **FIGURE 9-1** Distribution of fluid by compartments in the average adult. (From Harkreader, H., Hogan, M.A., & Thobaben, M. [2007]. *Fundamentals of nursing: Caring and clinical judgment* [3rd ed., p. 615]. St. Louis: Saunders.)

- e. The numbers of cations and anions must be the same for **homeostasis** to exist.
- f. Compartments are separated by semipermeable membranes.
2. Intravascular compartment: Refers to fluid inside a blood vessel
3. Intracellular compartment
  - a. The intracellular compartment refers to all fluid inside the cell.
  - b. Most bodily fluids are inside the cell.
4. The extracellular compartment
  - a. Refers to fluid outside the cell.
  - b. The extracellular compartment includes the interstitial fluid, which is fluid between cells (sometimes called the *third space*), blood, lymph, bone, connective tissue, water, and transcellular fluid.

### C. Third-spacing

1. Third-spacing is the accumulation and sequestration of trapped extracellular fluid in an actual or potential body space as a result of disease or injury.
2. The trapped fluid represents a volume loss and is unavailable for normal physiological processes.
3. Fluid may be trapped in body spaces such as the pericardial, pleural, peritoneal, or joint cavities;

the bowel; or the abdomen, or within soft tissues after trauma or burns.

4. Assessing the intravascular fluid loss caused by third-spacing is difficult. The loss may not be reflected in weight changes or intake and output records, and may not become apparent until after organ malfunction occurs.

### D. Edema

1. Edema is an excess accumulation of fluid in the interstitial space.
2. Localized edema occurs as a result of traumatic injury from accidents or surgery, local inflammatory processes, or burns.
3. Generalized edema, also called *anasarca*, is an excessive accumulation of fluid in the interstitial space throughout the body and occurs as a result of conditions such as cardiac, renal, or liver failure.

### E. Body fluid

#### 1. Description

- a. Body fluids transport nutrients to the cells and carry waste products from the cells.
- b. Total body fluid (intracellular and extracellular) amounts to about 60% of body weight in the adult, 55% in the older adult, and 80% in the infant.
- c. Thus infants and older adults are at a higher risk for fluid-related problems than younger adults; children have a greater proportion of body water than adults and the older adult has the least proportion of body water.

#### 2. Constituents of body fluids

- a. Body fluids consist of water and dissolved substances.
- b. The largest single fluid constituent of the body is water.
- c. Some substances, such as glucose, urea, and creatinine, do not dissociate in solution; that is, they do not separate from their complex forms into simpler substances when they are in solution.
- d. Other substances do dissociate; for example, when **sodium** chloride is in a solution, it dissociates, or separates, into two parts or elements.

▲ **Infants and older adults need to be monitored closely for fluid imbalances.**

### F. Body fluid transport

#### 1. Diffusion

- a. Diffusion is the process whereby a solute (substance that is dissolved) may spread through a solution or solvent (solution in which the solute is dissolved).
- b. Diffusion of a solute spreads the molecules from an area of higher concentration to an area of lower concentration.

- c. A permeable membrane allows substances to pass through it without restriction.
  - d. A selectively permeable membrane allows some solutes to pass through without restriction but prevents other solutes from passing freely.
  - e. Diffusion occurs within fluid compartments and from one compartment to another if the barrier between the compartments is permeable to the diffusing substances.
2. Osmosis
    - a. Osmotic pressure is the force that draws the solvent from a less concentrated solute through a selectively permeable membrane into a more concentrated solute, thus tending to equalize the concentration of the solvent.
    - b. If a membrane is permeable to water but not to all the solutes present, the membrane is a selective or semipermeable membrane.
    - c. Osmosis is the movement of solvent molecules across a membrane in response to a concentration gradient, usually from a solution of lower to one of higher solute concentration.
    - d. When a more concentrated solution is on one side of a selectively permeable membrane and a less concentrated solution is on the other side, a pull called *osmotic pressure* draws the water through the membrane to the more concentrated side, or the side with more solute.
  3. Filtration
    - a. Filtration is the movement of solutes and solvents by hydrostatic pressure.
    - b. The movement is from an area of higher pressure to an area of lower pressure.
  4. Hydrostatic pressure
    - a. Hydrostatic pressure is the force exerted by the weight of a solution.
    - b. When a difference exists in the hydrostatic pressure on two sides of a membrane, water and diffusible solutes move out of the solution that has the higher hydrostatic pressure by the process of filtration.
    - c. At the arterial end of the capillary, the hydrostatic pressure is higher than the osmotic pressure; therefore fluids and diffusible solutes move out of the capillary.
    - d. At the venous end, the osmotic pressure, or pull, is higher than the hydrostatic pressure, and fluids and some solutes move into the capillary.
    - e. The excess fluid and solutes remaining in the interstitial spaces are returned to the intravascular compartment by the lymph channels.
  5. Osmolality
    - a. Osmolality refers to the number of osmotically active particles per kilogram of water; it is the concentration of a solution.
      - b. In the body, osmotic pressure is measured in milliosmoles (mOsm).
      - c. The normal osmolality of plasma is 270 to 300 milliosmoles/kilogram (mOsm/kg) water.
- G. Movement of body fluid**
1. Description
    - a. Cell membranes separate the interstitial fluid from the intravascular fluid.
    - b. Cell membranes are selectively permeable; that is, the cell membrane and the capillary wall allow water and some solutes free passage through them.
    - c. Several forces affect the movement of water and solutes through the walls of cells and capillaries.
    - d. The greater the number of particles within the cell, the more pressure exists to force the water through the cell membrane.
    - e. If the body loses more electrolytes than fluids, as can happen in diarrhea, then the extracellular fluid contains fewer electrolytes or less solute than the intracellular fluid.
    - f. Fluids and electrolytes must be kept in balance for health; when they remain out of balance, death can occur.
  2. Isotonic solutions
    - a. When the solutions on both sides of a selectively permeable membrane have established equilibrium or are equal in concentration, they are isotonic.
    - b. Isotonic solutions are isotonic to human cells, and thus very little osmosis occurs; isotonic solutions have the same osmolality as body fluids.
    - c. Refer to Table 14-1 for a list of isotonic solutions.
  3. Hypotonic solutions
    - a. When a solution contains a lower concentration of salt or solute than another more concentrated solution, it is considered hypotonic.
    - b. A hypotonic solution has less salt or more water than an isotonic solution; these solutions have lower osmolality than body fluids.
    - c. Hypotonic solutions are hypotonic to the cells; therefore osmosis would continue in an attempt to bring about balance or equality.
    - d. Refer to Table 14-1 for a list of hypotonic solutions.
  4. Hypertonic solutions
    - a. A solution that has a higher concentration of solutes than another less concentrated solution is hypertonic; these solutions have a higher osmolality than body fluids.
    - b. Refer to Table 14-1 for a list of hypertonic solutions.

5. Osmotic pressure
  - a. The amount of osmotic pressure is determined by the concentration of solutes in solution.
  - b. When the solutions on each side of a selectively permeable membrane are equal in concentration, they are isotonic.
  - c. A hypotonic solution has less solute than an isotonic solution, whereas a hypertonic solution contains more solute.
  - d. A solvent moves from the less concentrated solute side to the more concentrated solute side to equalize concentration.
6. Active transport
  - a. If an ion is to move through a membrane from an area of lower concentration to an area of higher concentration, an active transport system is necessary.
  - b. An active transport system moves molecules or ions against concentration and osmotic pressure.
  - c. Metabolic processes in the cell supply the energy for active transport.
  - d. Substances that are transported actively through the cell membrane include ions of **sodium**, **potassium**, **calcium**, iron, and hydrogen, some of the sugars, and the amino acids.

#### H. Body fluid intake and output (Fig. 9-2)

1. Body fluid intake
  - a. Water enters the body through three sources—orally ingested liquids, water in foods, and water formed by oxidation of foods.
  - b. About 10 mL of water is released by the metabolism of each 100 calories of fat, carbohydrates, or proteins.

| Fluid intake        |                     | Fluid output                  |                     |
|---------------------|---------------------|-------------------------------|---------------------|
| Ingested water      | 1200-1500 mL        | Kidneys                       | 1500 mL             |
| Ingested food       | 800-1100 mL         | Insensible loss through skin  | 600-800 mL          |
| Metabolic oxidation | 300 mL              | Insensible loss through lungs | 400-600 mL          |
| <b>TOTAL</b>        | <b>2300-2900 mL</b> | Gastrointestinal tract        | 100 mL              |
|                     |                     | <b>TOTAL</b>                  | <b>2600-3000 mL</b> |

▲ **FIGURE 9-2** Sources of fluid intake and fluid output. (From Harkreader, H., Hogan, M.A., & Thobaben, M. [2007]. *Fundamentals of nursing: Caring and clinical judgment* [3rd ed., p. 626]. St. Louis: Saunders.)

2. Body fluid output
  - a. Water lost through the skin is called *insensible loss* (the individual is unaware of losing that water).
  - b. The amount of water lost by perspiration varies according to the temperature of the environment and of the body, but the average amount of loss by perspiration alone is 100 mL/day.
  - c. Water lost from the lungs is called *insensible loss* and is lost through expired air that is saturated with water vapor.
  - d. The amount of water lost from the lungs varies with the rate and the depth of respiration.
  - e. Large quantities of water are secreted into the gastrointestinal tract, but almost all this fluid is reabsorbed.
  - f. A large volume of electrolyte-containing liquids moves into the gastrointestinal tract and then returns again into the extracellular fluid.
  - g. Severe diarrhea results in the loss of large quantities of fluids and electrolytes.
  - h. The kidneys play a major role in regulating fluid and electrolyte balance and excrete the largest quantity of fluid.
  - i. Normal kidneys can adjust the amount of water and electrolytes leaving the body.
  - j. The quantity of fluid excreted by the kidneys is determined by the amount of water ingested and the amount of waste and solutes excreted.
  - k. As long as all organs are functioning normally, the body is able to maintain balance in its fluid content.

The client with diarrhea is at high risk for a fluid and electrolyte imbalance.

#### I. Maintaining fluid and electrolyte balance

##### 1. Description

- a. **Homeostasis** is a term that indicates the relative stability of the internal environment.
  - b. Concentration and composition of body fluids must be nearly constant.
  - c. When one of the substances in a client is deficient—either fluids or electrolytes—the substance must be replaced normally by the intake of food and water or by therapy such as IV solutions and medications.
  - d. When the client has an excess of fluid or electrolytes, therapy is directed toward assisting the body to eliminate the excess.
2. The kidneys play a major role in controlling balance in fluid and electrolytes.
  3. The adrenal glands, through the secretion of aldosterone, also aid in controlling extracellular fluid volume by regulating the amount of **sodium** reabsorbed by the kidneys.

- Antidiuretic hormone from the pituitary gland regulates the osmotic pressure of extracellular fluid by regulating the amount of water reabsorbed by the kidney.

## II. FLUID VOLUME DEFICIT

### A. Description

- Dehydration occurs when the fluid intake of the body is not sufficient to meet the fluid needs of the body.
- The goal of treatment is to restore fluid volume, replace electrolytes as needed, and eliminate the cause of the **fluid volume deficit**.

### B. Types of fluid volume deficits

- Isotonic dehydration
  - Water and dissolved electrolytes are lost in equal proportions.
  - Known as *hypovolemia*, isotonic dehydration is the most common type of dehydration.
  - Isotonic dehydration results in decreased circulating blood volume and inadequate tissue perfusion.
- Hypertonic dehydration
  - Water loss exceeds electrolyte loss.
  - The clinical problems that occur result from alterations in the concentrations of specific plasma electrolytes.
  - Fluid moves from the intracellular compartment into the plasma and interstitial fluid spaces, causing cellular dehydration and shrinkage.
- Hypotonic dehydration
  - Electrolyte loss exceeds water loss.
  - The clinical problems that occur result from fluid shifts between compartments, causing a decrease in plasma volume.
  - Fluid moves from the plasma and interstitial fluid spaces into the cells, causing a plasma volume deficit and causing the cells to swell.

### C. Causes of fluid volume deficits

- Isotonic dehydration
  - Inadequate intake of fluids and solutes
  - Fluid shifts between compartments
  - Excessive losses of isotonic body fluids
- Hypertonic dehydration—conditions that increase fluid loss, such as excessive perspiration, hyperventilation, ketoacidosis, prolonged fevers, diarrhea, early-stage renal failure, and diabetes insipidus
- Hypotonic dehydration
  - Chronic illness
  - Excessive fluid replacement (hypotonic)
  - Renal failure
  - Chronic malnutrition

### D. Assessment (Table 9-1)

### E. Interventions

- Monitor cardiovascular, respiratory, neuromuscular, renal, integumentary, and gastrointestinal status.
- Prevent further fluid losses and increase fluid compartment volumes to normal ranges.

**TABLE 9-1** Assessment Findings: Fluid Volume Deficit and Fluid Volume Excess

| Fluid Volume Deficit   | Fluid Volume Excess  |
|--|--|
| <b>CARDIOVASCULAR</b>  |  |
| <ul style="list-style-type: none"> <li>Thready, increased pulse rate</li> <li>Decreased blood pressure and orthostatic (postural) hypotension</li> <li>Flat neck and hand veins in dependent positions</li> <li>Diminished peripheral pulses</li> <li>Decreased central venous pressure</li> <li>Dysrhythmias</li> </ul> | <ul style="list-style-type: none"> <li>Bounding, increased pulse rate</li> <li>Elevated blood pressure</li> <li>Distended neck and hand veins</li> <li>Elevated central venous pressure</li> <li>Dysrhythmias</li> </ul> |

| <b>LABORATORY FINDINGS</b>   |  |
| <ul style="list-style-type: none"> <li>Increased serum osmolality</li> <li>Increased hematocrit</li> <li>Increased blood urea nitrogen (BUN) level</li> <li>Increased serum sodium level</li> <li>Increased urinary specific gravity</li> </ul>  | <ul style="list-style-type: none"> <li>Decreased serum osmolality</li> <li>Decreased hematocrit</li> <li>Decreased BUN level</li> <li>Decreased serum sodium level</li> <li>Decreased urine specific gravity</li> </ul>  |

3. Provide oral rehydration therapy if possible and IV fluid replacement if the dehydration is severe; monitor intake and output.
4. Generally, isotonic dehydration is treated with isotonic fluid solutions, hypertonic dehydration with hypotonic fluid solutions, and hypotonic dehydration with hypertonic fluid solutions.
5. Administer medications as prescribed, such as antidiarrheal, antimicrobial, antiemetic, and antipyretic medications, to correct the cause and treat any symptoms.
6. Administer oxygen as prescribed.
7. Monitor electrolyte values and prepare to administer medication to treat an imbalance, if present.

### III. FLUID VOLUME EXCESS

#### A. Description

1. Fluid intake or fluid retention exceeds the fluid needs of the body.
2. **Fluid volume excess** is also called *overhydration* or *fluid overload*.
3. The goal of treatment is to restore fluid balance, correct electrolyte imbalances if present, and eliminate or control the underlying cause of the overload.

#### B. Types

1. Isotonic overhydration
  - a. Known as *hypervolemia*, isotonic overhydration results from excessive fluid in the extracellular fluid compartment.
  - b. Only the extracellular fluid compartment is expanded, and fluid does not shift between the extracellular and intracellular compartments.
  - c. Isotonic overhydration causes circulatory overload and interstitial edema; when severe or when it occurs in a client with poor cardiac function, congestive heart failure and pulmonary edema can result.
2. Hypertonic overhydration
  - a. Occurrence of hypertonic overhydration is rare and is caused by an excessive **sodium** intake.
  - b. Fluid is drawn from the intracellular fluid compartment; the extracellular fluid volume expands, and the intracellular fluid volume contracts.
3. Hypotonic overhydration
  - a. Hypotonic overhydration is known as *water intoxication*.
  - b. The excessive fluid moves into the intracellular space, and all body fluid compartments expand.
  - c. Electrolyte imbalances occur as a result of dilution.

#### C. Causes

1. Isotonic overhydration
  - a. Inadequately controlled IV therapy
  - b. Renal failure
  - c. Long-term corticosteroid therapy

2. Hypertonic overhydration
  - a. Excessive **sodium** ingestion
  - b. Rapid infusion of hypertonic saline
  - c. Excessive **sodium** bicarbonate therapy
3. Hypotonic overhydration
  - a. Early renal failure
  - b. Congestive heart failure
  - c. Syndrome of inappropriate antidiuretic hormone secretion
  - d. Inadequately controlled IV therapy
  - e. Replacement of isotonic fluid loss with hypotonic fluids
  - f. Irrigation of wounds and body cavities with hypotonic fluids

#### D. Assessment (see Table 9-1)

#### E. Interventions

1. Monitor cardiovascular, respiratory, neuromuscular, renal, integumentary, and gastrointestinal status.
2. Prevent further fluid overload and restore normal fluid balance.
3. Administer diuretics; osmotic diuretics typically are prescribed first to prevent severe electrolyte imbalances.
4. Restrict fluid and **sodium** intake as prescribed.
5. Monitor intake and output; monitor weight.
6. Monitor electrolyte values, and prepare to administer medication to treat an imbalance if present.

 A client with renal failure is at high risk for fluid volume excess.

### IV. HYPONATREMIA

#### A. Description

1. **Hypонатremia** is a serum **sodium** level lower than 135 mEq/L (Box 9-2).
2. **Sodium** imbalances usually are associated with fluid volume imbalances.

#### B. Causes

1. Increased **sodium** excretion
  - a. Excessive diaphoresis
  - b. Diuretics

#### Box 9-2 Sodium

##### Normal Value

135 to 145 mEq/L

##### Common Food Sources

|  |                             |
|--|-----------------------------|
| Bacon                                      | Milk                        |
| Butter                                     | Mustard                     |
| Canned food                                | Processed food              |
| Cheese, such as American or cottage cheese | Snack food                  |
| Frankfurters                               | Soy sauce                   |
| Ketchup                                    | Table salt                  |
| Lunch meat                                 | White and whole-wheat bread |

- c. Vomiting
  - d. Diarrhea
  - e. Wound drainage, especially gastrointestinal
  - f. Renal disease
  - g. Decreased secretion of aldosterone
2. Inadequate **sodium** intake
    - a. Nothing by mouth
    - b. Low-salt diet
  3. Dilution of serum **sodium**
    - a. Excessive ingestion of hypotonic fluids or irrigation with hypotonic fluids
    - b. Renal failure
    - c. Freshwater drowning
    - d. Syndrome of inappropriate antidiuretic hormone secretion
    - e. Hyperglycemia
    - f. Congestive heart failure

**C. Assessment** (Table 9-2)

**D. Interventions**

1. Monitor cardiovascular, respiratory, neuromuscular, cerebral, renal, and gastrointestinal status.

2. If **hyponatremia** is accompanied by a **fluid volume deficit** (hypovolemia), IV **sodium chloride** infusions are administered to restore **sodium** content and fluid volume.
3. If **hyponatremia** is accompanied by **fluid volume excess** (hypervolemia), osmotic diuretics are administered to promote the excretion of water rather than **sodium**.
4. If caused by inappropriate or excessive secretion of antidiuretic hormone, medications that antagonize antidiuretic hormone may be administered.
5. Instruct the client to increase oral **sodium** intake and inform the client about the foods to include in the diet (see Box 9-2).
6. If the client is taking lithium (Lithobid), monitor the lithium level, because **hyponatremia** can cause diminished lithium excretion, resulting in toxicity.

Hyponatremia precipitates lithium toxicity in a client taking lithium (Lithobid).

**TABLE 9-2** Assessment Findings: Hyponatremia and Hypernatremia

| Hyponatremia   | Hypernatremia  |
|--|--|
| <p><b>CARDIOVASCULAR</b></p> <ul style="list-style-type: none"> <li>• Symptoms vary with changes in vascular volume</li> <li>• Normovolemic: rapid pulse rate; normal blood pressure</li> <li>• Hypovolemic: thready, weak, rapid pulse rate; hypotension; flat neck veins; normal or low central venous pressure</li> <li>• Hypervolemic: rapid, bounding pulse; blood pressure normal or elevated; normal or elevated central venous pressure</li> </ul> | <ul style="list-style-type: none"> <li>• Heart rate and blood pressure responds to vascular volume status</li> </ul>   |

| <p><b>NEUROMUSCULAR</b></p> <ul style="list-style-type: none"> <li>• Generalized skeletal muscle weakness that is worse in the extremities</li> <li>• Diminished deep tendon reflexes</li> </ul>   | <ul style="list-style-type: none"> <li>• Early: spontaneous muscle twitches; irregular muscle contractions</li> <li>• Late: skeletal muscle weakness; deep tendon reflexes diminished or absent</li> </ul>   |
| <p><b>CENTRAL NERVOUS SYSTEM</b></p> <ul style="list-style-type: none"> <li>• Headache</li> <li>• Personality changes</li> <li>• Confusion</li> <li>• Seizures</li> <li>• Coma</li> </ul>  | <ul style="list-style-type: none"> <li>• Altered cerebral function is the most common manifestation of hypernatremia</li> <li>• Normovolemia or hypovolemia: agitation, confusion, seizures</li> <li>• Hypervolemia: lethargy, stupor, coma</li> </ul> |
| <p><b>GASTROINTESTINAL</b></p> <ul style="list-style-type: none"> <li>• Increased motility and hyperactive bowel sounds</li> <li>• Nausea</li> <li>• Abdominal cramping and diarrhea</li> </ul>  | <ul style="list-style-type: none"> <li>• Extreme thirst</li> </ul>   |
| <p><b>RENAL</b></p> <ul style="list-style-type: none"> <li>• Increased urinary output</li> </ul>   | <ul style="list-style-type: none"> <li>• Decreased urinary output</li> </ul>   |
| <p><b>INTEGUMENTARY</b></p> <ul style="list-style-type: none"> <li>• Dry mucous membranes</li> </ul>   | <ul style="list-style-type: none"> <li>• Dry and flushed skin</li> <li>• Dry and sticky tongue and mucous membranes</li> <li>• Presence or absence of edema, depending on fluid volume changes</li> </ul>  |
| <p><b>LABORATORY FINDINGS</b></p> <ul style="list-style-type: none"> <li>• Serum sodium level less than 135 mEq/L</li> <li>• Decreased urinary specific gravity</li> </ul>   | <ul style="list-style-type: none"> <li>• Serum sodium level that exceeds 145 mEq/L</li> <li>• Increased urinary specific gravity</li> </ul>  |

## V. HYPERNATREMIA

**A.** Description: **Hypernatremia** is a serum **sodium** level that exceeds 145 mEq/L (see Box 9-2).

**B.** Causes

1. Decreased **sodium** excretion
  - a. Corticosteroids
  - b. Cushing's syndrome
  - c. Renal failure
  - d. Hyperaldosteronism
2. Increased **sodium** intake: excessive oral **sodium** ingestion or excessive administration of **sodium**-containing IV fluids
3. Decreased water intake: nothing by mouth
4. Increased water loss: increased rate of metabolism, fever, hyperventilation, infection, excessive diaphoresis, watery diarrhea, diabetes insipidus

**C.** Assessment (see Table 9-2)

**D.** Interventions

1. Monitor cardiovascular, respiratory, neuromuscular, cerebral, renal, and integumentary status.
2. If the cause is fluid loss, prepare to administer IV infusions.
3. If the cause is inadequate renal excretion of **sodium**, prepare to administer diuretics that promote **sodium** loss.
4. Restrict **sodium** and fluid intake as prescribed (see Box 9-2).

 **Monitor the client closely for signs of a potassium imbalance. A potassium imbalance can cause cardiac dysrhythmias that can be life-threatening!**

## VI. HYPOKALEMIA

**A.** Description

1. **Hypokalemia** is a serum **potassium** level lower than 3.5 mEq/L (Box 9-3).
2. **Potassium** deficit is potentially life-threatening because every body system is affected.

**B.** Causes

1. Actual total body **potassium** loss
  - a. Excessive use of medications such as diuretics or corticosteroids
  - b. Increased secretion of aldosterone, such as in Cushing's syndrome
  - c. Vomiting, diarrhea
  - d. Wound drainage, particularly gastrointestinal
  - e. Prolonged nasogastric suction
  - f. Excessive diaphoresis
  - g. Renal disease impairing reabsorption of **potassium**
2. Inadequate **potassium** intake: nothing by mouth
3. Movement of **potassium** from the extracellular fluid to the intracellular fluid
  - a. Alkalosis
  - b. Hyperinsulinism

## Box 9-3 Potassium

### Normal Value

3.5 to 5.1 mEq/L

### Common Food Sources

|            |                  |
|------------|------------------|
| Avocado    | Potatoes         |
| Bananas    | Pork, beef, veal |
| Cantaloupe | Raisins          |
| Carrots    | Spinach          |
| Fish       | Strawberries     |
| Mushrooms  | Tomatoes         |
| Oranges    |                  |

4. Dilution of serum **potassium**

- a. Water intoxication
- b. IV therapy with **potassium**-poor solutions

**C.** Assessment (Tables 9-3 and 9-4)

**D.** Interventions

1. Monitor cardiovascular, respiratory, neuromuscular, gastrointestinal, and renal status, and place the client on a cardiac monitor.
2. Monitor electrolyte values.
3. Administer **potassium** supplements orally or intravenously, as prescribed.
4. Oral **potassium** supplements
  - a. Oral **potassium** supplements may cause nausea and vomiting and they should not be taken on an empty stomach; if the client complains of abdominal pain, distention, nausea, vomiting, diarrhea, or gastrointestinal bleeding, the supplement may need to be discontinued.
  - b. Liquid **potassium** chloride has an unpleasant taste and should be taken with juice or another liquid.
5. Intravenously administered **potassium** (Box 9-4)
6. Institute safety measures for the client experiencing muscle weakness.
7. If the client is taking a **potassium**-losing diuretic, it may be discontinued; a **potassium**-sparing diuretic may be prescribed.
8. Instruct the client about foods that are high in **potassium** content (see Box 9-3).

 **Potassium is never administered by IV push, intramuscular, or subcutaneous routes. IV potassium is always diluted and administered using an infusion device!**

## VII. HYPERKALEMIA

**A.** Description: **Hyperkalemia** is a serum **potassium** level that exceeds 5.1 mEq/L (see Box 9-3).

**TABLE 9-3** Assessment Findings: Hypokalemia and Hyperkalemia

| Hypokalemia  | Hyperkalemia  |
|--|---|
| <b>CARDIOVASCULAR</b>  |   |
| <ul style="list-style-type: none"> <li>• Thready, weak, irregular pulse</li> <li>• Weak peripheral pulses</li> <li>• Orthostatic hypotension</li> </ul>  | <ul style="list-style-type: none"> <li>• Slow, weak, irregular heart rate</li> <li>• Decreased blood pressure</li> </ul>  |
| <b>RESPIRATORY</b>   |   |
| <ul style="list-style-type: none"> <li>• Shallow, ineffective respirations that result from profound weakness of the skeletal muscles of respiration</li> <li>• Diminished breath sounds</li> </ul>  | <ul style="list-style-type: none"> <li>• Profound weakness of the skeletal muscles leading to respiratory failure</li> </ul>  |
| <b>NEUROMUSCULAR</b>   |   |
| <ul style="list-style-type: none"> <li>• Anxiety, lethargy, confusion, coma</li> <li>• Skeletal muscle weakness, eventual flaccid paralysis</li> <li>• Loss of tactile discrimination</li> <li>• Paresthesias</li> <li>• Deep tendon hyporeflexia</li> </ul> | <ul style="list-style-type: none"> <li>• Early: muscle twitches, cramps, paresthesias (tingling and burning followed by numbness in the hands and feet and around the mouth)</li> <li>• Late: profound weakness, ascending flaccid paralysis in the arms and legs (trunk, head, and respiratory muscles become affected when the serum potassium level reaches a lethal level)</li> </ul> |
| <b>GASTROINTESTINAL</b>  |   |
| <ul style="list-style-type: none"> <li>• Decreased motility, hypoactive to absent bowel sounds</li> <li>• Nausea, vomiting, constipation, abdominal distention</li> <li>• Paralytic ileus</li> </ul>   | <ul style="list-style-type: none"> <li>• Increased motility, hyperactive bowel sounds</li> <li>• Diarrhea</li> </ul>  |
| <b>LABORATORY FINDINGS</b>   |   |
| <ul style="list-style-type: none"> <li>• Serum potassium level lower than 3.5 mEq/L</li> <li>• Electrocardiogram changes: ST depression, shallow, flat or inverted T wave, and prominent U wave</li> </ul>   | <ul style="list-style-type: none"> <li>• Serum potassium level that exceeds 5.1 mEq/L</li> <li>• Electrocardiographic changes: tall peaked T waves, flat P waves, widened QRS complexes, and prolonged PR intervals</li> </ul>  |

**TABLE 9-4** Electrocardiographic Changes in Electrolyte Imbalances

| Electrolyte Imbalance | Electrocardiographic Changes  |
|-----------------------|---|
| Hypocalcemia          | Prolonged ST interval<br>Prolonged QT interval                                      |
| Hypercalcemia         | Shortened ST segment<br>Widened T wave  |
| Hypokalemia           | ST depression<br>Shallow, flat, or inverted T wave<br>Prominent U wave              |
| Hyperkalemia          | Tall peaked T waves<br>Flat P waves<br>Widened QRS complex<br>Prolonged PR interval |
| Hypomagnesemia        | Tall T waves<br>Depressed ST segment  |
| Hypermagnesemia       | Prolonged PR interval<br>Widened QRS complexes                                      |

**B. Causes**

1. Excessive **potassium** intake
  - a. Overingestion of **potassium**-containing foods or medications, such as **potassium** chloride or salt substitutes
  - b. Rapid infusion of **potassium**-containing IV solutions
2. Decreased **potassium** excretion
  - a. **Potassium**-sparing diuretics
  - b. Renal failure

**Box 9-4 Precautions with Intravenously Administered Potassium**

Potassium is never given by intravenous (IV) push or by the intramuscular or subcutaneous route.

A dilution of no more than 1 mEq/10 mL of solution is recommended.

After adding potassium to an IV solution, rotate and invert the bag to ensure that the potassium is distributed evenly throughout the IV solution.

Ensure that the IV bag containing potassium is properly labeled.

The maximum recommended infusion rate is 5 to 10 mEq/hr, never to exceed 20 mEq/hr under any circumstances.

A client receiving more than 10 mEq/hr should be placed on a cardiac monitor and monitored for cardiac changes, and the infusion should be controlled by an infusion device.

Potassium infusion can cause phlebitis; therefore the nurse should assess the IV site frequently for signs of phlebitis or infiltration. If either occurs, the infusion should be stopped immediately.

The nurse should assess renal function before administering potassium, and monitor intake and output during administration.

- c. Adrenal insufficiency, such as in Addison's disease
3. Movement of **potassium** from the intracellular fluid to the extracellular fluid
    - a. Tissue damage
    - b. Acidosis

- c. Hyperuricemia
- d. Hypercatabolism

 **C.** Assessment (see Tables 9-3 and 9-4)

**D.** Interventions

1. Monitor cardiovascular, respiratory, neuromuscular, renal, and gastrointestinal status; place the client on a cardiac monitor.
2. Discontinue IV **potassium** (keep the IV catheter patent), and hold oral **potassium** supplements.
3. Initiate a **potassium**-restricted diet.
4. Prepare to administer **potassium**-excreting diuretics if renal function is not impaired.
5. If renal function is impaired, prepare to administer **sodium** polystyrene sulfonate (Kayexalate), a cation exchange resin that promotes gastrointestinal **sodium** absorption and **potassium** excretion.
6. Prepare the client for dialysis if **potassium** levels are critically high.
7. Prepare for the IV administration of hypertonic glucose with regular insulin to move excess **potassium** into the cells.
8. Monitor renal function.
9. When blood transfusions are prescribed for a client with a **potassium** imbalance, the client should receive fresh blood, if possible; transfusions of stored blood may elevate the **potassium** level because the breakdown of older blood cells releases **potassium**.
10. Teach the client to avoid foods high in **potassium** (see Box 9-3).
11. Instruct the client to avoid the use of salt substitutes or other **potassium**-containing substances.

 **Monitor the serum potassium level closely when a client is receiving a potassium-sparing diuretic!**

 **VIII. HYPOCALCEMIA**

**A.** Description: **Hypocalcemia** is a serum **calcium** level lower than 8.6 mg/dL (Box 9-5).

 **B.** Causes

1. Inhibition of **calcium** absorption from the gastrointestinal tract
  - a. Inadequate oral intake of **calcium**
  - b. Lactose intolerance
  - c. Malabsorption syndromes such as celiac sprue or Crohn's disease
  - d. Inadequate intake of vitamin D
  - e. End-stage renal disease
2. Increased **calcium** excretion
  - a. Renal failure, polyuric phase
  - b. Diarrhea

**Box 9-5 Calcium**

**Normal Value**

8.6 to 10 mg/dL

**Common Food Sources**

|                   |          |
|-------------------|----------|
| Cheese            | Sardines |
| Collard greens    | Spinach  |
| Milk and soy milk | Tofu     |
| Rhubarb           | Yogurt   |

c. Steatorrhea

d. Wound drainage, especially gastrointestinal 

3. Conditions that decrease the ionized fraction of **calcium**

a. Hyperproteinemia

b. Alkalosis

c. Medications such as **calcium** chelators or binders

d. Acute pancreatitis

e. **Hyperphosphatemia**

f. Immobility 

g. Removal or destruction of the parathyroid glands 

**C.** Assessment (Table 9-5; Fig. 9-3; see Table 9-4) 

**D.** Interventions

1. Monitor cardiovascular, respiratory, neuromuscular, and gastrointestinal status; place the client on a cardiac monitor.

2. Administer **calcium** supplements orally or **calcium** intravenously.

3. When administering **calcium** intravenously, warm the injection solution to body temperature before administration and administer slowly; monitor for electrocardiographic changes, observe for infiltration, and monitor for **hypercalcemia**. 

4. Administer medications that increase **calcium** absorption.

a. Aluminum hydroxide reduces serum **phosphorus** levels, causing the countereffect of increasing **calcium** levels.

b. Vitamin D aids in the absorption of **calcium** from the intestinal tract.

5. Provide a quiet environment to reduce environmental stimuli.

6. Initiate seizure precautions.

7. Move the client carefully, and monitor for signs of a pathological fracture.

8. Keep 10% **calcium** gluconate available for treatment of acute **calcium** deficit.

9. Instruct the client to consume foods high in **calcium** (see Box 9-5).

**TABLE 9-5** Assessment Findings: Hypocalcemia and Hypercalcemia

| Hypocalcemia   | Hypercalcemia   |
|--|---|
| <b>CARDIOVASCULAR</b> <ul style="list-style-type: none"> <li>Decreased heart rate</li> <li>Hypotension</li> <li>Diminished peripheral pulses</li> </ul>  | <ul style="list-style-type: none"> <li>Increased heart rate in the early phase; bradycardia that can lead to cardiac arrest in late phases</li> <li>Increased blood pressure</li> <li>Bounding, full peripheral pulses</li> </ul> |
| <b>RESPIRATORY</b> <ul style="list-style-type: none"> <li>Not directly affected; however, respiratory failure or arrest can result from decreased respiratory movement because of muscle tetany or seizures</li> </ul>   | <ul style="list-style-type: none"> <li>Ineffective respiratory movement as a result of profound skeletal muscle weakness</li> </ul>   |
| <b>NEUROMUSCULAR</b> <ul style="list-style-type: none"> <li>Irritable skeletal muscles: twitches, cramps, tetany, seizures</li> <li>Painful muscle spasms in the calf or foot during periods of inactivity</li> <li>Paresthesias followed by numbness that may affect the lips, nose, and ears in addition to the limbs</li> <li>Positive Trousseau's and Chvostek's signs</li> <li>Hyperactive deep tendon reflexes</li> <li>Anxiety, irritability</li> </ul> | <ul style="list-style-type: none"> <li>Profound muscle weakness</li> <li>Diminished or absent deep tendon reflexes</li> <li>Disorientation, lethargy, coma</li> </ul>   |
| <b>RENAL</b> <ul style="list-style-type: none"> <li>Urinary output varies depending on the cause</li> </ul>  | <ul style="list-style-type: none"> <li>Urinary output varies depending on the cause</li> <li>Formation of renal calculi; flank pain</li> </ul>  |
| <b>GASTROINTESTINAL</b> <ul style="list-style-type: none"> <li>Increased gastric motility; hyperactive bowel sounds</li> <li>Cramping, diarrhea</li> </ul>   | <ul style="list-style-type: none"> <li>Decreased motility and hypoactive bowel sounds</li> <li>Anorexia, nausea, abdominal distention, constipation</li> </ul>  |
| <b>LABORATORY FINDINGS</b> <ul style="list-style-type: none"> <li>Serum calcium level less than 8.6 mg/dL</li> <li>Electrocardiographic changes: prolonged ST interval, prolonged QT interval</li> </ul>   | <ul style="list-style-type: none"> <li>Serum calcium level that exceeds 10 mg/dL</li> <li>Electrocardiographic changes: shortened ST segment, widened T wave</li> </ul>   |

▲ **FIGURE 9-3** Tests for hypocalcemia. **A**, Chvostek's sign is contraction of facial muscles in response to a light tap over the facial nerve in front of the ear. **B**, Trousseau's sign is a carpal spasm induced by inflating a blood pressure cuff (**C**) above the systolic pressure for a few minutes. (From Lewis, S., Heitkemper, M., & Dirksen, S. [2007]. *Medical-surgical nursing* [7th ed.]. St. Louis: Mosby.)

## IX. HYPERCALCEMIA

- A.** Description: **Hypercalcemia** is a serum **calcium** level that exceeds 10 mg/dL (see Box 9-5).
- B.** Causes
- Increased **calcium** absorption
    - Excessive oral intake of **calcium**
    - Excessive oral intake of vitamin D
  - Decreased **calcium** excretion
    - Renal failure
    - Use of thiazide diuretics
  - Increased bone resorption of **calcium**
    - Hyperparathyroidism
    - Hyperthyroidism

- c. Malignancy (bone destruction from metastatic tumors)
- d. Immobility
- e. Use of glucocorticoids
4. Hemoconcentration
  - a. Dehydration
  - b. Use of lithium
  - c. Adrenal insufficiency

**C.** Assessment (see Tables 9-4 and 9-5)

**D.** Interventions

1. Monitor cardiovascular, respiratory, neuromuscular, renal, and gastrointestinal status; place the client on a cardiac monitor.
2. Discontinue IV infusions of solutions containing **calcium** and oral medications containing **calcium** or vitamin D.
3. Discontinue thiazide diuretics and replace with diuretics that enhance the excretion of **calcium**.
4. Administer medications as prescribed that inhibit **calcium** resorption from the bone, such as **phosphorus**, calcitonin (Calcimar), bisphosphonates, and prostaglandin synthesis inhibitors (aspirin, nonsteroidal anti-inflammatory drugs).
5. Prepare the client with severe **hypercalcemia** for dialysis if medications fail to reduce the serum **calcium** level.
6. Move the client carefully and monitor for signs of a pathological fracture.
7. Monitor for flank or abdominal pain, and strain the urine to check for the presence of urinary stones.
8. Instruct the client to avoid foods high in **calcium** (see Box 9-5).

 A client with a calcium imbalance is at risk for a pathological fracture. Move the client carefully and slowly; assist the client with ambulation.

**X. HYPOMAGNESEMIA**

- A.** Description: **Hypomagnesemia** is a serum **magnesium** level lower than 1.6 mg/dL (Box 9-6).

**Box 9-6 Magnesium**

**Normal Value**

1.6 to 2.6 mg/dL

**Common Food Sources**

|  |                     |
|--|---------------------|
| Avocado  | Oatmeal             |
| Canned white tuna                                    | Peanut butter       |
| Cauliflower  | Peas                |
| Green leafy vegetables, such as spinach and broccoli | Pork, beef, chicken |
| Milk   | Potatoes            |
|  | Raisins             |
|  | Yogurt              |

**B.** Causes

1. Insufficient **magnesium** intake
  - a. Malnutrition and starvation
  - b. Vomiting or diarrhea
  - c. Malabsorption syndrome
  - d. Celiac disease
  - e. Crohn's disease
2. Increased **magnesium** secretion
  - a. Medications such as diuretics
  - b. Chronic alcoholism
3. Intracellular movement of **magnesium**
  - a. Hyperglycemia
  - b. Insulin administration
  - c. Sepsis

**C.** Assessment (Table 9-6; see Table 9-4)

**D.** Interventions

1. Monitor cardiovascular, respiratory, gastrointestinal, neuromuscular, and central nervous system status; place the client on a cardiac monitor.
2. Because **hypocalcemia** frequently accompanies **hypomagnesemia**, interventions also aim to restore normal serum **calcium** levels.
3. Administer **magnesium** sulfate by the IV route in severe cases (intramuscular injections cause pain and tissue damage); monitor serum **magnesium** levels frequently.
4. Initiate seizure precautions.
5. Monitor for diminished deep tendon reflexes, suggesting **hypermagnesemia**, during the administration of **magnesium**.

**TABLE 9-6** Assessment Findings: Hypomagnesemia and Hypermagnesemia

| Hypomagnesemia   | Hypermagnesemia  |
|--|--|
| <b>CARDIOVASCULAR</b>  |  |
| <ul style="list-style-type: none"> <li>• Tachycardia</li> <li>• Hypertension</li> </ul>  | <ul style="list-style-type: none"> <li>• Bradycardia, dysrhythmias</li> <li>• Hypotension</li> </ul>   |
| <b>RESPIRATORY</b>   |  |
| <ul style="list-style-type: none"> <li>• Shallow respirations</li> </ul>   | <ul style="list-style-type: none"> <li>• Respiratory insufficiency when the skeletal muscles of respiration are involved</li> </ul>  |
| <b>NEUROMUSCULAR</b>   |  |
| <ul style="list-style-type: none"> <li>• Twitches; paresthesias</li> <li>• Positive Trousseau's and Chvostek's signs</li> <li>• Hyperreflexia</li> <li>• Tetany, seizures</li> </ul> | <ul style="list-style-type: none"> <li>• Diminished or absent deep tendon reflexes</li> <li>• Skeletal muscle weakness</li> </ul>  |
| <b>CENTRAL NERVOUS SYSTEM</b>  |  |
| <ul style="list-style-type: none"> <li>• Irritability</li> <li>• Confusion</li> </ul>  | <ul style="list-style-type: none"> <li>• Drowsiness and lethargy that progresses to coma</li> </ul>  |
| <b>LABORATORY FINDINGS</b>   |  |
| <ul style="list-style-type: none"> <li>• Serum magnesium level less than 1.6 mg/dL</li> <li>• Electrocardiographic changes: tall T waves, depressed ST segments</li> </ul>           | <ul style="list-style-type: none"> <li>• Serum magnesium level that exceeds 2.6 mg/dL</li> <li>• Electrocardiographic changes: prolonged PR interval, widened QRS complexes</li> </ul> |

6. Oral preparations of **magnesium** may cause diarrhea and increase **magnesium** loss.
7. Instruct the client to increase the intake of foods that contain **magnesium** (see Box 9-6).

## XI. HYPERMAGNESEMIA

**A.** Description: **Hypermagnesemia** is a serum **magnesium** level that exceeds 2.6 mg/dL (see Box 9-6).

**B.** Causes

1. Increased **magnesium** intake
  - a. **Magnesium**-containing antacids and laxatives
  - b. Excessive administration of **magnesium** intravenously
2. Decreased renal excretion of **magnesium** as a result of renal insufficiency

**C.** Assessment (see Tables 9-4 and 9-6)

**D.** Interventions

1. Monitor cardiovascular, respiratory, neuromuscular, and central nervous system status; place the client on a cardiac monitor.
2. Diuretics are prescribed to increase renal excretion of **magnesium**.
3. Intravenously administered **calcium** chloride or **calcium** gluconate may be prescribed to reverse the effects of **magnesium** on cardiac muscle.
4. Instruct the client to restrict dietary intake of **magnesium**-containing foods (see Box 9-6).
5. Instruct the client to avoid the use of laxatives and antacids containing **magnesium**.

 **Calcium gluconate is the antidote for magnesium overdose!**

## XII. HYPOPHOSPHATEMIA

**A.** Description

1. **Hypophosphatemia** is a serum **phosphorus** level lower than 2.7 mg/dL (Box 9-7).
2. A decrease in the serum **phosphorus** level is accompanied by an increase in the serum **calcium** level.

### Box 9-7 Phosphorus

**Normal Value**

2.7 to 4.5 mg/dL

**Common Food Sources**

Fish  
Organ meats  
Nuts  
Pork, beef, chicken  
Whole-grain breads and cereals

**B.** Causes

1. Insufficient **phosphorus** intake: malnutrition and starvation
2. Increased **phosphorus** excretion
  - a. Hyperparathyroidism
  - b. Malignancy
  - c. Use of **magnesium**-based or aluminum hydroxide-based antacids
3. Intracellular shift
  - a. Hyperglycemia
  - b. Respiratory alkalosis

**C.** Assessment

1. Cardiovascular
  - a. Decreased contractility and cardiac output
  - b. Slowed peripheral pulses
2. Respiratory: shallow respirations
3. Neuromuscular
  - a. Weakness
  - b. Decreased deep tendon reflexes
  - c. Decreased bone density that can cause fractures and alterations in bone shape
  - d. Rhabdomyolysis
4. Central nervous system
  - a. Irritability
  - b. Confusion
  - c. Seizures
5. Hematological
  - a. Decreased platelet aggregation and increased bleeding
  - b. Immunosuppression

**D.** Interventions

1. Monitor cardiovascular, respiratory, neuromuscular, central nervous system, and hematological status.
2. Discontinue medications that contribute to **hypophosphatemia**.
3. Administer **phosphorus** orally along with a vitamin D supplement.
4. Prepare to administer **phosphorus** intravenously when serum **phosphorus** levels fall below 1 mg/dL and when the client experiences critical clinical manifestations.
5. Administer IV **phosphorus** slowly because of the risks associated with **hyperphosphatemia**.
6. Assess the renal system before administering **phosphorus**.
7. Move the client carefully, and monitor for signs of a pathological fracture.
8. Instruct the client to increase the intake of the **phosphorus**-containing foods while decreasing the intake of any **calcium**-containing foods (Box 9-7; see Box 9-5).

 **A decrease in the serum phosphorus level is accompanied by an increase in the serum calcium level and an increase in the serum phosphorus level is accompanied by a decrease in the serum calcium level.**

**XIII. HYPERPHOSPHATEMIA****A. Description**

1. **Hyperphosphatemia** is a serum **phosphorus** level that exceeds 4.5 mg/dL (see Box 9-7).
2. Most body systems tolerate elevated serum **phosphorus** levels well.
3. An increase in the serum **phosphorus** level is accompanied by a decrease in the serum **calcium** level.
4. The problems that occur in **hyperphosphatemia** center on the **hypocalcemia** that results when serum **phosphorus** levels increase.

**B. Causes**

1. Decreased renal excretion resulting from renal insufficiency
2. Tumor lysis syndrome
3. Increased intake of **phosphorus**, including dietary intake or overuse of phosphate-containing laxatives or enemas
4. Hypoparathyroidism

**C. Assessment: Refer to assessment of hypocalcemia.****D. Interventions**

1. Interventions entail the management of **hypocalcemia**.
2. Administer phosphate-binding medications that increase fecal excretion of **phosphorus** by binding **phosphorus** from food in the gastrointestinal tract.
3. Instruct the client to avoid phosphate-containing medications, including laxatives and enemas.
4. Instruct the client to decrease the intake of food that is high in **phosphorus** (see Box 9-7).
5. Instruct the client in medication administration: take phosphate-binding medications, emphasizing that they should be taken with meals or immediately after meals.

1. Sustained tissue damage
2. Requires nasogastric suction
3. Has a history of Addison's disease
4. Is taking a potassium-sparing diuretic

**38.** A nurse reviews a client's electrolyte laboratory report and notes that the potassium level is 3.2 mEq/L. Which of the following would the nurse note on the electrocardiogram as a result of the laboratory value?

1. U waves
2. Absent P waves
3. Elevated T waves
4. Elevated ST segment

**39.** A nursing student needs to administer potassium chloride intravenously as prescribed to a client with hypokalemia. The nursing instructor determines that the student is unprepared for this procedure if the student states that which of the following is part of the plan for preparation and administration of the potassium?

1. Obtaining a controlled intravenous (IV) infusion pump
2. Monitoring urine output during administration
3. Preparing the medication for bolus administration
4. Diluting the medication in appropriate amount of normal saline

**40.** A nurse caring for a group of clients reviews the electrolyte laboratory results and notes a potassium level of 5.5 mEq/L on one client's laboratory report. The nurse understands that which client is at highest risk for the development of a potassium value at this level?

1. The client with colitis
2. The client with Cushing's syndrome
3. The client who has been overusing laxatives
4. The client who has sustained a traumatic burn

**41.** A nurse is reviewing laboratory results and notes that a client's serum sodium level is 150 mEq/L. The nurse reports the serum sodium level to the physician and the physician prescribes dietary instructions based on the sodium level. Which food item does the nurse instruct the client to avoid?

1. Peas
2. Nuts
3. Cauliflower
4. Processed oat cereals

**42.** A nurse is assessing a client with a suspected diagnosis of hypocalcemia. Which of the following clinical manifestations would the nurse expect to note in the client?

**MORE QUESTIONS ON THE CD!****Practice Questions**

**36.** The nurse is caring for a client with congestive heart failure. On assessment, the nurse notes that the client is dyspneic and that crackles are audible on auscultation. The nurse suspects excess fluid volume. What additional signs would the nurse expect to note in this client if excess fluid volume is present?

1. Weight loss
2. Flat neck and hand veins
3. An increase in blood pressure
4. A decreased central venous pressure (CVP)

**37.** A nurse is preparing to care for a client with a potassium deficit. The nurse reviews the client's record and determines that the client was at risk for developing the potassium deficit because the client:

1. Twitching
  2. Hypoactive bowel sounds
  3. Negative Trousseau's sign
  4. Hypoactive deep tendon reflexes
43. A nurse caring for a client with hypocalcemia would expect to note which of the following changes on the electrocardiogram?
1. Widened T wave
  2. Prominent U wave
  3. Prolonged QT interval
  4. Shortened ST segment
44. A nurse reviews the electrolyte results of an assigned client and notes that the potassium level is 5.4 mEq/L. Which of the following would the nurse expect to note on the electrocardiogram as a result of the laboratory value?
1. ST depression
  2. Inverted T wave
  3. Prominent U wave
  4. Tall peaked T waves
45. A nurse caring for a group of clients reviews the electrolyte laboratory results and notes a sodium level of 130 mEq/L on one client's laboratory report. The nurse understands that which client is at highest risk for the development of a sodium value at this level?
1. The client with Cushing's syndrome
  2. The client who is taking diuretics
  3. The client with hyperaldosteronism
  4. The client who is taking corticosteroids
46. A nurse is caring for a client with acute congestive heart failure who is receiving high doses of a diuretic. On assessment, the nurse notes that the client has flat neck veins, generalized muscle weakness, and diminished deep tendon reflexes. The nurse suspects hyponatremia. What additional signs would the nurse expect to note in a client with hyponatremia?
1. Extreme thirst
  2. Decreased urinary output
  3. Hyperactive bowel sounds
  4. Increased specific gravity of the urine
47. A nurse reviews a client's laboratory report and notes that the client's serum phosphorus level is 2 mg/dL. Which condition most likely caused this serum phosphorus level?
1. Alcoholism
  2. Renal insufficiency
  3. Hypoparathyroidism
  4. Tumor lysis syndrome
48. A nurse is reading a physician's progress notes in the client's record and reads that the physician has documented "insensible fluid loss of approximately 800 mL daily." The nurse interprets that this type of fluid loss can occur through:
1. The skin
  2. Urinary output
  3. Wound drainage
  4. The gastrointestinal tract
49. A nurse is assigned to care for a group of clients. On review of the clients' medical records, the nurse determines that which client is at risk for a fluid volume deficit?
1. A client with a colostomy
  2. A client with congestive heart failure
  3. A client on long-term corticosteroid therapy
  4. A client receiving frequent wound irrigations
50. A nurse caring for a client who has been receiving IV diuretics suspects that the client is experiencing a fluid volume deficit. Which assessment finding would the nurse note in a client with this condition?
1. Lung congestion
  2. Decreased hematocrit
  3. Increased blood pressure
  4. Decreased central venous pressure (CVP)
51. A nurse is assigned to care for a group of clients. On review of the clients' medical records, the nurse determines that which client is at risk for fluid volume excess?
1. The client taking diuretics
  2. The client with renal failure
  3. The client with an ileostomy
  4. The client who requires gastrointestinal suctioning

### Alternate Item Format: Multiple Response

52. The nurse provides instructions to a client with a low potassium level about the foods that are high in potassium and tells the client to consume which foods? **Select all that apply.**
1. Peas
  2. Raisins
  3. Potatoes
  4. Cauliflower
  5. Cantaloupe
  6. Strawberries

## ANSWERS

### 36. 3

**Rationale:** A fluid volume excess is also known as overhydration or fluid overload and occurs when fluid intake or fluid retention exceeds the fluid needs of the body. Assessment findings associated with fluid volume excess include cough, dyspnea, crackles, tachypnea, tachycardia, elevated blood pressure, bounding pulse, elevated CVP, weight gain, edema, neck and hand vein distention, altered level of consciousness, and decreased hematocrit. Options 1, 2, and 4 identify signs noted in fluid volume deficit.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject, fluid volume excess. Note that options 1, 2, and 4 are comparable or alike in that each of these signs reflects a decrease. Option 3 reflects an increase. If you had difficulty with this question, review the assessment findings noted in fluid volume excess.

**Level of Cognitive Ability:** Analyzing

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1441–1443). St. Louis: Saunders.

### 37. 2

**Rationale:** The normal serum potassium level is 3.5 mEq/L to 5.1 mEq/L. A potassium deficit is known as *hypokalemia*. Potassium-rich gastrointestinal fluids are lost through gastrointestinal suction, placing the client at risk for hypokalemia. The client with tissue damage or Addison's disease and the client taking a potassium-sparing diuretic are at risk for hyperkalemia.

**Test-Taking Strategy:** Use the process of elimination. Note that the subject of the question is potassium deficit. Option 2 is the only option that identifies a loss of body fluid. If you had difficulty with this question, review the causes of hypokalemia.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Ackley, B., Ladwig, G., Swan, B., & Tucker, S. (2008). *Evidence-based nursing care guidelines: Medical-surgical interventions* (p. 291). St. Louis: Mosby.

### 38. 1

**Rationale:** A serum potassium level lower than 3.5 mEq/L indicates hypokalemia. Potassium deficit is a common electrolyte imbalance and is potentially life-threatening. Electrocardiographic changes include inverted T waves, ST segment depression, and prominent U waves. Absent P waves are not a characteristic of hypokalemia but may be noted in a client with atrial fibrillation.

**Test-Taking Strategy:** From the information in the question, you need to determine that the client is experiencing hypokalemia. From this point, you must know the electrocardiographic changes that are expected when hypokalemia

exists. Remember that a prominent U wave is indicative of hypokalemia. If you had difficulty with this question, review the electrocardiographic changes that occur in hypokalemia.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Ackley, B., Ladwig, G., Swan, B., & Tucker, S. (2008). *Evidence-based nursing care guidelines: Medical-surgical interventions* (p. 293). St. Louis: Mosby.

### 39. 3

**Rationale:** Potassium chloride administered intravenously must always be diluted in IV fluid and infused via an infusion pump or controller. Potassium chloride is never given by bolus (IV push). Giving potassium chloride by IV push can result in cardiac arrest. Dilution in normal saline is recommended, and dextrose solution is avoided because this type of solution increases intracellular potassium shifting. The IV bag containing the potassium chloride is always gently agitated before hanging. The IV site is monitored closely because potassium chloride is irritating to the veins and there is risk of phlebitis. The nurse monitors urinary output during administration and contacts the physician if the urinary output is less than 30 mL/hr.

**Test-Taking Strategy:** Focus on the subject, the administration of potassium chloride intravenously. Note the strategic word *unprepared*. This word indicates a negative event query and the need to select the incorrect action. Noting the word *bolus* in option 3 will direct you to the correct option. Review the procedure for the administration of IV potassium chloride if you had difficulty with this question.

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology

**Reference:** Gahart, B., & Nazareno, A. (2009). *Intravenous medications* (25th ed., p. 1086). St. Louis: Mosby.

### 40. 4

**Rationale:** A serum potassium level higher than 5.1 mEq/L indicates hyperkalemia. Clients who experience cellular shifting of potassium in the early stages of massive cell destruction, such as with trauma, burns, sepsis, or metabolic or respiratory acidosis, are at risk for hyperkalemia. The client with Cushing's syndrome or colitis and the client who has been overusing laxatives are at risk for hypokalemia.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 3 first because they are comparable or alike, with both reflecting a gastrointestinal loss. From the remaining options, recalling that cell destruction causes potassium shifts will assist in directing you to the correct option. Also, remember that Cushing's syndrome presents a risk for hypokalemia and that Addison's disease presents a risk for hyperkalemia. If you had difficulty with this question, review the risk factors associated with hyperkalemia.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 973). St. Louis: Mosby.

#### 41. 4

**Rationale:** The normal serum sodium level is 135 to 145 mEq/L. A serum sodium level of 150 mEq/L indicates hypernatremia. Based on this finding, the nurse would instruct the client to avoid foods high in sodium. Nuts, cauliflower, and peas are good food sources of phosphorus. Processed foods are high in sodium content.

**Test-Taking Strategy:** First, you must determine that the client has hypernatremia. Next, note the strategic word *avoid* in the question. Eliminate options 1 and 3 first because these are vegetables. From the remaining options, note the word *processed* in option 4. Processed foods tend to be higher in sodium content. Review foods high in sodium content if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Nix, S. (2009). *Williams' basic nutrition and diet therapy* (13th ed., p. 486). St. Louis: Mosby.

#### 42. 1

**Rationale:** The normal serum calcium level is 8.6 to 10 mg/dL. A serum calcium level lower than 8.6 mg/dL indicates hypocalcemia. Signs of hypocalcemia include paresthesias followed by numbness, hyperactive deep tendon reflexes, and a positive Trousseau's or Chvostek's sign. Additional signs of hypocalcemia include increased neuromuscular excitability, muscle cramps, twitching, tetany, seizures, irritability, and anxiety. Gastrointestinal symptoms include increased gastric motility, hyperactive bowel sounds, abdominal cramping, and diarrhea.

**Test-Taking Strategy:** Use the process of elimination, noting that options 2, 3, and 4 are comparable or alike in that they reflect a hypoactivity. The option that is different is option 1. Review the assessment signs and symptoms noted in hypocalcemia if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 973). St. Louis: Mosby.

#### 43. 3

**Rationale:** The normal serum calcium level is 8.6 to 10 mg/dL. A serum calcium level lower than 8.6 mg/dL indicates hypocalcemia. Electrocardiographic changes that occur in a client with hypocalcemia include a prolonged ST or QT interval. A shortened ST segment and a widened T wave occur with hypercalcemia. Prominent U waves occur with hypokalemia.

**Test-Taking Strategy:** Use knowledge regarding the electrocardiographic changes that occur in a calcium imbalance to answer the question. Remember that hypocalcemia causes a prolonged ST or QT interval. If you had difficulty with this question, review the electrocardiographic changes that occur in these conditions.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 158). St. Louis: Saunders.

#### 44. 4

**Rationale:** A serum potassium level greater than 5.1 mEq/L indicates hyperkalemia. Electrocardiographic changes associated with hyperkalemia include flat P waves, prolonged PR intervals, widened QRS complexes, and tall peaked T waves.

**Test-Taking Strategy:** From the information in the question, you need to determine that this condition is a hyperkalemic one. From this point, you must know the electrocardiographic changes that are expected when hyperkalemia exists. Remember that tall peaked T waves are associated with hyperkalemia. If you had difficulty with this question, review the normal serum potassium level and the electrocardiographic changes that occur in hyperkalemia.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Ackley, B., Ladwig, G., Swan, B., & Tucker, S. (2008). *Evidence-based nursing care guidelines: Medical-surgical interventions* (p. 287). St. Louis: Mosby.

#### 45. 2

**Rationale:** Hyponatremia is evidenced by a serum sodium level less than 135 mEq/L. Hyponatremia can occur in the client taking diuretics. The client taking corticosteroids and the client with Cushing's syndrome or hyperaldosteronism are at risk for hypernatremia.

**Test-Taking Strategy:** First, determine that the client is experiencing hyponatremia. Next, you must know the causes of hyponatremia to direct you to option 2. Also recall that when a client takes a diuretic, the client loses fluid and electrolytes. Review the normal serum sodium level and the causes of hyponatremia if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**References:** Ackley, B., Ladwig, G., Swan, B., & Tucker, S. (2008). *Evidence-based nursing care guidelines: Medical-surgical interventions* (p. 299). St. Louis: Mosby.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 973). St. Louis: Mosby.

**46. 3**

**Rationale:** Hyponatremia is evidenced by a serum sodium level lower than 135 mEq/L. Hyperactive bowel sounds indicate hyponatremia. Options 1, 2, and 4 are signs of hypernatremia. In hyponatremia, increased urinary output and decreased specific gravity of the urine would be noted.

**Test-Taking Strategy:** Focus on the data in the question and the subject of the question. Recalling the signs of hyponatremia will direct you to option 3. Remember that increased bowel motility and hyperactive bowel sounds indicate hyponatremia. If you had difficulty with this question, review the assessment signs associated with hyponatremia and hypernatremia.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 144). St. Louis: Saunders.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 973). St. Louis: Mosby.

**47. 1**

**Rationale:** The normal serum phosphorus level is 2.7 to 4.5 mg/dL. The client is experiencing hypophosphatemia. Causative factors relate to malnutrition or starvation and the use of aluminum hydroxide-based or magnesium-based antacids. Malnutrition is associated with alcoholism. Renal insufficiency, hypoparathyroidism, and tumor lysis syndrome are causative factors of hyperphosphatemia.

**Test-Taking Strategy:** First you must determine that the client is experiencing hypophosphatemia. From this point, you must know the causes of hypophosphatemia in order to answer correctly. If you had difficulty with this question, review the causative factors associated with hypophosphatemia.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p.164). St. Louis: Saunders.

**48. 1**

**Rationale:** Sensible losses are those of which the person is aware, such as through wound drainage, gastrointestinal tract losses, and urination. Insensible losses may occur without the person's awareness. Insensible losses occur daily through the skin and the lungs.

**Test-Taking Strategy:** Note that the subject of the question is insensible fluid loss. Use the process of elimination, noting that options 2, 3, and 4 are comparable or alike. The types of losses in options 2, 3, and 4 can be measured for accurate output. Fluid loss through the skin cannot be measured accurately; it can only approximated. If you had difficulty with this question, review the difference between sensible and insensible fluid loss.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 133). St. Louis: Saunders.

**49. 1**

**Rationale:** A fluid volume deficit occurs when the fluid intake is not sufficient to meet the fluid needs of the body. Causes of a fluid volume deficit include vomiting, diarrhea, conditions that cause increased respirations or increased urinary output, insufficient intravenous fluid replacement, draining fistulas, and the presence of an ileostomy or colostomy. A client with congestive heart failure or on long-term corticosteroid therapy, or a client receiving frequent wound irrigations, is at risk for fluid volume excess.

**Test-Taking Strategy:** Read the question carefully, noting that it asks for the client at risk for a deficit. Read each option and think about the fluid imbalance that can occur in each. The clients presented in options 2, 3, and 4 retain fluid. The only condition that can cause a deficit is the condition noted in option 1. If you had difficulty with this question, review the causes of a fluid volume deficit.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 697). St. Louis: Saunders.

**50. 4**

**Rationale:** A fluid volume deficit occurs when the fluid intake is not sufficient to meet the fluid needs of the body. Assessment findings in a client with a fluid volume deficit include increased respirations and heart rate, decreased CVP, weight loss, poor skin turgor, dry mucous membranes, decreased urine volume, increased specific gravity of the urine, increased hematocrit, and altered level of consciousness. The normal CVP is between 4 and 11 cm H<sub>2</sub>O. A client with dehydration (fluid volume deficit) has a low CVP. The assessment findings in options 1, 2, and 3 are seen in a client with fluid volume excess.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject, fluid volume deficit. Eliminate options 1 and 3 first. Lung congestion is noted in fluid volume excess, as is increased blood pressure. From the remaining options, recall that CVP reflects the pressure under which blood is returned to the superior vena cava and right atrium. Therefore pressure (volume) would be decreased in a deficient fluid volume. If you had difficulty with this question, review the assessment findings noted in fluid volume deficit.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 973). St. Louis: Mosby.

**51. 2**

**Rationale:** A fluid volume excess is also known as *overhydration* or *fluid overload* and occurs when fluid intake or fluid retention exceeds the fluid needs of the body. The causes of fluid volume excess include decreased kidney function, congestive heart failure, use of hypotonic fluids to replace isotonic fluid losses, excessive irrigation of wounds and body cavities, and excessive ingestion of sodium. The client taking diuretics, the client with an ileostomy, and the client who requires gastrointestinal suctioning are at risk for fluid volume deficit.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject, fluid volume excess. Read each option and think about the fluid imbalance that can occur in each. The clients presented in options 1, 3, and 4 lose fluid. The only condition that can cause an excess is the condition noted in option 2. If you had difficulty with this question, review the causes of fluid volume excess.

# Acid-Base Balance

## PYRAMID TERMS

**Allen's test** A test to assess for collateral circulation to the hand by evaluating the patency of the radial and ulnar arteries.

**compensation** Compensation refers to the body processes that occur to counterbalance an acid-base disturbance. When compensation has occurred, the pH will be within normal limits.

**metabolic acidosis** A total concentration of buffer base that is lower than normal, with a relative increase in the hydrogen ion concentration. This results from loss of buffer bases or retention of too many acids without sufficient bases, and occurs in conditions such as renal failure and diabetic ketoacidosis, from the production of lactic acid, and from the ingestion of toxins, such as acetylsalicylic acid (aspirin).

**metabolic alkalosis** A deficit or loss of hydrogen ions or acids or an excess of base (bicarbonate) that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids. This occurs in conditions resulting in hypovolemia, the loss of gastric fluid, excessive bicarbonate intake, the massive transfusion of whole blood, and hyperaldosteronism.

**respiratory acidosis** A total concentration of buffer base that is lower than normal, with a relative increase in hydrogen ion concentration; thus a greater number of hydrogen ions is circulating in the blood than the buffer system can absorb. This is caused by primary defects in the function of the lungs or by changes in normal respiratory patterns as a result of secondary problems. Any condition that causes an obstruction of the airway or depresses respiratory status can cause respiratory acidosis.

**respiratory alkalosis** A deficit of carbonic acid or a decrease in hydrogen ion concentration that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids. This occurs in conditions that cause overstimulation of the respiratory system.

the pathophysiology with each cause. From this point, note the assessment signs related to each disorder and the treatment associated with the clinical manifestations. Maintenance of a patent airway is a priority. The nurse also needs to monitor vital signs, cardiovascular status, neurological status, intake and output, laboratory values, and arterial blood gas values. Remember that safety precautions should always be initiated. Seizure precautions may also be needed.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Establishing priorities
- Maintaining standard and transmission-based precautions and surgical asepsis
- Obtaining informed consent for invasive procedures
- Preventing accidents
- Providing safety for the client during implementation of various treatments for the acid-base imbalance

### Health Promotion and Maintenance

- Identifying clients at risk for an acid-base imbalance
- Performing physical assessment techniques
- Preventing disease
- Promoting health and wellness
- Teaching the client and family about prevention, early detection, and treatment measures for health disorders

### Psychosocial Integrity

- Identifying support systems
- Monitoring for sensory and perceptual alterations
- Providing emotional support to the client and family

### Physiological Integrity

- Administering and monitoring medications, intravenous fluids, and other therapeutic interventions
- Assisting with diagnostic tests
- Monitoring for alterations in body systems

## THE PYRAMID TO SUCCESS

Acid-base imbalance is a content area that sometimes is viewed as complex and difficult to understand. You must understand the description of each imbalance and then review the causes of each disorder, correlating

Monitoring for changes in status and for complications  
 Monitoring for expected effects of pharmacological and parenteral therapies  
 Monitoring laboratory values  
 Obtaining an arterial blood gas specimen and analyzing the results  
 Providing basic care and comfort  
 Providing wound care when blood is obtained for an arterial blood gas study  
 Reducing the likelihood that an acid-base imbalance will occur

## I. HYDROGEN IONS, ACIDS, AND BASES

- A. Hydrogen ions**
1. Vital to life
  2. Expressed as pH
  3. Circulate in the body in two forms:
    - a. Volatile hydrogen of carbonic acid
    - b. Nonvolatile form of hydrogen and organic acids
- B. Acids**
1. Acids are produced as end products of metabolism.
  2. Acids contain hydrogen ions and are hydrogen ion donors, which means that acids give up hydrogen ions to neutralize or decrease the strength of an acid or to form a weaker base.
  3. The strength of an acid is determined by the number of hydrogen ions it contains.
  4. The number of hydrogen ions in body fluid determines its acidity, alkalinity, or neutrality.
  5. The lungs excrete 13,000 to 30,000 mEq/day of volatile hydrogen in the form of carbonic acid as carbon dioxide ( $\text{CO}_2$ ).
  6. The kidneys excrete 50 mEq/day of nonvolatile acids.
- C. Bases**
1. Contain no hydrogen ions.
  2. Are hydrogen ion acceptors; they accept hydrogen ions from acids to neutralize or decrease the strength of a base or to form a weaker acid.

## II. REGULATORY SYSTEMS FOR HYDROGEN ION CONCENTRATION IN THE BLOOD (Box 10-1)

- A. Buffers**
1. Buffers are the fastest acting regulatory system.

### Box 10-1 Regulatory Systems for Hydrogen Ion Concentration in the Blood

#### Buffers

Primary buffer systems in extracellular fluid: hemoglobin system; plasma protein system; carbonic acid-bicarbonate system; phosphate buffer system

#### Lungs

#### Kidneys

Potassium exchange

2. Provide immediate protection against changes in hydrogen ion concentration in the extracellular fluid.
  3. Buffers are reactors that function only to keep the pH within the narrow limits of stability when too much acid or base is released into the system, and buffers absorb or release hydrogen ions as needed.
  4. Buffers serve as a transport mechanism that carries excess hydrogen ions to the lungs.
  5. Once the primary buffer systems react, they are consumed, leaving the body less able to withstand further stress until the buffers are replaced.
- B. Primary buffer systems in extracellular fluid**
1. Hemoglobin system
    - a. Red blood cells contain hemoglobin.
    - b. System maintains acid-base balance by a process called chloride shift.
    - c. Chloride shifts in and out of the cells in response to the level of  $\text{O}_2$  in the blood.
    - d. For each chloride ion that leaves a red blood cell, a bicarbonate ion enters.
    - e. For each chloride ion that enters a red blood cell, a bicarbonate ion leaves.
  2. Plasma protein system
    - a. The system functions along with the liver to vary the amount of hydrogen ions in the chemical structure of plasma proteins.
    - b. Plasma proteins have the ability to attract or release hydrogen ions.
  3. Carbonic acid-bicarbonate system
    - a. Primary buffer system in the body.
    - b. The system maintains a pH of 7.4 with a ratio of 20 parts bicarbonate ( $\text{HCO}_3^-$ ) to 1 part carbonic acid ( $\text{H}_2\text{CO}_3$ ) (Fig. 10-1).
    - c. This ratio (20:1) determines the hydrogen ion concentration of body fluid.

**▲ FIGURE 10-1** Acid-base balance. In the healthy state, a ratio of 1 part carbonic acid to 20 parts bicarbonate provides a normal serum pH between 7.35 and 7.45. Any deviation to the left of 7.35 results in an acidotic state. Any deviation to the right of 7.45 results in an alkalotic state. (From Harkreader, H., Hogan, M.A., & Thobaben, M. [2007]. *Fundamentals of nursing: caring and clinical judgment* [3rd ed., p. 624, Figure 25-5]. St. Louis: Saunders.)

- d. Carbonic acid concentration is controlled by the excretion of  $\text{CO}_2$  by the lungs; the rate and depth of respiration change in response to changes in the  $\text{CO}_2$ .
  - e. The kidneys control the bicarbonate concentration and selectively retain or excrete bicarbonate in response to bodily needs.
4. Phosphate buffer system
    - a. System is present in the cells and body fluids and is especially active in the kidneys.
    - b. System acts like bicarbonate and neutralizes excess hydrogen ions.

### C. Lungs

1. The lungs are the second defense of the body and interact with the buffer system to maintain acid-base balance.
2. In acidosis, the pH decreases and the respiratory rate and depth increase in an attempt to exhale acids. The carbonic acid created by the neutralizing action of bicarbonate can be carried to the lungs, where it is reduced to  $\text{CO}_2$  and water and is exhaled; thus hydrogen ions are inactivated and exhaled.
3. In alkalosis, the pH increases and the respiratory rate and depth decrease;  $\text{CO}_2$  is retained and carbonic acid increases to neutralize and decrease the strength of excess bicarbonate.
4. The action of the lungs is reversible in controlling an excess or deficit.
5. The lungs can hold hydrogen ions until the deficit is corrected or can inactivate hydrogen ions, changing the ions to water molecules to be exhaled along with  $\text{CO}_2$ , thus correcting the excess.
6. The process of correcting a deficit or excess takes 10 to 30 seconds to complete.
7. The lungs are capable of inactivating only hydrogen ions carried by carbonic acid; excess hydrogen ions created by other mechanisms must be excreted by the kidneys.

 **Monitor the client's respiratory status closely. In acidosis, the respiratory rate and depth increase in an attempt to exhale acids. In alkalosis, the respiratory rate and depth decrease;  $\text{CO}_2$  is retained to neutralize and decrease the strength of excess bicarbonate.**

### D. Kidneys

1. The ultimate correction of acid-base disturbances depends on the kidneys, even though the renal excretion of acids and alkalis occurs more slowly.
2. **Compensation** requires a few hours to several days; however, the **compensation** is more thorough and selective than that of other regulators, such as the buffer systems and lungs.
3. In acidosis, the pH decreases and excess hydrogen ions are secreted into the tubules and combine with buffers for excretion in the urine.

4. In alkalosis, the pH increases and excess bicarbonate ions move into the tubules, combine with sodium, and are excreted in the urine.
5. Selective regulation of bicarbonate occurs in the kidneys.
  - a. The kidneys restore bicarbonate by excreting hydrogen ions and retaining bicarbonate ions.
  - b. Excess hydrogen ions are excreted in the urine in the form of phosphoric acid.
  - c. The alteration of certain amino acids in the renal tubules results in a diffusion of ammonia into the kidneys; the ammonia combines with excess hydrogen ions and is excreted in the urine.

### E. Potassium ( $\text{K}^+$ )

1. Potassium plays an exchange role in maintaining acid-base balance.
2. The body changes the potassium level by drawing hydrogen ions into the cell or by pushing them out of the cell.
3. The potassium level changes to compensate for hydrogen ion level changes (Fig. 10-2).
  - a. In acidosis, the body protects itself from the acidic state by moving hydrogen ions into the cell. Therefore potassium moves out to make room for hydrogen ions and the serum potassium level increases.
  - b. In alkalosis, the cells release hydrogen ions into the blood in an attempt to increase the acidity of the blood; this forces the serum potassium into the cell and potassium levels decrease.

 **When the client experiences an acid-base imbalance, monitor the potassium level closely because the potassium moves in or out of the cells in an attempt to maintain acid-base balance.**

## III. RESPIRATORY ACIDOSIS

- A. Description: The total concentration of buffer base is lower than normal, with a relative increase in hydrogen ion concentration; thus a greater number of hydrogen ions is circulating in the blood than can be absorbed by the buffer system.
- B. Causes (Box 10-2)
  1. **Respiratory acidosis** is caused by primary defects in the function of the lungs or changes in normal respiratory patterns.
  2. Any condition that causes an obstruction of the airway or depresses the respiratory system can cause **respiratory acidosis**.
  3. Asthma: Spasms resulting from allergens, irritants, or emotions cause the smooth muscles of the bronchioles to constrict, resulting in ineffective gas exchange.
  4. Atelectasis: Excessive mucus collection, with the collapse of alveolar sacs caused by mucous plugs, infectious drainage, or anesthetic medications, results in ineffective gas exchange.

▲ **FIGURE 10-2** Movement of potassium in response to changes in the extracellular fluid hydrogen ion concentration. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders. Courtesy of M. Linda Workman.)

### Box 10-2 Causes of Respiratory Acidosis

Asthma  
 Atelectasis  
 Brain trauma  
 Bronchiectasis  
 Bronchitis  
 Central nervous system depressants  
 Emphysema  
 Hypoventilation  
 Pulmonary edema  
 Pneumonia  
 Pulmonary emboli

5. Brain trauma: Excessive pressure on the respiratory center or medulla oblongata depresses respirations.
6. Bronchiectasis: Bronchi become dilated as a result of inflammation, and destructive changes and weakness in the walls of the bronchi occur.
7. Bronchitis: Inflammation causes airway obstruction, resulting in inadequate gas exchange.
8. Central nervous system (CNS) depressants such as sedatives, opioids, and anesthetics depress the respiratory center, leading to hypoventilation; carbon dioxide is retained and the hydrogen ion concentration increases.
9. Emphysema: Loss of elasticity of alveolar sacs restricts air flow in and out, primarily out, leading to an increased  $\text{CO}_2$  level.
10. Hypoventilation: Carbon dioxide is retained and the hydrogen ion concentration increases, leading to the acidic state; carbonic acid is retained and the pH decreases.

11. Pulmonary edema: Extracellular accumulation of fluid in pulmonary tissue causes disturbances in alveolar diffusion and perfusion.
12. Pneumonia: Excess mucus production and lung congestion cause airway obstruction, resulting in inadequate gas exchange.
13. Pulmonary emboli: Emboli cause a pulmonary artery and airway obstruction, resulting in inadequate gas exchange.

⚠ If the client has a condition that causes an obstruction of the airway or depresses the respiratory system, monitor the client for respiratory acidosis.

- C. Assessment: In an attempt to compensate, the kidneys retain bicarbonate and excrete excess hydrogen ions into the urine (Table 10-1).
- D. Interventions
  1. Monitor for signs of respiratory distress.
  2. Administer oxygen as prescribed.
  3. Place the client in a semi-Fowler's position, unless contraindicated.
  4. Encourage and assist the client to turn, cough, and deep-breathe.
  5. Prepare to administer respiratory treatments as prescribed.
  6. Encourage hydration to thin secretions, unless excess fluid intake is contraindicated.
  7. Suction the client's airway, if necessary and if not contraindicated.
  8. Reduce restlessness by improving ventilation rather than by administering tranquilizers, sedatives, or opioids because these medications further depress respirations.

**TABLE 10-1** Clinical Manifestations of Acidosis

| Respiratory ( $\uparrow$ Pco <sub>2</sub> )   | Metabolic ( $\downarrow$ HCO <sub>3</sub> <sup>-</sup> )    |
|---|---|
| <b>NEUROLOGICAL</b>   |   |
| Drowsiness  | Drowsiness  |
| Disorientation  | Confusion   |
| Dizziness   | Headache  |
| Headache  | Coma  |
| Coma  |   |
| <b>CARDIOVASCULAR</b>   |   |
| Decreased blood pressure  | Decreased blood pressure                                    |
| Ventricular fibrillation (related to hyperkalemia from compensation)                              | Dysrhythmias (related to hyperkalemia from compensation)    |
| Warm, flushed skin (related to peripheral vasodilation)   | Warm, flushed skin (related to peripheral vasodilation)     |
| <b>GASTROINTESTINAL</b>   |   |
| No significant findings   | Nausea, vomiting, diarrhea, abdominal pain                  |
| <b>NEUROMUSCULAR</b>  |   |
| Seizures  | No significant findings                                     |
| <b>RESPIRATORY</b>  |   |
| Hypoventilation with hypoxia (lungs are unable to compensate when there is a respiratory problem) | Deep, rapid respirations (compensatory action by the lungs) |

From Lewis, S., Heitkemper, M., & Dirksen, S. (2007). *Medical-surgical nursing: Assessment and management of clinical problems* (7th ed.). St. Louis: Mosby.

9. Monitor electrolyte values, particularly the potassium level.
10. Administer antibiotics for respiratory infection or other medications as prescribed.
11. Prepare for endotracheal intubation and mechanical ventilation if CO<sub>2</sub> levels rise above 50 mm Hg and if signs of acute respiratory distress are present.

#### IV. RESPIRATORY ALKALOSIS

- A.** Description: A deficit of carbonic acid and a decrease in hydrogen ion concentration that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids.
- B.** Causes (Box 10-3)
  1. **Respiratory alkalosis** results from conditions that cause overstimulation of the respiratory system.
  2. Fever: Causes increased metabolism, resulting in overstimulation of the respiratory system.
  3. Hyperventilation: Rapid respirations cause the blowing off of CO<sub>2</sub>, leading to a decrease in carbonic acid.
  4. Hypoxia: Stimulates the respiratory center in the brainstem, which causes an increase in the respiratory rate in order to increase oxygen; this

#### Box 10-3 Causes of Respiratory Alkalosis

Fever  
 Hyperventilation  
 Hypoxia  
 Hysteria  
 Overventilation by mechanical ventilators  
 Pain

causes hyperventilation, which results in a decrease in the CO<sub>2</sub> level.

5. Hysteria: Hysteria often is neurogenic and related to a psychoneurosis; however, this condition leads to vigorous breathing and excessive exhaling of CO<sub>2</sub>.
6. Overventilation by mechanical ventilators: The administration of O<sub>2</sub> and the depletion of CO<sub>2</sub> can occur from mechanical ventilation, causing the client to be hyperventilated.
7. Pain: Overstimulation of the respiratory center in the brainstem results in a carbonic acid deficit.

 If the client has a condition that causes overstimulation of the respiratory system, monitor the client for respiratory alkalosis.

- C.** Assessment: Initially the hyperventilation and respiratory stimulation cause abnormal rapid respirations (tachypnea); in an attempt to compensate, the kidneys excrete excess circulating bicarbonate into the urine (Table 10-2)
- D.** Interventions
  1. Monitor for signs of respiratory distress.
  2. Provide emotional support and reassurance to the client.
  3. Encourage appropriate breathing patterns.
  4. Assist with breathing techniques and breathing aids as prescribed.
    - a. Encourage voluntary holding of the breath if appropriate
    - b. Provide use of a rebreathing mask as prescribed
    - c. Provide carbon dioxide breaths as prescribed (rebreathing into a paper bag)
  5. Provide cautious care with ventilator clients so that they are not forced to take breaths too deeply or rapidly.
  6. Monitor electrolyte values, particularly potassium and calcium levels.
  7. Administer medications as prescribed.
  8. Prepare to administer calcium gluconate for tetany as prescribed.

#### V. METABOLIC ACIDOSIS

- A.** Description: A total concentration of buffer base that is lower than normal, with a relative increase in the hydrogen ion concentration, resulting from loss of too much base and/or retention of too much acid.

**TABLE 10-2** Clinical Manifestations of Alkalosis

| Respiratory ( $\downarrow$ $P_{CO_2}$ )   | Metabolic ( $\uparrow$ $HCO_3^-$ )                      |
|---|---|
| <b>NEUROLOGICAL</b>   |   |
| Lethargy  | Drowsiness  |
| Lightheadedness   | Dizziness   |
| Confusion   | Nervousness   |
|   | Confusion   |
| <b>CARDIOVASCULAR</b>   |   |
| Tachycardia   | Tachycardia   |
| Dysrhythmias (related to hypokalemia from compensation)                               | Dysrhythmias (related to hypokalemia from compensation) |
| <b>GASTROINTESTINAL</b>   |   |
| Nausea  | Anorexia  |
| Vomiting  | Nausea  |
| Epigastric pain   | Vomiting  |
| <b>NEUROMUSCULAR</b>  |   |
| Tetany  | Tremors   |
| Numbness  | Hypertonic muscles                                      |
| Tingling of extremities   | Muscle cramps   |
| Hyperreflexia   | Tetany  |
| Seizures  | Tingling of extremities                                 |
|   | Seizures  |
| <b>RESPIRATORY</b>  |   |
| Hyperventilation (lungs are unable to compensate when there is a respiratory problem) | Hypoventilation (compensatory action by the lungs)      |

Modified from Lewis, S., Heitkemper, M., & Dirksen, S. (2007). *Medical-surgical nursing: Assessment and management of clinical problems* (7th ed.). St. Louis: Mosby.

### Box 10-4 Causes of Metabolic Acidosis

Diabetes mellitus or diabetic ketoacidosis  
Excessive ingestion of acetylsalicylic acid (aspirin)  
High-fat diet  
Insufficient metabolism of carbohydrates  
Malnutrition  
Renal insufficiency or renal failure  
Severe diarrhea

#### B. Causes (Box 10-4)

1. Diabetes mellitus or diabetic ketoacidosis: An insufficient supply of insulin causes increased fat metabolism, leading to an excess accumulation of ketones or other acids; the bicarbonate then ends up being depleted.
2. Excessive ingestion of acetylsalicylic acid (aspirin) causes an increase in the hydrogen ion concentration.
3. High-fat diet: A high intake of fat causes a much too rapid accumulation of the waste products of fat metabolism, leading to a buildup of ketones and acids.
4. Insufficient metabolism of carbohydrates: When the  $O_2$  supply is not sufficient for the

metabolism of carbohydrates, lactic acid is produced and lactic acidosis results.

5. Malnutrition: Improper metabolism of nutrients causes fat catabolism, leading to an excess buildup of ketones and acids.
6. Renal insufficiency or renal failure results in the following:
  - a. Increased waste products of protein metabolism are retained.
  - b. Acids increase, and bicarbonate is unable to maintain acid-base balance.
7. Severe diarrhea: Intestinal and pancreatic secretions are normally alkaline; therefore excessive loss of base leads to acidosis.

 An insufficient supply of insulin in a client with diabetes mellitus can result in metabolic acidosis known as *diabetic ketoacidosis*.

- C. Assessment: To compensate for the acidosis, hyperpnea with Kussmaul's respiration occurs as the lungs attempt to exhale the excess  $CO_2$  (see Table 10-1).

#### D. Interventions

1. Monitor for signs of respiratory distress.
2. Assess level of consciousness for central nervous system depression.
3. Monitor intake and output and assist with fluid and electrolyte replacement as prescribed.
4. Prepare to administer solutions intravenously as prescribed to increase the buffer base.
5. Initiate safety and seizure precautions.
6. Monitor the serum potassium level closely; as **metabolic acidosis** resolves, potassium moves back into the cell and the serum potassium level decreases.

#### E. Interventions in diabetes mellitus and diabetic ketoacidosis

1. Give insulin as prescribed to hasten the movement of serum glucose into the cell, thereby decreasing the concurrent ketosis.
2. When glucose is being properly metabolized, the body will stop converting fats to glucose.
3. Monitor for circulatory collapse caused by polyuria, which may result from the hyperglycemic state; osmotic diuresis may lead to extracellular volume deficit.

 Monitor the client experiencing severe diarrhea for manifestations of metabolic acidosis.

#### F. Interventions in renal failure

1. In renal failure, dialysis may be used to remove protein and waste products, thereby lessening the acidotic state.
2. A diet low in protein and high in calories decreases the amount of protein waste products, which in turn lessens the acidosis.

**Box 10-5 Causes of Metabolic Alkalosis**

Diuretics  
Excessive vomiting or gastrointestinal suctioning  
Hyperaldosteronism  
Ingestion of and/or infusion of excess sodium bicarbonate  
Massive transfusion of whole blood

**Box 10-6 Normal Arterial Blood Gas Values**

|                               |              |
|-------------------------------|--------------|
| pH                            | 7.35-7.45    |
| P <sub>CO<sub>2</sub></sub>   | 35-45 mm Hg  |
| HCO <sub>3</sub> <sup>-</sup> | 22-27 mEq/L  |
| P <sub>O<sub>2</sub></sub>    | 80-100 mm Hg |

 **VI. METABOLIC ALKALOSIS**

 **A.** Description: A deficit of carbonic acid and a decrease in hydrogen ion concentration that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids.

**B.** Causes (Box 10-5)

- 1. Metabolic alkalosis** results from a dysfunction of metabolism that causes an increased amount of available base solution in the blood or a decrease in available acids in the blood.
-  **2. Diuretics:** The loss of hydrogen ions and chloride from diuresis causes a compensatory increase in the amount of bicarbonate in the blood.
-  **3. Excessive vomiting or gastrointestinal suctioning** leads to an excessive loss of hydrochloric acid.
- 4. Hyperaldosteronism:** Increased renal tubular reabsorption of sodium occurs, with the resultant loss of hydrogen ions.
- 5. Ingestion of and/or infusion of excess sodium bicarbonate** causes an increase in the amount of base in the blood.
- 6. Massive transfusion of whole blood:** The citrate anticoagulant used for the storage of blood is metabolized to bicarbonate.

 **C.** Assessment: To compensate, respiratory rate and depth decrease to conserve CO<sub>2</sub> (see Table 10-2).

 **Monitor the client experiencing excessive vomiting or the client with gastrointestinal suctioning for manifestations of metabolic alkalosis.**

**D.** Interventions

1. Monitor for signs of respiratory distress.
2. Monitor potassium and calcium serum levels.
3. Institute safety precautions.
4. Prepare to administer medications as prescribed to promote the kidney excretion of bicarbonate.
5. Prepare to replace potassium chloride as prescribed.
6. Treat the underlying cause of the alkalosis.

 **VII. ARTERIAL BLOOD GASES** (Box 10-6)**A.** Collection of an arterial blood gas specimen

1. Obtain vital signs.
2. Determine whether the client has an arterial line in place.
3. Perform the **Allen's test** to determine the presence of collateral circulation (see Priority Nursing Actions).

**Priority Nursing Actions!****Actions to Take When Performing the Allen's Test**

- 1.** Explain the procedure to the client.
- 2.** Apply pressure over the ulnar and radial arteries simultaneously.
- 3.** Ask the client to open and close the hand repeatedly.
- 4.** Release pressure from the ulnar artery while compressing the radial artery.
- 5.** Assess the color of the extremity distal to the pressure point.
- 6.** Document the findings.

The Allen's test is performed before obtaining an arterial blood specimen from the radial artery to determine the presence of collateral circulation and the adequacy of the ulnar artery. Failure to determine the presence of adequate collateral circulation could result in severe ischemic injury to the hand if damage to the radial artery occurs with arterial puncture. The nurse first would explain the procedure to the client. To perform the test, the nurse applies direct pressure over the client's ulnar and radial arteries simultaneously. While applying pressure, the nurse asks the client to open and close the hand repeatedly; the hand should blanch. The nurse then releases pressure from the ulnar artery while compressing the radial artery and assesses the color of the extremity distal to the pressure point. If pinkness fails to return within 6 seconds, the ulnar artery is insufficient, indicating that the radial artery should not be used for obtaining a blood specimen. Finally, the nurse documents the findings.

**Reference:** Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed., pp. 118-119). St. Louis: Mosby.

- 4.** Assess factors that may affect the accuracy of the results, such as changes in the O<sub>2</sub> settings, suctioning within the past 20 minutes, and client's activities.
- 5.** Provide emotional support to the client.
- 6.** Assist with the specimen draw by preparing a heparinized syringe.
- 7.** Apply pressure immediately to the puncture site following the blood draw; maintain pressure for 5 minutes, or for 10 minutes if the client is taking anticoagulants.
- 8.** Appropriately label the specimen and transport it on ice to the laboratory.
- 9.** On the laboratory form, record the client's temperature and the type of supplemental oxygen that the client is receiving.

**TABLE 10-3** Acid-Base Imbalances: Usual Laboratory Value Changes

| Imbalance             | pH   | HCO <sub>3</sub> <sup>-</sup>                 | Pao <sub>2</sub>  | Paco <sub>2</sub>                             | K <sup>+</sup> |

C, Compensated; PC, partially compensated; U, uncompensated.

### Box 10-7 Analyzing Arterial Blood Gas Results

If you can remember the following Pyramid Points and Pyramid Steps, you will be able to analyze any blood gas report.

#### Pyramid Points

In acidosis, the pH is decreased.

In alkalosis, the pH is elevated.

The respiratory function indicator is the P<sub>CO<sub>2</sub></sub>.

The metabolic function indicator is the bicarbonate ion (HCO<sub>3</sub><sup>-</sup>).

#### Pyramid Steps

##### Pyramid Step 1

Look at the blood gas report. Look at the pH. Is the pH elevated or decreased? If the pH is elevated, it reflects alkalosis. If the pH is decreased, it reflects acidosis.

##### Pyramid Step 2

Look at the P<sub>CO<sub>2</sub></sub>. Is the P<sub>CO<sub>2</sub></sub> elevated or decreased? If the P<sub>CO<sub>2</sub></sub> reflects an opposite relationship to the pH, then the condition is a respiratory imbalance. If the P<sub>CO<sub>2</sub></sub> does not reflect an opposite relationship to the pH, go to Pyramid Step 3.

##### Pyramid Step 3

Look at the HCO<sub>3</sub><sup>-</sup>. Does the HCO<sub>3</sub><sup>-</sup> reflect a corresponding relationship with the pH? If it does, then the condition is a metabolic imbalance.

##### Pyramid Step 4

Compensation has occurred if the pH is in a normal range of 7.35 to 7.45. If the pH is not within normal range, look at the respiratory or metabolic function indicators.

If the condition is a respiratory imbalance, look at the HCO<sub>3</sub><sup>-</sup> to determine the state of compensation.

If the condition is a metabolic imbalance, look at the P<sub>CO<sub>2</sub></sub> to determine the state of compensation.

#### B. Respiratory acid-base imbalances (Table 10-3)

- Remember that the respiratory function indicator is the P<sub>CO<sub>2</sub></sub>.
- In a respiratory imbalance, you will find an opposite relationship between the pH and the P<sub>CO<sub>2</sub></sub>; in

other words, the pH will be elevated with a decreased P<sub>CO<sub>2</sub></sub> (alkalosis) or the pH will be decreased with an elevated P<sub>CO<sub>2</sub></sub> (acidosis).

- Look at the pH and the P<sub>CO<sub>2</sub></sub> to determine whether the condition is a respiratory problem.

4. **Respiratory acidosis:** The pH is decreased; the P<sub>CO<sub>2</sub></sub> is elevated.

5. **Respiratory alkalosis:** The pH is elevated; the P<sub>CO<sub>2</sub></sub> is decreased.

#### C. Metabolic acid-base imbalances (see Table 10-3)

1. Remember, the metabolic function indicator is the bicarbonate ion (HCO<sub>3</sub><sup>-</sup>).

2. In a metabolic imbalance, there is a corresponding relationship between the pH and the HCO<sub>3</sub><sup>-</sup>; in other words, the pH will be elevated and the HCO<sub>3</sub><sup>-</sup> will be elevated (alkalosis), or the pH will be decreased and the HCO<sub>3</sub><sup>-</sup> will be decreased (acidosis).

3. Look at the pH and the HCO<sub>3</sub><sup>-</sup> to determine whether the condition is a metabolic problem.

4. **Metabolic acidosis:** The pH is decreased; the HCO<sub>3</sub><sup>-</sup> is decreased.

5. **Metabolic alkalosis:** The pH is elevated; the HCO<sub>3</sub><sup>-</sup> is elevated.

**!** In a respiratory imbalance, the ABG result indicates an opposite relationship between the pH and the P<sub>CO<sub>2</sub></sub>. In a metabolic imbalance, the ABG result indicates a corresponding relationship between the pH and the HCO<sub>3</sub><sup>-</sup>.

#### D. Compensation (see Table 10-3)

- Compensation** refers to the body processes that occur to counterbalance the acid-base disturbance.
- When **compensation** has occurred, the pH is within normal limits.

#### E. Steps for analyzing arterial blood gas results (Box 10-7)

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 53.** A nurse reviews the arterial blood gas results of a client and notes the following: pH 7.45,  $P_{CO_2}$  of 30 mm Hg, and  $HCO_3^-$  of 22 mEq/L. The nurse analyzes these results as indicating which condition?
1. Metabolic acidosis, compensated
  2. Respiratory alkalosis, compensated
  3. Metabolic alkalosis, uncompensated
  4. Respiratory acidosis, uncompensated
- 54.** A nurse is caring for a client with a nasogastric tube that is attached to low suction. The nurse monitors the client, knowing that the client is at risk for which acid-base disorder?
1. Metabolic acidosis
  2. Metabolic alkalosis
  3. Respiratory acidosis
  4. Respiratory alkalosis
- 55.** A client with a 3-day history of nausea and vomiting presents to the emergency department. The client is hypoventilating and has a respiratory rate of 10 breaths/min. The electrocardiogram (ECG) monitor displays tachycardia, with a heart rate of 120 beats/min. Arterial blood gases are drawn and the nurse reviews the results, expecting to note which of the following?
1. A decreased pH and an increased  $CO_2$
  2. An increased pH and a decreased  $CO_2$
  3. A decreased pH and a decreased  $HCO_3^-$
  4. An increased pH with an increased  $HCO_3^-$
- 56.** A nurse caring for a client with an ileostomy understands that the client is most at risk for developing which acid-base disorder?
1. Metabolic acidosis
  2. Metabolic alkalosis
  3. Respiratory acidosis
  4. Respiratory alkalosis
- 57.** A nurse is caring for a client with diabetic ketoacidosis and documents that the client is experiencing Kussmaul's respirations. Based on this documentation, which of the following did the nurse observe?
1. Respirations that cease for several seconds
  2. Respirations that are regular but abnormally slow
  3. Respirations that are labored and increased in depth and rate
  4. Respirations that are abnormally deep, regular, and increased in rate
- 58.** A client who is found unresponsive has arterial blood gases drawn and the results indicate the following: pH is 7.12,  $P_{CO_2}$  is 90 mm Hg, and  $HCO_3^-$  is 22 mEq/L. The nurse interprets the results as indicating which condition?
1. Metabolic acidosis with compensation
  2. Respiratory acidosis with compensation
  3. Metabolic acidosis without compensation
  4. Respiratory acidosis without compensation
- 59.** A nurse plans care for a client with chronic obstructive pulmonary disease (COPD), understanding that the client is most likely to experience what type of acid-base imbalance?
1. Metabolic acidosis
  2. Metabolic alkalosis
  3. Respiratory acidosis
  4. Respiratory alkalosis
- 60.** A nurse reviews the blood gas results of a client with atelectasis. The nurse analyzes the results and determines that the client is experiencing respiratory acidosis. Which of the following validates the nurse's findings?
1. pH 7.25,  $P_{CO_2}$  50 mm Hg
  2. pH 7.35,  $P_{CO_2}$  40 mm Hg
  3. pH 7.50,  $P_{CO_2}$  52 mm Hg
  4. pH 7.52,  $P_{CO_2}$  28 mm Hg
- 61.** A nurse is caring for a client who is on a mechanical ventilator. Blood gas results indicate a pH of 7.50 and a  $P_{CO_2}$  of 30 mm Hg. The nurse has determined that the client is experiencing respiratory alkalosis. Which laboratory value would most likely be noted in this condition?
1. Sodium level of 145 mEq/L
  2. Potassium level of 3 mEq/L
  3. Magnesium level of 2 mg/dL
  4. Phosphorus level of 4 mg/dL

### Alternate Item Format: Multiple Response

- 62.** A nurse notes that a client's arterial blood gas results reveal a pH of 7.50 and a  $P_{CO_2}$  of 30 mm Hg. The nurse monitors the client for which clinical manifestations associated with these arterial blood gas results? **Select all that apply.**
- 1. Nausea
  - 2. Confusion
  - 3. Bradypnea
  - 4. Tachycardia
  - 5. Hyperkalemia
  - 6. Lightheadedness

## ANSWERS

## 53. 2

**Rationale:** The normal pH is 7.35 to 7.45. In a respiratory condition, an opposite effect will be seen between the pH and the  $P_{CO_2}$ . In this situation, the pH is at the high end of the normal value and the  $P_{CO_2}$  is low. In an alkalotic condition, the pH is elevated. Therefore the values identified in the question indicate a respiratory alkalosis. When the pH returns to a normal value, compensation has occurred.

**Test-Taking Strategy:** Remember that in a respiratory imbalance you will find an opposite response between the pH and the  $P_{CO_2}$  as indicated in the question. Therefore you can eliminate options 1 and 3. Also, remember that the pH increases in an alkalotic condition and compensation can be evidenced by a normal pH. Option 2 reflects a respiratory alkalotic condition and compensation and describes the blood gas values as indicated in the question. Review the steps related to reading blood gas values and the findings noted in respiratory alkalosis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 173). St. Louis: Saunders.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 977). St. Louis: Mosby.

## 54. 2

**Rationale:** Metabolic alkalosis is defined as a deficit or loss of hydrogen ions or acids or an excess of base (bicarbonate) that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids. This occurs in conditions resulting in hypovolemia, the loss of gastric fluid, excessive bicarbonate intake, the massive transfusion of whole blood, and hyperaldosteronism. Loss of gastric fluid via nasogastric suction or vomiting causes metabolic alkalosis as a result of the loss of hydrochloric acid. Options 1, 3, and 4 are incorrect interpretations.

**Test-Taking Strategy:** Remembering that a client receiving nasogastric suction loses hydrochloric acid will direct you to the option identifying an alkalotic condition. Because the question addresses a situation other than a respiratory one, the acid-base disorder would be a metabolic condition. If you had difficulty with this question, review the causes of metabolic alkalosis.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 625). St. Louis: Saunders.

## 55. 4

**Rationale:** Clients experiencing nausea and vomiting would most likely present with metabolic alkalosis resulting from loss of gastric acid, thus causing the pH and  $HCO_3^-$  to

increase. Symptoms experienced by the client would include hypoventilation and tachycardia. Option 1 reflects a respiratory acidotic condition. Option 2 reflects a respiratory alkalotic condition. Option 3 reflects a metabolic acidotic condition.

**Test-Taking Strategy:** Focus on the data in the question and note that the client is vomiting. Recalling that vomiting most likely causes metabolic alkalosis will assist in directing you to option 4. Review the causes of metabolic alkalosis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 175–176). St. Louis: Saunders.

## 56. 1

**Rationale:** Metabolic acidosis is defined as total concentration of buffer base that is lower than normal, with a relative increase in the hydrogen ion concentration. This results from loss of buffer bases or retention of too many acids without sufficient bases, and occurs in conditions such as renal failure; diabetic ketoacidosis; from the production of lactic acid; from the ingestion of toxins, such as acetylsalicylic acid (aspirin); malnutrition; or severe diarrhea. Intestinal secretions are high in bicarbonate and may be lost through enteric drainage tubes or an ileostomy, or with diarrhea. These conditions result in metabolic acidosis. Options 2, 3, and 4 are incorrect interpretations and do not occur in the client with an ileostomy.

**Test-Taking Strategy:** Note that the client's condition described in the question is a gastrointestinal disorder. This will direct you toward a metabolic disorder. Remembering that intestinal fluids are primarily alkaline will assist you in selecting the correct option. When excess bicarbonate is lost, acidosis will result. If you had difficulty with this question, review the causes of metabolic acidosis.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 176–177). St. Louis: Saunders.

## 57. 4

**Rationale:** Kussmaul's respirations are abnormally deep, regular, and increased in rate. Apnea is described as respirations that cease for several seconds. In bradypnea, respirations are regular but abnormally slow. In hyperpnea, respirations are labored and increased in depth and rate.

**Test-Taking Strategy:** Use knowledge of the description of Kussmaul's respirations. Recalling that this type of respiration occurs in diabetic ketoacidosis will direct you to option 4. Review the characteristics of this type of respiration if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 532). St. Louis: Mosby.

#### 58. 4

**Rationale:** The acid-base disturbance is respiratory acidosis without compensation. The normal pH is 7.35 to 7.45. The normal  $P_{CO_2}$  is 35 to 45 mm Hg. In respiratory acidosis the pH is decreased and the  $P_{CO_2}$  is elevated. The normal bicarbonate ( $HCO_3^-$ ) level is 22 to 27 mEq/L. Because the bicarbonate is still within normal limits, the kidneys have not had time to adjust for this acid-base disturbance. Additionally, the pH is not within normal limits. Therefore the condition is without compensation. Options 1, 2, and 3 are incorrect interpretations.

**Test-Taking Strategy:** Remember that in a respiratory imbalance you will find an opposite response between the pH and the  $P_{CO_2}$ . Also, remember that the pH is decreased in an acidotic condition and that compensation is reflected by a normal pH. Review the interpretation of arterial blood gas values if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 173). St. Louis: Saunders.

#### 59. 3

**Rationale:** Respiratory acidosis is most often caused by hypoventilation in a client with COPD. Other acid-base disturbances can occur in a client with COPD during exacerbation of the disease but the most likely imbalance is respiratory acidosis. Options 1, 2, and 4 are incorrect options.

**Test-Taking Strategy:** Note the strategic words *most likely* and *chronic*. Remembering that hypoventilation results in respiratory acidosis will direct you to option 3. Review the causes of respiratory acidosis if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 175–176). St. Louis: Saunders.

#### 60. 1

**Rationale:** Atelectasis is a condition characterized by the collapse of alveoli, preventing the respiratory exchange of oxygen and carbon dioxide in a part of the lungs. The normal pH is 7.35 to 7.45. The normal  $P_{CO_2}$  is 35 to 45 mm Hg. In respiratory acidosis, the pH is decreased and the  $P_{CO_2}$  is elevated. Option 2 identifies normal values. Option 3 identifies an alkalotic condition. Option 4 identifies respiratory alkalosis.

**Test-Taking Strategy:** Remember that in a respiratory imbalance you will find an opposite response between the pH and the  $P_{CO_2}$ . Also, remember that the pH is decreased in an acidotic condition. Option 2 reflects a normal blood gas result. Options 3 and 4 reflect an elevated pH, which indicates an alkalotic condition. Option 1 is the only option that reflects an acidotic condition. Review blood gas findings in respiratory acidosis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1915). St. Louis: Saunders.

Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed., pp. 113, 115). St. Louis: Mosby.

#### 61. 2

**Rationale:** Respiratory alkalosis is defined as a deficit of carbonic acid or a decrease in hydrogen ion concentration that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids. This occurs in conditions that cause overstimulation of the respiratory system. Clinical manifestations of respiratory alkalosis include headache, tachypnea, paresthesias, tetany, vertigo, convulsions, hypokalemia, and hypocalcemia. Options 1, 3, and 4 identify normal laboratory values. Option 2 identifies the presence of hypokalemia.

**Test-Taking Strategy:** Focus on the data in the question and use knowledge about the interpretation of arterial blood gas values to determine that the client is experiencing respiratory alkalosis. Next recall the manifestations that occur in this condition and the normal laboratory values. The only abnormal laboratory value is the potassium level, option 2. Review the clinical manifestations of respiratory alkalosis and normal laboratory values if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 174–175). St. Louis: Saunders.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 976). St. Louis: Mosby.

### ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

#### 62. 1, 2, 4, 6

**Rationale:** Respiratory alkalosis is defined as a deficit of carbonic acid or a decrease in hydrogen ion concentration that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids. This occurs in conditions that cause overstimulation of the respiratory system. Clinical manifestations of respiratory alkalosis include lethargy, lightheadedness, confusion, tachycardia,

dysrhythmias related to hypokalemia, nausea, vomiting, epigastric pain, and numbness and tingling of the extremities. Hyperventilation (tachypnea) occurs.

**Test-Taking Strategy:** Focus on the data in the question and use knowledge about the interpretation of arterial blood gas values to determine that the client is experiencing respiratory alkalosis. Next it is necessary to think about the pathophysiology that occurs in this condition and recall the manifestations that occur. Review the clinical manifestations of respiratory alkalosis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Fluids & Electrolytes/Acid-Base

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 174–175). St. Louis: Saunders.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 976). St. Louis: Mosby.

# Laboratory Values

## PYRAMID TERMS

**blood** The liquid pumped by the heart through the arteries, veins, and capillaries. Blood is composed of a clear yellow fluid (plasma), formed elements, and cell types with different functions (Fig. 11-1).

**blood cell** Any of the formed elements of the blood, including red cells (erythrocytes), white cells (leukocytes), and platelets (thrombocytes).

**plasma** The watery, straw-colored, fluid part of lymph and the blood in which the formed elements (blood cells) are suspended. Plasma is made up of water, electrolytes, protein, glucose, fats, bilirubin, and gases and is essential for carrying the cellular elements of the blood through the circulation.

**serum** The clear and thin fluid part of blood that remains after coagulation. Serum contains no blood cells, platelets, or fibrinogen.

**venipuncture** Puncture into a vein to obtain a blood specimen for testing; the antecubital veins are the veins of choice because of ease of access.

a result of the disorder. This process will assist you in determining the correct answer. For example, if the question asks about the immune status of a client receiving chemotherapy, assessment of laboratory values will focus on the white blood cell (WBC) count and the neutrophils. You will need to analyze these results as possibly being low and determine the specific client need, which in this case would be the risk for infection. In the client receiving chemotherapy who has a low WBC count, your plan centers on the immune system and protecting the client from infection. Implementation focuses on preventive interventions related to infection, perhaps protective isolation measures. Evaluation may focus on maintenance of a normal temperature in the client. Box 11-1 lists some of the common abbreviations found in laboratory values. The Priority Nursing Actions box lists the steps needed for obtaining a blood sample.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Applying principles of infection control
- Ensuring surgical asepsis when obtaining a specimen
- Implementing procedures for handling hazardous and infectious materials
- Maintaining standard, transmission-based, and surgical asepsis
- Obtaining informed consent for specific procedures
- Verifying the identity of the client

### Health Promotion and Maintenance

- Preparing the client for the laboratory test
- Discussing the importance of follow-up laboratory studies
- Identifying community resources available for the follow-up
- Implementing posttest procedures
- Describing specific interventions or home care measures required based on the results

## THE PYRAMID TO SUCCESS

This chapter identifies the normal adult values for the most common laboratory tests. It is important to remember that normal laboratory values may vary slightly, depending on the laboratory setting and equipment used in testing. If you are familiar with the normal values, you will be able to determine whether an abnormality exists when a laboratory value is presented in a question. The questions on the NCLEX-RN examination related to laboratory values will require you to identify whether the laboratory value is normal or abnormal, and then you are required to think critically about the effects of the laboratory value in terms of the client. Pyramid Points focus on knowledge of the normal values for the most common laboratory tests, therapeutic serum medication levels of commonly prescribed medications, and determination of the need to implement specific actions based on the findings. When a question is presented on the NCLEX-RN examination regarding a specific laboratory value, note the disorder presented in the question and the associated body organ affected as

▲ **FIGURE 11-1** Approximate values for the components of blood in a normal adult. (Modified from Thibodeau, G.A., & Patton, K.T. [2010]. *The human body in health and disease* [5th ed.]. St. Louis: Mosby.)

### Box 11-1 Pyramid Abbreviations

| Abbreviation    | Definition                    |
|-----------------|-------------------------------|
| g/dL            | grams per deciliter           |
| IU/L            | International units per liter |
| mcg/dL          | micrograms per deciliter      |
| mcg/mL          | micrograms per milliliter     |
| mEq/L           | milliequivalents per liter    |
| mg/dL           | milligrams per deciliter      |
| microunits/mL   | microunits per milliliter     |
| mL/kg           | milliliters per kilogram      |
| mm <sup>3</sup> | millimeters cubed             |
| mm/hr           | millimeters per hour          |
| ng/mL           | nanograms per milliliter      |
| pg/mL           | picogram per milliliter       |
| units/L         | units per liter               |
| μL              | microliters                   |

Monitoring for signs and symptoms that indicate the need to notify the health care provider

### Psychosocial Integrity

Communicating the purpose of the laboratory test to the client

Communicating with the client regarding the laboratory results  
Providing emotional support during testing

### Physiological Integrity

Identifying normal values for the most common laboratory tests  
Identifying therapeutic serum medication levels of commonly prescribed medications  
Monitoring for clinical manifestations associated with an abnormal laboratory value  
Providing comfort measures  
Reporting significant laboratory values  
Determining the significance of an abnormal laboratory value and the need to implement specific actions based on the laboratory results  
Monitoring for potential complications related to a test

⚠ Drawing blood specimens from an extremity in which an intravenous solution is infusing can produce an inaccurate result. Prolonged use of a tourniquet and clenching and unclenching the hand before venous sampling can increase the blood level of potassium, producing an inaccurate result.

### PRIORITY NURSING ACTIONS!

#### Actions to Take When Obtaining a Blood Sample

1. Check physician's prescription.
2. Identify foods, medications, or other factors that may affect the procedure or results.
3. Identify the client.
4. Explain the purpose of the test and procedure to the client.
5. Draw the blood sample.
6. Provide pressure and apply a Band-Aid or gauze dressing to the venipuncture site.
7. Maintain and deliver the specimen to the laboratory according to agency procedure.
8. Document specifics about the procedure.

The nurse should check the physician's prescription for the laboratory test prescribed and then ensure that the client is prepared for the test; for example, that NPO status has been maintained if needed. The nurse would also identify any foods, medications, or other factors that may affect test results. For example, a diet high in fat or leafy vegetables may shorten the prothrombin time. Additionally, there are many medications that can increase or decrease some test results. The nurse then identifies the client and makes sure that the test has been explained to the client. The nurse (or appropriate person as indicated by agency procedure) draws the blood sample, provides pressure, and applies a Band-Aid or gauze dressing to the venipuncture site. Once the client is comfortable, the nurse maintains and delivers the specimen to the laboratory according to agency procedure. The nurse always follows standard and transmission-based precautions as necessary in performing this procedure. The nurse should also check agency guidelines and laboratory manuals regarding the procedure for obtaining the specific blood sample. The nurse then documents the specifics about the procedure.

**Reference:** Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed.). St. Louis: Mosby.

**TABLE 11-1** Normal Adult Electrolyte Values

| Electrolyte          | Value         |
|----------------------|---------------|
| Sodium               | 135-145 mEq/L |
| Potassium            | 3.5-5.1 mEq/L |
| Chloride             | 98-107 mEq/L  |
| Bicarbonate (venous) | 22-29 mEq/L   |

- a. A major intracellular cation, potassium regulates cellular water balance, electrical conduction in muscle cells, and acid-base balance.
- b. The body obtains potassium through dietary ingestion and the kidneys preserve or excrete potassium, depending on cellular need.
- c. Potassium levels are used to evaluate cardiac function, renal function, gastrointestinal function, and the need for IV replacement therapy.

#### 2. Nursing considerations

- a. Note that the client is receiving potassium supplementation on the laboratory form.
- b. Clients with elevated WBC counts and platelet counts may have falsely elevated potassium levels.

#### C. Serum chloride

##### 1. Description

- a. A hydrochloric acid salt that is the most abundant body anion in the extracellular fluid
- b. Functions to counterbalance cations, such as sodium, and acts as a buffer during oxygen and carbon dioxide exchange in red **blood cells** (RBCs)
- c. Aids in digestion and maintaining osmotic pressure and water balance

2. Nursing consideration: Any condition accompanied by prolonged vomiting, diarrhea, or both will alter chloride levels.

#### D. Serum bicarbonate

1. Description: Part of the bicarbonate-carbonic acid buffering system and mainly responsible for regulating the pH of body fluids
2. Nursing consideration: Ingestion of acidic or alkaline solutions may cause increased or decreased results, respectively.

### II. COAGULATION STUDIES

#### A. Activated partial thromboplastin time (aPTT)

##### 1. Description

- a. The aPTT evaluates how well the coagulation sequence is functioning by measuring the amount of time it takes in seconds for recalcified citrated **plasma** to clot after partial thromboplastin is added to it.
- b. The test screens for deficiencies and inhibitors of all factors, except VII and XIII.
- c. Usually, the aPTT is used to monitor heparin therapy and screen for coagulation disorders.

### I. ELECTROLYTES (Table 11-1)

#### A. Serum sodium

##### 1. Description

- a. A major cation of extracellular fluid
- b. Maintains osmotic pressure and acid-base balance, and assists in the transmission of nerve impulses
- c. Is absorbed from the small intestine and excreted in the urine in amounts dependent on dietary intake
- d. Minimum daily requirement of sodium is approximately 15 mEq.

2. Nursing consideration: Drawing **blood** samples in the extremity in which an intravenous (IV) solution of sodium chloride is infusing increases the level, producing an inaccurate result.

#### B. Serum potassium

##### 1. Description

2. Value: 20 to 36 seconds, depending on the type of activator used
3. Nursing considerations
  - a. If the client is receiving intermittent heparin therapy, draw the **blood** sample 1 hour before the next scheduled dose.
  - b. Do not draw samples from an arm into which heparin is infusing.
  - c. Transport specimen to the laboratory immediately.
  - d. Provide direct pressure to the **venipuncture** site for 3 to 5 minutes.
  - e. The aPTT should be between 1.5 and 2.5 times normal when the client is receiving heparin therapy; if the value is prolonged (longer than 90 seconds), the client is at risk for bleeding.

 **If the aPTT value is prolonged (longer than 90 seconds) in a client receiving IV heparin therapy, initiate bleeding precautions.**

## B. Prothrombin time (PT) and international normalized ratio (INR)

1. Description
  - a. Prothrombin is a vitamin K–dependent glycoprotein produced by the liver that is necessary for fibrin clot formation.
  - b. Each laboratory establishes a normal or control value based on the method used to perform the PT test.
  - c. The PT measures the amount of time it takes in seconds for clot formation and is used to monitor response to warfarin sodium (Coumadin) therapy or to screen for dysfunction of the extrinsic clotting system resulting from liver disease, vitamin K deficiency, or disseminated intravascular coagulation.
  - d. A PT value within 2 seconds (plus or minus) of the control is considered normal.
  - e. The INR is a frequently used test to measure the effects of oral anticoagulants.
  - f. The INR standardized the PT ratio and is calculated in the laboratory setting by raising the observed PT ratio to the power of the international sensitivity index specific to the thromboplastin reagent used.
2. Values
  - a. PT: 9.6 to 11.8 seconds (male adult); 9.5 to 11.3 seconds (female adult)
  - b. INR: 2 to 3 for standard warfarin therapy
  - c. INR: 3 to 4.5 for high-dose warfarin therapy
3. Nursing considerations
  - a. A baseline PT should be drawn before anticoagulation therapy is started; note the time of collection on the laboratory form.
  - b. Provide direct pressure to the **venipuncture** site for 3 to 5 minutes.

- c. Concurrent warfarin therapy with heparin therapy can lengthen the PT for up to 5 hours after dosing.
- d. Diets high in green leafy vegetables can increase the absorption of vitamin K, which shortens the PT.
- e. Orally administered anticoagulation therapy usually maintains the PT at 1.5 to 2 times the laboratory control value.
- f. A PT longer than 30 seconds places the client at risk for bleeding.

 **If the PT value is longer than 30 seconds in a client receiving warfarin therapy, initiate bleeding precautions.**

## C. Clotting time

1. Description: The time required for the interaction of all factors involved in the clotting process
2. Value: 8 to 15 minutes
3. Nursing considerations
  - a. The client should not receive heparin therapy for 3 hours before specimen collection because the heparin therapy will affect the results.
  - b. The test result is falsely prolonged by anticoagulant therapy, test tube agitation, or exposure of the specimen to high temperatures.

## D. Platelet count

1. Description
  - a. Platelets function in hemostatic plug formation, clot retraction, and coagulation factor activation.
  - b. Platelets are produced by the bone marrow to function in hemostasis.
2. Value: 150,000 to 400,000 cells/mm<sup>3</sup>
3. Nursing considerations
  - a. Monitor the **venipuncture** site for bleeding in clients with known thrombocytopenia.
  - b. High altitudes, chronic cold weather, and exercise increase platelet counts.
  - c. Bleeding precautions should be instituted in clients with a low platelet count.

 **Monitor the platelet count closely in clients receiving chemotherapy because of the risk for thrombocytopenia.**

## III. ERYTHROCYTE STUDIES

### A. Erythrocyte sedimentation rate

1. Description
  - a. Rate at which erythrocytes settle out of anticoagulated **blood** in 1 hour
  - b. A nonspecific test used to detect illnesses associated with acute and chronic infection, inflammation, advanced neoplasm, and tissue necrosis or infarction

2. Value: 0 to 30 mm/hr, depending on age of client
3. Nursing consideration: Fasting is not necessary, but a fatty meal may cause **plasma** alterations.

#### B. Hemoglobin and hematocrit

1. Description
  - a. Hemoglobin is the main component of erythrocytes and serves as the vehicle for transporting oxygen and carbon dioxide.
  - b. Hemoglobin determinations are important in identifying anemia.
  - c. Hematocrit represents RBC mass and is an important measurement in the identification of anemia or polycythemia (Table 11-2).
2. Nursing consideration: Fasting is not required.

#### C. Serum iron

1. Description
  - a. Iron is found predominantly in hemoglobin.
  - b. Iron acts as a carrier of oxygen from the lungs to the tissues and indirectly aids in the return of carbon dioxide to the lungs.
  - c. Iron aids in diagnosing anemias and hemolytic disorders.
2. Normal values
  - a. Male adult: 65 to 175 mcg/dL
  - b. Female adult: 50 to 170 mcg/dL
3. Nursing consideration: Level of iron will be increased if the client has ingested iron before the test.

#### D. RBC count (erythrocytes)

1. Description
  - a. RBCs function in hemoglobin transport, which results in delivery of oxygen to the body tissues.
  - b. RBCs are formed by red bone marrow, have a life span of 120 days, and are removed from the **blood** via the liver, spleen, and bone marrow.
  - c. The RBC count aids in diagnosing anemias and **blood** dyscrasias.
  - d. The RBC count evaluates the ability of the body to produce RBCs in sufficient numbers.

**TABLE 11-2** Normal Adult Blood Components

| Blood Component        | Normal Value             |
|------------------------|--------------------------|
| <b>HEMOGLOBIN</b>      |                          |
| Male adult             | 14-16.5 g/dL             |
| Female adult           | 12-15 g/dL               |
| <b>HEMATOCRIT</b>      |                          |
| Male adult             | 42%-52%                  |
| Female adult           | 35%-47%                  |
| <b>IRON</b>            |                          |
| Male adult             | 65-175 mcg/dL            |
| Female adult           | 50-170 mcg/dL            |
| <b>RED BLOOD CELLS</b> |                          |
| Male adult             | 4.5-6.2 million/ $\mu$ L |
| Female adult           | 4-5.5 million/ $\mu$ L   |

2. Values
  - a. Female adult: 4 to 5.5 million cells/ $\mu$ L
  - b. Male adult: 4.5 to 6.2 million cells/ $\mu$ L
3. Nursing consideration: Fasting is not required.

#### IV. SERUM ENZYMES AND CARDIAC MARKERS (Table 11-3)

##### A. Creatine kinase (CK)

1. Description
  - a. Creatine kinase is an enzyme found in muscle and brain tissue that reflects tissue catabolism resulting from cell trauma.
  - b. The CK level begins to rise within 6 hours of muscle damage, peaks at 18 hours, and returns to normal in 2 to 3 days.
  - c. The test for CK is performed to detect myocardial or skeletal muscle damage or central nervous system damage; a normal CK value is 26 to 174 units/L.
  - d. Isoenzymes include CK-MB (cardiac), CK-BB (brain), and CK-MM (muscles).
  - e. Isoenzyme CK-MB is found mainly in cardiac muscle, CK-BB is found mainly in brain tissue, and CK-MM is found mainly in skeletal muscle.

**TABLE 11-3** Normal Adult Serum Enzymes/Cardiac Markers

| Serum Enzyme                      | Normal Value   |
|-----------------------------------|--|
| Creatine kinase (CK)              | 26-174 units/L   |
| CK isoenzymes                     |  |
| CK-MB                             | 0%-5% of total   |
| CK-MM                             | 95%-100% of total  |
| CK-BB                             | 0%   |
| Lactate dehydrogenase             | 140-280 units/L  |
| Lactate dehydrogenase isoenzymes  |  |
| LDH1                              | 14%-26%  |
| LDH2                              | 29%-39%  |
| LDH3                              | 20%-26%  |
| LDH4                              | 8%-16%   |
| LDH5                              | 6%-16%   |
| Troponin I                        | <0.6 ng/mL; >1.5 ng/mL indicates myocardial infarction                           |
| Troponin T                        | >0.1-0.2 ng/mL indicates myocardial infarction                                   |
| Myoglobin                         | <90 mcg/L; elevation could indicate myocardial infarction                        |
| Atrial natriuretic peptides (ANP) | 22 to 27 pg/mL   |
| Brain natriuretic peptides (BNP)  | Less than 100 pg/mL  |
| C-type natriuretic peptides (CNP) | Not yet determined; reference range provided with results and should be reviewed |

## 2. Values

- a. CK-MB: 0% to 5% of total
- b. CK-MM: 95% to 100% of total
- c. CK-BB: 0%

## 3. Nursing considerations

- a. If the test is to evaluate skeletal muscle, instruct the client to avoid strenuous physical activity for 24 hours before the test.
- b. Also instruct the client to avoid ingestion of alcohol for 24 hours before the test.
- c. Invasive procedures and intramuscular injections may falsely elevate CK levels.

**B. Lactate dehydrogenase (LDH)**

## 1. Description

- a. The LDH isoenzymes affected by acute myocardial infarction are LDH1 and LDH2.
- b. The LDH level begins to rise about 24 hours after myocardial infarction and peaks in 48 to 72 hours; thereafter, it returns to normal, usually within 7 to 14 days.
- c. The presence of an LDH flip (when LDH1 is higher than LDH2) is helpful in diagnosing a myocardial infarction.

## 2. Nursing considerations

- a. The LDH isoenzyme levels should be interpreted in view of the clinical findings.
- b. Testing should be repeated on 3 consecutive days.

**C. Troponins**

## 1. Description

- a. Troponin is a regulatory protein found in striated muscle (skeletal and myocardial).
- b. Increased amounts of troponins are released into the bloodstream when an infarction causes damage to the myocardium.
- c. Levels elevate as early as 3 hours after myocardial injury. Troponin I levels may remain elevated for 7 to 10 days and troponin T levels may remain elevated for as long as 10 to 14 days.
- d. Serial measurements are important to compare with a baseline test.

## 2. Values

- a. Troponin I: Value usually is lower than 0.6 ng/mL; value higher than 1.5 ng/mL is consistent with a myocardial infarction.
- b. Troponin T: Higher than 0.1 to 0.2 ng/mL is consistent with a myocardial infarction.

## 3. Nursing considerations

- a. Testing is repeated in 12 hours, followed by daily testing for 3 to 5 days.
- b. Rotate **venipuncture** sites.

**D. Myoglobin**

## 1. Description

- a. Myoglobin is an oxygen-binding protein that is found in striated (cardiac and skeletal) muscle that releases oxygen at very low tensions.

- b. Any injury to skeletal muscle will cause a release of myoglobin into the **blood**.

2. Values: Normal value is lower than 90 mcg/L; an elevation could indicate myocardial infarction.

## 3. Nursing considerations

- a. The level can rise as early as 2 hours after a myocardial infarction, with a rapid decline in the level after 7 hours.
- b. Because the myoglobin level is not cardiac-specific and rises and falls so rapidly, its use in diagnosing myocardial infarction may be limited.

**E. Natriuretic peptides**

## 1. Description

- a. Natriuretic peptides are neuroendocrine peptides that are used to identify clients with congestive heart failure (CHF).
- b. There are three major peptides: atrial natriuretic peptides (ANP) synthesized in cardiac atrial muscle, brain natriuretic peptides (BNP) synthesized in cardiac ventricle muscle, and C-type natriuretic peptides (CNP) synthesized by endothelial cells
- c. BNP is the primary marker for identifying CHF as the cause of dyspnea.

## 2. Values:

- a. ANP: 22 to 27 pg/mL
- b. BNP: less than 100 pg/mL
- c. CNP: not yet determined

## 3. Nursing consideration: Fasting is not required.

**!** The higher the BNP level, the more severe the CHF. If the BNP is elevated the dyspnea is due to CHF; if it is normal the dyspnea is due to a pulmonary problem.

**V. SERUM GASTROINTESTINAL STUDIES****A. Albumin**

## 1. Description

- a. A main **plasma** protein of **blood**
- b. Maintains oncotic pressure and transports bilirubin, fatty acids, medications, hormones, and other substances that are insoluble in water
- c. Increased in conditions such as dehydration, diarrhea, and metastatic carcinoma; decreased in conditions such as acute infection, ascites, and alcoholism
- d. Presence of detectable albumin, or protein, in the urine is indicative of abnormal renal function

## 2. Value: 3.4 to 5 g/dL

## 3. Nursing consideration: Fasting is not required.

**B. Alkaline phosphatase**

## 1. Description

- a. Alkaline phosphatase is an enzyme normally found in bone, liver, intestine, and placenta.

- b. The level rises during periods of bone growth, liver disease, and bile duct obstruction.
- 2. Value: 4.5 to 13 King-Armstrong units/dL
- 3. Nursing considerations
  - a. The client may need to fast 12 hours before the test.
  - b. Hepatotoxic medications administered within 12 hours before specimen collection can cause a falsely elevated value.
  - c. Transport the specimen to the laboratory immediately.

### C. Ammonia

- 1. Description
  - a. Ammonia is a byproduct of protein catabolism; most of it is created by bacteria acting on proteins present in the gut.
  - b. Ammonia is metabolized by the liver and excreted by the kidneys as urea.
  - c. Elevated levels resulting from hepatic dysfunction may lead to encephalopathy.
  - d. Venous ammonia levels are not a reliable indicator of hepatic coma.
- 2. Value: 10 to 80 mcg/dL
- 3. Nursing considerations
  - a. Instruct the client to fast, except for water, and to refrain from smoking for 8 to 10 hours before the test; smoking increases ammonia levels.
  - b. Place the specimen on ice and transport to the laboratory immediately.

### D. Alanine aminotransferase (ALT)

- 1. Description: Used to identify hepatocellular disease of the liver and to monitor improvement or worsening of the disease.
- 2. Value: 4 to 6 international units/L
- 3. Nursing considerations
  - a. Previous intramuscular injections may cause elevated levels.
  - b. No fasting is required.

### E. Aspartate aminotransferase (AST)

- 1. Description: Used to evaluate a client with suspected hepatocellular disease (may also be used along with other cardiac markers to evaluate coronary artery occlusive disease)
- 2. Value: 0 to 35 units/L
- 3. Nursing considerations
  - a. Previous intramuscular injections may cause elevated levels
  - b. No fasting is required.

### F. Amylase

- 1. Description
  - a. This enzyme, produced by the pancreas and salivary glands, aids in the digestion of complex carbohydrates and is excreted by the kidneys.
  - b. In acute pancreatitis, the amylase level is greatly increased; the level starts rising 3 to

6 hours after the onset of pain, peaks at about 24 hours, and returns to normal in 2 to 3 days after the onset of pain.

- 2. Value: 25 to 151 units/L
- 3. Nursing considerations
  - a. On the laboratory form, list the medications that the client has taken during the previous 24 hours before the test.
  - b. Note that many medications may cause false-positive or false-negative results.
  - c. Results are invalidated if the specimen was obtained less than 72 hours after cholecystography with radiopaque dyes.

### G. Lipase

- 1. Description
  - a. This pancreatic enzyme converts fats and triglycerides into fatty acids and glycerol.
  - b. Elevated lipase levels occur in pancreatic disorders; elevations may not occur until 24 to 36 hours after the onset of illness and may remain elevated for up to 14 days.
- 2. Value: 10 to 140 units/L
- 3. Nursing considerations: Endoscopic retrograde cholangiopancreatography (ERCP) may increase lipase activity.

### H. Bilirubin

- 1. Description
  - a. Bilirubin is produced by the liver, spleen, and bone marrow and is also a byproduct of hemoglobin breakdown.
  - b. Total bilirubin levels can be broken down into direct bilirubin, which is excreted primarily via the intestinal tract, and indirect bilirubin, which circulates primarily in the bloodstream.
  - c. Total bilirubin levels increase with any type of jaundice; direct and indirect bilirubin levels help differentiate the cause of the jaundice.
- 2. Values
  - a. Bilirubin, direct (conjugated): 0 to 0.3 mg/dL
  - b. Bilirubin, indirect (unconjugated): 0.1 to 1 mg/dL
  - c. Bilirubin, total: Lower than 1.5 mg/dL
- 3. Nursing considerations
  - a. Instruct the client to eat a diet low in yellow foods, avoiding foods such as carrots, yams, yellow beans, and pumpkins, for 3 to 4 days before the **blood** is drawn.
  - b. Instruct the client to fast for 4 hours before the **blood** is drawn.
  - c. Note that results will be elevated with the ingestion of alcohol or the administration of morphine sulfate, theophylline, ascorbic acid (vitamin C), or acetylsalicylic acid (aspirin).
  - d. Note that results are invalidated if the client has received a radioactive scan within 24 hours before the test.

- I. Lipids**
- Description
    - Blood** lipids consist primarily of cholesterol, triglycerides, and phospholipids.
    - Lipid assessment includes total cholesterol, high-density lipoprotein (HDL), low-density lipoprotein (LDL), and triglycerides.
    - Cholesterol is present in all body tissues and is a major component of LDLs, brain and nerve cells, cell membranes, and some gall-bladder stones.
    - Triglycerides constitute a major part of very low-density lipoproteins and a small part of LDLs.
    - Triglycerides are synthesized in the liver from fatty acids, protein, and glucose, and are obtained from the diet.
    - Increased cholesterol levels, LDL levels, and triglyceride levels place the client at risk for coronary artery disease.
    - HDL helps protect against the risk of coronary artery disease.
  - Values:
    - Cholesterol: 140 to 199 mg/dL
    - Low-density lipoproteins: Lower than 130 mg/dL
    - HDLs: 30 to 70 mg/dL
    - Triglycerides: Lower than 200 mg/dL
  - Nursing considerations
    - Oral contraceptives may increase the lipid level.
    - Instruct the client to abstain from foods and fluid, except for water, for 12 to 14 hours and from alcohol for 24 hours before the test.
    - Instruct the client to completely avoid high-cholesterol foods with the evening meal before the test.
- J. Protein**
- Description
    - Protein reflects the total amount of albumin and globulins in the **plasma**.
    - Protein regulates osmotic pressure and is necessary for the formation of many hormones, enzymes, and antibodies; it is a major source of building material for blood, skin, hair, nails, and internal organs.
    - Increased in conditions such as Addison's disease, autoimmune collagen disorders, chronic infection, and Crohn's disease.
    - Decreased in conditions such as burns, cirrhosis, edema, and severe hepatic disease.
  - Value: 6 to 8 g/dL
  - Nursing considerations: Instruct the client to avoid a high-fat diet for 8 hours before the test.
- K. Uric acid**
- Description
    - Uric acid is formed as the purines adenine and guanine are metabolized continuously during the formation and degradation of DNA and RNA. It is also formed from the metabolism of dietary purines.
    - Elevated amounts of uric acid deposit in joints and soft tissue and cause gout.
    - Conditions of increased cellular turnover, as well as slowed renal excretion of uric acid, may cause hyperuricemia.
    - Elevated levels of urinary uric acid precipitate into urate stones in the kidneys.
  - Values
    - Male adult: 4.5 to 8 mg/dL
    - Female adult: 2.5 to 6.2 mg/dL
  - Nursing considerations
    - Instruct the client to fast for 8 hours before the test.
    - Theophylline, caffeine, and vitamin C may cause falsely elevated results.
- ! Clients with liver disease often have prolonged clotting times; therefore, provide prolonged pressure at the venipuncture site and monitor the site closely for bleeding.**

## VI. GLUCOSE STUDIES

- A. Fasting blood glucose**
- Description
    - Glucose is a monosaccharide found in fruits and is formed from the digestion of carbohydrates and the conversion of glycogen by the liver.
    - Glucose is the main source of cellular energy for the body and is essential for brain and erythrocyte function.
    - Fasting **blood** glucose levels are used to help diagnose diabetes mellitus and hypoglycemia (Table 11-4).
  - Nursing considerations
    - Instruct the client to fast for 8 to 12 hours before the test.
    - Instruct a client with diabetes mellitus to withhold morning insulin or oral hypoglycemic medication until after the **blood** is drawn.

**TABLE 11-4** Normal Adult Glucose Values

| Measurement Setting                  | Normal Value  |
|--------------------------------------|---------------|
| Glucose, fasting                     | 70-110 mg/dL  |
| Glucose monitoring (capillary blood) | 60-110 mg/dL  |
| Glucose tolerance test, oral         |               |
| Baseline fasting                     | 70-110 mg/dL  |
| 30-min fasting                       | 110-170 mg/dL |
| 60-min fasting                       | 120-170 mg/dL |
| 90-min fasting                       | 100-140 mg/dL |
| 120-min fasting                      | 70-120 mg/dL  |
| Glucose, 2-hr postprandial           | <140 mg/dL    |

**B. Glucose tolerance test (see Table 11-4)**

1. Description
  - a. The glucose tolerance test aids in the diagnosis of diabetes mellitus.
  - b. If the glucose levels peak at higher than normal at 1 and 2 hours after injection or ingestion of glucose and are slower than normal to return to fasting levels, then diabetes mellitus is confirmed.
2. Nursing considerations
  - a. Instruct the client to eat a high-carbohydrate (200- to 300-g) diet for 3 days before the test.
  - b. Instruct the client to avoid alcohol, coffee, and smoking for 36 hours before the test.
  - c. Instruct the client to fast for 10 to 16 hours before the test.
  - d. Instruct the client to avoid strenuous exercise for 8 hours before and after the test.
  - e. Instruct the client with diabetes mellitus to withhold morning insulin or oral hypoglycemic medication.
  - f. Instruct the client that the test may take 3 to 5 hours, requires IV or oral administration of glucose, and multiple **blood** samples.

**C. Glycosylated hemoglobin**

1. Description
  - a. Glycosylated hemoglobin is **blood** glucose bound to hemoglobin.
  - b. Hemoglobin A<sub>1c</sub> (glycosylated hemoglobin A; HbA<sub>1c</sub>) is a reflection of how well **blood** glucose levels have been controlled for the past 3 to 4 months.
  - c. Hyperglycemia in clients with diabetes is usually a cause of an increase in the HbA<sub>1c</sub>.
2. Values
  - a. Values are expressed as a percentage of the total hemoglobin.
  - b. Good control of diabetes: 7% or lower
  - c. Fair control of diabetes: 7% to 8%
  - d. Poor control of diabetes: Higher than 8%
3. Nursing consideration: Fasting is not required before the test.

**D. Glycosylated serum albumin (fructosamine)**

1. Description
  - a. Reflects average **serum** glucose levels over a period of 2 to 3 weeks
  - b. More sensitive to recent changes than the HbA<sub>1c</sub>
2. Values: Normal ranges vary according to method of testing used; nondiabetic client, 1.5 to 2.7 mmol/L; diabetic client, 2 to 5 mmol/L.
3. Nursing consideration: The client needs to fast for 12 hours before the test.

**E. Diabetes mellitus autoantibody panel**

1. Description: Used to evaluate insulin resistance and to identify type 1 diabetes and clients with a suspected allergy to insulin
2. Value: Less than 1:4 titer with no antibody detected

## 3. Nursing considerations

- a. Radioactive scans within 7 days before the test may interfere with test results.
- b. No fasting is required.

**VII. RENAL FUNCTION STUDIES****A. Serum creatinine**

1. Description
  - a. Creatinine is a specific indicator of renal function.
  - b. Increased levels of creatinine indicate a slowing of the glomerular filtration rate.
2. Value: 0.6 to 1.3 mg/dL
3. Nursing consideration: Instruct the client to avoid excessive exercise for 8 hours and excessive red meat intake for 24 hours before the test.

**B. Blood urea nitrogen**

1. Description
  - a. Urea nitrogen is the nitrogen portion of urea, a substance formed in the liver through an enzymatic protein breakdown process.
  - b. Urea is normally freely filtered through the renal glomeruli, with a small amount reabsorbed in the tubules and the remainder excreted in the urine.
  - c. Elevated levels indicate a slowing of the glomerular filtration rate.
2. Value: 8 to 25 mg/dL
3. Nursing consideration: Creatinine and urea nitrogen levels should be analyzed when renal function is evaluated.

**VIII. ELEMENTS****A. Calcium**

1. Description
  - a. Calcium is a cation absorbed into the bloodstream from dietary sources and functions in bone formation, nerve impulse transmission, and contraction of myocardial and skeletal muscles.
  - b. Calcium aids in **blood** clotting by converting prothrombin to thrombin.
2. Value: 8.6 to 10 mg/dL
3. Nursing considerations
  - a. Instruct the client to eat a diet with a normal calcium level (800 mg/day) for 3 days before the test.
  - b. Instruct the client that fasting may be required for 8 hours before the test.

**B. Magnesium**

1. Description
  - a. Magnesium is used as an index to determine metabolic activity and renal function.
  - b. Magnesium is needed in the **blood**-clotting mechanism, regulates neuromuscular activity, acts as a cofactor that modifies the activity of many enzymes, and has an effect on the metabolism of calcium.

2. Value: 1.6 to 2.6 mg/dL
3. Nursing considerations
  - a. Prolonged use of magnesium products causes increased **serum** levels.
  - b. Long-term parenteral nutrition therapy or excessive loss of body fluids may decrease **serum** levels.

### C. Phosphorus

1. Description
  - a. Phosphorus is important in bone formation, energy storage and release, urinary acid-base buffering, and carbohydrate metabolism.
  - b. Phosphorus is absorbed from food and is excreted by the kidneys.
  - c. High concentrations of phosphorus are stored in bone and skeletal muscle.
2. Value: 2.7 to 4.5 mg/dL
3. Nursing considerations: Instruct the client to fast before the test.

## IX. THYROID STUDIES

### A. Description

1. Thyroid studies are performed if a thyroid disorder is suspected.
2. Thyroid studies help differentiate primary thyroid disease from secondary causes and from abnormalities in thyroxine-binding globulin levels.

### B. Values

1. Thyroid-stimulating hormone (also called thyrotropin): 0.2 to 5.4 microunits/mL
2. Thyroxine ( $T_4$ ): 5 to 12 mcg/dL
3. Thyroxine, free ( $FT_4$ ): 0.8 to 2.4 ng/dL
4. Triiodothyronine ( $T_3$ ): 80 to 230 ng/dL

- ### C. Nursing consideration: Test results may be invalid if the client has undergone a radionuclide scan within 7 days before the test.

## X. WHITE BLOOD CELL COUNT

### A. Description

1. WBCs function in the immune defense system of the body.
2. The WBC count assesses leukocyte distribution.

- ### B. Value: 4500 to 11,000 cells/mm<sup>3</sup> (Table 11-5)

**TABLE 11-5** Normal Adult White Blood Cell Differential Count

| Cell Type   | Count                           |
|-------------|---------------------------------|
| Neutrophils | 1800-7800 cells/mm <sup>3</sup> |
| Bands       | 0-700 cells/mm <sup>3</sup>     |
| Eosinophils | 0-450 cells/mm <sup>3</sup>     |
| Basophils   | 0-200 cells/mm <sup>3</sup>     |
| Lymphocytes | 1000-4800 cells/mm <sup>3</sup> |
| Monocytes   | 0-800 cells/mm <sup>3</sup>     |

### C. Nursing considerations

1. A “shift to the left” means that an increased number of immature neutrophils is present in the **blood**.
2. A low total WBC count with a left shift indicates a recovery from bone marrow depression or an infection of such intensity that the demand for neutrophils in the tissue is higher than the capacity of the bone marrow to release them into the circulation.
3. A high total WBC count with a left shift indicates an increased release of neutrophils by the bone marrow in response to an overwhelming infection or inflammation.
4. A “shift to the right” means that cells have more than the usual number of nuclear segments; found in liver disease, Down syndrome, and megaloblastic and pernicious anemia.

 Monitor the WBC count closely in clients receiving chemotherapy because of the risk for neutropenia.

## XI. HEPATITIS TESTING

### A. Description

1. Tests include radioimmunoassay, enzyme-linked immunosorbent assay (ELISA), and microparticle enzyme immunoassay.
2. Serological tests for specific hepatitis virus markers assist in defining the specific type of hepatitis.

### B. Values

1. The presence of immunoglobulin M (IgM) antibody to hepatitis A virus and the presence of the total antibody to hepatitis A virus identify the disease.
2. Detection of hepatitis B core antigen (HBcAg), envelope antigen (HBeAg), and surface antigen (HBsAg), or their corresponding antibodies, constitutes hepatitis B assessment.
3. Hepatitis C is confirmed by the presence of antibodies to hepatitis C virus.
4. Serological hepatitis D virus determination is made by detection of the hepatitis D antigen (HDAg) early in the course of the infection and by detection of anti-hepatitis D virus antibody in the later disease stages.
5. Specific serological tests for hepatitis E virus include detection of IgM and IgG antibodies to hepatitis E.
6. Hepatitis G virus has been found in some **blood** donors (donated **blood**), IV drug users, hemodialysis clients, and clients with hemophilia; however, hepatitis G virus does not appear to cause significant liver disease.

- ### C. Nursing consideration: If the radioimmunoassay technique is being used, the injection of radionuclides within 1 week before the **blood** test is performed may cause falsely elevated results.

## XII. HUMAN IMMUNODEFICIENCY VIRUS (HIV) AND ACQUIRED IMMUNODEFICIENCY SYNDROME (AIDS) TESTING

### A. Description

1. Testing detects HIV, which is the cause of AIDS.
2. Common tests used to determine the presence of antibodies to HIV include ELISA, Western blot, and immunofluorescence assay (IFA).
3. A single reactive ELISA test by itself cannot be used to diagnose HIV and should be repeated in duplicate with the same **blood** sample; if the result is repeatedly reactive, follow-up tests using Western blot or IFA should be performed.
4. A positive Western blot or IFA result is considered confirmatory for HIV.
5. A positive ELISA result that fails to be confirmed by Western blot or IFA should not be considered negative, and repeat testing should take place in 3 to 6 months.

### B. CD4<sup>+</sup> T-cell counts

1. Monitors the progression of HIV
2. As the disease progresses, usually the number of CD4<sup>+</sup> T-cells decreases, with a resultant decrease in immunity.
3. Normal CD4<sup>+</sup> T-cell count is between 500 and 1600 cells/L.
4. Generally, the immune system remains healthy with CD4<sup>+</sup> T-cell counts higher than 500 cells/L.
5. Immune system problems occur when the CD4<sup>+</sup> T-cell count is between 200 and 499 cells/L.
6. Severe immune system problems occur when the CD4<sup>+</sup> T-cell count is lower than 200 cells/L.

### C. CD4-to-CD8 ratio

1. Monitors progression of disease.
2. Normal ratio is approximately 2:1.

### D. Viral culture involves placing the infected client's **blood cells** in a culture medium and measuring the amount of reverse transcriptase activity over a specified period of time.

### E. Viral load testing measures the presence of HIV viral genetic material (RNA) or another viral protein in the client's **blood**.

### F. The p24 antigen assay quantifies the amount of HIV viral core protein in the client's **serum**.

### G. Oral testing for HIV

1. Uses a device that is placed against the gum and cheek for 2 minutes
2. Fluid (not saliva) is drawn into an absorbable pad, which, in an HIV-positive individual, contains antibodies.
3. The pad is placed in a solution and a specified observable change is noted if the test result is positive.

**TABLE 11-6** Normal Adult Values: Urine Tests

| Name of Test      | Value                                      |
|-------------------|--|
| Color             | Pale yellow                                |
| Odor              | Specific aromatic odor, similar to ammonia |
| Turbidity         | Clear                                      |
| pH                | 4.5-7.8                                    |
| Specific gravity  | 1.016 to 1.022                             |
| Glucose           | <0.5 g/day                                 |
| Ketones           | None                                       |
| Protein           | None                                       |
| Bilirubin         | None                                       |
| Casts             | None to few                                |
| Crystals          | None                                       |
| Bacteria          | None or <1000/mL                           |
| Red blood cells   | <3 cells/HPF                               |
| White blood cells | ≤4 cells/HPF                               |
| Chloride          | 110-250 mEq/24 hr                          |
| Magnesium         | 7.3-12.2 mg/dL                             |
| Potassium         | 25-125 mEq/24 hr                           |
| Sodium            | 40-220 mEq/24 hr                           |
| Uric acid         | 250-750 mg/24 hr                           |

HPF, High-powered field.

4. If the result is positive, a **blood** test is needed to confirm the results.

### H. Home test kits for HIV

1. In one at-home test kit, a drop of **blood** is placed on a test card with a special code number; the card is mailed to a laboratory for testing for HIV antibodies.
2. The individual receives the results by calling a special telephone number and entering the special code number; test results are then given.

### I. Nursing considerations

1. Maintain issues of confidentiality surrounding HIV and AIDS testing.
2. Follow prescribed state regulations and protocols related to reporting positive test results.

## XIII. URINE TESTS (Table 11-6)

## XIV. THERAPEUTIC SERUM MEDICATION LEVELS (Table 11-7)

**TABLE 11-7** Therapeutic Serum Medication Levels

| Medication                      | Therapeutic Range |
|---------------------------------|-------------------|
| Acetaminophen (Tylenol)         | 10-20 mcg/mL      |
| Amikacin (Amikin)               | 25-30 mcg/mL      |
| Amitriptyline                   | 120-150 ng/mL     |
| Carbamazepine (Tegretol)        | 5-12 mcg/mL       |
| Chloramphenicol (Chloromycetin) | 10-20 mcg/mL      |
| Desipramine (Norpramin)         | 150-300 ng/mL     |
| Digoxin (Lanoxin)               | 0.5-2 ng/mL       |
| Disopyramide (Norpace)          | 2-5 mcg/mL        |
| Ethosuximide (Zarontin)         | 40-100 mcg/mL     |
| Gentamicin                      | 5-10 mcg/mL       |
| Imipramine (Tofranil)           | 150-300 ng/mL     |
| Lidocaine (Xylocaine)           | 1.5-5 mcg/mL      |
| Lithium (Lithobid)              | 0.5-1.2 mEq/L     |
| Magnesium sulfate               | 4-7 mg/dL         |
| Phenobarbital (Luminal)         | 10-30 mcg/mL      |
| Phenytoin (Dilantin)            | 10-20 mcg/mL      |
| Propranolol (Inderal)           | 50-100 ng/mL      |
| Salicylate                      | 100-250 mcg/mL    |
| Theophylline                    | 10-20 mcg/mL      |
| Tobramycin (Nebcin)             | 5-10 mcg/mL       |
| Valproic acid (Depakene)        | 50-100 mcg/mL     |

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 63.** A client with atrial fibrillation who is receiving maintenance therapy of warfarin sodium (Coumadin) has a prothrombin time (PT) of 35 seconds. Based on the prothrombin time, the nurse anticipates which of the following prescriptions?
1. Adding a dose of heparin sodium
  2. Holding the next dose of warfarin
  3. Increasing the next dose of warfarin
  4. Administering the next dose of warfarin
- 64.** The nurse checks the laboratory result for a serum digoxin level that was prescribed for a client earlier in the day and notes that the result is 2.4 ng/mL. The nurse should take which immediate action?
1. Notify the physician.
  2. Check the client's last pulse rate.
  3. Record the normal value on the client's flow sheet.
  4. Administer the next dose of the medication as scheduled.
- 65.** A client has been admitted to the hospital for urinary tract infection and dehydration. The nurse determines that the client has received adequate volume replacement if the blood urea nitrogen level drops to:
1. 3 mg/dL
  2. 15 mg/dL
  3. 29 mg/dL
  4. 35 mg/dL
- 66.** A client arrives in the emergency room complaining of chest pain that began 4 hours ago. A troponin T blood specimen is obtained, and the results indicate a level of 0.6 ng/mL. The nurse determines that this result indicates:
1. A normal level
  2. A low value that indicates possible gastritis
  3. A level that indicates a myocardial infarction
  4. A level that indicates the presence of possible angina
- 67.** A client is receiving a continuous intravenous infusion of heparin sodium to treat deep vein thrombosis. The client's activated partial thromboplastin (aPTT) time is 65 seconds. The nurse anticipates that which action is needed?
1. Discontinuing the heparin infusion
  2. Increasing the rate of the heparin infusion
  3. Decreasing the rate of the heparin infusion
  4. Leaving the rate of the heparin infusion as is
- 68.** A client with a history of cardiac disease is due for a morning dose of furosemide (Lasix). Which serum potassium level, if noted in the client's laboratory report, should be reported before administering the dose of furosemide?
1. 3.2 mEq/L
  2. 3.8 mEq/L
  3. 4.2 mEq/L
  4. 4.8 mEq/L
- 69.** A client with a history of gastrointestinal bleeding has a platelet count of 300,000 cells/mm<sup>3</sup>. The nurse should take which action after seeing the laboratory results?

1. Report the abnormally low count.
  2. Report the abnormally high count.
  3. Place the client on bleeding precautions.
  4. Place the normal report in the client's medical record.
- 70.** An adult client with cirrhosis has been following a diet with optimal amounts of protein because neither an excess nor a deficiency of protein has been helpful. The nurse evaluates the client's status as being most satisfactory if the total protein level is which of the following values?
1. 0.4 g/dL
  2. 3.7 g/dL
  3. 6.4 g/dL
  4. 9.8 g/dL
- 71.** A client with diabetes mellitus has a glycosylated hemoglobin A<sub>1c</sub> level of 9%. Based on this test result, the nurse plans to teach the client about the need to:
1. Avoid infection.
  2. Take in adequate fluids.
  3. Prevent and recognize hypoglycemia.
  4. Prevent and recognize hyperglycemia.
- 72.** The nurse is caring for a client with a diagnosis of cancer who is immunosuppressed. The nurse would consider implementing neutropenic precautions if the client's white blood cell count was which of the following?
1. 2000 cells/mm<sup>3</sup>
  2. 5800 cells/mm<sup>3</sup>
  3. 8400 cells/mm<sup>3</sup>
  4. 11,500 cells/mm<sup>3</sup>
- 73.** A client brought to the emergency department states that he has accidentally been taking two times his prescribed dose of warfarin (Coumadin) for the past week. After noting that the client has no evidence of obvious bleeding, the nurse plans to do which of the following?
1. Prepare to administer an antidote.
  2. Draw a sample for type and crossmatch and transfuse the client.
  3. Draw a sample for an activated partial thromboplastin time (aPTT) level.
  4. Draw a sample for prothrombin time (PT) and international normalized ratio (INR).
- 74.** The nurse is assigned to a 40-year-old client who has a diagnosis of chronic pancreatitis. The nurse anticipates the client's serum amylase level to be which of the following?
1. 45 units/L
  2. 100 units/L
  3. 300 units/L
  4. 500 units/L
- 75.** An adult female client has a hemoglobin level of 10.8 g/dL. The nurse interprets that this result is most likely caused by which of the following conditions noted in the client's history?
1. Dehydration
  2. Heart failure
  3. Iron deficiency anemia
  4. Chronic obstructive pulmonary disease

### Alternate Item Format: Multiple Response

- 76.** Several laboratory tests are prescribed for a client, and the nurse reviews the results of the tests. Select the abnormal laboratory test results that the nurse should report. **Select all that apply.**
- 1. Calcium, 7 mg/dL
  - 2. Magnesium, 1 mg/dL
  - 3. Phosphorus, 3.6 mg/dL
  - 4. Neutrophils, 1000/mm<sup>3</sup>
  - 5. Serum creatinine, 1 mg/dL
  - 6. White blood cells, 3000/mm<sup>3</sup>

## ANSWERS

### 63. 2

**Rationale:** The normal PT is 9.6 to 11.8 seconds (male adult) or 9.5 to 11.3 seconds (female adult). A therapeutic PT level is 1.5 to 2 times higher than the normal level. Because the value of 35 seconds is high (and perhaps near the critical range), the nurse should anticipate that the client would not receive further doses at this time. Therefore the prescriptions noted in options 1, 3, and 4 are incorrect.

**Test-Taking Strategy:** Recall that the normal PT is 9.6 to 11.8 seconds (male adult) or 9.5 to 11.3 seconds (female adult) and that a therapeutic PT level is 1.5 to 2 times higher than the normal level. Remember that a PT level greater than 30

seconds places the client at risk for bleeding; this will direct you to the correct option. If this question was difficult, review the normal PT level and the expected level if the client is receiving warfarin sodium.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Laboratory Values

**References:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 680). St. Louis: Saunders.

Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed., p. 779). St. Louis: Mosby.

**64. 1**

**Rationale:** The normal therapeutic range for digoxin is 0.5 to 2 ng/mL. A level of 2.4 ng/mL exceeds the therapeutic range and indicates toxicity. The nurse should notify the physician, who may give further prescriptions about holding further doses of digoxin. Option 3 is incorrect because the level is not normal. The next dose should not be administered because the serum digoxin level exceeds the therapeutic range. Checking the client's last pulse rate may have limited value in this situation. Depending on the time that has elapsed since the last assessment, a current assessment of the client's status may be more useful.

**Test-Taking Strategy:** Note the strategic word *immediate*. To choose correctly, you must be familiar with the therapeutic range for this medication and note that the level of 2.4 ng/mL is a toxic one. This will direct you to option 1. If this question was difficult, review the immediate nursing interventions if the client has a toxic digoxin level.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Content Area:** Fundamental Skills—Laboratory Values

**Reference:** Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed., p. 354). St. Louis: Mosby.

**65. 2**

**Rationale:** The normal blood urea nitrogen level is 8 to 25 mg/dL. Values such as those in options 3 and 4 reflect continued dehydration. Option 1 reflects a lower than normal value, which may occur with fluid volume overload, among other conditions.

**Test-Taking Strategy:** Use the process of elimination and knowledge of the normal blood urea nitrogen level to answer the question. Option 2 is the only option that identifies a normal value. Review the normal blood urea nitrogen level if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Fundamental Skills—Laboratory Values

**Reference:** Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed., p. 954). St. Louis: Mosby.

**66. 3**

**Rationale:** Troponin is a regulatory protein found in striated muscle. The troponins function together in the contractile apparatus for striated muscle in skeletal muscle and in the myocardium. Increased amounts of troponins are released into the bloodstream when an infarction causes damage to the myocardium. A troponin T value that is higher than 0.1 to 0.2 ng/mL is consistent with a myocardial infarction. A normal troponin I level is lower than 0.6 ng/mL.

**Test-Taking Strategy:** Note that the subject of the question relates to the troponin T. Knowing that a level higher than 0.1 to 0.2 ng/mL is consistent with a myocardial infarction will direct you to option 3. Review the normal troponin T and the normal troponin I level if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Laboratory Values

**Reference:** Chernecky, C., & Berger, B. (2008). *Laboratory tests and diagnostic procedures* (5th ed., p. 1116). St. Louis: Saunders.

**67. 4**

**Rationale:** The normal aPTT varies between 20 and 36 seconds, depending on the type of activator used in testing. The therapeutic dose of heparin for treatment of deep vein thrombosis is to keep the aPTT between 1.5 and 2.5 times normal. This means that the client's value should not be less than 30 seconds or greater than 90 seconds. Thus the client's aPTT is within the therapeutic range and the dose should remain unchanged.

**Test-Taking Strategy:** Remember that the normal range is 20 to 36 seconds and that the aPTT should be between 1.5 and 2.5 times normal when the client is receiving heparin therapy. Simple multiplication of 1.5 and 2.5 by 20 and 30 will yield a range of 30 to 90 seconds. This client's value is 65 seconds. If this question was difficult, review the aPTT level and the expected level if the client is receiving heparin.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Laboratory Values

**Reference:** Gahart, B., & Nazareno, A. (2009). *Intravenous medications* (25th ed., p. 670). St. Louis: Mosby.

**68. 1**

**Rationale:** The normal serum potassium level in the adult is 3.5 to 5.1 mEq/L. Option 1 is the only value that falls below the therapeutic range. Administering furosemide to a client with a low potassium level and a history of cardiac problems could precipitate ventricular dysrhythmias. Options 2, 3, and 4 are within the normal range.

**Test-Taking Strategy:** Note the subject of the question, the level that should be reported. This indicates that you are looking for an abnormal level. Remember, the normal serum potassium level in the adult is 3.5 to 5.1 mEq/L. This will direct you to option 1. If this question was difficult, memorize the normal serum potassium level.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Laboratory Values

**Reference:** Chernecky, C., & Berger, B. (2008). *Laboratory tests and diagnostic procedures* (5th ed., p. 891). St. Louis: Saunders.

**69. 4**

**Rationale:** A normal platelet count ranges from 150,000 to 400,000 cells/mm<sup>3</sup>. The nurse should place the report containing the normal laboratory value in the client's medical record. A platelet count of 300,000 cells/mm<sup>3</sup> is not an elevated count. The count also is not low; therefore bleeding precautions are not needed.

**Test-Taking Strategy:** Use the process of elimination. Remember that options that are comparable or alike are not

likely to be correct. With this in mind, eliminate options 1 and 3 first. From the remaining options, recalling the normal range for this laboratory test will direct you to option 4. Review the normal platelet count if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Laboratory Values

**Reference:** Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed., p. 731). St. Louis: Mosby.

### 70. 3

**Rationale:** The normal range for total serum protein level in the adult client is 6 to 8 g/dL. The client with cirrhosis often has low total protein levels as a result of inadequate nutrition. Excess protein is not helpful, though, because a function of the liver is to metabolize protein. A diseased liver may not metabolize protein well. Options 1 and 2 identify low values, and option 4 identifies a high protein value.

**Test-Taking Strategy:** Note the strategic words *most satisfactory*. Recalling the normal total protein level will direct you to option 3. Review total serum protein level if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Fundamental Skills—Laboratory Values

**Reference:** Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed., p. 769). St. Louis: Mosby.

### 71. 4

**Rationale:** In the test result for glycosylated hemoglobin A<sub>1c</sub>, 7% or less indicates good control, 7% to 8% indicates fair control, and 8% or higher indicates poor control. This test measures the amount of glucose that has become permanently bound to the red blood cells from circulating glucose. Elevations in the blood glucose level will cause elevations in the amount of glycosylation. Thus the test is useful in identifying clients who have periods of hyperglycemia that are undetected in other ways. Elevations indicate continued need for teaching related to the prevention of hyperglycemic episodes.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the values for glycosylated hemoglobin A<sub>1c</sub> and their significance to answer the question. Focusing on the level identified in the question will assist in directing you to option 4. If you had difficulty with this question or are unfamiliar with the glycosylated hemoglobin A<sub>1c</sub>, review this content.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Laboratory Values

**Reference:** Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed., p. 492). St. Louis: Mosby.

### 72. 1

**Rationale:** The normal white blood cell count ranges from 4500 to 11,000/mm<sup>3</sup>. The client who has a decrease in the

number of circulating white blood cells is immunosuppressed. The nurse implements neutropenic precautions when the client's values fall sufficiently below the normal level. The specific value for implementing neutropenic precautions usually is determined by agency policy. Options 2, 3, and 4 are normal values.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject, the need to implement neutropenic precautions. Recalling that the normal white blood cell count is 4500 to 11,000/mm<sup>3</sup> will direct you to option 1. Review the normal white blood cell counts if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Laboratory Values

**References:** Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed., p. 998). St. Louis: Mosby.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 15). St. Louis: Mosby.

### 73. 4

**Rationale:** The next action is to draw a sample for PT and INR level to determine the client's anticoagulation status and risk for bleeding. These results will provide information as to how to best treat this client (e.g., if an antidote such as vitamin K or a blood transfusion is needed). The aPTT monitors the effects of heparin therapy.

**Test-Taking Strategy:** Use a process of elimination. Eliminate option 3 because it is unrelated to warfarin therapy and relates to heparin therapy. Next, eliminate options 1 and 2 because these therapies would not be implemented unless the PT and INR levels are known. Review care to the client receiving warfarin therapy and the purpose of the PT and INR if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Laboratory Values

**Reference:** Kee, J., Hayes, E., & McCuiston, L. (2009). *Pharmacology: A nursing process approach* (6th ed., pp. 682–683). St. Louis: Saunders.

### 74. 3

**Rationale:** The normal serum amylase level is 25 to 151 units/L. With chronic cases of pancreatitis, the rise in serum amylase levels usually does not exceed three times the normal value. In acute pancreatitis, the value may exceed five times the normal value. Options 1 and 2 are within normal limits. Option 4 is an extremely elevated level seen in acute pancreatitis.

**Test-Taking Strategy:** Note the strategic word *chronic* in the question. Recalling the normal amylase level and focusing on the strategic word will direct you to option 3. Review the normal serum amylase level and the findings in chronic pancreatitis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Laboratory Values

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 470). St. Louis: Mosby.

**75. 3**

**Rationale:** The normal hemoglobin level for an adult female client is 12 to 15 g/dL. Iron deficiency anemia can result in lower hemoglobin levels. Dehydration may increase the hemoglobin level by hemoconcentration. Heart failure and chronic obstructive pulmonary disease may increase the hemoglobin level as a result of the body's need for more oxygen-carrying capacity.

**Test-Taking Strategy:** Use the process of elimination. Evaluate each of the options in terms of whether each is likely to raise or lower the hemoglobin level. Also, note the relationship between hemoglobin level in the question and option 3. Review the normal hemoglobin level if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Laboratory Values

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 2004–2005). St. Louis: Saunders.

Chernecky, C., & Berger, B. (2008). *Laboratory tests and diagnostic procedures* (5th ed., p. 617). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

**76. 1, 2, 4, 6**

**Rationale:** The normal values include the following: calcium, 8.6 to 10 mg/dL; magnesium, 1.6 to 2.6 mg/dL; phosphorus, 2.7 to 4.5 mg/dL; neutrophils, 1800 to 7800/mm<sup>3</sup>; serum creatinine, 0.6 to 1.3 mg/dL; and white blood cells, 4500 to 11,000/mm<sup>3</sup>. The calcium level noted is low; the magnesium level noted is low; the phosphorus level noted is normal; the neutrophil level noted is low; the serum creatinine level noted is normal; and the white blood cell level is low.

**Test-Taking Strategy:** Note the strategic word *abnormal* in the question. Recalling the normal laboratory values for the blood studies identified in the options will assist in answering this question. Review these normal values if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Laboratory Values

# Nutrition

## PYRAMID TERMS

**absorption** Passage of digested nutrients through the wall of the stomach or small intestine into the blood or lymph system.

**enteral nutrition** Administration of nutrition with liquefied foods into the gastrointestinal tract via a tube.

**malnutrition** Deficiency of the nutrients required for development and maintenance of the human body.

**metabolism** Ongoing chemical process within the body that converts digested nutrients into energy for the functioning of body cells.

**nutrients** Carbohydrates, fats or lipids, proteins, vitamins, minerals, electrolytes, and water that must be supplied in adequate amounts to provide energy, growth, development, and maintenance of the human body.

## THE PYRAMID TO SUCCESS

Nutrition is a basic need that must be met for all clients. Nurses must have the knowledge required to educate and care for healthy clients and for clients with nutritional needs or disorders requiring alterations in dietary measures. The NCLEX-RN examination addresses the dietary measures required for basic needs and for particular body system alterations. When presented with a question related to nutrition, consider the client's diagnosis and the particular requirement or restriction necessary for treatment of the disorder. Pyramid Points focus on the common types of therapeutic diets, nutrients contained in food items, and supplemental or enteral feedings.

## CLIENT NEEDS

### Safe and Effective Care Environment

Consulting with members of the health care team such as a dietitian regarding dietary needs  
Obtaining informed consent for invasive procedures  
Maintaining standard and transmission-based and asepsis  
Providing information to the client about community classes for nutrition education

## Health Promotion and Maintenance

Initiating health promotion programs  
Performing physical assessment  
Preventing disease  
Promoting health and wellness  
Providing dietary teaching

## Psychosocial Integrity

Considering cultural preferences related to nutritional patterns and lifestyle choices  
Identifying coping mechanisms  
Identifying religious and spiritual influences on health

## Physiological Integrity

Assessing elimination patterns  
Monitoring for alterations in body systems  
Monitoring of enteral feedings and the client's ability to tolerate feedings  
Monitoring of fluid and electrolyte balance  
Monitoring of laboratory values  
Monitoring of nutritional intake and oral hydration

## I. NUTRIENTS

### A. Carbohydrates (Box 12-1)

1. Carbohydrates are the preferred source of energy.
2. Sugars, starches, and cellulose provide 4 cal/g.
3. Carbohydrates promote normal fat **metabolism**, spare protein, and enhance lower gastrointestinal function.
4. Major food sources of carbohydrates include milk, grains, fruits, and vegetables.
5. Inadequate carbohydrate intake affects **metabolism**.

### B. Fats (Box 12-2)

1. Fats provide a concentrated source and a stored form of energy.
2. Fats protect internal organs and maintain body temperature.
3. Fats enhance **absorption** of the fat-soluble vitamins.
4. Fats provide 9 cal/g.

- 
5. Inadequate fat intake leads to clinical manifestations of sensitivity to cold, skin lesions, increased risk of infection, and amenorrhea in women.
  6. Diets high in fat can lead to obesity and increase the risk of cardiovascular disease and some cancers.
- C. Proteins (Box 12-3)**
1. Amino acids, which make up proteins, are critical to all aspects of growth and development of body tissues, and provide 4 cal/g.
  2. Proteins build and repair body tissues, regulate fluid balance, maintain acid-base balance,

produce antibodies, provide energy, and produce enzymes and hormones.

3. Essential amino acids are required in the diet because the body cannot manufacture them. 
4. High-quality proteins or complete proteins such as eggs, dairy products, meat, fish, and poultry contain adequate amounts of essential amino acids. 
5. Foods that do not contain the essential amino acids in sufficient amounts are lower quality or incomplete proteins.
6. Inadequate protein can cause protein energy **malnutrition** and severe wasting of fat and muscle tissue. 

### Box 12-1 Food Sources of Carbohydrates

#### Cellulose

Apples  
Beans  
Bran  
Cabbage

#### Fructose

Fruits  
Honey

#### Glucose

Carrots  
Corn  
Dates  
Grapes  
Oranges

#### Lactose

Milk

#### Starch

Barley  
Beets, carrots, and peas  
Corn  
Oats  
Potatoes and pasta  
Rye  
Wheat

#### Sucrose

Apricots  
Granulated table sugar  
Honeydew and cantaloupe  
Molasses  
Peaches  
Peas and corn  
Plums

### Box 12-2 Food Sources of Fats

#### Cholesterol

Animal products  
Egg yolks  
Liver and organ meats  
Shellfish

#### Monounsaturated Fats

Duck and goose  
Eggs  
Olive and peanut oils

#### Polyunsaturated Fats

Corn oil  
Safflower oil  
Sunflower oil

#### Saturated Fats

Beef  
Butter  
Hard yellow cheeses  
Luncheon meats

### D. Vitamins (Box 12-4)

1. Vitamins facilitate **metabolism** of proteins, fats, and carbohydrates and act as catalysts for metabolic functions.
2. Vitamins promote life and growth processes, and maintain and regulate body functions.
3. Fat-soluble vitamins A, D, E, and K can be stored in the body, so an excess can cause toxicity. 
4. The B vitamins and vitamin C are water-soluble vitamins, are not stored in the body, and can be excreted in the urine.

### Box 12-3 Food Sources of Protein

Bread and cereal products  
Dairy products  
Dried beans  
Eggs  
Meats, fish, and poultry

### Box 12-4 Food Sources of Vitamins

#### Water-Soluble Vitamins

Folic acid: Green, leafy vegetables; liver, beef, and fish; legumes; grapefruit and oranges  
Niacin: Meats, poultry, fish, beans, peanuts, grains  
Vitamin B<sub>1</sub> (thiamine): Pork and nuts, whole-grain cereals, and legumes  
Vitamin B<sub>2</sub> (riboflavin): Milk, lean meats, fish, grains  
Vitamin B<sub>6</sub> (pyridoxine): Yeast, corn, meat, poultry, fish  
Vitamin B<sub>12</sub> (cobalamin): Meat, liver  
Vitamin C (ascorbic acid): Citrus fruits, tomatoes, broccoli, cabbage

#### Fat-Soluble Vitamins

Vitamin A: Liver, egg yolk, whole milk, green or orange vegetables, fruits  
Vitamin D: Fortified milk, fish oils, cereals  
Vitamin E: Vegetable oils; green, leafy vegetables; cereals; apricots, apples, and peaches  
Vitamin K: Green leafy vegetables; cauliflower and cabbage

5. Vitamin K acts as a catalyst for facilitating blood-clotting factors, especially prothrombin.
6. Vitamin C functions in the production of collagen, a vital component in wound healing.
7. Vitamin A maintains eyesight and epithelial linings.

#### E. Minerals (Box 12-5)

1. Minerals are components of hormones, cells, tissues, and bones.
2. Minerals act as catalysts for chemical reactions and enhancers of cell function.
3. Almost all foods contain some form of minerals.
4. A deficiency of minerals can occur in chronically ill or hospitalized clients.
5. Electrolytes play a major role in osmolality and body water regulation, acid-base balance, enzyme reactions, and neuromuscular activity (see Chapter 9 for additional information regarding electrolytes).

**!** Always assess the client's ability to eat and swallow and promote independence in eating as much as is possible.

## II. FOOD GUIDE PYRAMID (Fig. 12-1)

### A. The food guide pyramid (MyPyramid)

1. MyPyramid provides individualized guidance to healthy eating and physical activity.
2. Activity, which is illustrated by the person climbing the steps in Figure 12-1, symbolizes the importance of finding a balance between food and physical activity.
3. Food groups, illustrated by the bands on the pyramid in Figure 12-1, include grains, vegetables, fruits, milk, and meat and beans.
4. MyPyramid provides recommendations regarding physical activity and the amounts and types of foods from each food group to consume.

### B. Shape of the pyramid

1. The wide base of each food group band on the pyramid indicates foods with little or no solid fats or added sugars; these are foods that should be eaten most often.
2. The narrower part of the food group band indicates foods containing more added sugars and solid fats; these foods should be eaten less often (increased activity is needed when these foods are eaten).

**!** Always consider the client's cultural and personal choices when planning nutritional intake.

## III. THERAPEUTIC DIETS

### A. Clear liquid diet

1. Indications
  - a. Clear liquid diet provides fluids and some electrolytes to prevent dehydration.

### Box 12-5 Food Sources of Minerals

#### Calcium

Broccoli  
Carrots  
Cheese  
Collard greens  
Green beans  
Milk  
Rhubarb  
Spinach  
Tofu  
Yogurt

#### Chloride

Salt

#### Magnesium

Avocado  
Canned white tuna  
Cauliflower  
Cooked rolled oats  
Green leafy vegetables  
Milk  
Peanut butter  
Peas  
Pork, beef, chicken  
Potatoes  
Raisins  
Yogurt

#### Phosphorus

Fish  
Nuts  
Organ meats  
Pork, beef, chicken  
Whole-grain breads and cereals

#### Potassium

Avocado  
Bananas  
Cantaloupe  
Carrots

Fish  
Mushrooms  
Oranges  
Pork, beef, veal  
Potatoes  
Raisins  
Spinach  
Strawberries  
Tomatoes

#### Sodium

American cheese  
Bacon  
Butter  
Canned food  
Cottage cheese  
Cured pork  
Hot dogs  
Ketchup  
Lunch meat  
Milk  
Mustard  
Processed food  
Snack food  
Soy sauce  
Table salt  
White and whole-wheat bread

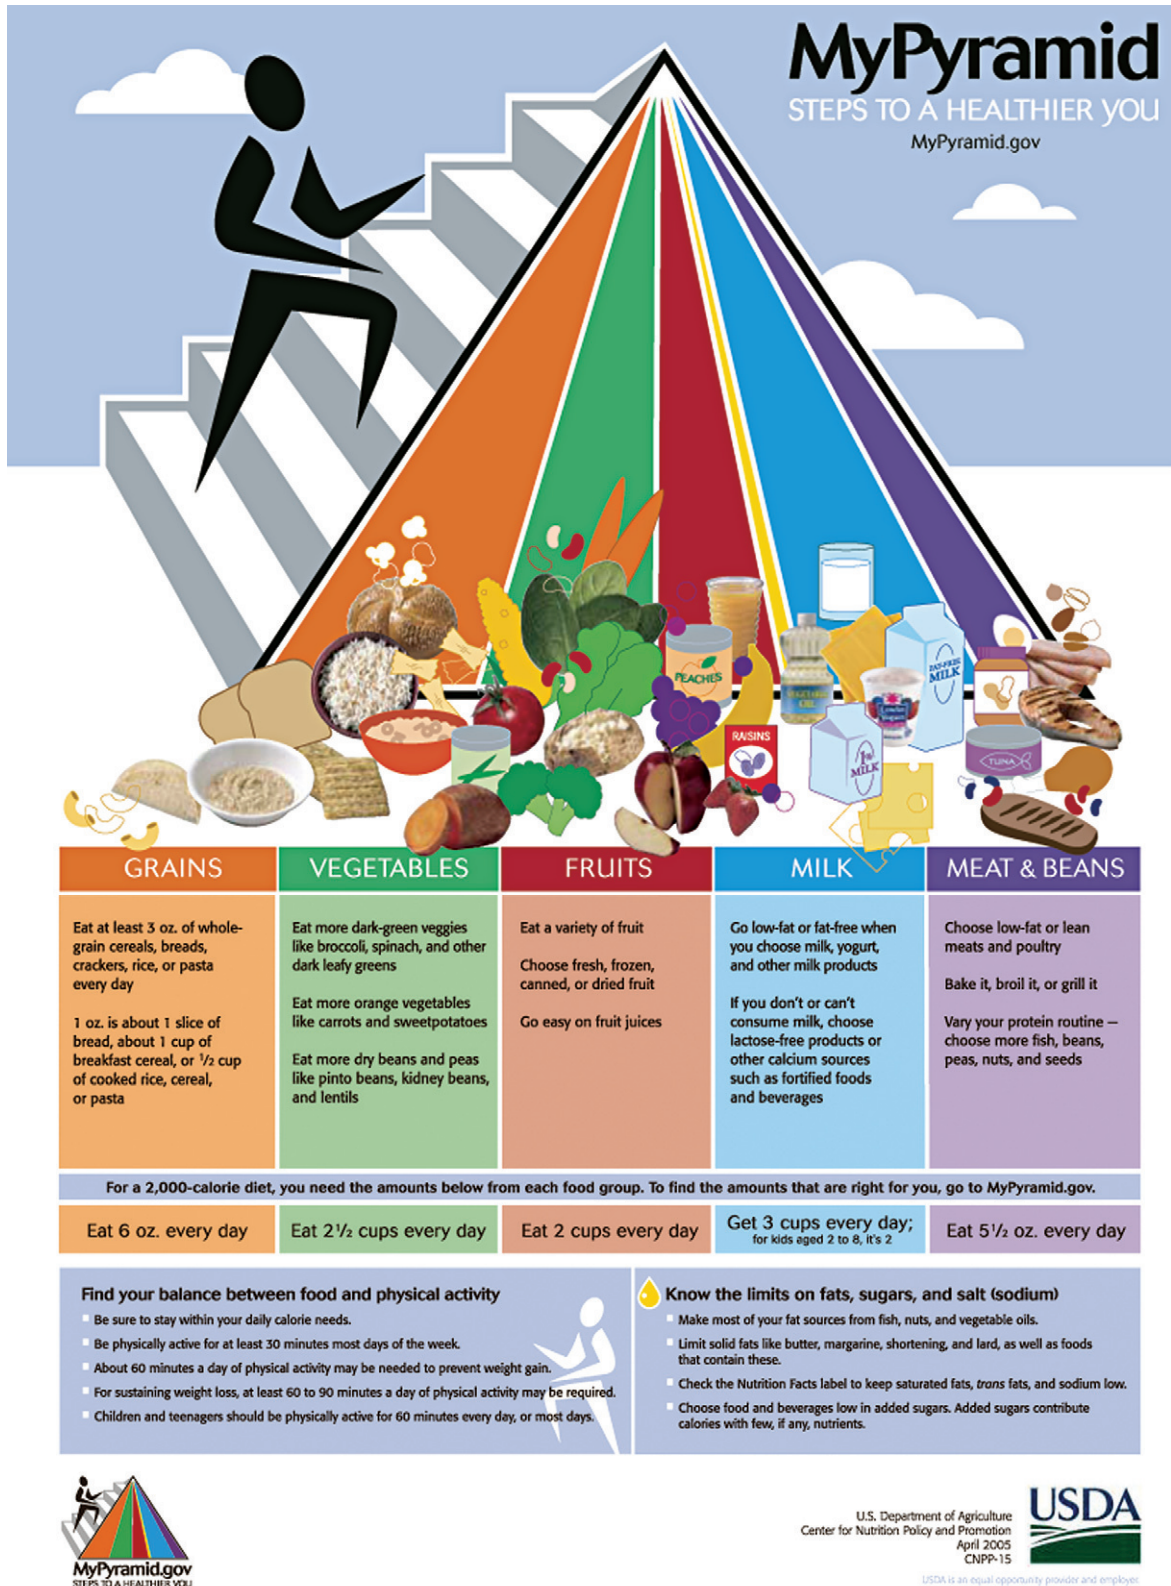

#### Iron

Breads and cereals  
Dark green vegetables  
Egg yolk  
Liver  
Meats

#### Zinc

Eggs  
Leafy vegetables  
Meats  
Protein-rich foods

- b. Clear liquid diet is used as an initial feeding after complete bowel rest.
  - c. Clear liquid diet is used initially to feed a malnourished person or a person who has not had any oral intake for some time.
  - d. Clear liquid diet is used for bowel preparation for surgery or tests, as well as post-operatively and in clients with fever, vomiting, or diarrhea.
  - e. Clear liquid diet is used in gastroenteritis or pancreatitis.
2. Nursing considerations
    - a. Clear liquid diet is deficient in energy (calories) and many **nutrients**.
    - b. Clear liquid diet is easily digested and absorbed.

▲ FIGURE 12-1 MyPyramid. (From U.S. Department of Agriculture. <http://www.mypyramid.gov>.)

- c. Minimal residue is left in the gastrointestinal tract.
- d. Clients may find a clear liquid diet unappetizing and boring.
- e. As a transition diet, clear liquids are intended for short-term use.
- f. Clear liquids and foods that are relatively transparent to light and are liquid at body temperature are considered “clear liquids,” such as water, bouillon, clear broth, carbonated beverages, gelatin, hard candy, lemonade, Popsicles, and regular or decaffeinated coffee or tea.
- g. By limiting caffeine intake, upset stomach and sleeplessness may be prevented.
- h. The client may consume salt and sugar.
- i. Dairy products and fruit juices with pulp are not clear liquids.

 **Monitor the client’s hydration status by assessing intake and output, weight, monitoring for edema, and monitoring for signs of dehydration.**

## B. Full liquid diet

1. Indication: may be used as a transition diet after clear liquids following surgery or for clients who have difficulty chewing, swallowing, or tolerating solid foods
2. Nursing considerations
  - a. A full liquid diet is nutritionally deficient in energy (calories) and many **nutrients**.
  - b. The diet includes clear and opaque liquid foods, and those that are liquid at body temperature.
  - c. Foods include all clear liquids and items such as plain ice cream, sherbet, breakfast drinks, milk, pudding and custard, soups that are strained, refined cooked cereals, fruit juices, and strained vegetable juices.
  - d. Use of a complete nutritional liquid supplement is often necessary to meet nutrient needs for clients on a full liquid diet for more than 3 days.

 **Provide nutritional supplements such as those high in protein, as prescribed for the client on a liquid diet.**

## C. Mechanically altered diet

1. Indications
  - a. Provides foods that have been mechanically altered in texture to require minimal chewing
  - b. Used for clients who have difficulty chewing but can tolerate more variety in texture than a liquid diet offers
  - c. Used for clients who have dental problems, surgery of the head or neck, or dysphagia (requires swallowing evaluation and may require thickened liquids)

## 2. Nursing considerations

- a. Degree of texture modification depends on individual need, including pureed, mashed, ground, or chopped.
- b. Foods to be avoided in mechanically altered diets include nuts; dried fruits; raw fruits and vegetables; fried foods; tough, smoked, or salted meats; and foods with coarse textures.

## D. Soft diet

### 1. Indications

- a. Used for clients who have difficulty chewing or swallowing
- b. Used for clients who have ulcerations of the mouth or gums, oral surgery, broken jaw, plastic surgery of the head or neck, or dysphagia, or for the client who has had a stroke

### 2. Nursing considerations

- a. Clients with mouth sores should be served foods at cooler temperatures.
- b. Clients who have difficulty chewing and swallowing because of dry mouth can increase salivary flow by sucking on sour candy.
- c. Encourage the client to eat a variety of foods.
- d. Provide plenty of fluids with meals to ease chewing and swallowing of foods.
- e. Drinking fluids through a straw may be easier than drinking from a cup or glass.
- f. All foods and seasonings are permitted; however, liquid, chopped, or pureed foods or regular foods with a soft consistency are tolerated best.
- g. Foods that contain nuts or seeds, which easily can become trapped in the mouth and cause discomfort, should be avoided.
- h. Raw fruits and vegetables, fried foods, and whole grains should be avoided.

 **Consider the client’s disease or illness and how it may impact on nutritional status.**

## E. Low-residue, low-fiber diet

### 1. Indications

- a. Supplies foods that are least likely to form an obstruction when the intestinal tract is narrowed by inflammation or scarring or when gastrointestinal motility is slowed
- b. Used for inflammatory bowel disease, partial obstructions of the intestinal tract, gastroenteritis, diarrhea, or other gastrointestinal disorders

### 2. Nursing considerations

- a. Foods that are low in residue include white bread, refined cooked cereals, cooked potatoes without skins, white rice, and refined pasta.

- b. Foods to limit or avoid are raw fruits (except bananas), vegetables, nuts and seeds, plant fiber, and whole grains.
- c. Dairy products should be limited to two servings a day.

#### F. High-residue, high-fiber diet

1. Indication: Used for constipation, irritable bowel syndrome when the primary symptom is alternating constipation and diarrhea, and asymptomatic diverticular disease
2. Nursing considerations
  - a. High-residue diet provides 20 to 35 g of dietary fiber daily.
  - b. Volume and weight are added to the stool, speeding the movement of undigested materials through the intestine.
  - c. High-residue foods are fruits and vegetables and whole-grain products.
  - d. Increase fiber gradually and provide adequate fluids to reduce possible undesirable side effects such as abdominal cramps, bloating, diarrhea, and dehydration.
  - e. Gas-forming foods should be limited (Box 12-6)

#### G. Cardiac diet (Box 12-7; see Box 12-2)

1. Indications
  - a. Indicated for atherosclerosis, diabetes mellitus, hyperlipidemia, hypertension, myocardial infarction, nephrotic syndrome, and renal failure
  - b. Reduces the risk of heart disease
2. Nursing consideration: Restricts total amounts of fat, including saturated, trans, polyunsaturated, and monounsaturated; cholesterol; and sodium

#### Box 12-6 Gas-Forming Foods

|                  |          |
|------------------|----------|
| Apples           | Figs     |
| Artichokes       | Honey    |
| Barley           | Melons   |
| Beans            | Milk     |
| Bran             | Molasses |
| Broccoli         | Nuts     |
| Brussels sprouts | Onions   |
| Cabbage          | Radishes |
| Celery           | Soybeans |
| Cherries         | Wheat    |
| Coconuts         | Yeast    |
| Eggplant         |          |

#### Box 12-7 Sodium-Free Spices and Flavorings

|                         |                |
|-------------------------|----------------|
| Allspice                | Ginger         |
| Almond extract          | Lemon extract  |
| Bay leaves              | Maple extract  |
| Caraway seeds           | Marjoram       |
| Cinnamon                | Mustard powder |
| Curry powder            | Nutmeg         |
| Garlic powder or garlic |                |

#### H. Fat-restricted diet

##### 1. Indications

- a. Used to reduce symptoms of abdominal pain, steatorrhea, flatulence, and diarrhea associated with high intakes of dietary fat, and to decrease nutrient losses caused by ingestion of dietary fat in individuals with malabsorptive disorders
- b. Used for clients with malabsorption disorders, pancreatitis, gallbladder disease, and gastroesophageal reflux

##### 2. Nursing considerations

- a. Restricts total amount of fat, including saturated, trans, polyunsaturated, and monounsaturated
- b. Clients with malabsorption may also have difficulty tolerating fiber and lactose.
- c. Vitamin and mineral deficiencies may occur in clients with diarrhea or steatorrhea.
- d. A fecal fat test indicates fat malabsorption with excretion of more than 6 to 8 g fat (or more than 10% of fat consumed) per day during the 3 days of specimen collection.

#### I. High-calorie, high-protein diet

1. Indication: Used for severe stress, burns, wound healing, cancer, human immunodeficiency virus, acquired immunodeficiency syndrome, chronic obstructive pulmonary disease, respiratory failure, or any other type of debilitating disease
2. Nursing considerations
  - a. Encourage nutrient-dense, high-calorie, high-protein foods such as whole milk and milk products, peanut butter, nuts and seeds, beef, chicken, fish, pork, and eggs.
  - b. Some high-calorie foods include sugar, cream, gravy, oil, butter, mayonnaise, dried fruit, avocado, and honey.
  - c. Encourage snacks between meals, such as milkshakes, instant breakfasts, and nutritional supplements.

 **Calorie counts assist in determining the client's total nutritional intake and can identify a deficit or excess intake.**

#### J. Carbohydrate-consistent diet

1. Indication: Used for clients with diabetes mellitus, hypoglycemia, hyperglycemia, and obesity
2. Nursing considerations
  - a. The Exchange System for Meal Planning, developed by the American Dietetic Association and the American Diabetes Association, is a food guide that may be recommended.
  - b. The Exchange System groups foods according to the amounts of carbohydrates, fats, and proteins they contain.

- c. Major food groups include the carbohydrate, meat and meat substitute, and fat groups.
- d. The MyPyramid diet may also be recommended.

**K. Sodium-restricted diet (see Box 12-7)**

1. Indication: Used for hypertension, heart failure, renal disease, cardiac disease, and liver disease
2. Nursing considerations
  - a. Individualized; can include 4 g of sodium daily (no-added salt diet), 2 to 3 g of sodium daily (moderate restriction), 1 g of sodium daily (strict restriction), or 500 mg of sodium daily (severe restriction and seldom prescribed)
  - b. Encourage intake of fresh foods, rather than processed foods, which contain higher amounts of sodium.
  - c. Canned, frozen, instant, smoked, pickled, and boxed foods usually contain higher amounts of sodium. Lunch meats, soy sauce, salad dressings, fast foods, soups, and snacks such as potato chips and pretzels also contain large amounts of sodium.
  - d. Certain medications contain significant amounts of sodium.
  - e. Salt substitutes may be used to improve palatability; most salt substitutes contain large amounts of potassium and should not be used by clients with renal disease.

**L. Protein-restricted diet**

1. Indication: Used for renal disease and liver disease
2. Nursing considerations
  - a. Provide enough protein to maintain nutritional status but not an amount that will allow the buildup of waste products from protein **metabolism** (40 to 60 g of protein daily).
  - b. The less protein allowed, the more important it becomes that all protein in the diet be of high biological value (contain all essential amino acids in recommended proportions).
  - c. An adequate total energy intake from foods is critical for clients on protein-restricted diets (protein will be used for energy, rather than for protein synthesis).
  - d. Special low-protein products, such as pastas, bread, cookies, wafers, and gelatin made with wheat starch, can improve energy intake and add variety to the diet.
  - e. Carbohydrates in powdered or liquid forms can provide additional energy.
  - f. Vegetables and fruits contain some protein and, for very low-protein diets, these foods must be calculated into the diet.
  - g. Foods are limited from the milk, meat, bread, and starch exchange.

**M. Renal diet (see Boxes 12-3 and 12-5)**

1. Indication: Used for the client with acute or chronic renal failure and those requiring hemodialysis or peritoneal dialysis

**2. Nursing considerations**

- a. Controlled amounts of protein, sodium, phosphorus, calcium, potassium, and fluids may be prescribed; may also need modification in fiber, cholesterol, and fat based on individual requirements
- b. Most clients receiving dialysis need to restrict fluids (Box 12-8).

 An initial assessment includes identifying food and medication interactions.

**N. Potassium-modified diet (see Box 12-5)**

**1. Indications**

- a. Low-potassium diet is indicated for hyperkalemia, which may be caused by impaired renal function, hypoaldosteronism, Addison's disease, angiotensin-converting enzyme inhibitor medications, immunosuppressive medications, potassium-sparing diuretics, and chronic hyperkalemia.
- b. High-potassium diet is indicated for hypokalemia, which may be caused by renal tubular acidosis, gastrointestinal losses (diarrhea, vomiting), intracellular shifts, potassium-wasting diuretics, antibiotics, mineralocorticoid or glucocorticoid excess resulting from primary or secondary aldosteronism, Cushing's syndrome, or exogenous corticosteroid use.

**2. Nursing considerations**

- a. Foods that are low in potassium include applesauce, green beans, cabbage, lettuce, peppers, grapes, blueberries, cooked summer squash, cooked turnip greens, pineapple, and raspberries.
- b. Box 12-5 lists foods that are high in potassium.

**O. High-calcium diet**

1. Indication: Calcium is needed during bone growth and in adulthood to prevent osteoporosis and to facilitate vascular contraction, vasodilation, muscle contraction, and nerve transmission.
2. Nursing considerations
  - a. Primary dietary sources of calcium are dairy products (see Box 9-5 for food items high in calcium).

**Box 12-8 Measures to Relieve Thirst**

Chew gum or suck hard candy.  
 Freeze fluids so they take longer to consume.  
 Add lemon juice to water to make it more refreshing.  
 Gargle with refrigerated mouthwash.

 b. Lactose-intolerant clients should incorporate nondairy sources of calcium into their diet regularly.

**P. Low-purine diet**

1. Indication: Used for gout, kidney stones, and elevated uric acid levels
2. Nursing considerations
  - a. Purine is a precursor for uric acid, which forms stones and crystals.

 b. Foods to restrict include anchovies, herring, mackerel, sardines, scallops, glandular meats, gravies, meat extracts, wild game, goose, and sweetbreads.

**Q. High-iron diet**

1. Indication: Used for clients with anemia
2. Nursing considerations
  - a. The high-iron diet replaces iron deficit from inadequate intake or loss.
  - b. The diet includes organ meats, meat, egg yolks, whole-wheat products, dark green leafy vegetables, dried fruit, and legumes.

**R. Miscellaneous diets:** See Boxes 9-2, 9-3, 9-6, and 9-7, for foods high in sodium, potassium, magnesium, and phosphorus, respectively.

 **IV. VEGETARIAN DIETS**

**A. Types (Box 12-9)**

 **B. Nursing considerations**

1. Ensure that the client eats a sufficient amount of varied foods to meet nutrient and energy needs.
2. Clients should be educated about consuming complementary proteins over the course of each day to ensure that all essential amino acids are provided.
3. Potential deficiencies in vegetarian diets include energy, protein, vitamin B<sub>12</sub>, zinc, iron, calcium, omega-3 fatty acids, and vitamin D (if limited exposure to sunlight).
4. To enhance **absorption** of iron, vegetarians should consume a good source of iron and vitamin C with each meal.

**Box 12-9 Types of Vegetarian Diets**

**Lacto-Ovo Vegetarian**

Consumes eggs and dairy products, but excludes meat, poultry, and seafood

**Lacto Vegetarian**

Consumes dairy products, but excludes eggs, meat, poultry, and seafood

**Vegan**

Excludes animal products

**Pesco Vegetarian**

Consumes seafood, but excludes meat, poultry, eggs, and dairy products

5. Foods commonly eaten include tofu, tempeh, soy milk and soy products, meat analogues, legumes, nuts and seeds, sprouts, and a variety of fruits and vegetables.
6. Soy protein is considered equivalent in quality to animal protein.

 **Body mass index (BMI)** can be calculated by dividing the client's weight in kilograms by height in meters squared. For example, a client who weighs 75 kg (165 pounds) and is 1.8 m<sup>2</sup> (5 feet 9 inches) tall has a BMI of 23.15 (75 divided by 1.8 = 23.15).

**V. ENTERAL NUTRITION**

**A. Description:** Provides liquefied foods into the gastrointestinal tract via a tube

**B. Indications**

1. When the gastrointestinal tract is functional but oral intake is not meeting estimated nutrient needs
2. Used for clients with swallowing problems, burns, major trauma, liver or other organ failure, or severe **malnutrition**

**C. Nursing considerations**

1. Clients with lactose intolerance need to be placed on lactose-free formulas. 
2. See Chapter 21 for information regarding the administration of gastrointestinal tube feedings and associated complications.

**MORE QUESTIONS ON THE CD!**

**Practice Questions**

- 77.** The nurse is teaching a client who has iron deficiency anemia about foods she should include in her diet. The nurse determines that the client understands the dietary modifications if she selects which of the following from her menu?
1. Nuts and milk
  2. Coffee and tea
  3. Cooked rolled oats and fish
  4. Oranges and dark green leafy vegetables
- 78.** A nurse is planning to teach a client with malabsorption syndrome about the necessity of following a low-fat diet. The nurse develops a list of high-fat foods to avoid and includes which food item on the list?
1. Oranges
  2. Broccoli
  3. Cream cheese
  4. Broiled haddock

79. The nurse instructs a client with renal failure who is receiving hemodialysis about dietary modifications. The nurse determines that the client understands these dietary modifications if the client selects which items from the dietary menu?
1. Cream of wheat, blueberries, coffee
  2. Sausage and eggs, banana, orange juice
  3. Bacon, cantaloupe melon, tomato juice
  4. Cured pork, grits, strawberries, orange juice
80. The nurse is conducting a dietary assessment on a client who is on a vegan diet. The nurse provides dietary teaching focusing on foods high in which vitamin that may be lacking in a vegan diet?
1. Vitamin A
  2. Vitamin B<sub>12</sub>
  3. Vitamin C
  4. Vitamin E
81. A client with hypertension has been told to maintain a diet low in sodium. A nurse who is teaching this client about foods that are allowed includes which food item in a list provided to the client?
1. Tomato soup
  2. Boiled shrimp
  3. Instant oatmeal
  4. Summer squash
82. A nurse is caring for a client with cirrhosis of the liver. To minimize the effects of the disorder, the nurse teaches the client about foods that are high in thiamine. The nurse determines that the client has the best understanding of the dietary measures to follow if the client states an intention to increase the intake of:
1. Pork
  2. Milk
  3. Chicken
  4. Broccoli
83. The nurse is instructing a client with hypertension on the importance of choosing foods low in sodium. The nurse should teach the client to limit which of the following foods?
1. Apples
  2. Bananas
  3. Smoked sausage
  4. Steamed vegetables
84. A client who is recovering from surgery has been advanced from a clear liquid diet to a full liquid diet. The client is looking forward to the diet change because he has been “bored” with the clear liquid diet. The nurse would offer which full liquid item to the client?
1. Tea
  2. Gelatin
  3. Custard
  4. Popsicle
85. A client is recovering from abdominal surgery and has a large abdominal wound. A nurse encourages the client to eat which food item that is naturally high in vitamin C to promote wound healing?
1. Milk
  2. Oranges
  3. Bananas
  4. Chicken

### Alternate Item Format: Multiple Response

86. A postoperative client has been placed on a clear liquid diet. The nurse provides the client with which items that are allowed to be consumed on this diet. **Select all that apply.**
- 1. Broth
  - 2. Coffee
  - 3. Gelatin
  - 4. Pudding
  - 5. Vegetable juice
  - 6. Pureed vegetables

## ANSWERS

### 77. 4

**Rationale:** Dark green leafy vegetables are a good source of iron and oranges are a good source of vitamin C, which enhances iron absorption. All other options are not food sources that are high in iron and vitamin C.

**Test-Taking Strategy:** Use knowledge of foods high in iron and vitamin C and recall that vitamin C enhances iron absorption. Use the process of elimination to eliminate options 1, 2, and 3 because they do not contain sources of iron and vitamin C. Review food sources of vitamins and minerals if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Fundamental Skills—Nutrition

**Reference:** Nix, S. (2009). *Williams' basic nutrition and diet therapy* (13th ed., pp. 139–140). St. Louis: Mosby.

### 78. 3

**Rationale:** Fruits and vegetables tend to be lower in fat because they do not come from animal sources. Broiled haddock is also naturally lower in fat. Cream cheese is a high-fat food.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject of the question, the high-fat food.

Options 1 and 2 (fruit and vegetable) can be eliminated first. From the remaining options, remember that cheese is high in fat content. Review foods that are high in fat content if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Nutrition

**Reference:** Nix, S. (2009). *Williams' basic nutrition and diet therapy* (13th ed., p.38). St. Louis: Mosby.

### 79. 1

**Rationale:** The diet for a client with renal failure who is receiving hemodialysis should include controlled amounts of sodium, phosphorus, calcium, potassium, and fluids. The food items in options 2, 3, and 4 are high in sodium, phosphorus, or potassium.

**Test-Taking Strategy:** Focus on the client's diagnosis to recall that sodium needs to be limited. Noting the items sausage (option 2), bacon (option 3), and cured pork (option 4) will assist in eliminating these options. Review dietary guidelines for the client with renal failure if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Fundamental Skills—Nutrition

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1617). St. Louis: Saunders.

Nix, S. (2009). *Williams' basic nutrition and diet therapy* (13th ed., p. 419). St. Louis: Mosby.

### 80. 2

**Rationale:** Vegans do not consume any animal products. Vitamin B<sub>12</sub> is found in animal products and therefore would most likely be lacking in a vegan diet. Vitamins A, C, and E are found in fresh fruits and vegetables, which are consumed in a vegan diet.

**Test-Taking Strategy:** Focus on the subject, a vegan diet. Recalling the food items eaten and restricted in this diet will direct you to the correct option. Remember that vegans do not consume any animal products. Review vegan diets and sources of vitamins if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Nutrition

**Reference:** Nix, S. (2009). *Williams' basic nutrition and diet therapy* (13th ed., p. 53). St. Louis: Mosby.

### 81. 4

**Rationale:** Foods that are lower in sodium include fruits and vegetables (option 4), because they do not contain physiological saline. Highly processed or refined foods (options 1 and 3) are higher in sodium unless their food labels specifically state "low sodium." Saltwater fish and shellfish are high in sodium.

**Test-Taking Strategy:** Use the process of elimination. Begin to answer this question by eliminating option 2, recalling that saltwater fish and shellfish are high in sodium. Next, eliminate options 1

and 3 because they are processed foods. Review the foods that are high in sodium if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Nutrition

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 138, 1439). St. Louis: Saunders.

### 82. 1

**Rationale:** The client with cirrhosis needs to consume foods high in thiamine. Thiamine is present in a variety of foods of plant and animal origin. Pork products are especially rich in this vitamin. Other good food sources include nuts, whole grain cereals, and legumes. Milk contains vitamins A, D, and B<sub>2</sub>. Poultry contains niacin. Broccoli contains vitamins C, E, and K and folic acid.

**Test-Taking Strategy:** Note the strategic words *best understanding*. This may indicate that more than one option may be a food that contains thiamine. Remembering that pork products are especially rich in thiamine will direct you to option 1. Review food items high in thiamine if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Fundamental Skills—Nutrition

**Reference:** Nix, S. (2009). *Williams' basic nutrition and diet therapy* (13th ed., p. 106). St. Louis: Mosby.

### 83. 3

**Rationale:** Smoked foods are high in sodium. Options 1, 2, and 4 are fruits and vegetables that are low in sodium.

**Test-Taking Strategy:** Note the strategic word *limit* and use the process of elimination, recalling the food items that are high in sodium. Remember that smoked foods are high in sodium. If you had difficulty with this question, review the foods high in sodium.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Nutrition

**Reference:** Nix, S. (2009). *Williams' basic nutrition and diet therapy* (13th ed., pp. 132–133). St. Louis: Mosby.

### 84. 3

**Rationale:** Full liquid food items include items such as plain ice cream, sherbet, breakfast drinks, milk, pudding and custard, soups that are strained, refined cooked cereals, and strained vegetable juices. A clear liquid diet consists of foods that are relatively transparent. The food items in options 1, 2, and 4 are clear liquids.

**Test-Taking Strategy:** Focus on the subject, a full liquid item. Remember that a clear liquid diet consists of foods that are relatively transparent. This will assist you in eliminating options 1, 2, and 4. Review food items allowed on a clear liquid diet and a full liquid diet if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Nutrition

**Reference:** Nix, S. (2009). *Williams' basic nutrition and diet therapy* (13th ed., p. 330). St. Louis: Mosby.

**85. 2**

**Rationale:** Citrus fruits and juices are especially high in vitamin C. Bananas are high in potassium. Meats and dairy products are two food groups that are high in the B vitamins.

**Test-Taking Strategy:** Note the strategic words *naturally high* in the question. Use the process of elimination, recalling that citrus fruits and juices are high in vitamin C. Review the foods high in vitamin C if you are unfamiliar with them.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Nutrition

**Reference:** Nix, S. (2009). *Williams' basic nutrition and diet therapy* (13th ed., pp. 105, 437). St. Louis: Mosby.

**ALTERNATE ITEM FORMAT:  
MULTIPLE RESPONSE**

**86. 1, 2, 3**

**Rationale:** A clear liquid diet consists of foods that are relatively transparent to light and are clear and liquid at room and body temperature. These foods include items such as water, bouillon, clear broth, carbonated beverages, gelatin, hard candy, lemonade, Popsicles, and regular or decaffeinated coffee or tea. The incorrect food items are items that are allowed on a full liquid diet.

**Test-Taking Strategy:** Focus on the subject, a clear liquid diet. Recalling that a clear liquid diet consists of foods that are relatively transparent to light and are clear will assist in answering the question. Review foods allowed on a clear and full liquid diet if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Nutrition

**Reference:** Nix, S. (2009). *Williams' basic nutrition and diet therapy* (13th ed., p. 330). St. Louis: Mosby.

# Parenteral Nutrition

## PYRAMID TERMS

**fat emulsion (lipids)** A white, opaque solution administered intravenously during parenteral nutrition therapy to prevent fatty acid deficiency.

**parenteral nutrition (PN)** Administration of a nutritionally complete formula through a central or peripheral intravenous (IV) catheter. In the clinical setting, the term *PN* may be used interchangeably with the term *total parenteral nutrition (TPN)* or *hyperalimentation*.

**peripheral parenteral nutrition (PPN)** Parenteral nutrition administered through a peripheral vein in an extremity. PN solutions administered peripherally are not as calorically dense as those administered through a central vein.

## THE PYRAMID TO SUCCESS

The NCLEX-RN examination test plan addresses parenteral nutrition (PN) as related content in the Client Needs area of Physiological Integrity, Pharmacological and Parenteral Therapies. Pyramid Points focus on the administration, maintenance, and discontinuation of PN and fat emulsions; nursing interventions; the interventions required in monitoring for side effects or adverse effects; and the actions to take if a complication arises. Pyramid Points also focus on home care instructions for the client receiving PN at home.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Consulting with members of the health care team, including the dietitian
- Handling hazardous and infectious materials
- Initiating home health care referrals
- Maintaining standard, transmission-based, and surgical asepsis to prevent infection
- Obtaining informed consent for venous access and placement of the catheter

## Health Promotion and Maintenance

- Promoting health and wellness related to nutrition
- Providing client and family education regarding the administration of PN at home
- Providing client and family education regarding monitoring for side or adverse effects and actions to take if a complication arises

## Psychosocial Integrity

- Discussing role changes related to the client's need to receive PN
- Identifying support systems in the home to assist with the administration of PN

## Physiological Integrity

- Assessing the central venous access device for administering PN
- Monitoring for expected effects
- Monitoring laboratory values
- Monitoring nutritional needs
- Monitoring for potential side or adverse effects and actions to take if a complication arises
- Providing comfort and assistance in the performance of activities of daily living
- Promoting rest and sleep

## I. PARENTERAL NUTRITION (PN)

### A. Description

- Supplies nutrients via the veins
- Supplies carbohydrates in the form of dextrose, fats in an emulsified form, proteins in the form of amino acids, vitamins, minerals, electrolytes, and water
- Prevents subcutaneous fat and muscle protein from being catabolized by the body for energy

### B. Indications

- Clients with severely dysfunctional or nonfunctional gastrointestinal tracts who are unable to process nutrients may benefit from PN.
- Clients who can take some oral nutrition, but not enough to meet their nutrient requirements, may benefit from PN.

3. Clients with multiple gastrointestinal surgeries, gastrointestinal trauma, severe intolerance to enteral feedings, or intestinal obstructions, or who need to rest the bowel for healing, may benefit from **PN**.
4. Clients with severe nutritionally deficient conditions such as acquired immunodeficiency syndrome, cancer, burn injuries, malnutrition, or clients receiving chemotherapy may benefit from **PN**.

**!** **PN** is the least desirable form of nutrition and is used when there is no other nutritional alternative. Other forms of administering nutrition such as orally or via a gastrointestinal tube are initiated first.

### C. Administration of **PN** (Fig. 13-1)

#### 1. Central vein

- a. **PN** is administered through a central vein when the client requires a larger concentration of carbohydrates (greater than 10% glucose concentration).
- b. The subclavian or internal jugular vein is the central vein normally used when **PN** is a short-term intervention (less than 4 weeks).
- c. When **PN** is anticipated for an extended period (longer than 4 weeks), a more permanent catheter, such as a peripherally inserted central catheter (PICC) line, a tunneled catheter, or an implanted vascular access device, is used.

#### 2. Peripheral vein (**PN**)

- a. **PN** can be administered through a peripheral vein, typically in the arm, via a PICC line.

- b. **PN** administered through a peripheral vein delivers isotonic or mildly hypertonic solutions.

**!** The delivery of hypertonic solutions into peripheral veins can cause sclerosis, phlebitis, or swelling. Monitor closely for these complications.

## II. COMPONENTS OF PARENTERAL NUTRITION

### A. Carbohydrates

1. Concentrations of dextrose (glucose) range from 5% to 70%.
2. The strength of the dextrose solution depends on the client's nutritional needs, the route of administration (central or peripheral), and agency protocols.
3. Carbohydrates typically provide 60% to 70% of calorie (energy) needs.
4. Dextrose provides 3.4 kcal/g.

### B. Amino acids (protein)

1. Concentrations range from 3.5% to 20%; lower concentrations are most commonly used for peripheral vein administration and higher concentrations are most often administered through a central vein.
2. Amino acid solutions provide approximately 4 kcal/g of protein.
3. About 15% to 20% of total energy needs should come from protein.

### C. Fat emulsion (lipids)

1. Lipids provide up to 30% of calorie (energy) needs.
2. Lipids provide nonprotein calories and prevent or correct fatty acid deficiency.

**▲ FIGURE 13-1** **A**, Placement of peripherally inserted central catheter through antecubital fossa. (Modified from Lewis, S., Heitkemper, M., Dirksen, S., O'Brien P., & Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.) **B**, Placement of central venous catheter inserted into subclavian vein. (From Elkin, M., Perry, A., & Potter, P. [2008]. *Nursing interventions and clinical skills* [4th ed., p. 787]. St. Louis: Mosby.)

3. Available concentrations are 10%, 20%, and 30%, providing 1.1, 2, and 3 kcal/mL, respectively
4. Lipid solutions are isotonic and therefore can be administered through a peripheral or central vein; the solution may be administered through a separate IV line below the filter of the main IV administration set by a Y-connector or as an admixture to the **PN** solution (3-in-1 admixture consisting of dextrose, amino acids, lipids).
5. Most **fat emulsions** are prepared from soybean or safflower oil, with egg yolk to provide emulsification; the primary components are linoleic, oleic, palmitic, linolenic, and stearic acids.
6. Glucose-intolerant clients or clients with diabetes mellitus may benefit from receiving a larger percentage of their **PN** from lipids, which helps control blood glucose levels and lower insulin requirements caused by infused dextrose.
7. Examine the bottle for separation of emulsion into layers or fat globules or for the accumulation of froth; if observed, do not use and return the solution to the pharmacy.
8. Additives should not be put into the **fat emulsion** solution.
9. Follow agency policy regarding the filter size that should be used; usually a 1.2- $\mu$ m filter or larger should be used because the lipid particles are too large to pass through a 0.22- $\mu$ m filter.
10. Infuse solution at the flow rate prescribed—usually slowly at 1 mL/min initially—monitor vital signs every 10 minutes, and observe for adverse reactions for the first 30 minutes of the infusion. If signs of an adverse reaction occur, stop the infusion and notify the physician (Box 13-1).
11. If no adverse reaction occurs, adjust the flow rate to the prescribed rate.
12. Monitor serum lipids 4 hours after discontinuing the infusion.

 **Fat emulsions (lipids) contain egg yolk phospholipids and should not be given to clients with egg allergies.**

#### D. Vitamins

1. **PN** solutions usually contain a standard multivitamin preparation to meet most vitamin needs and prevent deficiencies.

### Box 13-1 Signs of an Adverse Reaction to Lipids

|                     |                        |
|---------------------|------------------------|
| Chest and back pain | Flushing               |
| Chills              | Headache               |
| Cyanosis            | Nausea and vomiting    |
| Diaphoresis         | Pressure over the eyes |
| Dyspnea             | Thrombophlebitis       |
| Fever               | Vertigo                |

2. Individual vitamin preparations can be added, as needed and as prescribed.

- E. Minerals and trace elements: Commercial mineral and trace element preparations are available in different concentrations to promote normal metabolism.
- F. Electrolytes: Electrolyte requirements for individuals receiving **PN** therapy vary, depending on body weight, presence of malnutrition or catabolism, degree of electrolyte depletion, changes in organ function, ongoing electrolyte losses, and the disease process.
- G. Water: The amount of water needed in a **PN** solution is determined by electrolyte balance and fluid requirements.
- H. Insulin: May be added to control the blood glucose level because of the high concentration of glucose in the **PN** solution.
- I. Heparin: May be added to reduce the buildup of a fibrinous clot at the catheter tip.

### III. ADMINISTRATION AND DISCONTINUATION

#### A. Types of administration

1. Continuous **PN**
  - a. Infused continuously over 24 hours
  - b. Most commonly used in a hospital setting
  - c. Less risk of complications when administered continuously
2. Intermittent **PN**
  - a. Generally 12-hour infusions that are usually given at night
  - b. Allows client requiring **PN** on long-term basis to participate in activities of daily living during the day without the inconvenience of an IV bag and pump set
  - c. Monitor glucose levels closely.
  - d. Preferable for use in home settings

#### B. Discontinuing **PN** therapy

1. Gradually decrease the flow rate for 1 to 2 hours while increasing oral intake (this assists in preventing hypoglycemia).
2. After removing the IV catheter, change the dressing daily until the insertion site heals.
3. Encourage oral nourishment.
4. Record oral intake, body weight, and laboratory results of serum electrolyte and glucose levels.

 **Abrupt discontinuation of a PN solution can result in hypoglycemia. The flow rate should be decreased gradually when the PN is discontinued.**

### IV. COMPLICATIONS (Table 13-1)

#### A. Description

1. Pneumothorax and air embolism are associated with central line placement; air embolism is also associated with tubing changes.

**TABLE 13-1** Complications of Parenteral Nutrition

| Complication  | Possible Cause   | Signs or Symptoms  | Intervention  | Prevention   |
|---------------|--|--|---|--|
| Air embolism  | <ul style="list-style-type: none"> <li>• Catheter system opened or IV tubing disconnected</li> <li>• Air entry on IV tubing changes</li> </ul>   | <ul style="list-style-type: none"> <li>• Apprehension</li> <li>• Chest pain</li> <li>• Dyspnea</li> <li>• Hypotension</li> <li>• Loud churning sound heard over pericardium on auscultation</li> <li>• Rapid and weak pulse</li> <li>• Respiratory distress</li> </ul>                                   | <ul style="list-style-type: none"> <li>• Clamp the catheter.</li> <li>• Place the client in a left side-lying position with the head lower than the feet.</li> <li>• Notify the physician.</li> <li>• Administer oxygen.</li> </ul>                             | <ul style="list-style-type: none"> <li>• Make sure all catheter connections are secure.</li> <li>• Clamp the catheter when not in use (follow agency protocol for flushing and clamping the catheter).</li> <li>• Instruct the client in the Valsalva maneuver for tubing and cap changes.</li> <li>• For tubing and cap changes, place the client in the Trendelenburg position (if not contraindicated), with the head turned in the opposite direction of the insertion site; client should hold breath and bear down.</li> </ul> |
| Hyperglycemia | <ul style="list-style-type: none"> <li>• Client receiving solution too quickly</li> <li>• Not enough insulin</li> <li>• Infection</li> </ul>   | <ul style="list-style-type: none"> <li>• Restlessness</li> <li>• Weakness</li> <li>• Confusion</li> <li>• Diaphoresis</li> <li>• Elevated blood glucose level (&gt;200 mg/dL)</li> <li>• Excessive thirst</li> <li>• Fatigue</li> <li>• Kussmaul's respirations</li> <li>• Coma (when severe)</li> </ul> | <ul style="list-style-type: none"> <li>• Notify the physician.</li> <li>• The infusion rate may need to be slowed.</li> <li>• Administer regular insulin as prescribed.</li> <li>• Monitor blood glucose levels.</li> </ul>                                     | <ul style="list-style-type: none"> <li>• Assess the client for a history of glucose intolerance.</li> <li>• Assess the client's medication history.</li> <li>• Begin infusion at a slow rate as prescribed.</li> <li>• Monitor blood glucose levels.</li> <li>• Use strict aseptic technique.</li> </ul>   |
| Hypervolemia  | <ul style="list-style-type: none"> <li>• Excessive fluid administration or administration of fluid too rapidly</li> <li>• Renal dysfunction</li> <li>• Heart failure</li> <li>• Hepatic failure</li> </ul> | <ul style="list-style-type: none"> <li>• Bounding pulse</li> <li>• Crackles on lung auscultation</li> <li>• Headache</li> <li>• Increased blood pressure</li> <li>• Jugular vein distention</li> <li>• Weight gain greater than desired</li> </ul>   | <ul style="list-style-type: none"> <li>• Slow or stop IV infusion.</li> <li>• Restrict fluids.</li> <li>• Administer diuretics.</li> <li>• Use dialysis (in extreme cases).</li> </ul>  | <ul style="list-style-type: none"> <li>• Assess client's history for risk for hypervolemia.</li> <li>• Administer solution via an electronic infusion device.</li> <li>• Monitor intake and output.</li> <li>• Monitor weight daily.</li> </ul>  |
| Hypoglycemia  | <ul style="list-style-type: none"> <li>• PN abruptly discontinued</li> <li>• Too much insulin being administered</li> </ul>  | <ul style="list-style-type: none"> <li>• Anxiety</li> <li>• Diaphoresis</li> <li>• Hunger</li> <li>• Low blood glucose level (&lt;70 mg/dL)</li> <li>• Shakiness</li> <li>• Weakness</li> </ul>  | <ul style="list-style-type: none"> <li>• Administer IV dextrose.</li> <li>• Notify the physician.</li> <li>• Monitor blood glucose level.</li> </ul>  | <ul style="list-style-type: none"> <li>• Gradually decrease PN solution when discontinued.</li> <li>• Infuse 10% dextrose at same rate as the PN to prevent hypoglycemia when the PN solution is discontinued.</li> <li>• Monitor glucose levels when insulin is being given.</li> </ul>   |
| Infection     | <ul style="list-style-type: none"> <li>• Poor aseptic technique</li> <li>• Catheter contamination</li> <li>• Contamination of solution</li> </ul>  | <ul style="list-style-type: none"> <li>• Chills</li> <li>• Fever</li> <li>• Elevated white blood cell count</li> <li>• Redness or drainage at insertion site</li> </ul>  | <ul style="list-style-type: none"> <li>• Notify the physician</li> <li>• Remove catheter.</li> <li>• Send catheter tip to the laboratory for culture.</li> <li>• Prepare to obtain blood cultures.</li> <li>• Prepare for antibiotic administration.</li> </ul> | <ul style="list-style-type: none"> <li>• Use strict aseptic techniques.</li> <li>• Monitor temperature.</li> <li>• Assess IV site for signs of infection.</li> <li>• Change site dressing, solution, and tubing as specified by agency policy.</li> <li>• Do not disconnect tubing unnecessarily.</li> </ul>   |

IV, Intravenous; PN, parenteral nutrition.

Modified from Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed). St. Louis: Saunders.

2. Other complications include infection (catheter-related), hypervolemia, and metabolic alterations such as hyperglycemia and hypoglycemia; these complications are usually caused by the **PN** solution itself.

#### B. Air embolism

1. Air embolism occurs because of the entry of air into the catheter system.
2. Instruct the client in the Valsalva maneuver for IV tubing and cap changes.
3. For tubing and cap changes, place the client in the Trendelenburg position (if not contraindicated) with the head turned in the opposite direction of the insertion site (increases intrathoracic venous pressure); also, ask the client to take a deep breath, hold it, and bear down.
4. Check all catheter connections and secure (use tape per agency protocol) tubing connections.
5. If an air embolism is suspected, do the following:
  - a. Clamp the IV catheter.
  - b. Place the client in a left side-lying position with the head lower than the feet (to trap air in right side of the heart).
  - c. Notify the physician.
  - d. Administer oxygen as prescribed.

#### C. Hyperglycemia

1. Hyperglycemia occurs because of the high concentration of dextrose (glucose) in the solution. If the client receives the solution too rapidly, does not receive enough insulin, or contracts an infection, hyperglycemia can occur.
2. Assess the client for a history of glucose intolerance.
3. Assess the client's medication history (corticosteroids may increase the blood glucose level).
4. Begin infusion at a slow rate (usually 40 to 60 mL/hr) as prescribed.
5. Monitor blood glucose levels every 4 to 6 hours or according to agency protocol.
6. Administer regular insulin as prescribed.

#### D. Hypervolemia

1. Hypervolemia occurs if the client receives the IV solution too rapidly; the client with cardiac, renal, or hepatic dysfunction is at high risk.
2. **PN** is always delivered via an electronic infusion device.
3. Never increase the infusion rate to "catch up" if the IV infusion gets behind.
4. Monitor intake and output.
5. Weigh the client daily (ideal weight gain is 1 to 2 lb/week).

#### E. Hypoglycemia

1. Hypoglycemia occurs when the **PN** is abruptly discontinued or when too much insulin is administered.
2. Monitor the blood glucose level.
3. Gradually decrease the infusion rate when discontinuing **PN**.

4. When an infusion of hypertonic glucose is stopped, an infusion of 10% dextrose should be instituted and maintained for 1 to 2 hours to prevent hypoglycemia.

5. Assess the blood glucose level 1 hour after discontinuing **PN**.

6. Prepare for the administration of glucose or IV dextrose if hypoglycemia occurs.

#### F. Infection

1. Infection can occur as a result of poor aseptic technique or via catheter or solution contamination.
2. Use strict aseptic technique. Because the **PN** solution has a high concentration of glucose, it is a medium for bacterial growth.
3. Monitor temperature. If the client has a fever, suspect sepsis.
4. Assess the IV site for redness, swelling, tenderness, or drainage.
5. Change the **PN** solution every 12 to 24 hours as prescribed or according to agency protocol.
6. Change the IV tubing every 24 hours or according to agency protocol.
7. Change the dressing at the IV site every 48 hours or according to agency protocol (see Priority Nursing Actions).

### **PRIORITY NURSING ACTIONS!**

#### **Actions to Take If an Infection Is Suspected at a Central Venous Catheter Site**

1. Notify the physician.
2. Remove the catheter and prepare for possible restart at a different location.
3. Remove the tip of the catheter and send it to the laboratory for culture.
4. Prepare the client for obtaining blood cultures.
5. Prepare for antibiotic administration.
6. Document the occurrence, the actions taken, and the client's response.

Signs of infection at the catheter site include redness or drainage. The client will also exhibit chills, fever, and an elevated white blood cell count. If the nurse suspects infection, the physician is notified because of the risk for sepsis. The catheter is removed and the client is prepared for a possible restart at a different location as prescribed. Also, intravenous (IV) antibiotics may be prescribed and an IV site will be needed for administration. The catheter tip is sent to the laboratory for culture to identify the bacteria present so that the effective antibiotic is prescribed. Blood cultures are also performed to determine the presence of bacteria in the blood. Antibiotics are not started until blood cultures are obtained; otherwise the results of the cultures may not be accurate. Finally the nurse documents the occurrence, actions taken, and the client's response.

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care*. (6th ed. p. 228.) St. Louis: Saunders.

**Box 13-2 Home Care Instructions**

Teach the client and caregiver how to obtain, administer, and maintain parenteral nutrition fluids.

Teach the client and caregiver how to change a sterile dressing.

Obtain a daily weight at the same time of day in the same clothes.

Stress that if a weight gain of more than 3 lb/week is noted, this may indicate excessive fluid intake and should be reported.

Monitor the blood glucose level and report abnormalities immediately.

Teach the client and caregiver about the signs and symptoms of side or adverse effects such as infection, thrombosis, air embolism, and catheter displacement.

Teach the client and caregiver the actions to take if a complication arises and about the importance of reporting complications to the health care provider.

For symptoms of thrombosis, the client should report edema of the arm or at the catheter insertion site, neck pain, and jugular vein distention.

Leaking of fluid from the insertion site or pain or discomfort as the fluids are infused may indicate displacement of the catheter; this must be reported immediately.

Encourage the client and caregiver to contact the health care provider if they have questions about administration or any other questions.

Inform the client and caregiver about the importance of follow-up care.

**G. Pneumothorax**

1. Pneumothorax can occur as a result of inexact catheter placement that results in puncture of the pleural space.
2. After insertion of the catheter, obtain a portable chest x-ray film to confirm correct catheter placement and to detect the presence of a pneumothorax. **PN** is not initiated until correct catheter placement is verified and the absence of pneumothorax is confirmed.

- K.** Additions of substances such as nutrients to **PN** solutions should be made in the pharmacy and not on the nursing unit.

**VI. HOME CARE INSTRUCTIONS (Box 13-2)****MORE QUESTIONS ON THE CD!****Practice Questions****V. ADDITIONAL NURSING CONSIDERATIONS**

- A.** Check the **PN** solution with the physician's prescription to ensure that the prescribed components are contained in the solution.
- B.** To prevent infection and solution incompatibility, IV medications and blood are not given through the **PN** line.
- C.** Monitor partial thromboplastin time and prothrombin time for clients receiving anticoagulants.
- D.** Monitor electrolyte and albumin levels and liver and renal function studies, as well as any other prescribed laboratory studies.
- E.** In severely dehydrated clients, the albumin level may drop initially after initiating **PN**, because the treatment restores hydration.
- F.** With severely malnourished clients, monitor for "refeeding syndrome" (a rapid drop in potassium, magnesium, and phosphate serum levels).
- G.** Abnormal liver function values may indicate intolerance to or an excess of **fat emulsion** or problems with metabolism with glucose and protein.
- H.** Abnormal renal function tests may indicate an excess of amino acids.
- I.** **PN** solutions should be stored under refrigeration and administered within 24 hours from the time they are prepared (remove from refrigerator 0.5 to 1 hour before use).
- J.** **PN** solutions that are cloudy or darkened should not be used and should be returned to the pharmacy.

- 87.** A client is being weaned from parenteral nutrition (PN) and is expected to begin taking solid food today. The ongoing solution rate has been 100 mL/hr. A nurse anticipates that which of the following prescriptions regarding the PN solution will accompany the diet order?
  1. Discontinue the PN.
  2. Decrease PN rate to 50 mL/hr.
  3. Start 0.9% normal saline at 25 mL/hr.
  4. Continue current infusion rate orders for PN.
- 88.** A nurse is preparing to change the parenteral nutrition (PN) solution bag and tubing. The client's central venous line is located in the right subclavian vein. The nurse asks the client to take which essential action during the tubing change?
  1. Breathe normally.
  2. Turn the head to the right.
  3. Exhale slowly and evenly.
  4. Take a deep breath, hold it, and bear down.
- 89.** A client with parenteral nutrition (PN) infusing has disconnected the tubing from the central line catheter. A nurse assesses the client and suspects an air embolism. The nurse should immediately place the client in which position?
  1. On the left side, with the head lower than the feet
  2. On the left side, with the head higher than the feet

3. On the right side, with the head lower than the feet
  4. On the right side, with the head higher than the feet
- 90.** A client receiving parenteral nutrition (PN) complains of a headache. A nurse notes that the client has an increased blood pressure, bounding pulse, jugular vein distention, and crackles bilaterally. The nurse determines that the client is experiencing which complication of PN therapy?
1. Sepsis
  2. Air embolism
  3. Hypervolemia
  4. Hyperglycemia
- 91.** A client is receiving nutrition by means of parenteral nutrition (PN). A nurse monitors the client for complications of the therapy and assesses the client for which of the following signs of hyperglycemia?
1. Fever, weak pulse, and thirst
  2. Nausea, vomiting, and oliguria
  3. Sweating, chills, and abdominal pain
  4. Weakness, thirst, and increased urine output
- 92.** A nurse is changing the central line dressing of a client receiving parenteral nutrition (PN) and notes that the catheter insertion site appears reddened. The nurse next assesses which of the following items?
1. Client's temperature
  2. Expiration date on the bag
  3. Time of last dressing change
  4. Tightness of tubing connections
- 93.** A nurse is preparing to hang fat emulsion (lipids) and notes that fat globules are visible at the top of the solution. The nurse takes which of the following actions?
1. Rolls the bottle of solution gently
  2. Obtains a different bottle of solution
  3. Shakes the bottle of solution vigorously
  4. Runs the bottle of solution under warm water
- 94.** A client receiving parenteral nutrition (PN) suddenly spikes a fever. A nurse notifies the physician, and the physician initially prescribes that the solution and tubing be changed. The nurse should do which of the following with the discontinued materials?
1. Discard them in the unit trash.
  2. Return them to the hospital pharmacy.
  3. Send them to the laboratory for culture.
  4. Save them for return to the manufacturer.
- 95.** A client has been discharged to home on parenteral nutrition (PN). With each visit, a home care nurse assesses which of the following parameters most closely in monitoring this therapy?
1. Pulse and weight
  2. Temperature and weight
  3. Pulse and blood pressure
  4. Temperature and blood pressure
- 96.** A nurse is caring for a group of adult clients on an acute care medical-surgical nursing unit. The nurse understands that which of the following clients would be the least likely candidate for parenteral nutrition (PN)?
1. A 66-year-old client with extensive burns
  2. A 42-year-old client who has had an open cholecystectomy
  3. A 27-year-old client with severe exacerbation of Crohn's disease
  4. A 35-year-old client with persistent nausea and vomiting from chemotherapy
- 97.** A nurse is preparing to hang the first bag of parenteral nutrition (PN) solution via the central line of an assigned client. The nurse obtains which most essential piece of equipment before hanging the solution?
1. Urine test strips
  2. Blood glucose meter
  3. Electronic infusion pump
  4. Noninvasive blood pressure monitor
- 98.** A nurse is making initial rounds at the beginning of the shift and notes that the parenteral nutrition (PN) bag of an assigned client is empty. Which of the following solutions readily available on the nursing unit should the nurse hang until another PN solution is mixed and delivered to the nursing unit?
1. 5% dextrose in water
  2. 10% dextrose in water
  3. 5% dextrose in Ringer's lactate
  4. 5% dextrose in 0.9% sodium chloride
- 99.** A nurse is monitoring the status of a client's fat emulsion (lipid) infusion and notes that the infusion is 1 hour behind. Which of the following actions by the nurse is appropriate?
1. Adjust the infusion rate to catch up over the next hour.
  2. Increase the infusion rate to catch up over the next 2 hours.
  3. Ensure that the fat emulsion infusion rate is infusing at the prescribed rate.
  4. Adjust the infusion rate to run wide open until the solution is back on time.

- 100.** A client receiving parenteral nutrition (PN) in the home setting has a weight gain of 5 lb in 1 week. The nurse next assesses the client to detect the presence of which of the following?
1. Thirst
  2. Polyuria
  3. Decreased blood pressure
  4. Crackles on auscultation of the lungs
- 101.** A nurse is caring for a restless client who is beginning nutritional therapy with parenteral nutrition (PN). The nurse should plan to ensure that which of the following is done to prevent the client from injury?
1. Calculate daily intake and output.
  2. Monitor the temperature once daily.
  3. Secure all connections in the PN system.
  4. Monitor blood glucose levels every 12 hours.

### Alternate Item Format: Prioritizing (Ordered Response)

- 102.** A nurse is monitoring a client receiving parenteral nutrition (PN). The client suddenly develops respiratory distress, dyspnea, and chest pain, and the nurse suspects air embolism. Number the actions that the nurse would take in order of priority. (Number 1 is the first action and number 6 is the last action.)
- \_\_\_\_\_ Administer oxygen.
  - \_\_\_\_\_ Contact the physician.
  - \_\_\_\_\_ Document the occurrence.
  - \_\_\_\_\_ Take the client's vital signs.
  - \_\_\_\_\_ Clamp the intravenous (IV) catheter.
  - \_\_\_\_\_ Position the client in left Trendelenburg's position.

## ANSWERS

### 87. 2

**Rationale:** When a client begins eating a regular diet after a period of receiving PN, the PN is decreased gradually. PN that is discontinued abruptly can cause hypoglycemia. Clients often have anorexia after being without food for some time, and the digestive tract also is not used to producing the digestive enzymes that will be needed. Gradually decreasing the infusion rate allows the client to remain adequately nourished during the transition to a normal diet and prevents the occurrence of hypoglycemia. Even before clients are started on a solid diet, they are given clear liquids followed by full liquids to further ease the transition. A solution of normal saline does not provide the glucose needed during the transition of discontinuing the PN and could cause the client to experience hypoglycemia.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *weaned* in the question. Recalling the effects of PN and the complications that occur will direct you to option 2. Remember that hypoglycemia can occur if the PN is discontinued abruptly. If you had difficulty with this question, review the procedures related to discontinuing PN solution.

Nix, S. (2009). *Williams' basic nutrition and diet therapy* (13th ed., p. 446). St. Louis: Mosby.

### 88. 4

**Rationale:** The client should be asked to perform the Valsalva maneuver during tubing changes. This helps avoid air

embolism during tubing changes. The nurse asks the client to take a deep breath, hold it, and bear down. If the intravenous line is on the right, the client turns his or her head to the left. This position increases intrathoracic pressure. Options 1 and 3 are inappropriate and could cause the potential for an air embolism during the tubing change.

**Test-Taking Strategy:** Note the strategic word *essential*. Use the process of elimination, recalling that air embolism is a complication that can occur during tubing changes. This will direct you to option 4. Review the procedure for PN bag and tubing change if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

Kee, J., Hayes, E., & McCuistion, L. (2009). *Pharmacology: A nursing process approach* (6th ed., p. 261). St. Louis: Saunders.

### 89. 1

**Rationale:** Air embolism occurs when air enters the catheter system, such as when the system is opened for intravenous (IV) tubing changes or when the IV tubing disconnects. Air embolism is a critical situation; if it is suspected, the client should be placed in a left side-lying position. The head should be lower than the feet. This position is used to minimize the effect of the air traveling as a bolus to the lungs by trapping it in the right side of the heart. Options 2, 3, and 4 are incorrect positions if an air embolism is suspected.

**Test-Taking Strategy:** Use the process of elimination and recall that the goal in this emergency situation is to trap air in the right side of the heart. Think about the position that will achieve this goal; this will direct you to option 1. If you had difficulty with this question, review the immediate interventions when air embolism is suspected.

**Level of Cognitive Ability:** Applying

Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 850). St. Louis: Mosby.

### 90. 3

**Rationale:** Hypervolemia is a critical situation and occurs from excessive fluid administration or administration of fluid too rapidly. Clients with cardiac, renal, or hepatic dysfunction are also at increased risk. The client's signs and symptoms presented in the question are consistent with hypervolemia. The increased intravascular volume increases the blood pressure, whereas the pulse rate increases as the heart tries to pump the extra fluid volume. The increased volume also causes neck vein distention and shifting of fluid into the alveoli, resulting in lung crackles. The signs and symptoms presented in the question do not indicate hyperglycemia, air embolism, or sepsis.

**Test-Taking Strategy:** Use the process of elimination, focusing on the signs and symptoms presented in the question. Recalling the signs of hypervolemia will direct you to option 3. If you had difficulty with this question, review the signs of hypervolemia.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Critical Care

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 575). St. Louis: Mosby.

### 91. 4

**Rationale:** The high glucose concentration in PN places the client at risk for hyperglycemia. Signs of hyperglycemia include excessive thirst, fatigue, restlessness, confusion, weakness, Kussmaul's respirations, diuresis, and coma when hyperglycemia is severe. If the client has these symptoms, the blood glucose level should be checked immediately. Options 1, 2, and 3 do not identify signs specific to hyperglycemia.

**Test-Taking Strategy:** For an option to be correct, all of the parts of that option must be correct. Begin to answer this question by eliminating options 1 and 3 because fever and chills are indicative of infection. Choose option 4 over option 2 because the client with hyperglycemia has increased urine output rather than decreased urine output. Review the signs of hyperglycemia if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Nutrition

**References:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 850). St. Louis: Mosby.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 576). St. Louis: Mosby.

### 92. 1

**Rationale:** Redness at the catheter insertion site is a possible indication of infection. The nurse would next assess for other signs of infection. Of the options given, the temperature is the next item to assess. The tightness of tubing connections should be assessed each time the PN is checked; loose connections would result in leakage, not skin redness. The expiration date on the bag is a viable option, but this also should be checked at the time the solution is hung and with each shift change. The time of the last dressing change should be checked with each shift change.

**Test-Taking Strategy:** Note the strategic word *next*. This question requires that you prioritize based on the information provided in the question. Also note the relationship between *site appears reddened* in the question and the word *temperature* in the correct option. Focusing on the subject of infection will direct you to option 1. Review the signs of infection in the client receiving PN if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Safety/Infection Control

**References:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 850, 855). St. Louis: Mosby.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 575). St. Louis: Mosby.

### 93. 2

**Rationale:** Fat emulsion (lipids) is a white, opaque solution administered intravenously during parenteral nutrition therapy to prevent fatty acid deficiency. The nurse should examine the bottle of fat emulsion for separation of emulsion into layers or fat globules or for the accumulation of froth. The nurse should not hang a fat emulsion if any of these are observed and should return the solution to the pharmacy. Therefore options 1, 3, and 4 are inappropriate actions.

**Test-Taking Strategy:** Remember that options that are comparable or alike are not likely to be correct. With this in mind, eliminate options 1 and 3 first. Select between the remaining options by recalling the significance of fat globules in the solution. Also, think about the potential adverse effect of fat globules entering the client's bloodstream. Review the procedure for administering fat emulsion if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**References:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 853). St. Louis: Mosby.

Skidmore-Roth, L. (2009). *Mosby's drug guide for nurses* (8th ed., pp. 396–397). St. Louis: Mosby.

### 94. 3

**Rationale:** When the client who is receiving PN spikes a temperature, a catheter-related infection should be suspected. The solution and tubing should be changed, and the discontinued materials should be cultured for infectious organisms. The other options are incorrect. Because culture for infectious

organisms is necessary, the discontinued materials are not discarded or returned to the pharmacy or manufacturer.

**Test-Taking Strategy:** Use the process of elimination. Identifying the subject of the question, infection, and correlating the fever with infection associated with the intravenous line should direct you to option 3. Remember that the discontinued materials need to be cultured. Review the procedure when infection is suspected in the client receiving PN if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 234). St. Louis: Saunders.

### 95. 2

**Rationale:** The client receiving PN at home should have her or his temperature monitored as a means of detecting infection, which is a potential complication of this therapy. An infection also could result in sepsis because the catheter is in a blood vessel. The client's weight is monitored as a measure of the effectiveness of this nutritional therapy and to detect hypervolemia. The pulse and blood pressure are important parameters to assess, but they do not relate specifically to the effects of PN.

**Test-Taking Strategy:** Note the strategic words *most closely*, which tell you that more than one or all the options may be partially or totally correct. Remember also that when there are multiple parts to an option, all the parts must be correct for that option to be correct. Recalling that infection and hypervolemia are complications of PN and that weight is monitored as a measure of the effectiveness of this nutritional therapy will direct you to option 2. Review the priority assessments of a client receiving PN if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Nutrition

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., pp. 856–857). St. Louis: Mosby.

### 96. 2

**Rationale:** Parenteral nutrition is indicated in clients whose gastrointestinal tracts are not functional or who cannot take in a diet enterally for extended periods. Examples of these conditions include those of the clients identified in options 1, 3, and 4. Other clients would be those who have had extensive surgery, have multiple fractures, are septic, or have advanced cancer or acquired immunodeficiency syndrome. The client with the open cholecystectomy is not a candidate because this client would resume a regular diet within a few days following surgery.

**Test-Taking Strategy:** Note the strategic words *least likely*, which tell you that the correct option is the client who does not require this type of nutritional support. Use nursing knowledge of these various conditions and baseline knowledge of the purposes of PN to make your selection.

Review the indications for PN if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Nutrition

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1396). St. Louis: Saunders.

### 97. 3

**Rationale:** The nurse obtains an electronic infusion pump before hanging a PN solution. Because of the high glucose content, use of an infusion pump is necessary to ensure that the solution does not infuse too rapidly or fall behind. Because the client's blood glucose level is monitored every 4 to 6 hours during administration of PN, a blood glucose meter also will be needed, but this is not the most essential item needed before hanging the solution. Urine test strips (to measure glucose) rarely are used because of the advent of blood glucose monitoring. Although the blood pressure will be monitored, a noninvasive blood pressure monitor is not the most essential piece of equipment needed for this procedure.

**Test-Taking Strategy:** Note the strategic words *most essential*. They tell you that the correct option identifies the item needed to start the infusion. Visualizing the procedure for initiating PN will direct you to option 3. Review the procedure for initiating PN if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 852). St. Louis: Mosby.

### 98. 2

**Rationale:** The client is at risk for hypoglycemia; therefore the solution containing the highest amount of glucose should be hung until the new PN solution becomes available. Because PN solutions contain high glucose concentrations, the 10% dextrose in water solution is the best of the choices presented. The solution selected should be one that minimizes the risk of hypoglycemia. Options 1, 3, and 4 will not be as effective in minimizing the risk of hypoglycemia.

**Test-Taking Strategy:** Use the process of elimination, recalling that this particular client is at risk for hypoglycemia. With this in mind, you would then select the solution that minimizes this risk to the client. Also, remember that options that are comparable or alike are not likely to be correct. Each of the incorrect options represents a solution that contains 5% dextrose. Review the nursing actions to prevent hypoglycemia in the client receiving PN if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Nutrition

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 850). St. Louis: Mosby.

### 99. 3

**Rationale:** The nurse should not increase the rate of a fat emulsion to make up the difference if the infusion timing falls behind. Doing so could place the client at risk for fat overload. Additionally, increasing the rate suddenly can cause fluid overload. The same principle (not increasing the rate) applies to PN or any intravenous (IV) infusion. Therefore options 1, 2, and 4 are incorrect.

**Test-Taking Strategy:** Focus on the data in the question and note the strategic word *appropriate*. Remember also that options that are comparable or alike are not likely to be correct. This guides you to eliminate options 1 and 2 first. Choose option 3 over option 4, recalling that the nurse never increases the infusion rate or adjusts an infusion rate to run wide open if an infusion is behind. Review these safety principles related to IV therapy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 858). St. Louis: Mosby.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 575). St. Louis: Mosby.

### 100. 4

**Rationale:** Optimal weight gain when the client is receiving PN is 1 to 2 lb/week. The client who has a weight gain of 5 lb/week while receiving PN is likely to have fluid retention. This can result in hypervolemia. Signs of hypervolemia include increased blood pressure, crackles on lung auscultation, a bounding pulse, jugular vein distention, headache, and weight gain more than desired. Options 1 and 2 are associated with hyperglycemia. Option 3 is likely to be noted in deficient fluid volume.

**Test-Taking Strategy:** Focus on the subject of the question, a weight gain of 5 lb in 1 week. This should direct your thinking to the potential for hypervolemia. With this in mind, use the process of elimination, selecting the option that identifies the signs of hypervolemia. If you had difficulty with this question, review the signs and symptoms of hypervolemia associated with the administration of PN.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Critical Care

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 853). St. Louis: Mosby.

### 101. 3

**Rationale:** The nurse should plan to secure all connections in the tubing (tape is used per agency protocol). This helps prevent the restless client from pulling the connections apart

accidentally. The nurse should also monitor intake and output, but this does not relate specifically to a risk for injury as presented in the question. Also, options 2 and 4 do not relate to a risk for injury as presented in the question. In addition, the client's temperature and blood glucose levels are monitored more frequently than the timeframes identified in the options to detect signs of infection and hyperglycemia, respectively.

**Test-Taking Strategy:** Note the strategic words *restless*, *ensure*, *prevent*, and *injury*. Focus on the subject of the question, which is safety. This will direct you to option 3. Review the precautions related to PN if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 852). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: PRIORITIZING (ORDERED RESPONSE)

### 102. 4, 3, 6, 5, 1, 2

**Rationale:** Air embolism occurs when air enters the catheter system during IV tubing changes or when the IV tubing disconnects. Air embolism is a critical situation. If air embolism is suspected, the nurse would first clamp the IV catheter to prevent further introduction of air and the air embolism from traveling through the heart to the pulmonary system. The nurse would next place the client in a left side-lying position with the head lower than the feet (to trap air in right side of the heart). The nurse would notify the physician and administer oxygen as prescribed. The nurse would monitor the client closely and take the client's vital signs. Finally, the nurse documents the occurrence.

**Test-Taking Strategy:** Think about the pathophysiology and effects of an air embolism. Recalling that a primary concern is that the embolism will travel to the pulmonary system will assist in determining that the catheter needs to be clamped first and that the client needs to be positioned to trap the air in the right side of the heart. Because this event is an emergency, the nurse notifies the physician next and the physician will provide a prescription for oxygen, if necessary. The nurse monitors the client and takes the client's vital signs frequently. Review the immediate nursing interventions for a client experiencing air embolism if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Delegating/Prioritizing

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 231). St. Louis: Saunders.

# Intravenous Therapy

## PYRAMID TERMS

**air embolism** An obstruction caused by a bolus of air that enters the vein through an inadequately primed intravenous (IV) line, from a loose connection, during a tubing change, or during removal of an IV line.

**catheter embolism** An obstruction caused by breakage of the catheter tip during IV line insertion or removal.

**hypertonic** Solutions that are more concentrated or have a higher osmolality than body fluids.

**hypotonic** Solutions that are more dilute or have a lower osmolality than body fluids.

**infiltration** Seepage of IV fluid out of the vein and into the surrounding interstitial spaces.

**isotonic** Solutions that have the same osmolality as body fluids.

**phlebitis** An inflammation of the vein that can occur from mechanical or chemical (medication) trauma or from a local infection.

Handling hazardous or infectious materials safely  
Maintaining standard precautions, transmission-based precautions, and surgical asepsis during handling of equipment and supplies  
Obtaining informed consent for invasive procedures  
Preventing errors in administering IV fluids  
Using equipment such as electronic IV infusion devices safely

## Health Promotion and Maintenance

Assessing the client's ability to perform self-care  
Considering lifestyle choices related to home care of the IV line  
Evaluating the client's home environment for self-care modifications  
Promoting health and wellness  
Teaching the client and family about care of the IV line  
Performing physical assessment techniques

## Psychosocial Integrity

Assessing coping mechanisms  
Assessing the client's emotional response to treatment  
Identifying support systems in the home for caring for the IV line

## Physiological Integrity

Assessing and caring for central venous access devices  
Initiating immediate interventions if a complication occurs  
Maintaining IV therapy  
Monitoring for complications of IV therapy  
Monitoring for expected effects of IV therapy  
Monitoring laboratory values for fluid and electrolyte imbalances

## I. INTRAVENOUS THERAPY

- A.** Purpose and uses
1. Used to sustain clients who are unable to take substances orally
  2. Replaces water, electrolytes, and nutrients more rapidly than oral administration

## THE PYRAMID TO SUCCESS

Professional nurses are responsible for managing and providing care to clients receiving IV therapy. Pyramid Points focus on the safety measures required to initiate, maintain, and remove an IV line, including a peripherally inserted central catheter (PICC). Assessment of the client for allergies, including latex sensitivity, before initiation of an IV line is a critical nursing responsibility. Additional nursing responsibilities include monitoring for complications related to the IV line and initiating the measures required when an IV complication occurs. Pyramid Points focus on the signs and symptoms of infection, infiltration, phlebitis, circulatory overload, and air embolism, as well as the treatment measures associated with each. Maintaining an epidural infusion is also a Pyramid Point.

## CLIENT NEEDS

### Safe and Effective Care Environment

Applying principles of infection control  
Consulting with members of the health care team  
Establishing priorities

3. Provides immediate access to the vascular system for the rapid delivery of specific solutions without the time required for gastrointestinal tract absorption
4. Provides a vascular route for the administration of medication or blood components

#### B. Types of solutions (Table 14-1)

1. **Isotonic** solutions
  - a. Have the same osmolality as body fluids
  - b. Increase extracellular fluid volume
  - c. Do not enter the cells because no osmotic force exists to shift the fluids
2. **Hypotonic** solutions
  - a. Are more dilute solutions and have a lower osmolality than body fluids
  - b. Cause the movement of water into cells by osmosis
  - c. Should be administered slowly to prevent cellular edema
3. **Hypertonic** solutions
  - a. Are more concentrated solutions and have a higher osmolality than body fluids
  - b. Concentrate extracellular fluid and cause movement of water from cells into the extracellular fluid by osmosis
4. Colloids
  - a. Also called plasma expanders
  - b. Pull fluid from the interstitial compartment into the vascular compartment
  - c. Used to increase the vascular volume rapidly, such as in hemorrhage or severe hypovolemia

**TABLE 14-1** Types of Intravenous Solutions

| Solution  | Tonicity   |
|---|------------|
| 0.9% sodium chloride (normal saline); (0.9% NS)                               | Isotonic   |
| 5% dextrose in water (D <sub>5</sub> W)                                       | Isotonic   |
| 5% dextrose in 0.225% saline (D <sub>5</sub> W/¼ NS)                          | Isotonic   |
| Lactated Ringer's (LR)  | Isotonic   |
| 0.45% sodium chloride (normal saline); (½ NS)                                 | Hypotonic  |
| 0.225% sodium chloride (normal saline); (¼ NS)                                | Hypotonic  |
| 0.33% sodium chloride (normal saline); (⅓ NS)                                 | Hypotonic  |
| 3% sodium chloride (normal saline); (3% NS)                                   | Hypertonic |
| 5% sodium chloride (normal saline); (5% NS)                                   | Hypertonic |
| 10% dextrose in water (D <sub>10</sub> W)                                     | Hypertonic |
| 5% dextrose in 0.9% sodium chloride (normal saline); D <sub>5</sub> W/NS      | Hypertonic |
| 5% dextrose in 0.45% sodium chloride (normal saline); (D <sub>5</sub> W/½ NS) | Hypertonic |
| 5% dextrose in lactated Ringer's (D <sub>5</sub> LR)                          | Hypertonic |
| Dextran   | Colloid    |
| Albumin   | Colloid    |

**!** Administration of an IV solution or medication provides immediate access to the vascular system. This is a benefit of administering solutions or medications via this route but can also present a risk. Therefore, it is critical to ensure that physician's prescriptions are checked carefully and the correct solution or medication is administered as prescribed. Always follow the six rights for medication administration.

## II. INTRAVENOUS DEVICES

### A. IV cannulas

1. Steel needles or butterfly sets
  - a. The set is a wing-tip needle with a metal cannula, plastic or rubber wings, and a plastic catheter or hub.
  - b. The needle is 0.5 to 1.5 inches in length, with needle gauge sizes from 16 to 26.
  - c. **Infiltration** is more common with these devices.
  - d. The butterfly infusion set commonly is used in children and older clients, whose veins are likely to be small or fragile.
2. Plastic cannulas
  - a. Plastic cannulas may be an over-the-needle device or an in-needle catheter and are used primarily for short-term therapy.
  - b. The over-the-needle device is preferred for rapid infusion and is more comfortable for the client.
  - c. The in-needle catheter can cause **catheter embolism** if the tip of the cannula breaks.

### B. IV gauges

1. The gauge refers to the diameter of the lumen of the needle or cannula.
2. The smaller the gauge number, the larger the diameter of the lumen; the larger the gauge number, the smaller the diameter of the lumen.
3. The size of the gauge used depends on the solution to be administered and the diameter of the available vein.
4. Large-diameter lumens (smaller gauge numbers) allow a higher fluid rate than smaller diameter lumens and allow the administration of higher concentrations of solutions.
5. For rapid emergency fluid administration, blood products, or anesthetics, large-diameter lumen needles or cannulas are used, such as a 14-, 16-, 18-, or 19-gauge.
6. For peripheral fat infusions (lipids), a 20- or 21-gauge lumen or cannula is used.
7. For standard IV fluid and clear liquid IV medications, a 22- or 24-gauge lumen or cannula is used.
8. If the client has very small veins, a 24- to 25-gauge lumen or cannula is used.

### C. IV containers

1. Container may be glass or plastic.
2. Squeeze the plastic bag to ensure intactness and assess the glass bottle for any cracks before hanging.

**!** Do not write on a plastic IV bag with a marking pen because the ink may be absorbed through the plastic into the solution. Use a label and a ballpoint pen for marking the bag, placing the label onto the bag.

### D. IV tubing (Fig. 14-1)

1. IV tubing contains a spike end for the bag or bottle, drip chamber, roller clamp, Y site, and adapter end for attachment to the cannula or needle that is inserted into the client's vein.
2. Shorter secondary tubing is used for piggyback solutions, connecting them to the injection sites nearest to the drip chamber (Fig. 14-2).
3. Special tubing is used for medication that absorbs into plastic (check specific medication administration guidelines when administering IV medications).
4. Vented and nonvented tubing are available.
  - a. A vent allows air to enter the IV container as the fluid leaves.
  - b. A vented adapter can be used to add a vent to a nonvented IV tubing system.
  - c. Use nonvented tubing for flexible containers.
  - d. Use vented tubing for glass or rigid plastic containers to allow air to enter and displace the fluid as it leaves; fluid will not flow from a rigid IV container unless it is vented.

**▲ FIGURE 14-1** Intravenous tubing. (From Kee, J. & Marshall, S. [2009]. *Clinical calculations: With applications to general and specialty areas* [6th ed.]. St. Louis: Saunders.)

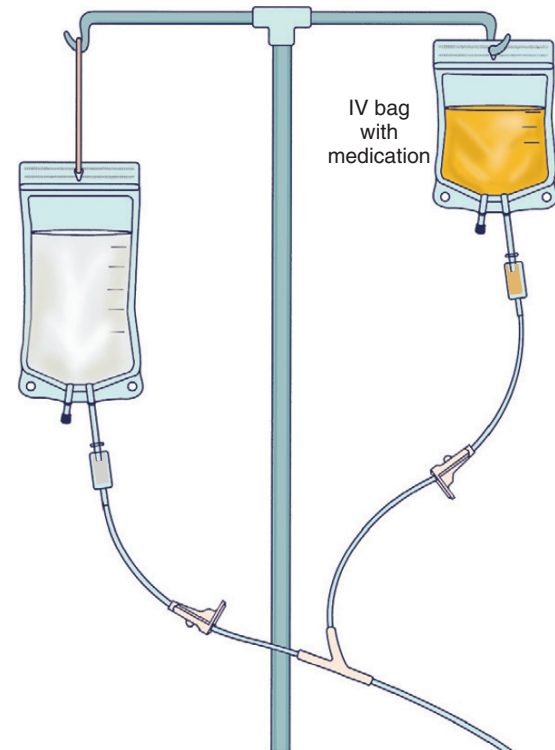

Extension tubing can be added to an IV tubing set to provide extra length to the tubing. Add extension tubing to the IV tubing set for children, clients who are restless, or clients who have special mobility needs.

### E. Drip chambers (Fig. 14-3)

#### 1. Macro drip chamber

- a. The chamber is used if the solution is thick or is to be infused rapidly.

**▲ FIGURE 14-2** Secondary bag with medication. (Modified from Kee, J., & Marshall, S. [2009]. *Clinical calculations: With applications to general and specialty areas* [6th ed.]. St. Louis: Saunders.)

**▲ FIGURE 14-3** Macro drip and microdrip sizes. (From Kee, J., & Marshall, S. [2009]. *Clinical calculations: With applications to general and specialty areas* [6th ed.]. St. Louis: Saunders.)

- b. The drop factor varies from 10 to 20 gtt/mL, depending on the manufacturer.
  - c. Read the tubing package to determine how many drops per milliliter are delivered (drop factor).
2. Microdrip chamber
- a. Normally, the chamber has a short vertical metal piece (stylet) where the drop forms.
  - b. The chamber delivers about 60 gtt/mL.
  - c. Read the tubing package to determine the drop factor (gtt/mL).
  - d. Microdrip chambers are used if fluid will be infused at a slow rate (less than 50 mL/hr) or if the solution contains potent medication that needs to be titrated, such as in a critical care setting or in pediatric clients.

#### F. Filters

- 1. Filters provide protection by preventing particles from entering the client's veins.
- 2. They are used in IV lines to trap small particles such as undissolved antibiotics or salt, or medications that have precipitated in solution.
- 3. Assess the agency policy regarding the use of filters.
- 4. A 0.22- $\mu\text{m}$  filter is used for most solutions, a 1.2- $\mu\text{m}$  filter is used for solutions containing lipids or albumin, and a special filter is used for blood components.
- 5. Change filters every 24 to 72 hours (depending on agency policy) to prevent bacterial growth.

#### G. Needleless infusion devices

- 1. Needleless infusion devices include recessed needles, plastic cannulas, and one-way valves; these systems decrease the exposure to contaminated needles.
- 2. Do not administer parenteral nutrition or blood products through a one-way valve.

#### H. Intermittent infusion devices

- 1. Intermittent infusion devices are used when intravascular accessibility is desired for intermittent administration of medications by IV push or IV piggyback.
- 2. Patency is maintained by periodic flushing with normal saline solution (sodium chloride and normal saline are interchangeable names).
- 3. Depending on agency policy, when administering medication, flush with 1 to 2 mL of normal saline to confirm placement of the IV cannula; administer the prescribed medication and then flush the cannula again with 1 to 2 mL of normal saline to maintain patency.

#### I. Electronic IV infusion devices

- 1. IV infusion pumps control the amount of fluid infusing and should be used with central venous lines, arterial lines, solutions containing medication, and parenteral nutrition infusions.
- 2. A syringe pump is used when a small volume of medication is administered; the syringe that

contains the medication and solution fits into a pump and is set to deliver the medication at a controlled rate.

- 3. Patient controlled analgesia (PCA) is a device that allows the client to self-administer IV medication, such as an analgesic; the client can administer bolus doses at set intervals and the pump can be set to lock out bolus doses that are not within the preset time frame to prevent overdose.

 **Check electronic IV infusion devices frequently.** Although these devices are electronic, this does not ensure that they are infusing solutions and medications accurately.

### III. LATEX ALLERGY

- A. Assess the client for an allergy to latex.
- B. IV supplies, including IV catheters, IV tubing, IV ports (particularly IV rubber injection ports), rubber stoppers on multidose vials, and adhesive tape, may contain latex.
- C. Latex-safe IV supplies need to be used for clients with a latex allergy.
- D. A three-way stopcock, rather than a rubber injection port, needs to be used on plastic tubing.
- E. See Chapter 70 for additional information regarding latex allergy.

### IV. SELECTION OF A PERIPHERAL IV SITE

- A. Veins in the hand, forearm, and antecubital fossa are suitable sites (Fig. 14-4).
- B. Veins in the lower extremities (legs and feet) are not suitable for an adult client because of the risk of thrombus formation and the possible pooling of medication in areas of decreased venous return (Box 14-1).
- C. Veins in the scalp and feet may be suitable sites for infants (see Fig. 14-4).
- D. Assess the veins of both arms closely before selecting a site.
- E. Start the IV infusion distally to provide the option of proceeding up the extremity if the vein is ruptured or **infiltration** occurs; if **infiltration** occurs from the antecubital vein, the lower veins in the same arm usually cannot be used for further puncture sites.
- F. Determine the client's dominant side, and select the opposite side for a venipuncture site.
- G. Bending the elbow on the arm with an IV may easily obstruct the flow of solution, causing **infiltration** that could lead to thrombophlebitis.
- H. Avoid checking the blood pressure on the arm receiving the IV infusion if possible.
- I. Do not place restraints over the venipuncture site.
- J. Use an armboard as needed when the venipuncture site is located in an area of flexion.

**▲ FIGURE 14-4** Common intravenous sites. **A**, Inner arm. **B**, Dorsal surface of hand. **C**, Dorsal surface of the foot (children only). (From Potter, P., & Perry, A. [2009]. *Fundamentals of nursing* [7th ed.]. St. Louis: Mosby.)

### Box 14-1 Peripheral Intravenous Sites to Avoid

Edematous extremity  
 An arm that is weak, traumatized, or paralyzed  
 The arm on the same side as a mastectomy  
 An arm that has an arteriovenous fistula or shunt for dialysis  
 A skin area that is infected

**!** In an adult, the most frequently used sites for inserting an IV cannula/needle are the veins of the forearm because the bones of the forearm act as a natural support and splint.

### V. ADDITION OF MEDICATION TO AN IV SOLUTION

- A.** Assess for compatibility of medication and solution.
- B.** When adding medication to the IV bag, mix the bag end to end several times before hanging it to disperse the medication.
- C.** Manufacturer-prepared IV medication systems are available; these systems are similar to a secondary IV with medication or a piggyback system.
- D.** Ensure that the medication can be mixed in soft plastic because some medications absorb into the soft plastic and should be mixed only in glass.

### VI. INITIATION AND ADMINISTRATION OF IV SOLUTIONS

- A.** Check the IV solution against the physician's prescription for the type, amount, percentage of

solution, and rate of flow; follow the six rights for medication administration.

- B.** Assess the health status and medical disorders of the client and identify client conditions that contraindicate use of a particular IV solution or IV equipment such as an allergy to cleansing solution, adhesive materials, or latex.
- C.** Check client's identification and explain the procedure to the client; assess client's previous experience with IV therapy and preference for insertion site.
- D.** Wash hands thoroughly before inserting an IV line and before working with an IV line; wear gloves.
- E.** Use sterile technique when inserting an IV line and when changing the dressing over the IV site.
- F.** Change the venipuncture site every 48 to 72 hours, depending on agency policy.
- G.** Change the IV dressing every 72 hours, when the dressing is wet or contaminated, or as specified by the agency policy.
- H.** Change the IV tubing every 24 to 72 hours, depending on agency policy.
- I.** Do not let an IV bag or bottle of solution hang for more than 24 hours to diminish the potential for bacterial contamination and possibly sepsis.
- J.** Do not allow the IV tubing to touch the floor to prevent potential bacterial contamination.
- K.** Before adding medications to solutions, swab access ports with 70% alcohol, an equally effective solution, or as specified by the agency policy.
- L.** Refer to the Priority Nursing Actions box for instructions on inserting an IV.
- M.** Refer to the Priority Nursing Actions box for instructions on removing an IV.

**PRIORITY NURSING ACTIONS!****Actions for Inserting a Peripheral Intravenous Line**

Refer to VI, Initiation and Administration of IV Solutions, for additional preprocedure and postprocedure interventions.

1. Check the physician's prescription and determine the type and size of infusion device and prepare intravenous (IV) tubing and solution; prime the IV tubing to remove air from the system; explain procedure to the client.
2. Select the vein for insertion; apply tourniquet and palpate the vein for resilience (see Fig. 14-4)
3. Clean the skin with an antimicrobial solution, using an inner to outer circular motion, or as specified by the agency policy
4. Stabilize the vein below the insertion site and puncture the skin and vein observing for blood in the flashback chamber; when observed, advance the catheter into the vein (if unsuccessful, a new sterile device is used for the next attempt at insertion).
5. Apply pressure above the insertion site with the middle finger of the nondominant hand and retract the stylet from the catheter; connect the end of the IV tubing to the catheter tubing, secure it, and begin IV flow.
6. Tape and secure insertion site with a dressing as specified by agency procedure; label the tubing, dressing, and solution bags clearly, indicating the date and time.
7. Document the specifics about the procedure such as number of attempts at insertion; the insertion site, type and size of device, solution and flow rate and time; and the client's response; additionally follow agency procedure for documentation of procedure.

The nurse checks the physician's prescription for the IV line and then determines the type and size of infusion device. The type and size is important to ensure adequate flow of the prescribed solution. For example, if a blood product is prescribed then the nurse would need to insert an appropriate catheter gauge size for blood delivery. The nurse also considers the client's size, age, mobility and other factors in selecting the type and size of the infusion device. The nurse prepares the appropriate IV tubing and primes the IV tubing to remove air from the system. The appropriate vein is selected, the tourniquet is applied, and the vein is checked and palpated for resilience. Strict surgical asepsis is employed and the skin is cleaned with an antimicrobial solution (as specified by the agency policy) using an inner to outer circular motion. The vein is stabilized to prevent its movement and the skin is punctured. Blood in the flashback chamber indicates that the device is in the vein and when noted the catheter is carefully advanced to avoid puncture of the back wall of the vein. The stylet is removed from the catheter device, the IV tubing is connected, and the IV flow is started. The nurse tapes and secures the site and labels the tubing, dressing, and solution bag appropriately and according to agency policy. The nurse checks the site and ensures that the solution is flowing. Finally the nurse documents the specifics about the procedure.

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., pp. 994–1004). St. Louis: Mosby.

**PRIORITY NURSING ACTIONS!****Actions for Removing a Peripheral Intravenous Line**

1. Check the physician's prescription and explain the procedure to the client; ask the client to hold the extremity still during cannula/needle removal.
2. Turn off the intravenous (IV) tubing clamp and remove the dressing and tape covering the site, while stabilizing the catheter.
3. Apply light pressure with sterile gauze or other material as specified by agency procedure over the site and withdraw the catheter using a slow, steady movement, keeping the hub parallel to the skin.
4. Apply pressure for 2 to 3 minutes using dry sterile gauze (apply pressure for a longer period of time if the client has a bleeding disorder or is taking anticoagulant medication).
5. Inspect the site for redness, drainage, or swelling; check the catheter for intactness.
6. Document the procedure and the client's response.

The nurse checks for a physician's prescription to remove the IV line and then explains the procedure to the client. The nurse asks the client to hold the extremity still during removal. The IV tubing clamp is placed in the off position and the dressing and tape is removed. The nurse is careful to stabilize the catheter so that it is not pulled, resulting in vein trauma. Light pressure is applied over the site to stabilize the catheter and it is removed using a slow, steady movement, keeping the hub parallel to the skin. Pressure is applied until hemostasis occurs. The site is inspected for redness, drainage, or swelling and the catheter is checked for intactness to ensure that any part of it has not broken off. Finally the nurse documents the procedure and the client's response.

**Reference:** Elkin, M., Perry, A., & Potter, P. (2007). *Nursing interventions & clinical skills* (4th ed., pp. 620–621). St. Louis: Mosby.

**VII. PRECAUTIONS FOR IV LINES**

- A. On insertion, an IV line can cause initial pain and discomfort for the client.
- B. An IV puncture provides a route of entry for microorganisms into the body.
- C. Medications administered by the IV route enter the blood immediately, and any adverse reactions or allergic responses can occur immediately.
- D. Fluid (circulatory) overload or electrolyte imbalances can occur from excessive or too rapid infusion of IV fluids.
- E. Incompatibilities between certain solutions and medications can occur.

A client with congestive heart failure usually is not given a solution containing saline because this type of fluid promotes the retention of water and would therefore exacerbate heart failure by increasing the fluid overload.

### VIII. COMPLICATIONS (Table 14-2)

#### A. Air embolism

1. Description: A bolus of air enters the vein through an inadequately primed IV line, from a loose connection, during tubing change, or during removal of the IV.
2. Prevention and interventions
  - a. Prime tubing with fluid before use, and monitor for any air bubbles in the tubing.
  - b. Secure all connections.
  - c. Replace the IV fluid before the bag or bottle is empty.
  - d. Monitor for signs of **air embolism**; if suspected, clamp the tubing, turn the client on the left side with the head of the bed lowered (Trendelenburg's position) to trap the air in the right atrium, and notify the physician.

#### B. Catheter embolism

1. Description: An obstruction that results from breakage of the catheter tip during IV line insertion or removal
2. Prevention and interventions
  - a. Remove the catheter carefully.
  - b. Inspect the catheter when removed.
  - c. If the catheter tip has broken off, place a tourniquet as proximally as possible to the IV site on the affected limb, notify the physician immediately, prepare to obtain a radiograph, and prepare the client for surgery to remove the catheter piece(s), if necessary.

#### C. Circulatory overload

1. Description: Also known as *fluid overload*; results from the administration of fluids too rapidly especially in a client at risk for fluid overload
2. Prevention and interventions
  - a. Identify clients at risk for circulatory overload.
  - b. Calculate and monitor the drip (flow) rate frequently.
  - c. Use an electronic IV infusion device and frequently check the drip rate or setting (at least every hour for an adult).
  - d. Add a time tape (label) to the IV bag or bottle (Fig. 14-5).
  - e. Monitor for signs of circulatory overload. If circulatory overload occurs, decrease the flow rate to a minimum, at a keep-vein-open rate; elevate the head of the bed; keep the client warm; assess lung sounds; assess for edema; and notify the physician.

**TABLE 14-2** Signs of Complications of Intravenous Therapy

| Complication         | Signs   |
|----------------------|---|
| Air embolism         | Tachycardia<br>Dyspnea<br>Hypotension<br>Cyanosis<br>Decreased level of consciousness   |
| Catheter embolism    | Decrease in blood pressure<br>Pain along the vein<br>Weak, rapid pulse<br>Cyanosis of the nail beds<br>Loss of consciousness            |
| Circulatory overload | Increased blood pressure<br>Distended jugular veins<br>Rapid breathing<br>Dyspnea<br>Moist cough and crackles                           |
| Electrolyte overload | Signs depend on the specific electrolyte overload imbalance   |
| Hematoma             | Ecchymosis, immediate swelling and leakage of blood at the site, and hard and painful lumps at the site                                 |
| Infection            | Local—redness, swelling, and drainage at the site<br>Systemic—chills, fever, malaise, headache, nausea, vomiting, backache, tachycardia |
| Infiltration         | Edema, pain, and coolness at the site; may or may not have a blood return   |
| Phebitis             | Heat, redness, tenderness at the site<br>Not swollen or hard<br>Intravenous infusion sluggish   |
| Thrombophlebitis     | Hard and cordlike vein<br>Heat, redness, tenderness at site<br>Intravenous infusion sluggish  |
| Tissue damage        | Skin color changes, sloughing of the skin, discomfort at the site   |

**▲ FIGURE 14-5** Intravenous fluid bag with medication label and time tape. (Modified from Potter, P., & Perry, A. [2009]. *Fundamentals of nursing* [7th ed.]. St. Louis: Mosby.)

 Clients with respiratory, cardiac, renal, or liver disease, older clients, and very young persons are at risk for circulatory overload and cannot tolerate an excessive fluid volume.

#### D. Electrolyte overload

1. Description: An electrolyte imbalance caused by too rapid or excessive infusion or by use of an inappropriate IV solution
2. Prevention and interventions
  - a. Assess laboratory value reports.
  - b. Verify the correct solution.
  - c. Calculate and monitor the flow rate.
  - d. Use an electronic IV infusion device and frequently check the drip rate or setting (at least every hour for an adult).
  - e. Add a time tape (label) to the IV bag or bottle (see Fig. 14-5).
  - f. Place a red medication sticker on the bag or bottle if a medication, such as potassium chloride, has been added to the IV solution (see Fig. 14-5).
  - g. Monitor for signs of an electrolyte imbalance, and notify the physician if they occur.

 Lactated Ringer's solution contains potassium and should not be administered to clients with renal failure.

#### E. Hematoma

1. Description: The collection of blood in the tissues after an unsuccessful venipuncture or after the venipuncture site is discontinued and blood continues to ooze into the tissue
2. Prevention and interventions
  - a. When starting an IV, avoid piercing the posterior wall of the vein.
  - b. Do not apply a tourniquet to the extremity immediately after an unsuccessful venipuncture.
  - c. When discontinuing an IV, apply pressure to the site for 2 to 3 minutes and elevate the extremity; apply pressure longer for clients with a bleeding disorder or who are taking anticoagulants.
  - d. If a hematoma develops, elevate the extremity and apply pressure and ice as prescribed.

#### F. Infection

1. Description
  - a. Infection occurs from the entry of microorganisms into the body through the venipuncture site.
  - b. Venipuncture interrupts the integrity of the skin, the first line of defense against infection.
  - c. The longer the therapy continues, the greater the risk for infection.
  - d. Infection can occur locally at the IV insertion site or systemically from the entry of microorganisms into the body.

#### 2. At-risk clients

- a. Immunocompromised clients with diseases such as cancer, human immunodeficiency virus, or acquired immunodeficiency syndrome are at risk for infection.
  - b. Clients receiving treatments such as chemotherapy who have an altered or lowered white blood cell count are at risk for infection.
  - c. Older clients, because aging alters the effectiveness of the immune system, are at risk for infection.
  - d. Clients with diabetes mellitus are at risk for infection.
3. Prevention and interventions
    - a. Assess the client for predisposition to or risk for infection.
    - b. Maintain strict asepsis when caring for the IV site.
    - c. Monitor for signs of local or systemic infection.
    - d. Monitor white blood cell counts.
    - e. Check fluid containers for cracks, leaks, cloudiness, or other evidence of contamination.
    - f. Change tubing and site dressing every 24 to 72 hours according to agency policy.
    - g. Use antimicrobial ointment at the IV site.
    - h. Label the IV site, bag or bottle, and tubing with the date and time to ensure that these are changed on time according to agency policy.
    - i. Ensure that the IV solution is not hanging for more than 24 hours.
    - j. If infection occurs, the physician is notified; discontinue the IV, and place the venipuncture device in a sterile container for possible culture.
    - k. Prepare to obtain blood cultures as prescribed if infection occurs.
    - l. Restart an IV in the opposite arm to differentiate sepsis (systemic infection) from local infection at the IV site.

 A client with diabetes mellitus usually does not receive dextrose (glucose) solutions because the solution can increase the blood glucose level.

#### G. Infiltration

1. Description
  - a. **Infiltration** is a form of tissue damage; it may also be called *extravasation*.
  - b. **Infiltration** is seepage of the IV fluid out of the vein and into the surrounding interstitial spaces.
  - c. **Infiltration** occurs when an access device has become dislodged or perforates the wall of the vein or when venous backpressure occurs because of a clot or venospasm.
2. Prevention and interventions
  - a. Avoid venipuncture over an area of flexion.

- b. Anchor the cannula and a loop of tubing securely with tape.
- c. Use an armboard or splint as needed if the client is restless or active.
- d. Monitor the IV rate for a decrease or a cessation of flow.
- e. Evaluate the IV site for **infiltration** by occluding the vein proximal to the IV site. If the IV fluid continues to flow, the cannula is probably outside the vein (infiltrated); if the IV flow stops after occlusion of the vein, the IV device is still in the vein.
- f. Lower the IV fluid container below the IV site, and monitor for the appearance of blood in the IV tubing; if blood appears, the IV device is most likely in the vein.
- g. If **infiltration** has occurred, remove the IV device immediately; elevate the extremity and apply compresses (warm or cool, depending on the IV solution that was infusing and the physician's prescription) over the affected area.
- h. Do not rub an infiltrated area, which can cause hematoma.

#### H. Phlebitis and thrombophlebitis

1. Description
  - a. **Phlebitis** is an inflammation of the vein that can occur from mechanical or chemical (medication) trauma or from a local infection.
  - b. **Phlebitis** can cause the development of a clot (thrombophlebitis).
2. Prevention and interventions
  - a. Use an IV cannula smaller than the vein, and avoid using very small veins when administering irritating solutions.
  - b. Avoid using the lower extremities (legs and feet) as an access area for the IV.
  - c. Avoid venipuncture over an area of flexion.
  - d. Anchor the cannula and a loop of tubing securely with tape.
  - e. Use an armboard or splint as needed if the client is restless or active.
  - f. Change the venipuncture site every 48 to 72 hours, depending on agency policy.
  - g. If **phlebitis** occurs, remove the IV device immediately and restart it in the opposite extremity; notify the physician if **phlebitis** is suspected, and apply warm, moist compresses, as prescribed.
  - h. If thrombophlebitis occurs, do not irrigate the IV catheter; remove the IV, notify the physician, and restart the IV in the opposite extremity.

#### I. Tissue damage

1. Description
  - a. Tissues most commonly damaged include the skin, veins, and subcutaneous tissue.
  - b. Tissue damage can be uncomfortable and can cause permanent negative effects.

2. Prevention and interventions
  - a. Use a careful and gentle approach when applying a tourniquet.
  - b. Avoid tapping the skin over the vein when starting an IV.
  - c. Monitor for ecchymosis when penetrating the skin with the cannula.
  - d. Assess for allergies to tape or dressing adhesives.
  - e. Monitor for skin color changes, sloughing of the skin, or discomfort at the IV site.
  - f. Notify the physician if tissue damage is suspected.

 Always document the occurrence of a complication, assessment findings, actions taken, and the client's response.

### IX. CENTRAL VENOUS CATHETERS

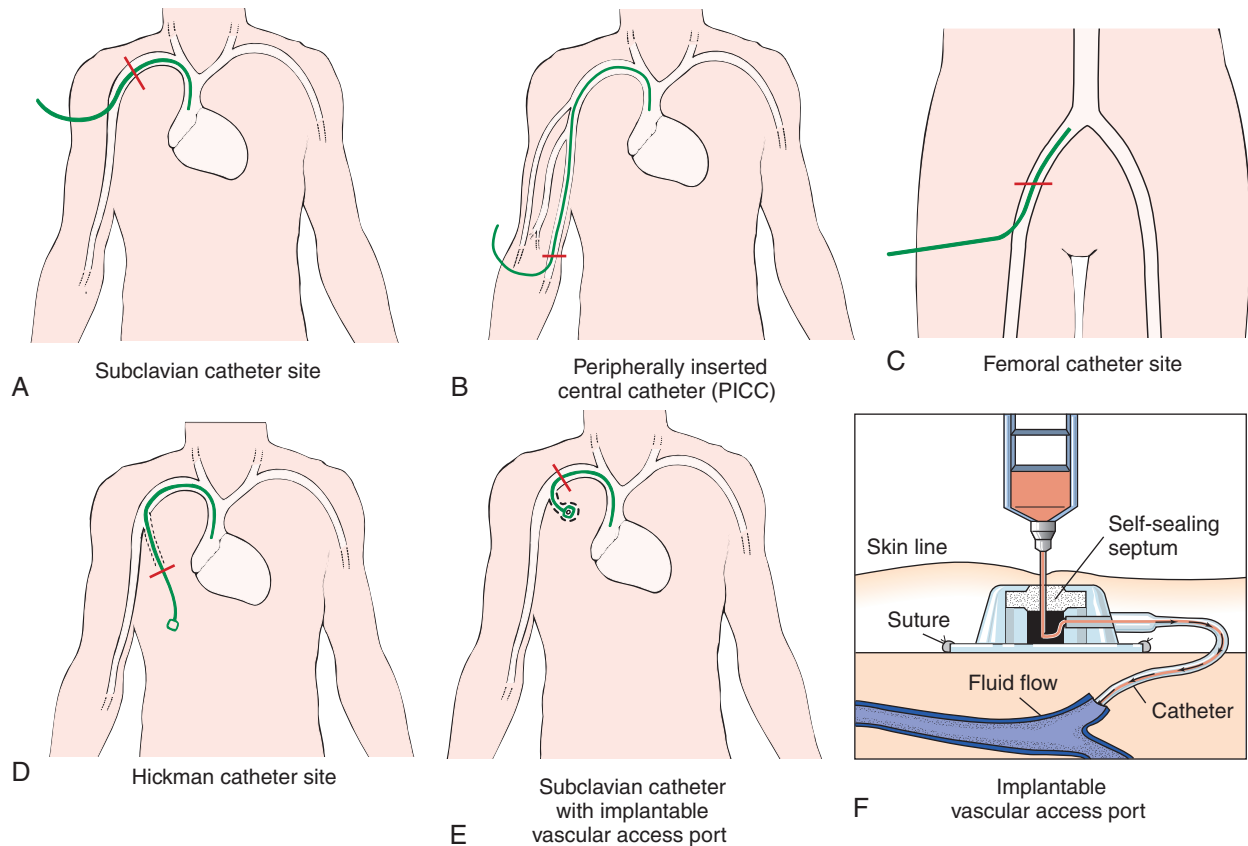

#### A. Description

1. Central venous catheters (Fig. 14-6) are used to deliver hyperosmolar solutions, measure central venous pressure, infuse parenteral nutrition, or infuse multiple IV solutions or medications.
2. Catheter position is determined by radiography after insertion.
3. The catheter may have a single, double, or triple lumen.
4. The catheter may be inserted peripherally and threaded through the basilic or cephalic vein into the superior vena cava, inserted centrally through the internal jugular or subclavian veins, or surgically tunneled through subcutaneous tissue.
5. With multilumen catheters, more than one medication can be administered at the same time without incompatibility problems, and only one insertion site is present.

 For central line insertion, tubing change, and line removal, place the client in the Trendelenburg's position if not contraindicated or in the supine position, and instruct the client to perform the Valsalva maneuver to increase pressure in the central veins when the IV system is open.

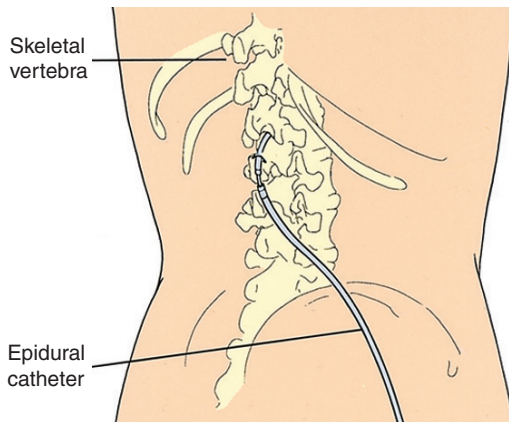

#### B. Tunneled central venous catheters

1. A more permanent type of catheter, such as the Hickman, Broviac, or Groshong catheter, is used for long-term IV therapy.
2. The catheter may be single lumen or multilumen.
3. The catheter is inserted in the operating room, and the catheter is threaded into the lower part of the vena cava at the entrance of the right atrium.
4. The catheter is fitted with an intermittent infusion device to allow access as needed and to keep the system closed and intact.

▲ **FIGURE 14-6** Central venous access sites. **A**, Subclavian catheter. **B**, Peripherally inserted central catheter (PICC). **C**, Femoral catheter. **D**, Hickman catheter. **E**, Subclavian catheter with implantable vascular access port. **F**, Implantable vascular access port. (From Kee, J. & Marshall, S. [2009]. *Clinical calculations: With applications to general and specialty areas* [6th ed.]. St. Louis: Saunders; **F** redrawn from Winters, B. [1984]. Implantable vascular access devices. *Oncology Nursing Forum*, 11, 25-30.)

5. Patency is maintained by flushing with a diluted heparin solution or normal saline solution, depending on the type of catheter, per agency policy.
- C.** Vascular access ports (implantable port)
1. Surgically implanted under the skin, ports such as a Port-a-Cath, Mediport, or Infusaport are used for long-term administration of repeated IV therapy.
  2. For access, the port requires palpation and injection through the skin into the self-sealing port with a noncoring needle, such as a Huber-point needle.
  3. Patency is maintained by periodic flushing with a diluted heparin solution as prescribed and as per agency policy.
- D.** PICC line
1. The catheter is used for long-term IV therapy, frequently in the home.
  2. The basilic vein usually is used, but the median cubital and cephalic veins in the antecubital area also can be used.
  3. The catheter is threaded so that the catheter tip may terminate in the subclavian vein or superior vena cava.
4. A small amount of bleeding may occur at the time of insertion and may continue for 24 hours, but bleeding thereafter is not expected.
  5. **Phlebitis** is a common complication.
  6. Insertion is below the heart level; therefore **air embolism** is not common.
- X. EPIDURAL CATHETER** (Fig. 14-7)
- A.** Catheter is placed in the epidural space for the administration of analgesics; this method of administration reduces the amount needed to control pain; therefore, the client experiences fewer side effects.
  - B.** Assess client's vital signs, level of consciousness, and motor and sensory function.
  - C.** Monitor insertion site for signs of infection and be sure that the catheter is secured to the client's skin and that all connections are taped to prevent disconnection.
  - D.** Check physician's prescription regarding solution and medication administration.
  - E.** For continuous infusion, monitor the electronic infusion device for proper rate of flow.

**▲ FIGURE 14-7** Tunneled epidural catheter. (From Elkin, M., Perry, A., & Potter, P. (2007). *Nursing interventions & clinical skills* [4th ed.]. St. Louis: Mosby.)

- F.** For bolus dose administration, follow the procedure for administering bolus doses through a central or peripheral IV line and follow agency procedure.
- G.** Aspiration is done before injecting medication; if more than 1 mL of clear fluid or blood returns, do not inject the medication and notify the physician or anesthesiologist immediately (catheter may have migrated into the subarachnoid space or a blood vessel).

**!** Contraindications to an epidural catheter and administration of epidural analgesia include skeletal and spinal abnormalities, bleeding disorders, use of anticoagulants, history of multiple abscesses, and sepsis.

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 103.** A client had a 1000-mL bag of 5% dextrose in 0.9% sodium chloride hung at 3 PM. The nurse making rounds at 3:45 PM finds that the client is complaining of a pounding headache and is dyspneic, is experiencing chills, and is apprehensive, with an increased pulse rate. The intravenous (IV) bag has 400 mL remaining. The nurse should take which action first?
1. Call the physician.
  2. Slow the IV infusion.
  3. Sit the client up in bed.
  4. Remove the IV catheter.
- 104.** The nurse has a prescription to hang an intravenous (IV) bag of 1000 mL 5% dextrose in water with 20 mEq potassium chloride. The nurse should plan to do which of the following immediately after injecting the potassium chloride into the port of the IV bag?
1. Rotate the bag gently.
  2. Attach the tubing to the client.
  3. Prime the tubing with the IV solution.
  4. Check the solution for yellowish discoloration.
- 105.** A client with the recent diagnosis of myocardial infarction and impaired renal function is recuperating on the step-down cardiac unit. The client's blood pressure has been borderline low and intravenous (IV) fluids have been infusing at 100 mL/hr via a central line catheter in the right internal jugular for approximately 24 hours to increase renal output and maintain the blood pressure. Upon entering the client's room, the nurse notes that the client is breathing rapidly and is coughing. The nurse determines that the client is most likely experiencing which complication of IV therapy?
1. Hematoma
  2. Air embolism
  3. Systemic infection
  4. Circulatory overload
- 106.** The nurse is making initial rounds on the nursing unit to assess the condition of assigned clients. The nurse notes that a client's intravenous (IV) site is cool, pale, and swollen, and the solution is not infusing. The nurse concludes that which of the following complications has occurred?
1. Infection
  2. Phlebitis
  3. Infiltration
  4. Thrombosis
- 107.** The nurse is inserting an intravenous line into a client's vein. After the initial stick, the nurse continues to advance the catheter if:
1. The catheter advances easily.
  2. The vein is distended under the needle.
  3. The client does not complain of discomfort.
  4. Blood return shows in the backflash chamber of the catheter.
- 108.** The nurse notes that the site of a client's peripheral intravenous (IV) catheter is reddened, warm, painful, and slightly edematous proximal to the insertion point of the IV catheter. After taking appropriate steps to care for the client, the nurse documents in the medical record that the client experienced:
1. Phlebitis of the vein
  2. Infiltration of the IV line
  3. Hypersensitivity to the IV solution
  4. Allergic reaction to the IV catheter material

- 109.** The nurse is preparing a continuous intravenous (IV) infusion at the medication cart. As the nurse goes to attach the distal end of the IV tubing to a needleless device, the exposed tubing drops and hits the top of the medication cart. Which of the following is the appropriate action by the nurse?
1. Obtain new IV tubing.
  2. Attach a new needleless device.
  3. Wipe the distal end of the tubing with Betadine.
  4. Scrub the needleless device with an alcohol swab.
- 110.** A physician has written a prescription to discontinue an intravenous (IV) line. The nurse obtains which of the following supplies from the unit supply area for applying pressure to the site after removing the IV catheter?
1. Elastic wrap
  2. Betadine swab
  3. Adhesive bandage
  4. Sterile 2 × 2 gauze
- 111.** A client has just undergone insertion of a central venous catheter at the bedside. The nurse would be sure to check the results of which of the following before initiating the flow rate of the client's intravenous (IV) solution at 100 mL/hr?
1. Serum osmolality
  2. Serum electrolyte levels
  3. Portable chest x-ray film
  4. Intake and output record
- 112.** A client involved in a motor vehicle crash presents to the emergency department with severe internal bleeding. The client is severely hypotensive and unresponsive. The nurse anticipates that which intravenous (IV) solution will most likely be prescribed to increase intravascular volume, replace immediate blood loss volume, and increase blood pressure?
1. 5% dextrose in lactated Ringer's
  2. 0.33% sodium chloride ( $\frac{1}{3}$  normal saline)
  3. 0.225% sodium chloride ( $\frac{1}{4}$  normal saline)
  4. 0.45% sodium chloride ( $\frac{1}{2}$  normal saline)
- 113.** The nurse provides a list of instructions to a client being discharged to home with a peripherally inserted central catheter (PICC). The nurse determines that the client needs further instructions if the client made which statement?
1. "I need to wear a Medic-Alert tag or bracelet."
  2. "I need to have a repair kit available in the home for use if needed."
  3. "I need to keep the insertion site protected when in the shower or bath."
  4. "I need to keep my activity level to a minimum while this catheter is in place."

### Alternate Item Format: Multiple Response

- 114.** A client rings the call bell and complains of pain at the site of an intravenous (IV) infusion. The nurse assesses the site and determines that phlebitis has developed. The nurse should take which actions in the care of this client? **Select all that apply.**
- 1. Notifies the physician.
  - 2. Removes the IV catheter at that site.
  - 3. Applies warm moist packs to the site.
  - 4. Starts a new IV line in a proximal portion of the same vein.
  - 5. Documents the occurrence, actions taken, and the client's response

### Alternate Item Format: Fill-In-The-Blank

- 115.** The nurse is completing a time tape for a 1000-mL IV bag that is scheduled to infuse over 8 hours. The nurse has just placed the 11:00 AM marking at the 500-mL level. The nurse would place the mark for noon at which numerical level (mL) on the time tape?  
\_\_\_\_\_ mL

## ANSWERS

### 103. 2

**Rationale:** The client's symptoms are compatible with circulatory overload. This may be verified by noting that 600 mL has infused in the course of 45 minutes. The first action of the nurse is to slow the infusion. Other actions may follow in rapid sequence. The nurse may elevate the head of the bed to aid the client's breathing, if necessary. The nurse also notifies the physician. The IV catheter is not removed; it may be needed once the complication has been resolved.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *first*. This tells you that more than

one or all of the options are likely to be correct actions and that the nurse needs to prioritize them according to a time sequence. You must be able to recognize the signs of circulatory overload. From this point, select the option that provides the intervention specific to circulatory overload. Review the immediate nursing actions in the event of circulatory overload if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Delegating/Prioritizing

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p.230). Philadelphia: Saunders.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p 1024). St Louis: Mosby.

#### 104. 1

**Rationale:** After adding a medication to a bag of IV solution, the nurse should agitate or rotate the bag gently to mix the medication evenly in the solution. The nurse should then attach a completed medication label. The nurse can then prime the tubing. The IV solution should have been checked for discoloration before the medication was added to the solution. The tubing is attached to the client last.

**Test-Taking Strategy:** Note the strategic words *immediately after injecting*. They imply a correct time sequence, and you need to prioritize. Visualize and think through the steps of adding medication to an IV bag, and make your choice accordingly. Review the procedure for adding potassium chloride to an IV bag if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**References:** Edmunds, M. (2010). *Introduction to clinical pharmacology* (6th ed., p. 119). St. Louis: Mosby.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 756). St. Louis: Mosby.

#### 105. 4

**Rationale:** Circulatory (fluid) overload is a complication of intravenous therapy. Signs include rapid breathing, dyspnea, a moist cough, and crackles. When circulatory overload is present, the client's blood pressure also increases. Hematoma is characterized by ecchymosis, swelling, and leakage at the IV insertion site, as well as hard and painful lumps at the site. Air embolism is characterized by tachycardia, dyspnea, hypotension, cyanosis, and decreased level of consciousness. Systemic infection is characterized by chills, fever, malaise, headache, nausea, vomiting, backache, and tachycardia.

**Test-Taking Strategy:** Focus on the data in the question. Noting that the client is experiencing rapid breathing and is coughing will assist in directing you to the correct option. Review the signs of circulatory overload if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Critical Care

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 230). St. Louis: Saunders.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p 1024). St Louis: Mosby.

#### 106. 3

**Rationale:** An infiltrated IV is one that has dislodged from the vein and is lying in subcutaneous tissue. Pallor, coolness, and swelling are the results of IV fluid being deposited in the subcutaneous tissue. When the pressure in the tissues exceeds

the pressure in the tubing, the flow of the IV solution will stop. The corrective action is to remove the catheter and start a new IV line at another site. Infection, phlebitis, and thrombosis are likely to be accompanied by warmth at the site, not coolness.

**Test-Taking Strategy:** Focus on the clinical manifestations identified in the question. Noting the strategic word *cool* in the question will direct you to option 3. Remember that pallor, coolness, and swelling are signs of infiltration. Review the signs of infiltration if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**References:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 755). St. Louis: Mosby.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p 1012). St Louis: Mosby.

#### 107. 4

**Rationale:** The IV catheter has entered the lumen of the vein successfully when blood backflash shows in the IV catheter. The vein should have been distended by the tourniquet before the vein was cannulated. Client discomfort varies with the client, the site, and the nurse's insertion technique and is not a reliable measure of catheter placement. The nurse should not advance the catheter until placement in the vein is verified by blood return.

**Test-Taking Strategy:** Use the process of elimination, focusing on the subject of the question: correct placement of an IV catheter. Noting the strategic words *blood return* in option 4 will direct you to this option because a blood return is expected if the catheter is in a vein. Review the steps for inserting an IV catheter if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p 1000). St Louis: Mosby.

#### 108. 1

**Rationale:** Phlebitis at an IV site can be distinguished by client discomfort at the site and by redness, warmth, and swelling proximal to the catheter. If phlebitis occurs, the nurse should discontinue the IV line and insert a new IV line at a different site. Coolness at the site would be noted if the IV catheter was infiltrated. An allergic reaction produces a rash, redness, and itching. A major reaction, such as hypersensitivity, can cause dyspnea, a swollen tongue, and cyanosis.

**Test-Taking Strategy:** Use the process of elimination. Options 3 and 4 are comparable or alike and therefore are eliminated first. Choose option 1 over option 2 after recalling that warmth is noted with phlebitis and coolness is noted with infiltration. Review the signs and symptoms of phlebitis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 755). St. Louis: Mosby.

### 109. 1

**Rationale:** The nurse should obtain a new IV tubing because contamination has occurred and could cause systemic infection to the client. Wiping with Betadine is insufficient and is contraindicated because the tubing will be attached directly to a catheter in the client's vein. The needleless device has not been contaminated and does not need replacement or cleaning.

**Test-Taking Strategy:** Use the process of elimination and knowledge of basic infection control measures and IV therapy concepts to answer this question. Clearly, only one option is correct. Remember that if an item is contaminated, discard it and obtain a new sterile item. Review surgical aseptic technique if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., pp. 188, 742). St. Louis: Mosby.

### 110. 4

**Rationale:** A dry sterile dressing such as a sterile 2 × 2 is used to apply pressure to the discontinued IV site. This material is absorbent, sterile, and nonirritating. A Betadine swab would irritate the opened puncture site and would not stop the blood flow. An adhesive bandage or elastic wrap may be used to cover the site once hemostasis has occurred.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *applying pressure*. Visualize this procedure, thinking about each of the items identified in the options to direct you to option 4. Review the procedure for removing an IV catheter if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 770). St. Louis: Mosby.

### 111. 3

**Rationale:** Before beginning administration of IV solution, the nurse should assess whether the chest radiograph reveals that the central catheter is in the proper place. This is necessary to prevent infusion of IV fluid into pulmonary or subcutaneous tissues. The other options represent items that are useful for the nurse to be aware of in the general care of this client, but they do not relate to this procedure.

**Test-Taking Strategy:** Use the process of elimination and note the words *central venous catheter at the bedside*. Recalling the potential complications associated with the insertion of

central venous catheters will direct you to option 3. Review the principles of care for a central venous catheter after insertion if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 217, 222). St. Louis: Saunders.

Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 780). St. Louis: Mosby.

### 112. 1

**Rationale:** The goal of therapy with this client is to expand intravascular volume as quickly as possible. The 5% dextrose in lactated Ringer's (hypertonic solution) would increase intravascular volume and immediately replace lost fluid volume until a transfusion could be administered, resulting in an increase in the client's blood pressure. The solutions in options 2, 3, and 4 would not be given to this client because they are hypotonic solutions and, instead of increasing intravascular space, the solutions would move into the cells via osmosis.

**Test-Taking Strategy:** Focus on the data in the question, noting that the client requires increased intravascular volume. Recalling IV fluid types and how hypotonic and hypertonic solutions function within the intravascular space will direct you to the correct option. Review these types of IV fluids if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Critical Care

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., pp. 741–742). St. Louis: Mosby.

### 113. 4

**Rationale:** The client should be taught that only minor activity restrictions apply with this type of catheter. The client should protect the site during bathing and should carry or wear a Medic-Alert identification. The client should have a repair kit in the home for use as needed because the catheter is for long-term use.

**Test-Taking Strategy:** Note the strategic words *needs further instructions*. These words indicate a negative event query and the need to select the incorrect client statement. Recalling that the PICC is for long-term use will assist in directing you to option 4. To keep activity to a minimum with such a catheter is unreasonable. Review home care instructions for a client with a PICC if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., pp. 756, 765). St. Louis: Mosby.

**ALTERNATE ITEM FORMAT:  
MULTIPLE RESPONSE****114. 1, 2, 3, 5**

**Rationale:** Phlebitis is an inflammation of the vein that can occur from mechanical or chemical (medication) trauma or from a local infection and can cause the development of a clot (thrombophlebitis). The nurse should remove the IV at the phlebitic site and apply warm moist compresses to the area to speed resolution of the inflammation. Because phlebitis has occurred, the nurse also notifies the physician about the IV complication. The nurse should restart the IV in a vein other than the one that has developed phlebitis. Finally, the nurse documents the occurrence, actions taken, and the client's response.

**Test-Taking Strategy:** Focus on the subject: actions to take if phlebitis occurs. Recall that phlebitis is an inflammation of the vein. This will assist in eliminating option 4 because an IV should be restarted in a vein other than the one that has developed phlebitis. Review nursing interventions related to the occurrence of phlebitis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 755). St. Louis: Mosby.

**ALTERNATE ITEM FORMAT:  
FILL-IN-THE-BLANK****115. 375**

**Rationale:** If the IV is scheduled to run over 8 hours, then the hourly rate is 125 mL/hr. Using 500 mL as the reference point, the next hourly marking would be at 375 mL, which is 125 mL less than 500.

**Test-Taking Strategy:** Use basic principles related to pharmacology math and IV administration to answer this question. Subtract 125 from 500 to yield 375. If this question was difficult, review the procedure for marking an IV solution by using a time tape.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**References:** Edmunds, M. (2010). *Introduction to clinical pharmacology* (6th ed., p. 119). St. Louis: Mosby.

# Administration of Blood Products

## PYRAMID TERMS

**ABO** A type of antigen system. The ABO type of the donor should be compatible with the recipient's. Type A can match with type A or O; type B can match with type B or O; type O can match only with type O; type AB can match with type A, B, AB, or O.

**autologous donation** A donation of the client's own blood before a scheduled procedure.

**blood salvage** An autologous donation that involves suctioning blood from body cavities, joint spaces, or other closed body sites during a procedure.

**circulatory overload** A complication resulting from the infusion of blood at a rate too rapid for the size, age, cardiac status, or clinical condition of the recipient.

**compatibility** Matching of blood from two persons by two different types of antigen systems, ABO and Rh, present on the membrane surface of the red blood cells, to prevent a transfusion reaction.

**crossmatching** The testing of the donor's blood and the recipient's blood for compatibility.

**designated donor** A compatible donor who has been selected by the recipient.

**fresh-frozen plasma** A blood product administered to increase the level of clotting factors in clients with such a deficiency.

**iron overload** A delayed transfusion complication that occurs in clients who receive multiple blood transfusions, such as clients with anemia or thrombocytopenia.

**platelets** A blood product administered to clients with low platelet counts and to thrombocytopenic clients who are bleeding actively or are scheduled for an invasive procedure.

**red blood cells** A blood product used to replace erythrocytes lost as a result of trauma or surgical interventions or in clients with bone marrow suppression.

**Rh factor** Rh stands for *rhesus factor*. A person having the factor is Rh positive; a person lacking the factor is Rh negative. The presence or absence of Rh antigens on the surface of red blood cells determines the classification as Rh positive or Rh negative.

**septicemia** The presence of infective agents or their toxins in the bloodstream. Septicemia is a serious infection and must be treated promptly; otherwise, the infection leads to circulatory collapse, profound shock, and death.

**transfusion reaction** A hemolytic reaction caused by blood type or Rh incompatibility. An allergic transfusion reaction most often occurs in clients with a history of allergy. A febrile transfusion reaction most commonly occurs in clients with antibodies directed against the transfused white blood cells. A bacterial transfusion reaction occurs after transfusion of contaminated blood products.

## THE PYRAMID TO SUCCESS

Pyramid Points focus on the safe administration of blood components, managing and providing care related to the procedure for administering blood components, and monitoring for complications. Focus is on the safe procedure for administering blood products and on the signs and symptoms of transfusion reaction. Pyramid Points also focus on the immediate interventions if a transfusion reaction occurs, and evaluation and documentation of expected and unexpected effects of the therapy.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Establishing priorities of care
- Ensuring ethical practice and legal responsibilities
- Handling of hazardous and infectious materials
- Identifying the client prior to the administration of the blood product
- Implementing standard, transmission-based precautions, and surgical asepsis
- Maintaining continuity of care and providing close supervision during a blood transfusion
- Obtaining informed consent for the administration of blood products
- Upholding client rights

### Health Promotion and Maintenance

- Identifying lifestyle choices related to receiving a blood transfusion
- Providing client education about the procedure and the signs of a transfusion reaction

## Psychosocial Integrity

Ensuring therapeutic interactions with the client regarding the procedure for blood administration

Identifying religious, spiritual, and cultural considerations related to blood administration

## Physiological Integrity

Administering blood products safely

Assessing venous access devices for blood administration

Managing medical emergencies if a transfusion reaction or other complication occurs

Monitoring for complications related to blood administration

Monitoring laboratory values and documenting the client's response to receiving the blood product

### I. TYPES OF BLOOD COMPONENTS

#### A. Packed red blood cells (PRBCs)

1. **Red blood cells** are a blood product used to replace erythrocytes; infusion time for 1 unit is usually between 2 and 4 hours.
2. Each unit increases the hemoglobin level by 1 g/dL and hematocrit by 2% to 3%; the change in laboratory values takes 4 to 6 hours after completion of the blood transfusion.
3. Evaluation of an effective response is based on the resolution of the symptoms of anemia and an increase in the erythrocyte count.

 **Washed red blood cells** (depleted of plasma, platelets, and leukocytes) may be prescribed for a client with a history of allergic transfusion reactions or those who underwent hematopoietic stem cell transplant.

#### B. Platelets

1. **Platelets** are used to treat thrombocytopenia and platelet dysfunctions.
2. **Crossmatching** is not required but usually is done (platelet concentrates contain few **red blood cells**).
3. The volume in a unit of **platelets** may vary; always check the bag for the volume of the blood component (in milliliters).
4. **Platelets** are administered immediately upon receipt from the blood bank and are given rapidly, usually over 15 to 30 minutes.
5. Evaluation of an effective response is based on improvement in the platelet count, and platelet counts normally are evaluated 1 hour and 18 to 24 hours after the transfusion.

#### C. Fresh-frozen plasma

1. **Fresh-frozen plasma** may be used to provide clotting factors or volume expansion; it contains no **platelets**.
2. **Fresh-frozen plasma** is infused within 2 hours of thawing while clotting factors are still viable and is infused over a period of 15 to 30 minutes.

3. Rh **compatibility** and **ABO compatibility** are required for the transfusion of plasma products.
4. Evaluation of an effective response is assessed by monitoring coagulation studies, particularly the prothrombin time and the partial thromboplastin time, and resolution of hypovolemia.

#### D. Cryoprecipitates

1. Prepared from **fresh-frozen plasma**, cryoprecipitates can be stored for 1 year. Once thawed, the product must be used; 1 unit is administered over 15 to 30 minutes.
2. Used to replace clotting factors, especially factor VIII and fibrinogen
3. Evaluation of an effective response is assessed by monitoring coagulation studies and fibrinogen levels.

#### E. White blood cells (WBCs)

1. Used to treat a client with sepsis or a neutropenic client with an infection that is unresponsive to antibiotics
2. One unit—approximately 400 mL—is administered over 1 hour.
3. Evaluation of an effective response is assessed by monitoring the white blood cell count and differential counts.

 **Document the necessary information about the blood transfusion in the client's medical record (follow agency guidelines). Include the client's tolerance and response to the transfusion and the effectiveness of the transfusion.**

### II. TYPES OF BLOOD DONATIONS

#### A. Autologous

1. A donation of the client's own blood before a scheduled procedure is autologous; it reduces the risk of disease transmission and potential transfusion complications.
2. **Autologous donation** is not an option for a client with leukemia or bacteremia.
3. A donation can be made every 3 days as long as the hemoglobin remains within a safe range.
4. Donations should begin within 5 weeks of the transfusion date and end at least 3 days before the date of transfusion.

#### B. Blood salvage

1. **Blood salvage** is an autologous donation that involves suctioning blood from body cavities, joint spaces, or other closed body sites.
2. Blood may need to be "washed," a special process that removes tissue debris before reinfusion.

#### C. Designated donor

1. Designated donation occurs when recipients select their own compatible donors.
2. Donation does not reduce the risk of contracting infections transmitted by the blood; however, recipients feel more comfortable identifying their donors.

**TABLE 15-1** Compatibility Chart for Red Blood Cell Transfusions

|                       |    | Recipient |   |    |   |
|-----------------------|----|-----------|---|----|---|
|                       |    | A         | B | AB | O |
| D<br>o<br>n<br>o<br>r | A  | X         |   | X  |   |
|                       | B  |           | X | X  |   |
|                       | AB |           |   | X  |   |
|                       | O  | X         | X | X  | X |

The ABO type of the donor should be compatible with the recipient's. Type A can receive from type A or O; type B from type B or O; type AB can receive from type A, B, AB, or O; type O only from type O.

From Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed.). St. Louis: Saunders.

### III. COMPATIBILITY (Table 15-1)

-  **A.** Client (the recipient) blood samples are drawn and labeled at the client's bedside at the time the blood sample is drawn; the client is asked to state his or her name, which is compared with the name on the client's identification band or bracelet.
- B.** The recipient's **ABO** type and Rh type are identified.
- C.** An antibody screen is done to determine the presence of antibodies other than anti-A and anti-B.
- D.** **Crossmatching** is done, in which donor **red blood cells** are combined with the recipient's serum and Coombs' serum; the crossmatch is compatible if no red blood cell agglutination occurs.
-  **E.** The universal red blood cell donor is O negative; the universal recipient is AB positive.

 The donor's blood and the recipient's blood must be tested for compatibility. If the blood is not compatible, a life-threatening transfusion reaction can occur.

### IV. INFUSION CONTROLLERS AND PUMPS

- A.** Infusion controllers and pumps may be used to administer blood products if they are designed to function with opaque solutions; special intravenous tubing is used specifically for blood products to prevent hemolysis of **red blood cells**.
-  **B.** Always consult manufacturer guidelines for how to use the controller or pump.
- C.** Special manual pressure cuffs designed specifically for blood product administration may be used to increase the flow rate, but it should not exceed 300 mm Hg.
-  **D.** Standard sphygmomanometer cuffs are not to be used to increase the flow rate because they do not exert uniform pressure against all parts of the bag.

### V. BLOOD WARMERS

- A.** Blood warmers may be used to prevent hypothermia and adverse reactions when several units of blood are being administered.

- B.** Special warmers have been designed for this purpose, and only devices specifically approved for this use can be used.

 If blood warming is necessary use only warming devices specifically designed and approved for warming blood products. Do not warm blood products in a microwave oven or in hot water.

### VI. PRECAUTIONS AND NURSING RESPONSIBILITIES (Box 15-1)

 Check the client's identity before administering a blood product. Be sure to check the physician's prescription, that the client has an appropriate venous access site, that crossmatching procedures have been completed, that an informed consent has been obtained, and that the correct client is receiving the correct type of blood.

### VII. COMPLICATIONS (Box 15-2)

- A.** Transfusion reactions 
  1. Description
    - a.** A **transfusion reaction** is an adverse reaction that happens as a result of receiving a blood transfusion
    - b.** Types of transfusion reactions include hemolytic, allergic, febrile or bacterial reactions (**septicemia**), or transfusion-associated graft-versus-host disease (GVHD).
  2. Signs of an immediate **transfusion reaction** 
    - a.** Chills and diaphoresis
    - b.** Muscle aches, back pain, or chest pain
    - c.** Rashes, hives, itching, and swelling
    - d.** Rapid, thready pulse
    - e.** Dyspnea, cough, or wheezing
    - f.** Pallor and cyanosis
    - g.** Apprehension
    - h.** Tingling and numbness
    - i.** Headache
    - j.** Nausea, vomiting, abdominal cramping, and diarrhea
  3. Signs of a **transfusion reaction** in an unconscious client 
    - a.** Weak pulse
    - b.** Fever
    - c.** Tachycardia or bradycardia
    - d.** Hypotension
    - e.** Visible hemoglobinuria
    - f.** Oliguria or anuria
  4. Delayed transfusion reactions
    - a.** Reactions can occur days to years after a transfusion.
    - b.** Signs include fever, mild jaundice, and a decreased hematocrit level.

 Stay with the client for the first 15 minutes of the infusion of the blood and monitor the client for signs and symptoms of a transfusion reaction; the first 15 minutes of the transfusion are the most critical, and the nurse must stay with the client.

## Box 15-1 Precautions and Nursing Responsibilities

### General Precautions

A large volume of refrigerated blood infused rapidly through a central venous catheter into the ventricle of the heart can cause cardiac dysrhythmias.

No solution other than normal saline should be added to blood components.

Medications are never added to blood components or piggybacked into a blood transfusion.

To avoid the risk of septicemia, infusions (1 unit) should not exceed prescribed time for administration (2 to 4 hours for packed red blood cells); follow evidence-based practice guidelines and agency procedure.

The blood administration set should be changed with each unit of blood, or according to agency policy, to reduce the risk of septicemia.

Check the blood bag for the date of expiration; components expire at midnight on the day marked on the bag unless otherwise specified.

Inspect the blood bag for leaks, abnormal color, clots, and bubbles.

Blood must be administered as soon as possible (within 20 to 30 minutes) from its being received from the blood bank, because this is the maximal allowable time out of monitored storage.

Never refrigerate blood in refrigerators other than those used in blood banks; if the blood is not administered within 20 to 30 minutes, return it to the blood bank.

The recommended rate of infusion varies with the blood component being transfused and depends on the client's condition; generally blood is infused as quickly as the client's condition allows.

Components containing few red blood cells and platelets may be infused rapidly, but caution should be taken to avoid circulatory overload.

The nurse should measure vital signs and assess lung sounds before the transfusion and again after the first 15 minutes and every hour until 1 hour after the transfusion is completed.

### Blood Bank Precautions

Blood will be released from the blood bank only to personnel specified by agency policy.

The name and identification number of the intended recipient must be provided to the blood bank, and a documented permanent record of this information must be maintained.

Blood should be transported from the blood bank to only one client at a time to prevent blood delivery to the wrong client.

### Client Identity and Compatibility

Check the physician's prescription for the administration of the blood product.

The most critical phase of the transfusion is confirming product compatibility and verifying client identity.

Two licensed nurses need to check the physician's prescription, the client's identity, and the client's identification band or bracelet and number, verifying that the name

and number are identical to those on the blood component tag.

At the bedside, the nurse asks the client to state his or her name, and the nurse compares the name with the name on the identification band or bracelet.

The nurse checks the blood bag tag, label, and blood requisition form to ensure that ABO and Rh types are compatible.

If the nurse notes any inconsistencies when verifying client identity and compatibility, the nurse notifies the blood bank immediately.

### Client Assessment

Assess for any cultural or religious beliefs regarding blood transfusions.

A Jehovah's Witness cannot receive blood or blood products; this group believes that blood transfusions have eternal consequences.

Ensure that an informed consent has been obtained.

Explain the procedure to the client and determine whether the client has ever received a blood transfusion or experienced any previous reactions to blood transfusions.

Check the client's vital signs; assess renal, circulatory, and respiratory status and the client's ability to tolerate intravenously administered fluids.

If the client's temperature is elevated, notify the physician before beginning the transfusion; a fever may be a cause for delaying the transfusion in addition to masking a possible symptom of an acute transfusion reaction.

### Administration of the Transfusion

Maintain standard and transmission-based precautions and surgical asepsis as necessary.

Insert an intravenous (IV) line and infuse normal saline; maintain the infusion at a keep-vein-open rate.

An 18- or 19-gauge IV needle will be needed to achieve a maximum flow rate of blood products and prevent damage to red blood cells; if a smaller gauge needle must be used, red blood cells may be diluted with normal saline (check agency procedure).

A central venous catheter is an acceptable venous access option for blood transfusions; for a multilumen catheter, use the largest catheter port available or check the port size to ensure that it is adequate for blood administration.

Always check the bag for the volume of the blood component.

Blood products should be infused through administration sets designed specifically for blood; use a Y-tubing or straight tubing blood administration set that contains a filter designed to trap fibrin clots and other debris that accumulate during blood storage (Fig. 15-1).

Premedicate the client with acetaminophen (Tylenol) or diphenhydramine (Benadryl), as prescribed, if the client has a history of adverse reactions; if prescribed, oral medications should be administered 30 minutes before the transfusion is started, and intravenously administered medications may be given immediately before the transfusion is started.

### Box 15-1 Precautions and Nursing Responsibilities—cont'd

▲ **FIGURE 15-1** Tubing for blood administration has an in-line filter. (From Potter, P., & Perry, A. [2009]. *Fundamentals of nursing* [7th ed.]. St. Louis: Mosby.)

Instruct the client to report anything unusual immediately. Determine the rate of infusion by the physician's prescription or, if not specified, by agency policy.

Begin the transfusion slowly under close supervision; if no reaction is noted within the first 15 minutes, the flow can be increased to the prescribed rate.

During the transfusion, monitor the client for signs and symptoms of a transfusion reaction; the first 15 minutes of the transfusion are the most critical, and the nurse must stay with the client.

If a major ABO incompatibility exists or a severe allergic reaction occurs, the reaction is usually evident within the first 50 mL of the transfusion.

Document the client's tolerance to the administration of the blood product.

Monitor appropriate laboratory values and document effectiveness of treatment related to the specific type of blood product.

#### Reactions to the Transfusion

If a transfusion reaction occurs, stop the transfusion, change the IV tubing down to the IV site, keep the IV line open with normal saline, notify the physician and blood bank, and return the blood bag and tubing to the blood bank.

Do not leave the client alone, and monitor the client for any life-threatening symptoms.

Obtain appropriate laboratory samples according to agency policies, such as blood and urine samples (free hemoglobin indicates that red blood cells were hemolyzed).

### Box 15-2 Complications of a Blood Transfusion

|                       |                      |
|-----------------------|----------------------|
| Transfusion reactions | Disease transmission |
| Circulatory overload  | Hypocalcemia         |
| Septicemia            | Hyperkalemia         |
| Iron overload         |                      |

#### PRIORITY NURSING ACTIONS

##### Actions to Take in the Care of a Client Experiencing a Transfusion Reaction

1. Stop the transfusion.
2. Change the intravenous (IV) tubing down to the IV site and keep the IV line open with normal saline.
3. Notify the physician and blood bank.
4. Stay with the client, observing signs and symptoms and monitoring vital signs as often as every 5 minutes.
5. Prepare to administer emergency medications as prescribed.
6. Obtain a urine specimen for laboratory studies (perform any other laboratory studies as prescribed).
7. Return blood bag, tubing, attached labels, and transfusion record to the blood bank.
8. Document the occurrence, actions taken, and the client's response.

If the client exhibits signs of a transfusion reaction, the nurse immediately stops the transfusion and changes the IV tubing down to the IV site to prevent the entrance of additional blood solution into the client. Normal saline solution is hung and infused to keep the IV line open in the event that emergency medications need to be administered. The physician is notified and the nurse also notifies the blood bank of the occurrence. The nurse stays with the client and monitors the client closely while other personnel obtain needed supplies to treat the client. As prescribed by the physician, the nurse administers emergency medications. The nurse then obtains a urine specimen for laboratory studies and any other laboratory studies as prescribed to check for free hemoglobin indicating that red blood cells were hemolyzed. The blood bag, tubing, attached labels, and transfusion record are returned to the blood bank so that the blood bank can check the items to determine the reason that the reaction occurred. Finally the nurse documents the occurrence, actions taken, and the client's response.

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed.). St. Louis: Mosby.

5. Interventions (see Priority Nursing Actions above)
  - a. Stop the transfusion.
  - b. Keep the intravenous line open with 0.9% (normal) saline.
  - c. Notify the physician and blood bank.
  - d. Remain with the client, observing signs and symptoms and monitoring vital signs as often as every 5 minutes.

- e. Prepare to administer emergency medications such as antihistamines, vasopressors, fluids, and corticosteroids, as prescribed.
- f. Obtain a urine specimen for laboratory studies (perform any other laboratory studies as prescribed).
- g. Return blood bag, tubing, attached labels, and transfusion record to the blood bank.

 Stop the transfusion immediately if a blood transfusion reaction is suspected.

### B. Circulatory overload

1. Description: Caused by the infusion of blood at a rate too rapid for the client to tolerate
2. Assessment
  - a. Cough, dyspnea, chest pain, and wheezing on auscultation of the lungs
  - b. Headache
  - c. Hypertension
  - d. Tachycardia and a bounding pulse
  - e. Distended neck veins
3. Interventions
  - a. Slow the rate of infusion.
  - b. Place the client in an upright position, with the feet in a dependent position.
  - c. Notify the physician.
  - d. Administer oxygen, diuretics, and morphine sulfate, as prescribed.
  - e. Monitor for dysrhythmias.
  - f. Phlebotomy also may be a method of prescribed treatment in a severe case.

 Immediately slow the rate of infusion and place the client in an upright position, with the feet in a dependent position, if circulatory overload is suspected.

### C. Septicemia

1. Description: Occurs with the transfusion of blood that is contaminated with microorganisms
2. Assessment
  - a. Rapid onset of chills and a high fever
  - b. Vomiting
  - c. Diarrhea
  - d. Hypotension
  - e. Shock
3. Interventions
  - a. Notify the physician.
  - b. Obtain blood cultures and cultures of the blood bag.
  - c. Administer oxygen, intravenous fluids, antibiotics, vasopressors, and corticosteroids prescribed.

### D. Iron overload

1. Description: A delayed transfusion complication that occurs in clients who receive multiple blood

transfusions, such as clients with anemia or thrombocytopenia

2. Assessment
  - a. Vomiting
  - b. Diarrhea
  - c. Hypotension
  - d. Altered hematological values
3. Interventions
  - a. Deferoxamine (Desferal), administered intravenously or subcutaneously, removes accumulated iron via the kidneys.
  - b. Urine turns red as iron is excreted after the administration of deferoxamine; treatment is discontinued when serum iron levels return to normal.

 Contact the physician immediately if a transfusion reaction or a complication of blood administration arises.

### E. Disease transmission

1. A disease most commonly transmitted is hepatitis C, which is manifested by anorexia, nausea, vomiting, dark urine, and jaundice; the symptoms usually occur within 4 to 6 weeks after the transfusion.
2. Other infectious agents and diseases transmitted by blood transfusion include hepatitis B virus, human immunodeficiency virus, human herpesvirus type 6, Epstein-Barr virus, human T-cell leukemia, cytomegalovirus, and malaria.
3. Donor screening has greatly reduced the risk of transmission of infectious agents; additionally, antibody testing of donors for human immunodeficiency virus has greatly reduced the risk of transmission.

### F. Hypocalcemia

1. Citrate in transfused blood binds with calcium and is excreted.
2. Assess serum calcium level before and after the transfusion.
3. Monitor for signs of hypocalcemia (hyperactive reflexes, paresthesias, tetany, muscle cramps, positive Trousseau's sign, positive Chvostek's sign).
4. Slow the transfusion and notify the physician if signs of hypocalcemia occur.

### G. Hyperkalemia

1. Stored blood liberates potassium through hemolysis.
2. The older the blood, the greater the risk of hyperkalemia; therefore clients at risk for hyperkalemia, such as those with renal insufficiency or renal failure, should receive fresh blood.
3. Assess the date on the blood and the serum potassium level before and after the transfusion.
4. Monitor the potassium level and for signs of hyperkalemia (paresthesias, weakness, abdominal cramps, diarrhea, and dysrhythmias).

5. Slow the transfusion and notify the physician if signs of hyperkalemia occur.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 116.** Packed red blood cells have been prescribed for a client with low hemoglobin and hematocrit levels. The nurse takes the client's temperature before hanging the blood transfusion and records 100.6° F orally. Which of the following is the appropriate nursing action?
1. Begin the transfusion as prescribed.
  2. Delay hanging the blood and notify the physician.
  3. Administer an antihistamine and begin the transfusion.
  4. Administer two tablets of acetaminophen (Tylenol) and begin the transfusion.
- 117.** The nurse has received a prescription to transfuse a client with a unit of packed red blood cells. Before explaining the procedure to the client, the nurse asks which initial question?
1. "Have you ever had a transfusion before?"
  2. "Why do you think that you need the transfusion?"
  3. "Have you ever gone into shock for any reason in the past?"
  4. "Do you know the complications and risks of a transfusion?"
- 118.** A client receiving a transfusion of packed red blood cells (PRBCs) begins to vomit. The client's blood pressure is 90/50 mm Hg from a baseline of 125/78 mm Hg. The client's temperature is 100.8° F orally from a baseline of 99.2° F orally. The nurse determines that the client may be experiencing which complication of a blood transfusion?
1. Septicemia
  2. Hyperkalemia
  3. Circulatory overload
  4. Delayed transfusion reaction
- 119.** The nurse determines that a client is having a transfusion reaction. After the nurse stops the transfusion, which action should immediately be taken next?
1. Remove the intravenous (IV) line.
  2. Run a solution of 5% dextrose in water.
  3. Run normal saline at a keep-vein-open rate.
  4. Obtain a culture of the tip of the catheter device removed from the client.
- 120.** The nurse has just received a unit of packed red blood cells from the blood bank for transfusion to an assigned client. The nurse is careful to select tubing especially made for blood products, knowing that this tubing is manufactured with:
1. An air vent.
  2. An in-line filter.
  3. A microdrip chamber.
  4. Tinted tubing to protect the blood from light.
- 121.** A client has received a transfusion of platelets. The nurse evaluates that the client is benefiting most from this therapy if the client exhibits which of the following?
1. Increased hematocrit level
  2. Increased hemoglobin level
  3. Decline of elevated temperature to normal
  4. Decreased oozing of blood from puncture sites and gums
- 122.** The nurse has obtained a unit of blood from the blood bank and has checked the blood bag properly with another nurse. Just before beginning the transfusion, the nurse assesses which priority item?
1. Vital signs
  2. Skin color
  3. Urine output
  4. Latest hematocrit level
- 123.** The nurse has just received a prescription to transfuse a unit of packed red blood cells for an assigned client. Approximately how long will the nurse need to stay with the client to ensure that a transfusion reaction is not occurring?
1. 5 minutes
  2. 15 minutes
  3. 30 minutes
  4. 45 minutes
- 124.** A client has a prescription to receive a unit of packed red blood cells. The nurse should obtain which of the following intravenous (IV) solutions from the IV storage area to hang with the blood product at the client's bedside?
1. Lactated Ringer's
  2. 0.9% sodium chloride
  3. 5% dextrose in 0.9% sodium chloride
  4. 5% dextrose in 0.45% sodium chloride
- 125.** The nurse listening to morning report learns that an assigned client received a unit of granulocytes the previous evening. The nurse makes a note to assess the results of which of the following daily serum laboratory studies to assess the effectiveness of the transfusion?
1. Hematocrit level
  2. Erythrocyte count
  3. Hemoglobin level
  4. White blood cell count

- 126.** A client is brought to the emergency department having experienced blood loss related to an arterial laceration. Fresh-frozen plasma is prescribed and transfused to replace fluid and blood loss. The nurse understands that the rationale for transfusing fresh-frozen plasma in this client is:
1. To treat the loss of platelets
  2. To promote rapid volume expansion
  3. That the transfusion must be done slowly
  4. That it will increase the hemoglobin and hematocrit levels
- 127.** The nurse who is about to begin a blood transfusion knows that blood cells start to deteriorate after a certain period of time. Which of the following items is important to check regarding the age of blood cells before the transfusion is begun?
1. Expiration date
  2. Presence of clots
  3. Blood group and type
  4. Blood identification number
- 128.** A client requiring surgery is anxious about the possible need for a blood transfusion during or after the procedure. The nurse suggests to the client to do which of the following to reduce the risk of possible transfusion complications?
1. Give an autologous blood donation before the surgery.
  2. Ask a friend or family member to donate blood ahead of time.
  3. Take iron supplements before surgery to boost hemoglobin levels.
  4. Request that any donated blood be screened twice by the blood bank.
- 129.** A client with severe blood loss resulting from multiple trauma requires rapid transfusion of several units of blood. The nurse asks another health team member to obtain which device for use during the transfusion procedure to help reduce the risk of cardiac dysrhythmias?
1. Pulse oximetry
  2. Cardiac monitor
  3. Infusion controller
  4. Blood-warming device

### Alternate Item Format: Prioritizing (Ordered Response)

- 130.** A unit of packed red blood cells has been prescribed for a client with low hemoglobin and hematocrit levels. The nurse notifies the blood bank of the prescription, and a blood specimen is drawn from the client for typing and cross-matching. The nurse receives a telephone call from the blood bank and is informed that the unit of blood is ready for administration. Number the actions in order of priority that the nurse should take to administer the blood. (Number 1 is the first action and number 6 is the last action.)
- \_\_\_\_\_ Hang the bag of blood.
- \_\_\_\_\_ Obtain the unit of blood from the blood bank.
- \_\_\_\_\_ Ensure that an informed consent has been signed.
- \_\_\_\_\_ Insert an 18- or 19- gauge intravenous catheter into the client.
- \_\_\_\_\_ Verify the physician's prescription for the blood transfusion.
- \_\_\_\_\_ Ask a licensed nurse to assist in confirming blood compatibility and verifying client identity.

## ANSWERS

### 116. 2

**Rationale:** If the client has a temperature higher than 100° F, the unit of blood should not be hung until the physician is notified and has the opportunity to give further prescriptions. The physician likely will prescribe that the blood be administered regardless of the temperature, but the decision is not within the nurse's scope of practice to make. The nurse needs a physician's prescription to administer medications to the client.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1, 3, and 4 because they all indicate beginning the transfusion. Additionally, options 3 and 4 indicate administering medication to the client, which is not done without a physician's prescription. Review the nursing responsibilities before administering a blood transfusion if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., pp. 788, 791). St. Louis: Mosby.

### 117. 1

**Rationale:** Asking the client about personal experience with transfusion therapy provides a good starting point for client teaching about this procedure. Options 3 and 4 are not helpful because they may elicit a fearful response from the client. Although determining whether the client knows the reason for the transfusion is important, option 2 is not an appropriate statement in terms of eliciting information from the client regarding an understanding of the need for the transfusion.

**Test-Taking Strategy:** Use the process of elimination and note that the strategic words in the question are *initial question*. This tells you that the correct option is the best starting point for discussion about the transfusion therapy. Options 3 and 4 have emotionally laden trigger words, including *gone into shock*

and *risks*, respectively, which make them incorrect. From the remaining options, focus on the strategic words and use therapeutic communication techniques to direct you to option 1. Review pretransfusion assessment procedures if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 788). St. Louis: Mosby.

### 118. 1

**Rationale:** Septicemia occurs with the transfusion of blood contaminated with microorganisms. Signs include chills, fever, vomiting, diarrhea, hypotension, and the development of shock. Hyperkalemia causes weakness, paresthesias, abdominal cramps, diarrhea, and dysrhythmias. Circulatory overload causes cough, dyspnea, chest pain, wheezing, tachycardia, and hypertension. A delayed transfusion reaction can occur days to years after a transfusion. Signs include fever, mild jaundice, and a decreased hematocrit level.

**Test-Taking Strategy:** Focus on the data in the question. Noting that the client's temperature is elevated will direct you to option 1. Review the signs of complications of a blood transfusion and the indications of septicemia if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 2013, 2015). St. Louis: Saunders.

### 119. 3

**Rationale:** If the nurse suspects a transfusion reaction, the nurse stops the transfusion and infuses normal saline at a keep-vein-open rate pending further physician prescriptions. This maintains a patent IV access line and aids in maintaining the client's intravascular volume. The nurse would not remove the IV line because then there would be no IV access route. Obtaining a culture of the tip of the catheter device removed from the client is incorrect. First, the catheter should not be removed. Second, cultures are performed when infection, not transfusion reaction, is suspected. Normal saline is the solution of choice over solutions containing dextrose because saline does not cause red blood cells to clump.

**Test-Taking Strategy:** Note the strategic word *next*. Knowing that the IV should not be removed assists in eliminating options 1 and 4. Recalling that normal saline, not dextrose, is used when administering a unit of blood will direct you to option 3. Review care for the client experiencing a transfusion reaction if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Delegating/Prioritizing

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., pp. 795–796). St. Louis: Mosby.

### 120. 2

**Rationale:** The tubing used for blood administration has an in-line filter. The filter helps ensure that any particles larger than the size of the filter are caught in the filter and are not infused into the client. The tubing should be macrodrip, not microdrip, to allow blood to flow freely through the drip chamber. An air vent is unnecessary because the blood bag is not made of glass. Option 4 is incorrect because blood does not need to be protected from light.

**Test-Taking Strategy:** Use the process of elimination. Read each option carefully and visualize the process of blood administration. Remember that tubing used for blood administration has an in-line filter. Review concepts related to tubing used for blood administration if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 918). St. Louis: Saunders.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1022). St. Louis: Mosby.

### 121. 4

**Rationale:** Platelets are necessary for proper blood clotting. The client with insufficient platelets may exhibit frank bleeding or oozing of blood from puncture sites, wounds, and mucous membranes. Increased hemoglobin and hematocrit levels would occur when the client has received a transfusion of red blood cells. An elevated temperature would decline to normal after infusion of granulocytes if those cells were instrumental in fighting infection in the body.

**Test-Taking Strategy:** Use knowledge regarding the potential uses and benefits of the various types of blood product transfusions. Eliminate options 1 and 2 first because they are comparable or alike. From the remaining options, recalling that platelets are necessary for proper blood clotting will direct you to option 4. If this question was difficult, review the types of blood products available for transfusion and their indications for use.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 920). St. Louis: Saunders.

### 122. 1

**Rationale:** A change in vital signs during the transfusion from baseline may indicate that a transfusion reaction is occurring. This is why the nurse assesses vital signs before the procedure and again after the first 15 minutes. The other options do not identify assessments that are a priority just before beginning a transfusion.

**Test-Taking Strategy:** Note the strategic words *just before beginning the transfusion* and *priority*. This tells you that more than one of the options may be partially or totally correct

and that the correct option needs to be assessed for possible comparison during the transfusion. Use the ABCs—airway, breathing, and circulation—to direct you to option 1. Review the nursing interventions for preparing to administer a blood transfusion if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 787). St. Louis: Mosby.

### 123. 2

**Rationale:** The nurse must remain with the client for the first 15 minutes of a transfusion, which is usually when a transfusion reaction may occur. This enables the nurse to detect a reaction and intervene quickly. The nurse engages in safe nursing practice by obtaining coverage for the other assigned clients during this time. Therefore options 1, 3, and 4 are incorrect time frames.

**Test-Taking Strategy:** Use knowledge regarding blood transfusion procedures to answer this question. Remember that the client must be monitored directly for the first 15 minutes of the transfusion. Review the nursing responsibilities involved in beginning a blood transfusion if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 918). St. Louis: Saunders.

### 124. 2

**Rationale:** Sodium chloride 0.9% (normal saline) is a standard isotonic solution used to precede and follow infusion of blood products. Dextrose is not used because it could result in clumping and subsequent hemolysis of red blood cells. Lactated Ringer's is not the solution of choice with this procedure.

**Test-Taking Strategy:** Use the process of elimination and eliminate options 3 and 4 first because they are comparable or alike in that both solutions contain dextrose. From the remaining options, remember that normal saline is the solution compatible with red blood cells. If this question was difficult, review the procedures related to the administration of blood.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 796). St. Louis: Mosby.

### 125. 4

**Rationale:** The client who has neutropenia may receive a transfusion of granulocytes, or white blood cells. These clients

often have severe infections and are unresponsive to antibiotic therapy. The nurse notes the results of follow-up white blood cell counts to evaluate the effectiveness of the therapy. The nurse also continues to monitor the client for signs and symptoms of infection. Erythrocyte count and hemoglobin and hematocrit levels are determined after transfusion of packed red blood cells.

**Test-Taking Strategy:** Use the process of elimination. Recalling that granulocytes are a component of white blood cells will assist in directing you to option 4. In addition, note that options 1, 2, and 3 are comparable or alike in that these options all refer to erythrocytes. Review the types of blood products and their indications for use if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 920). St. Louis: Saunders.

### 126. 2

**Rationale:** Fresh-frozen plasma is often used for volume expansion as a result of fluid and blood loss. It does not contain platelets, so it is not used to treat any type of low platelet count disorder. It is rich in clotting factors and can be thawed quickly and transfused quickly. It will not specifically increase the hemoglobin and hematocrit level.

**Test-Taking Strategy:** Focus on the data in the question. Note the relationship between the words *experienced blood loss* and option 2. Review the purpose and use for fresh-frozen plasma if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 917). St. Louis: Saunders.

Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 790). St. Louis: Mosby.

### 127. 1

**Rationale:** The nurse notes the expiration date on the unit of blood to ensure that the blood is fresh. Blood cells begin to deteriorate over time, so safe storage usually is limited to 35 days. Careful notation of the expiration date by the nurse is an essential part of the verification process before hanging a unit of blood. The nurse also notes the blood identification (unit) number, blood group and type, and client's name. The nurse also inspects the unit of blood for leaks, abnormal color, clots, and bubbles and returns the unit to the blood bank if clots are noted.

**Test-Taking Strategy:** Use the process of elimination and note that the strategic word in this question is *deteriorate*. To answer this question correctly, you must know which part of the pretransfusion verification procedure relates to the

freshness of the unit of blood. Keeping this in mind should direct you to option 1. Review the procedure for checking blood if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 919). St Louis: Saunders.

### 128. 1

**Rationale:** A donation of the client's own blood before a scheduled procedure is autologous. Donating autologous blood to be reinfused as needed during or after surgery reduces the risk of disease transmission and potential transfusion complications. The next most effective way is to ask a family member to donate blood before surgery. Blood banks do not provide extra screening on request. Preoperative iron supplements are helpful for iron deficiency anemia but are not helpful in replacing blood lost during the surgery.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject, reducing the risk of possible transfusion complications. Recalling that an autologous transfusion is the collection of the client's own blood will direct you to option 1. Review the information related to disease transmission and blood donation procedures if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 786). St. Louis: Mosby.

### 129. 4

**Rationale:** If several units of blood are to be administered, a blood warmer should be used. Rapid transfusion of cool blood places the client at risk for cardiac dysrhythmias. To prevent this, the nurse warms the blood using a blood-warming device. Pulse oximetry and cardiac monitoring equipment are useful for the early assessment of complications but do not reduce the occurrence of cardiac dysrhythmias. Electronic infusion devices are not helpful in this case because the infusion must be rapid, and infusion devices generally are used to control the flow rate. In addition, not all infusion devices are made to handle blood or blood products.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *rapid* and *reduce the risk*. These words tell you that the infusions will infuse quickly and that the correct option is the one that will minimize the risk of cardiac dysrhythmias. Eliminate options 1 and 2 first because these items are used to assess for rather than reduce the risk of complications. From the remaining options, use knowledge related to the complications of transfusion therapy and note the relationship between the words *several units of blood* in

the question and *blood warming device* in the correct option. Review the concepts related to the use of a blood warmer if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**References:** Ackley, B., Ladwig, G., Swan, B., & Tucker, S. (2008). *Evidence-based nursing care guidelines: Medical-surgical interventions* (p. 110). St. Louis: Mosby.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1023). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: PRIORITIZING (ORDERED RESPONSE)

### 130. 6, 4, 2, 3, 1, 5

**Rationale:** The nurse would first verify the physician's prescription for the blood transfusion and ensure that the client has been informed about the procedure and has signed an informed consent. Once this has been done, the nurse would ensure that at least an 18- or 19-gauge intravenous needle is inserted into the client. Blood has a thicker and stickier consistency than intravenous solutions, and using an 18- or 19-gauge catheter ensures that the bore of the catheter is large enough to prevent damage to the blood cells. Next, the blood is obtained from the blood bank, once the nurse is sure that the client has been informed and has an adequate access for administering the blood. Once the blood has been obtained, two registered nurses, or one registered and a licensed practical nurse (depending on agency policy), must together check the label on the blood product against the client's identification number, blood group, and complete name. This minimizes the risk of error in checking information on the blood bag and thereby minimizes the risk of harm or injury to the client. The nurse should measure vital signs and assess lung sounds and then hang the transfusion.

**Test-Taking Strategy:** Remember that a physician's prescription is needed for treatments and procedures. This will direct you to the first nursing action. Recalling that the client needs to be informed about a procedure will assist in determining that the next action would be to ensure that the client has signed a consent form. Next, remember that client preparation for the procedure is important. You would not obtain the blood from the blood bank unless the client was prepared; therefore the nurse would ensure that the client had an adequate intravenous access. Once blood is obtained, remember that verifying compatibility and client identity is critical before hanging the blood. Review the procedure for administering blood if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Delegating/Prioritizing

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 791). St. Louis: Mosby.

# UNIT IV

## Fundamental Skills

# Provision of a Safe Environment

## PYRAMID TERMS

**home safety** Removing items from the home environment and avoiding situations or events that place the client at risk for accident or injury.

**health care–associated (nosocomial) infections** Infections acquired in the hospital or other health care facility that were not present or incubating at the time of the client’s admission; also referred to as hospital-acquired infections.

**physical hazards** Any situation or event that places the client at risk for accident, injury, or death.

**restraints (safety devices)** Physical devices (that the client is unable to remove) applied to restrict a client’s movement are known as *physical restraints*. Medications given to inhibit a specific behavior or movement are known as *chemical restraints*.

**poison** Any substance that impairs health or destroys life when ingested, inhaled, or otherwise absorbed by the body.

**standard precautions** Guidelines used by all health care providers for all clients to reduce the risk of infection for clients and caregivers.

**transmission-based precautions** Guidelines used in addition to standard precautions for specific syndromes that are highly suggestive of infections until a diagnosis is confirmed.

**warfare agent** Biological or chemical substance that can cause mass destruction or fatality.

## THE PYRAMID TO SUCCESS

Safety and Infection Control is a subcategory of the Client Needs component, Safe and Effective Care Environment, of the NCLEX-RN examination test plan. Pyramid Points focus on safety measures, maintaining environmental safety in the home, preventing accidents, using safety devices, emergency response plans, priority nursing actions in the event of a disaster, and biological and chemical warfare agents. Pyramid Points also focus on standard and transmission-based precautions and the measures required to handle hazardous or infectious materials.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Emergency response plan and biological and chemical warfare agents
- Ensuring that client’s rights are upheld, including informed consent
- Establishing priorities
- Following guidelines regarding the use of safety devices
- Handling hazardous and infectious materials safely
- Maintaining precautions to prevent errors, accidents, and injury
- Using ergonomic principles
- Using standard and transmission-based precautions and surgical asepsis procedures

### Health Promotion and Maintenance

- Assisting clients and families to identify environmental hazards in the home
- Performing home safety assessments
- Teaching clients and families about accident prevention
- Teaching clients and families about measures to be implemented in an emergency or disaster
- Teaching clients and families about preventing the spread of infection

### Psychosocial Integrity

- Assessing the client for sensory and perceptual alterations
- Identifying cultural and religious lifestyles
- Identifying support systems

### Physiological Integrity

- Assisting the client with activities of daily living
- Implementing priority nursing actions in an emergency or disaster
- Managing and providing care to clients with infectious diseases
- Providing comfort and assistance to the client
- Using assistive devices to prevent injury

### PRIORITY NURSING ACTIONS!

#### Actions to Take in the Event of a Fire

1. Rescue clients who are in immediate danger.
2. Activate the fire alarm.
3. Confine the fire.
4. Extinguish the fire: obtain the fire extinguisher.
5. Pull the pin on the fire extinguisher.
6. Aim at the base of the fire.
7. Squeeze the extinguisher handle.
8. Sweep extinguisher from side to side to coat the area of the fire evenly.

Remember the mnemonic *RACE* to prioritize in the event of a fire. *R* is rescue clients in immediate danger, *A* is alarm (sound the alarm), *C* is confine the fire by closing all doors, and *E* is extinguish. To properly use the fire extinguisher, remember the mnemonic *PASS* to prioritize in the use of a fire extinguisher. *P* is pull the pin, *A* is aim at the base of the fire, *S* is squeeze the handle, and *SS* is sweep from side to side to coat the area evenly.

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., pp. 839-841). St. Louis: Mosby.

### I. ENVIRONMENTAL SAFETY

-  **A. Fire safety** (see Priority Nursing Actions)
1. Keep open spaces free of clutter.
  2. Clearly mark fire exits.
  3. Know the locations of all fire alarms, exits, and extinguishers (Table 16-1; also see Priority Nursing Actions).
  4. Know the telephone number for reporting fires.
  5. Know the fire drill and evacuation plan of the agency.
  6. Never use the elevator in the event of a fire.
  7. Turn off oxygen and appliances in the vicinity of the fire.
  8. In the event of a fire, if a client is on life support, maintain respiratory status manually with an Ambu bag (resuscitation bag) until the client is moved away from the threat of the fire and can be placed back on life support.
  9. In the event of a fire, ambulatory clients can be directed to walk by themselves to a safe area and, in some cases, may be able to assist in moving clients in wheelchairs.
  10. Bedridden clients generally are moved from the scene of a fire by stretcher, their bed, or wheelchair.
  11. If a client must be carried from the area of a fire, appropriate transfer techniques need to be used.
  12. If fire department personnel are at the scene of the fire, they will help evacuate clients.

 Remember the mnemonic *RACE* to set priorities in the event of a fire and the mnemonic *PASS* to use a fire extinguisher.

**TABLE 16-1** Types of Fire Extinguishers

| Type | Class of Fire  |
|------|--|
| A    | Wood, cloth, upholstery, paper, rubbish, plastic         |
| B    | Flammable liquids or gases, grease, tar, oil-based paint |
| C    | Electrical equipment                                     |

### B. Electrical safety

1. Electrical equipment must be maintained in good working order and should be grounded; otherwise it presents a **physical hazard**.
2. Use a three-pronged electrical cord. 
3. In a three-pronged electrical cord, the third longer prong of the cord is the ground; the other two prongs carry the power to the piece of electrical equipment.
4. Check electrical cords and outlets for exposed, frayed, or damaged wires. 
5. Avoid overloading any circuit.
6. Read warning labels on all equipment; never operate unfamiliar equipment.
7. Use safety extension cords only when absolutely necessary, and tape them to the floor with electrical tape.
8. Never run electrical wiring under carpets.
9. Never pull a plug by using the cord; always grasp the plug itself.
10. Never use electrical appliances near sinks, bathtubs, or other water sources.
11. Always disconnect a plug from the outlet before cleaning equipment or appliances.
12. If a client receives an electrical shock, turn off the electricity before touching the client. 

 Any electrical equipment that the client brings into the health care facility must be inspected for safety before use.

### C. Radiation safety

1. Know the protocols and guidelines of the health care agency.
2. Label potentially radioactive material.
3. To reduce exposure to radiation, do the following: 
  - a. Limit the time spent near the source.
  - b. Make the distance from the source as great as possible.
  - c. Use a shielding device such as a lead apron.
4. Monitor radiation exposure with a film (dosimeter) badge.
5. Place the client who has a radiation implant in a private room.
6. Never touch dislodged radiation implants. 
7. Keep all linens in the client's room until the implant is removed.

### Box 16-1 Physiological Changes in Older Clients That Increase Risk of Accidents

#### Musculoskeletal Changes

Strength and function of muscles decrease.  
Joints become less mobile and bones become brittle.  
Postural changes and limited range of motion occur.

#### Nervous System Changes

Voluntary and autonomic reflexes become slower.  
Decreased ability to respond to multiple stimuli occurs.  
Decreased sensitivity to touch occurs.

#### Sensory Changes

Decreased vision and lens accommodation and cataracts develop.  
Delayed transmission of hot and cold impulses occurs.  
Impaired hearing develops, with high-frequency tones less perceptible.

#### Genitourinary Changes

Increased nocturia and occurrences of incontinence may occur.

Modified from Potter A, & Perry, P. (2009). *Fundamentals of nursing* (7th ed., p. 816). St. Louis: Mosby. (Modified from Ebersole, P., Hess, P., & Luggen, A. [2004] *Toward healthy aging* [6th ed.]. St. Louis: Mosby.)

#### D. Disposal of infectious wastes

1. Handle all infectious materials as a hazard.
2. Dispose of waste in designated areas only, using proper containers for disposal.
3. Ensure that infectious material is labeled properly.
4. Dispose of all sharps immediately after use in closed, puncture-resistant disposal containers that are leakproof and labeled or color-coded.

 **Needles (sharps) should not be recapped, bent, or broken because of the risk of accidental injury (needle stick).**

#### E. Physiological changes in the older client that increase the risk of accidents (Box 16-1)

#### F. Measures to prevent falls (Box 16-2)

#### G. Restraints (safety devices)

1. **Restraints (safety devices)** are protective devices used to limit the physical activity of a client or to immobilize a client or an extremity for safety purposes.
2. Physical **restraints** restrict client movement through the application of a device.
3. Chemical **restraints** are medications given to inhibit a specific behavior or movement.
4. Interventions
  - a. Use alternative devices whenever possible, such as pressure-sensitive beds or chair pads with alarms or other types of bed or chair alarms.

### Box 16-2 Measures to Prevent Falls

Assess the client's risk for falling.

Assign the client at risk for falling to a room near the nurses' station.

Alert all personnel to the client's risk for falling.

Assess the client frequently.

Orient the client to physical surroundings.

Instruct the client to seek assistance when getting up.

Explain the use of the call bell system.

Use safety devices such as bed or chair alarms that alert health care personnel.

Keep the bed in the low position with side rails adjusted to a safe position (follow agency policy).

Lock all beds, wheelchairs, and stretchers.

Keep clients' personal items within their reach.

Eliminate clutter and obstacles in the client's room.

Provide adequate lighting.

Reduce bathroom hazards.

Maintain the client's toileting schedule throughout the day.

- b. If safety devices are necessary, the physician's prescriptions should state the type of restraint, identify specific client behaviors for which **restraints** are to be used, and identify a limited time frame for use.
- c. Physicians' prescriptions for safety devices should be renewed within a specific time frame according to the policy of the agency.
- d. Safety devices are not to be prescribed PRN, that is, as needed.
- e. The reason for the safety device should be given to the client and the family, and their permission should be sought.
- f. Safety devices should not interfere with any treatments or affect the client's health problem.
- g. Use a half-bow or safety knot (quick release tie) to secure the device to the bed frame or chair, not to the side rails.
- h. Ensure that enough slack is on the straps to allow some movement of the body part.
- i. Assess skin integrity and neurovascular and circulatory status every 30 minutes and remove the safety device at least every 2 hours to permit muscle exercise and to promote circulation (follow agency policies).
- j. Continually assess and document the need for safety devices (Box 16-3).

 **A physician's prescription for use of a safety device is needed. Alternative measures for safety devices should always be used first.**

#### 5. Alternatives to safety devices

- a. Orient the client and family to the surroundings.

### Box 16-3 Documentation Points With Use of a Safety Device

Reason for safety device  
 Method of use for safety device  
 Date and time of application of safety device  
 Duration of use of safety device and client's response  
 Release from safety device with periodic exercise and circulatory, neurovascular, and skin assessment  
 Assessment of continued need for safety device  
 Evaluation of client's response

- b. Explain all procedures and treatments to the client and family.
- c. Encourage family and friends to stay with the client, and use sitters for clients who need supervision.
- d. Assign confused and disoriented clients to rooms near the nurses' station.
- e. Provide appropriate visual and auditory stimuli to the client, such as clocks, calendars, television, and a radio.
- f. Place familiar items, such as family pictures, near the client's bedside.
- g. Maintain toileting routines.
- h. Eliminate bothersome treatments, such as tube feedings, as soon as possible.
- i. Evaluate all medications that the client is receiving.
- j. Use relaxation techniques with the client.
- k. Institute exercise and ambulation schedules as the client's condition allows.

#### H. Poisons

1. A **poison** is any substance that impairs health or destroys life when ingested, inhaled, or otherwise absorbed by the body.
2. Specific antidotes or treatments are available only for some types of **poisons**.
3. The capacity of body tissue to recover from a **poison** determines the reversibility of the effect.
4. **Poison** can impair the respiratory, circulatory, central nervous, hepatic, gastrointestinal, and renal systems of the body.
5. The toddler, the preschooler, and the young school-age child must be protected from accidental poisoning.
6. In older adults, diminished eyesight and impaired memory may result in accidental ingestion of poisonous substances or an overdose of prescribed medications.
7. A Poison Control Center phone number should be visible on the telephone in homes with small children; in all cases of suspected poisoning, the number should be called immediately.
8. Interventions
  - a. Remove any obvious materials from the mouth, eyes, or body area immediately.

### Box 16-4 Common Drug-Resistant Health-Care Associated Infections

Vancomycin-resistant enterococci  
 Methicillin-resistant *Staphylococcus aureus*  
 Multidrug-resistant tuberculosis

- b. Identify the type and amount of substance ingested.
- c. Call the Poison Control Center before attempting an intervention.
- d. If the victim vomits or vomiting is induced, save the vomitus if requested to do so, and deliver it to the Poison Control Center.
- e. If instructed by the Poison Control Center to take the person to the emergency department, call an ambulance.
- f. Never induce vomiting following ingestion of lye, household cleaners, grease, or petroleum products.
- g. Never induce vomiting in an unconscious victim.

 The Poison Control Center should be called first before attempting an intervention.

#### II. HEALTH CARE–ASSOCIATED (NOSOCOMIAL) INFECTIONS (Box 16-4)

- A. **Health care–associated (nosocomial) infections** also are referred to as *hospital-acquired infections*.
- B. Such infections are infections acquired in a hospital or other health care facility that were not present or incubating at the time of a client's admission.
- C. Illness impairs the normal defense mechanisms of the body.
- D. The hospital environment provides exposure to a variety of virulent organisms that the client has not been exposed to in the past; therefore the client has not developed resistance to these organisms.
- E. Infections can be transmitted by health care personnel who fail to practice proper handwashing procedures or fail to change gloves between client contacts.
- F. At many health care agencies, dispensers containing an alcohol-based solution for hand rubs are mounted at the entrance to each client's room.

#### III. STANDARD PRECAUTIONS

- A. Description
  1. Nurses must practice **standard precautions** with all clients in any setting, regardless of the diagnosis or presumed infectiousness.
  2. **Standard precautions** include handwashing and the use of gloves, masks, eye protection, and gowns, when appropriate, for client contact.

-  3. These precautions apply to blood, all body fluids (whether or not they contain blood), secretions and excretions, nonintact skin, and mucous membranes.

#### B. Interventions

1. Wash hands between client contacts; after contact with blood, body fluids, secretions or excretions, nonintact skin, or mucous membranes; after contact with equipment or contaminated articles; and immediately after removing gloves.
2. Wear gloves when touching blood, body fluids, secretions, excretions, nonintact skin, mucous membranes, or contaminated items; remove gloves and wash hands between client care contacts.
3. Wear masks, eye protection, or face shields if client care activities may generate splashes or sprays of blood or body fluid.
4. Wear gowns if soiling of clothing is likely from blood or body fluid; wash hands after removing a gown.
5. Clean and reprocess client care equipment properly and discard single-use items.
6. Place contaminated linen in leak-proof bags and handle to prevent skin and mucous membrane exposure.
-  7. Use needleless devices or special needle safety devices whenever possible to reduce the risk of needle sticks and sharps injuries to health care workers.
-  8. Discard all sharp instruments and needles in a puncture-resistant container; dispose of needles uncapped or use a mechanical device for recapping the needle, if necessary and available.
-  9. Clean spills of blood or body fluids with a solution of bleach and water (diluted 1:10) or agency-approved disinfectant.

 **Handle all blood and body fluids from all clients as if they were contaminated.**

#### IV. TRANSMISSION-BASED PRECAUTIONS

 **A. Transmission-based precautions** include airborne, droplet, and contact precautions

##### **B. Airborne precautions**

1. Diseases
  - a. Measles
  - b. Chickenpox (varicella)
  - c. Disseminated varicella zoster
  - d. Tuberculosis
-  2. Barrier protection
  - a. Single room is maintained under negative pressure; door remains closed except upon entering and exiting.
  - b. Negative airflow pressure is used in the room, with a minimum of 6 to 12 air exchanges per

hour depending on health care agency protocol.

- c. Ultraviolet germicide irradiation or high-efficiency particulate air filter is used in the room
- d. Health care workers wear mask or personal respiratory protection device.
- e. Mask placed on client when client is out of the room; client leaves the room only if necessary.

##### **C. Droplet precautions**

1. Diseases
  - a. Adenovirus
  - b. Diphtheria (pharyngeal)
  - c. Epiglottitis
  - d. Influenza, including H1N1 influenza
  - e. Meningitis
  - f. Mumps
  - g. Mycoplasmal pneumonia or meningococcal pneumonia
  - h. Parvovirus B19
  - i. Pertussis
  - j. Pneumonia
  - k. Rubella
  - l. Scarlet fever
  - m. Sepsis
  - n. Streptococcal pharyngitis
2. Barrier protection 
  - a. Private room or cohort client
  - b. Use of a mask
  - c. Mask placed on client when client is out of the room; client leaves the room only if necessary.

##### **D. Contact precautions**

1. Diseases
  - a. Colonization or infection with a multidrug-resistant organism
  - b. Enteric infections, such as *Clostridium difficile*
  - c. Respiratory infections, such as respiratory syncytial virus
  - d. H1N1 influenza: Infection can occur by touching something with flu viruses on it and then touching the mouth or nose.
  - e. Wound infections
  - f. Skin infections, such as cutaneous diphtheria, herpes simplex, impetigo, pediculosis, scabies, staphylococci, and varicella zoster
  - g. Eye infection such as conjunctivitis
2. Barrier protection 
  - a. Private room or cohort client
  - b. Use of gloves and a gown when in contact with the client

#### V. EMERGENCY RESPONSE PLAN AND DISASTERS

- A.** Know the emergency response plan of the agency. 
- B.** *Internal disasters* are those in which the agency is in danger.
- C.** *External disasters* occur in the community, and victims are brought to the health care facility for care.

▲ **FIGURE 16-1** Anthrax. (From *Mosby's dictionary of medicine, nursing, & health professions* [8th ed.]. [2009]. St. Louis: Mosby.)

- D. When the health care agency is notified of a disaster, the nurse would follow the guidelines specified in the emergency response plan of the agency.
- E. See Chapter 8 for additional information on disaster planning.

⚠ In the event of a disaster, the emergency response plan is immediately activated.

## VI. BIOLOGICAL WARFARE AGENTS

A. A **warfare agent** is a biological or chemical substance that can cause mass destruction or fatality.

- B. Anthrax (Fig. 16-1)
  1. The disease is caused by *Bacillus anthracis* and can be contracted through the digestive system, abrasions in the skin, or inhalation through the lungs.
  2. Anthrax is transmitted by direct contact with bacteria and spores; spores are dormant encapsulated bacteria that become active when they enter a living host (no person-to-person spread) (Box 16-5).
  3. The infection is carried to the lymph nodes and then spreads to the rest of the body by way of the blood and lymph; high levels of toxins lead to shock and death.
  4. In the lungs, anthrax can cause buildup of fluid, tissue decay, and death (fatal if untreated).
  5. A blood test is available to detect anthrax (magnifies DNA from the blood sample and matches it to anthrax DNA).
  6. Anthrax is usually treated with antibiotics such as ciprofloxacin (Cipro), doxycycline, or penicillin.
  7. The vaccine has limited availability.

- C. Smallpox (Fig. 16-2)
  1. Smallpox is transmitted in air droplets and by handling contaminated materials and is highly contagious.
  2. Symptoms begin 7 to 17 days after exposure and include fever, back pain, vomiting, malaise, and headache.

### Box 16-5 Anthrax: Transmission and Symptoms

#### Skin

Spores enter the skin through cuts and abrasions and are contracted by handling contaminated animal skin products.

Infection starts with an itchy bump like a mosquito bite that progresses to a small liquid-filled sac.

The sac becomes a painless ulcer with an area of black, dead tissue in the middle.

Toxins destroy surrounding tissue.

#### Gastrointestinal

Infection occurs following the ingestion of contaminated undercooked meat.

Symptoms begin with nausea, loss of appetite, and vomiting.

The disease progresses to severe abdominal pain, vomiting of blood, and severe diarrhea.

#### Inhalation

Infection is caused by the inhalation of bacterial spores, which multiply in the alveoli.

The disease begins with the same symptoms as the flu, including fever, muscle aches, and fatigue.

Symptoms suddenly become more severe with the development of breathing problems and shock.

Toxins cause hemorrhage and destruction of lung tissue.

▲ **FIGURE 16-2** Smallpox. (From McKinney, E., James, S., Murray, S., & Ashwill, J. [2009]. *Maternal-child nursing* [3rd ed.]. St. Louis: Saunders. Courtesy of Centers for Disease Control and Prevention. [2002]. *Evaluating patients for smallpox*. Atlanta: Author.)

3. Papules develop 2 days after symptoms develop and progress to pustular vesicles that are abundant on the face and extremities initially.
  4. A vaccine is available to those at risk for exposure to smallpox.
- D. Botulism
    1. Botulism is a serious paralytic illness caused by a nerve toxin produced by the bacterium *Clostridium botulinum* (death can occur within 24 hours).
    2. Its spores are found in the soil and can spread through the air or food (improperly canned food) or via a contaminated wound.

- 3. Botulism cannot be spread from person to person.
- 4. Symptoms include abdominal cramps, diarrhea, nausea and vomiting, double vision, blurred vision, drooping eyelids, difficulty swallowing or speaking, dry mouth, and muscle weakness.
- 5. Neurological symptoms begin 12 to 36 hours after ingestion of foodborne botulism and 24 to 72 hours after inhalation and can progress to paralysis of the arms, legs, trunk, or respiratory muscles (mechanical ventilation is necessary).
- 6. If diagnosed early, foodborne and wound botulism can be treated with an antitoxin that blocks the action of toxin circulating in the blood.
- 7. Other treatments include induction of vomiting, enemas, and penicillin.
- 8. No vaccine is available.

#### E. Plague

- 1. Plague is caused by *Yersinia pestis*, a bacteria found in rodents and fleas.
- 2. Plague is contracted by being bitten by a rodent or flea that is carrying the plague bacterium, by the ingestion of contaminated meat, or by handling an animal infected with the bacteria.
- 3. Transmission is by direct person-to-person spread.
- 4. Forms include bubonic (most common), pneumonic, and septicemic (most deadly).
- 5. Symptoms usually begin within 1 to 3 days and include fever, chest pain, lymph node swelling, and a productive cough (hemoptysis).
- 6. The disease rapidly progresses to dyspnea, stridor, and cyanosis; death occurs from respiratory failure, shock, and bleeding.
- 7. Antibiotics are only effective if administered immediately; the usual medications of choice include streptomycin or gentamicin.
- 8. A vaccine is available.

#### F. Tularemia

- 1. Tularemia (also called *deer fly fever* or *rabbit fever*) is an infectious disease of animals caused by the bacillus *Francisella tularensis*.
- 2. The disease is transmitted by ticks, deer flies, or contact with an infected animal.
- 3. Symptoms include fever, headache, an ulcerated skin lesion with localized lymph node enlargement, eye infections, gastrointestinal ulcerations, or pneumonia.
- 4. Treatment is with antibiotics.
- 5. Recovery produces lifelong immunity (a vaccine is available).

#### G. Hemorrhagic fever

- 1. Hemorrhagic fever is caused by several viruses, including Marburg, Lassa, Junin, and Ebola.
- 2. The virus is carried by rodents and mosquitoes.

- 3. The disease can be transmitted directly by person-to-person spread via body fluids.
- 4. Symptoms include fever, headache, malaise, conjunctivitis, nausea, vomiting, hypotension, hemorrhage of tissues and organs, and organ failure.
- 5. No known specific treatment is available; treatment is symptomatic.

**!** Anthrax is transmitted by direct contact with bacteria and spores and can be contracted through the digestive system, abrasions in the skin, or inhalation through the lungs.

### VII. CHEMICAL WARFARE AGENTS

#### A. Sarin

- 1. Sarin is a highly toxic nerve gas that can cause death within minutes of exposure.
- 2. It enters the body through the eyes and skin and acts by paralyzing the respiratory muscles.

#### B. Phosgene is a colorless gas normally used in chemical manufacturing that if inhaled at high concentrations for a long enough period will lead to severe respiratory distress, pulmonary edema, and death.

#### C. Mustard gas is yellow to brown and has a garlic-like odor that irritates the eyes and causes skin burns and blisters.

#### D. Ionizing radiation

- 1. Acute radiation exposure develops after a substantial exposure to radiation.
- 2. Exposure can occur from external radiation or internal absorption.
- 3. Symptoms depend on the amount of exposure to the radiation and range from nausea and vomiting, diarrhea, fever, electrolyte imbalances, and neurological and cardiovascular impairment to leukopenia, purpura, hemorrhage, and death.

### VIII. NURSE'S ROLE FOR EXPOSURE TO WARFARE AGENTS

- A. Be aware that initially, a bioterrorism attack may resemble a naturally occurring outbreak of an infectious disease.
- B. Nurses and other health care workers must be prepared to assess and determine what type of event occurred, the number of clients who may be affected, and how and when clients will be expected to arrive to the health care agency.
- C. It is essential to determine any changes in the microorganism that may increase its virulence or make it resistant to conventional antibiotics or vaccines.
- D. See Chapter 8 for additional information on disasters and emergency response planning.

**MORE QUESTIONS ON THE CD!****Practice Questions**

- 131.** A nurse is preparing to initiate an intravenous line containing a high dose of potassium chloride and plans to use an intravenous infusion pump. The nurse brings the pump to the bedside, prepares to plug the pump cord into the wall, and notes that no receptacle is available in the wall socket. Which of the following is the appropriate nursing action?
1. Initiate the intravenous line without the use of a pump.
  2. Contact the electrical maintenance department for assistance.
  3. Plug in the pump cord in the available plug above the room sink.
  4. Use an extension cord from the nurses' lounge for the pump plug.
- 132.** A nurse obtains a prescription from a physician to restrain a client by using a jacket safety device and instructs a nursing assistant to apply the safety device to the client. Which observation by the nurse indicates unsafe application of the safety device by the nursing assistant?
1. A safety knot in the safety device straps
  2. Safety device straps that are safely secured to the side rails
  3. Safety device straps that do not tighten when force is applied against them
  4. Safety device secured so that two fingers can slide easily between the safety device and the client's skin
- 133.** The nurse is caring for a client with meningitis and implements which transmission-based precautions for this client?
1. Private room or cohort client
  2. Personal respiratory protection device
  3. Private room with negative airflow pressure
  4. Mask worn by staff when the client needs to leave the room
- 134.** A nurse is giving a report to a nursing assistant who will be caring for a client who has hand restraints (safety devices). The nurse instructs the nursing assistant to check the skin integrity of the restrained hands:
1. Every 2 hours
  2. Every 3 hours
  3. Every 4 hours
  4. Every 30 minutes
- 135.** A nurse is planning care for a client with an internal radiation implant. Which of the following is an incorrect component to include in the plan of care?
1. Wearing gloves when emptying the client's bedpan
  2. Keeping all linens in the room until the implant is removed
  3. Wearing a lead apron when providing direct care to the client
  4. Placing the client in a semiprivate room at the end of the hallway
- 136.** Contact precautions are initiated for a client with a health care-associated (nosocomial) infection caused by methicillin-resistant *Staphylococcus aureus*. The nurse prepares to provide colostomy care and obtains which of the following protective items needed to perform this procedure?
1. Gloves and gown
  2. Gloves and goggles
  3. Gloves, gown, and shoe protectors
  4. Gloves, gown, goggles, and face shield
- 137.** A nurse enters a client's room and finds that the wastebasket is on fire. The nurse immediately assists the client out of the room. What is the next nursing action?
1. Call for help.
  2. Extinguish the fire.
  3. Activate the fire alarm.
  4. Confine the fire by closing the room door.
- 138.** A mother calls a neighbor who is a nurse and tells the nurse that her 3-year-old child has just ingested liquid furniture polish. The nurse would direct the mother immediately to:
1. Induce vomiting.
  2. Call an ambulance.
  3. Call the Poison Control Center.
  4. Bring the child to the emergency department.
- 139.** An emergency department nurse receives a telephone call and is informed that a tornado has hit a local residential area and that numerous casualties have occurred. The victims will be brought to the emergency department. The initial nursing action is which of the following?
1. Prepare the triage rooms.
  2. Activate the emergency response plan.
  3. Obtain additional supplies from the central supply department.
  4. Obtain additional nursing staff to assist in treating the casualties.

### Alternate Item Format: Multiple Response

**140.** A community health nurse is providing a teaching session about terrorism to members of the community and is discussing information regarding anthrax. The nurse tells those attending that anthrax can be transmitted by which route(s)? Select all that apply.

- 1. Bites from ticks or deer flies
- 2. Inhalation of bacterial spores
- 3. Through a cut or abrasion in the skin
- 4. Direct contact with an infected individual
- 5. Sexual contact with an infected individual
- 6. Ingestion of contaminated undercooked meat

## ANSWERS

### 131. 2

**Rationale:** Electrical equipment must be maintained in good working order and should be grounded; otherwise it presents a physical hazard. An intravenous line that contains a high dose of potassium chloride should be administered by pump. The nurse needs to use hospital resources for assistance. A regular extension cord should not be used because it poses a risk for fire. Use of electrical appliances near a sink also presents a hazard.

**Test-Taking Strategy:** Use the process of elimination. Noting the strategic words *high dose* in the question will assist in eliminating option 1. Recalling safety issues related to electrical hazards will assist in eliminating options 3 and 4. If you had difficulty with this question, review the interventions related to electrical safety.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 323). St. Louis: Mosby.

### 132. 2

**Rationale:** The safety device straps are secured to the bed frame and never to the side rail to avoid accidental injury in the event that the side rail is released. A half-bow or safety knot should be used for applying a safety device because it does not tighten when force is applied against it and it allows quick and easy removal of the safety device in case of an emergency. The jacket safety device should be secure, and one to two fingers should slide easily between the safety device and the client's skin.

**Test-Taking Strategy:** Note the strategic words *indicates unsafe application*. These words indicate a negative event query and ask you to select an option that is an incorrect observation. Read each option carefully. The words *secured to the side rails* in option 2 should direct your attention to this as an incorrect and unsafe action. Review guidelines related to the application of safety devices if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 838). St. Louis: Mosby.

### 133. 1

**Rationale:** Meningitis is transmitted by droplet infection. Precautions for this disease include a private room or cohort client

and use of a standard precaution mask. Private negative airflow pressure rooms and personal respiratory protection devices are required for clients with airborne disease such as tuberculosis. When appropriate, a mask must be worn by the client and not the staff when the client leaves the room.

**Test-Taking Strategy:** Use the process of elimination to determine the correct precaution needs for this client. Focusing on the client's diagnosis and recalling that meningitis is transmitted by droplets will direct you to option 1. Review transmission-based categories including precaution criteria for the client with meningitis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 663). St. Louis: Mosby.

### 134. 4

**Rationale:** The nurse should instruct the nursing assistant to check safety devices and skin integrity every 30 minutes. The neurovascular and circulatory status of the extremity should also be checked every 30 minutes. Additionally, the safety device should be removed at least every 2 hours to permit muscle exercise and to promote circulation. Agency guidelines regarding the use of safety devices should always be followed.

**Test-Taking Strategy:** Use the process of elimination. In this situation, selecting the option that identifies the most frequent time frame is best. Review the guidelines related to the use of safety devices if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Leadership and Management—Delegating/Prioritizing

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., pp. 837–838). St. Louis: Mosby.

### 135. 4

**Rationale:** A private room with a private bath is essential if a client has an internal radiation implant. This is necessary to prevent accidental exposure of other clients to radiation. Options 1, 2, and 3 are accurate interventions for a client with a radiation implant.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *incorrect*. This word indicates a negative event query and the need to select the incorrect nursing intervention. Option 1 can be eliminated first because this is a component of standard precautions for all clients. Options 2 and 3 can be eliminated next because they directly relate to radiation safety.

Remember that the client with an internal radiation implant needs to be placed in a private room. Review radiation safety principles if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 274). St. Louis: Saunders.

### 136. 4

**Rationale:** Splashes of body secretions can occur when providing colostomy care. Goggles and a face shield are worn to protect the mucous membranes of the eyes during interventions that may produce splashes of blood, body fluids, secretions, or excretions. In addition, contact precautions require the use of gloves, and a gown should be worn if direct client contact is anticipated. Shoe protectors are not necessary.

**Test-Taking Strategy:** Note the strategic words *contact precautions* and *colostomy*. Use the process of elimination and visualize care for this client to determine the necessary items required in caring for this client. This will direct you to option 4. If you had difficulty with this question, review transmission-based precautions and care to the client requiring colostomy care.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 663). St. Louis: Mosby.

### 137. 3

**Rationale:** The order of priority in the event of a fire is to rescue the clients who are in immediate danger. The next step is to activate the fire alarm. The fire then is confined by closing all doors and, finally, the fire is extinguished.

**Test-Taking Strategy:** Remember the mnemonic RACE to prioritize in the event of a fire. *R* is rescue clients in immediate danger, *A* is alarm (sound the alarm), *C* is confine the fire by closing all doors, and *E* is extinguish or evacuate. If you had difficulty with this question, review the principles related to fire safety.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., pp. 839–840). St. Louis: Mosby.

### 138. 3

**Rationale:** If a poisoning occurs, the Poison Control Center should be contacted immediately. Vomiting should not be induced if the victim is unconscious or if the substance ingested is a strong corrosive or petroleum product. Bringing the child to the emergency department or calling an ambulance would not be the initial action because this would delay treatment. The Poison Control Center may advise the mother

to bring the child to the emergency department and, if this is the case, the mother should call an ambulance.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *immediately*. Eliminate options 2 and 4 because these options will delay treatment. Recalling that vomiting should not be induced if a corrosive substance was ingested will assist in eliminating option 1. Review poison control measures if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 842). St. Louis: Mosby.

### 139. 2

**Rationale:** In an external disaster (a disaster that occurs outside of the institution or agency), many victims may be brought to the emergency department for treatment. Although options 1, 3, and 4 may be components of preparing for the casualties, the initial nursing action must be to activate the emergency response plan.

**Test-Taking Strategy:** Note the strategic word *initial* and determine the priority action. Note that option 2 is the umbrella option. If the emergency response plan is activated then options 1, 3, and 4 will occur. Review procedures related to management of an external disaster if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 2213–2214). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 140. 2, 3, 6

**Rationale:** Anthrax is caused by *Bacillus anthracis* and can be contracted through the digestive system or abrasions in the skin, or inhaled through the lungs. It cannot be spread from person to person or animal to person, and it is not contracted via bites from ticks or deer flies.

**Test-Taking Strategy:** Knowledge regarding the methods of contracting anthrax is needed to answer this question. Remember that it is not spread by person-to-person contact or contracted via tick or deer fly bites. Review information related to this infection if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Safety/Infection Control

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 338). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 672–673). St. Louis: Saunders.

# Administration of Medication and Intravenous Solutions

## PYRAMID TERMS

**conversion** The first step in the calculation of a medication problem.

**generic name** Also known as the nonproprietary name of a medication, or the U.S. adopted name; each medication has only one generic name.

**medication reconciliation** An organized process to avoid medication errors by comparing the client's medication prescriptions to all the medications that the client was previously taking.

**milliequivalent** An expression of the number of grams of a medication contained in 1 mL of a solution; abbreviated mEq.

**parenteral** Given by injection, such as by the intravenous, intramuscular, subcutaneous, or intradermal route.

**percentage solution** The number of grams of a medication per 100 mL of solution.

**ratio solution** The number of grams of a medication per total milliliters of solution.

**reconstitution** Dissolving a powder in a sterile diluent before use, usually in sterile water or normal saline.

**trade name** Also known as the proprietary or brand name of a medication. The trade name is the name under which a medication is marketed. A medication can have many trade names; therefore trade names must be approved by the U.S. Food and Drug Administration (FDA) to ensure that no two trade names are alike.

**unit** A measurement of a medication in terms of its action, not its physical weight.

On the NCLEX-RN examination, the fill-in-the-blank questions may require that you calculate a medication dose or an intravenous (IV) flow rate. You will be provided with a computer on-screen calculator for these medication and IV problems. Even if you use the calculator to calculate dosages and flow rates, you need to check the calculation before selecting an option or typing the answer. Follow the formula, place the decimal point in the correct place, and check the accuracy of the calculation. Remember that practice makes perfect.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Handling hazardous and infectious materials
- Maintaining client's rights
- Maintaining surgical asepsis
- Maintaining standard and transmission-based precautions
- Preventing errors
- Using equipment safely

### Health Promotion and Maintenance

- Performing a physical assessment of a client
- Preventing diseases
- Respecting lifestyle choices
- Teaching the client about prescribed medication(s) or IV therapy

### Psychosocial Integrity

- Identifying support systems
- Identifying the cultural, religious, and spiritual factors influencing health
- Interacting therapeutically with the client and family
- Identifying the use of coping mechanisms

### Physiological Integrity

- Administering medications and IV therapy
- Assessing for expected and unexpected effects of pharmacological therapy

## THE PYRAMID TO SUCCESS

When a medication or intravenous calculation question is presented, a nurse should always use the appropriate formula to solve the problem. The nurse should not use shortcuts to make these calculations. The problem and answer should be expressed in the correct units of measure. Be careful with decimal points. Correct placement of the decimal point is important or the answer will be incorrect. When solving a medication calculation problem, the nurse determines whether the answer is within reason and makes sense. In the clinical setting, the nurse should always seek assistance if unsure of the accuracy of a calculation.

**Box 17-1 Medication Administration**

Assess the medication prescription.  
 Compare the client's medication prescription with all the medications that the client was previously taking (medication reconciliation).  
 Ask the client about a history of allergies.  
 Assess the client's current condition and the purpose for the medication or intravenous solution.  
 Determine the client's understanding regarding the purpose of the prescribed medication or need for intravenous solution.  
 Teach the client about the medication and about self-administration at home.  
 Identify and address concerns (social, cultural, religious) that the client may have about taking the medication.  
 Assess the need for conversion when preparing a dose of medication for administration to the client.  
 Assess the six rights of medication administration: right medication, right dose, right client, right route, right time, and right documentation.  
 Assess the vital signs, check significant laboratory results, and identify any potential interactions (food or medication interactions) before administering medication, when appropriate.  
 Document the administration of the prescribed therapy and client's response to the therapy.

**Box 17-2 Metric System**

| Abbreviations  | Equivalents                |
|----------------|----------------------------|
| meter: m       | 1 mcg = 0.000001 g         |
| liter: L       | 1 mg = 1000 mcg or 0.001 g |
| milliliter: mL | 1 g = 1000 mg              |
| kilogram: kg   | 1 kg = 1000 g              |
| gram: g        | 1 kg = 2.2 lb              |
| milligram: mg  | 1 mL = 0.001 L             |
| microgram: mcg |                            |

Calculating medication doses and intravenous flow rates  
 Identifying the adverse effects of and contraindications to medication or IV therapy  
 Monitoring for alterations in body systems  
 Monitoring laboratory values

**I. MEDICATION ADMINISTRATION** (Box 17-1)**II. DRUG MEASUREMENT SYSTEMS**

- A.** Metric system (Box 17-2)
- The basic units of metric measures are meter, liter, and gram.
  - Meter measures length; liter measures volume; gram measures mass.
- B.** Apothecary and household systems (Box 17-3)
- The apothecary and household systems are the oldest of the medication measurement systems.

**Box 17-3 Apothecary and Household Systems****Abbreviations****Apothecary (Weight)**

grain: gr  
 ounce: oz

**Household (Volume)**

drops: gtt  
 teaspoon: t or tsp  
 tablespoon: T or tbs  
 fluid ounce: fl oz  
 cup: C  
 pint: pt  
 quart: qt

**Household (Weight)**

pound: lb

**Equivalents**

1 gr = 60 or 65 mg  
 5 gr = 300 or 325 mg  
 15 gr = 1000 mg or 1 g  
 $\frac{1}{150}$  gr = 0.4 mg  
 1 fl oz = 30 mL  
 1 T = 15 mL or 3 tsp  
 1 t or tsp = 5 mL  
 1 C = 8 fl oz  
 1 qt = 946 mL or 0.946 L  
 1 qt = 2 pt or 32 fl oz  
 1 pt = 16 fl oz  
 16 oz = 1 lb  
 2.2 lb = 1 kg

**Box 17-4 Conversion Between Metric Units****Problem 1**

Convert 2 g to milligrams.

**Solution**

Change a larger unit to a smaller unit.  
 2 g = 2000 mg (moving decimal three places to right)

**Problem 2**

Convert 250 mL to liters.

**Solution**

Change a smaller unit to a larger unit.  
 250 mL = 0.25 L (moving decimal three places to left)

- Apothecary measures such as grain, dram, minim, and ounce are not commonly used in the clinical setting.
  - Commonly used household measures include drop, teaspoon, tablespoon, ounce, pint, and cup.
- C.** Additional common drug measures
- Milliequivalent**
    - Milliequivalent** is abbreviated mEq.
    - The **milliequivalent** is an expression of the number of grams of a medication contained in 1 mL of a solution.
    - For example, the measure of serum potassium is given in **milliequivalents**.
  - Unit**
    - Unit** measures a medication in terms of its action, not its physical weight.
    - For example, penicillin, heparin sodium, and insulin are measured in units.

**III. CONVERSIONS**

- A. Conversion** between metric units (Box 17-4)
- The metric system is a decimal system; therefore **conversions** between the units in this system

**Box 17-5 Ratio and Proportion**

**Ratio:** The relationship between two numbers, separated by a colon; for example, 1:2 (1 to 2).

**Proportion:** The relationship between two ratios, separated by a double colon (::) or an equal sign (=).

**Formula:**

H (on hand):V (vehicle) :: (=) (desired dose):X (unknown)

To solve a ratio and proportion problem: The middle numbers (means) are multiplied and the end numbers (extremes) are multiplied.

**Sample Problem**

H = 1

V = 2

Desired dose = 3

X = unknown

Set up the formula:

1:2::3:X

Solve: Multiply means and extremes.

1X = 6

X = 6

can be done by dividing or multiplying by 1000 or by moving the decimal point three places to the right or three places to the left.

- In the metric system, to convert larger to smaller, multiply by 1000 or move the decimal point three places to the right.
- In the metric system, to convert smaller to larger, divide by 1000 or move the decimal point three places to the left.

**B. Conversion** between household and metric systems

- Household and metric measures are equivalent and not equal measures.
- Conversion** to equivalent measures between systems is necessary when a medication prescription is written in one system but the medication label is stated in another.
- Medications are not always prescribed and prepared in the same system of measurement; therefore **conversion** of units from one system to another is necessary.
- Calculating equivalents between two systems may be done by using the method of ratio and proportion (Boxes 17-5 and 17-6).

 **Conversion is the first step in the calculation of dosages.**

**IV. CELSIUS AND FAHRENHEIT TEMPERATURE**

(Box 17-7)

- To convert Fahrenheit to Celsius, subtract 32 and divide the result by 1.8.
- To convert Celsius to Fahrenheit, multiply by 1.8 and add 32.

**Box 17-6 Calculating Equivalents Between Two Systems**

Calculating equivalents between two systems may be done by using the method of ratio and proportion.

**Problem**

The physician prescribes nitroglycerin, grain (gr)  $\frac{1}{150}$ . The medication label reads 0.4 milligrams (mg) per tablet. The nurse prepares to administer how many tablets to the client?

**Ratio and Proportion Formula**

H (on hand):V (vehicle) :: (=) (desired dose):X

1 gr:60 mg ::  $\frac{1}{150}$  gr:X mg

$60 \times \frac{1}{150} = X$

X = 0.4 mg (1 tablet)

**Box 17-7 Celsius and Fahrenheit Temperature****Fahrenheit to Celsius**

To convert Fahrenheit to Celsius, subtract 32 and divide the result by 1.8.

**Formula:**

$$C = \frac{(F - 32)}{1.8}$$

**Celsius to Fahrenheit**

To convert Celsius to Fahrenheit, multiply by 1.8 and add 32.

**Formula:**

$$F = (1.8 \times C) + 32$$

**Box 17-8 Medication Prescriptions**

Name of client  
Date and time when prescription is written  
Name of medication to be given  
Dosage of medication  
Medication route  
Time and frequency of administration  
Signature of person writing the prescription

**V. MEDICATION LABELS**

- A medication label contains the **generic name** and the **trade name** of the medication.
- Always check expiration dates on medication labels. 

**VI. MEDICATION PRESCRIPTIONS** (Box 17-8)

- In a medication prescription, the name of the medication is written first, followed by the dosage, route, and frequency (depending on the frequency of the prescription, times of administration are usually established by the health care agency and written in an agency policy).

- B.** Medication prescriptions need to be written using accepted abbreviations, acronyms, and symbols approved by The Joint Commission; also follow agency guidelines.

**!** If the nurse has any questions about or sees inconsistencies in the written prescription, the nurse must contact the person who wrote the prescription immediately and must verify the prescription.

## VII. ORAL MEDICATIONS

- A.** Scored tablets contain an indented mark to be used for possible breakage into partial doses; when necessary, scored tablets (those marked for division) can be divided into halves or quarters.
- B.** Enteric-coated tablets and sustained-released capsules delay absorption until the medication reaches the small intestine; these medications should not be crushed.
- C.** Capsules contain a powdered or oily medication in a gelatin cover.
- D.** Orally administered liquids are supplied in solution form and contain a specific amount of medication in a given amount of solution, as stated on the label.
- E.** The medicine cup
1. The medicine cup has a capacity of 30 mL or 1 oz and is used for orally administered liquids.
  2. The medicine cup is calibrated to measure teaspoons, tablespoons, and ounces.
  3. To pour accurately, place the medication cup on a level surface at eye level and then pour the liquid while reading the measuring markings.
- F.** Volumes of less than 5 mL are measured by using a syringe with the needle removed.

**!** A calibrated dropper is used for giving medicine to children or for adding small amounts of liquid to water or juice; calibrations are in milliliters or drops.

## VIII. PARENTERAL MEDICATIONS

- A. Parenteral** always means an injection route and **parenteral** medications are administered by intravenous, intramuscular, subcutaneous, or intradermal injection (see Fig. 17-1 for angles of injection).
- B. Parenteral** medications are packaged in single-use ampules, in single- and multiple-use rubber-stoppered vials, and in premeasured syringes and cartridges.
- C.** The nurse should not administer more than 3 mL per intramuscular or 1 mL per subcutaneous injection site; larger volumes are difficult for an injection site to absorb and, if prescribed, need to be verified.

- D.** The standard 3-mL syringe is used to measure most injectable medications and is calibrated in tenths (0.1) of a milliliter.
- E.** The calibrations on a syringe are read from the top black ring on the syringe, not the middle section and not the bottom ring (Fig. 17-2).

**!** Always question and verify excessively large or small volumes of medication.

- F.** Prefilled medication cartridge

1. The medication cartridge slips into the cartridge holder, which provides a plunger for injection of the medication.

**▲ FIGURE 17-1** Angles of injection. (From Kee, J., & Marshall, S. [2009]. *Clinical calculations: With applications to general and specialty areas* [6th ed.]. St. Louis: Saunders.)

**▲ FIGURE 17-2** Parts of a syringe. (From Kee, J., & Marshall, S. [2009]. *Clinical calculations: With applications to general and specialty areas* [6th ed.]. St. Louis: Saunders.)

2. The cartridge is designed to provide sufficient capacity to allow for the addition of a second medication when combined dosages are prescribed.
  3. The prefilled medication cartridge is to be used once and discarded; if a nurse is to give less than the full single dose provided, the nurse needs to discard the extra amount before giving the client the injection, following agency policies and procedures.
- G.** Generally, standard medication doses for adults are to be rounded to the nearest tenth (0.1 mL) of a milliliter and measured on the milliliter scale; for example, 1.25 mL is rounded to 1.3 mL (follow agency policy for rounding medication doses).
- H.** When volumes larger than 3 mL are required, the nurse may use a 5-mL syringe; these syringes are calibrated in fifths (0.2 mL) (Fig. 17-3).
- I.** Other syringes sizes may be available (10, 20, and 50 mL) and may be used for medication administration requiring dilution.
- J.** Tuberculin syringe (Fig. 17-4)
1. The tuberculin syringe holds 1 mL and is used to measure small or critical amounts of medication, such as allergen extract, vaccine, or a child's medication.
  2. The syringe is calibrated in hundredths (0.01) of a milliliter, with each one tenth (0.1) marked on the metric scale.
- K.** Insulin syringe (Fig. 17-5)
1. The standard 100-unit insulin syringe is calibrated for 100 units of insulin (100 units = 1 mL); low-dose insulin syringes ( $\frac{1}{2}$ - and 1-mL sizes) may also be used when administering smaller insulin doses.
  2. Insulin should not be measured in any other type of syringe.
- L.** Safety needles contain shielding devices that are attached to the needle and slipped over the needle to reduce the incidence of needle stick injuries

**!** If the insulin prescription states to administer regular and NPH insulin, combine both types of insulin in the same syringe. Use the mnemonic RN: Draw Regular insulin into the insulin syringe first, and then draw the NPH insulin.

#### IX. INJECTABLE MEDICATIONS IN POWDER FORM

- A.** Some medications become unstable when stored in solution form and are therefore packaged in powder form.
- B.** Powders must be dissolved with a sterile diluent before use; usually, sterile water or normal saline is used. The dissolving procedure is called **reconstitution** (Box 17-9).

#### X. CALCULATING THE CORRECT DOSAGE (See Box 17-10 for the standard formula)

**▲ FIGURE 17-3** Five-milliliter syringe. (From Kee, J., & Marshall, S. [2009]. *Clinical calculations: With applications to general and specialty areas* [6th ed.]. St. Louis: Saunders.)

**▲ FIGURE 17-4** Tuberculin syringe. (From Kee, J., & Marshall, S. [2009]. *Clinical calculations: With applications to general and specialty areas* [6th ed.]. St. Louis: Saunders.)

**▲ Figure 17-5** A 100-unit insulin syringe. (From Kee, J., & Marshall, S. [2009]. *Clinical calculations: With applications to general and specialty areas* [6th ed.]. St. Louis: Saunders.)

- A.** When calculating dosages of oral medications, check the calculation and question the prescription if the calculation calls for more than three tablets.
- B.** When calculating dosages of **parenteral** medications, check the calculation and question the prescription if the amount to be given is too large a dose.
-  **C.** Be sure that all measures are in the same system, and that all units are in the same size, converting when necessary; carefully consider what the reasonable amount of the medication that should be administered is.
- D.** Round standard injection doses to tenths and measure in a 3-mL syringe (follow agency policy).
- E.** Round small, critical amounts or children's doses to hundredths and measure in the 1-mL tuberculin syringe (follow agency policy).
- F.** In addition to using the standard formula (see Box 17-10), calculations can be done through the use of dimensional analysis; the required elements of a dimensional analysis equation include the desired answer units, **conversion** formula that includes the desired answer units and the units that need to be converted, and the original factors to convert including quantity and units.

 Regardless of the source or cause of a medication error, if a nurse gives an incorrect dose, the nurse is legally responsible for the action.

### Box 17-9 Reconstitution

In reconstituting the medication, locate the instructions on the label or in the vial package insert, and read and follow the directions carefully.

Instructions will state the volume of diluent to be used and the resulting volume of the reconstituted medication.

Often, the powdered medication adds volume to the solution in addition to the amount of diluent added.

When reconstituting a multiple-dose vial, label the medication vial with the date and time of preparation, your initials, and the date of expiration.

Indicating the strength per volume on the medication label also is important.

The total volume of the prepared solution will exceed the volume of the diluent added.

### Box 17-10 Standard Formula for Calculating a Medication Dosage

$$\frac{D}{A} \times Q = X$$

D (desired) is the dosage that the physician prescribed.

A (available) is the dosage strength as stated on the medication label.

Q (quantity) is the volume or form in which the dosage strength is available, such as tablets, capsules, or milliliters.

## XI. PERCENTAGE AND RATIO SOLUTIONS

### A. Percentage solutions

- Express the number of grams of the medication per 100 mL of solution.
- For example, calcium gluconate 10% is 10 g of pure medication per 100 mL of solution.

### B. Ratio solutions

- Express the number of grams of the medication per total milliliters of solution.
- For example, epinephrine 1:1000 is 1 g of pure medication per 1000 mL solution.

## XII. INTRAVENOUS FLOW RATES (Box 17-11)

- A.** Monitor IV flow rate frequently even if the IV solution is being administered through an electronic infusion device (follow agency policy regarding frequency).
- B.** If an IV is running behind schedule, collaborate with the physician to determine the client's ability to tolerate an increased flow rate, particularly for clients with cardiac, pulmonary, renal, or neurological conditions.

 The nurse should never increase the rate (speed up) of an IV infusion to catch up if the infusion is running behind schedule.

- C.** Whenever a prescribed IV rate is increased, the nurse should assess the client for increased heart rate, increased respirations, and increased lung congestion, which could indicate fluid overload.
- D.** Intravenously administered fluids are prescribed most frequently based on milliliters per hour to be administered.
- E.** The volume per hour prescribed is administered by setting the flow rate, which is counted in drops per minute.
- F.** Most flow rate calculations involve changing milliliters per hour into drops per minute.
- G.** Intravenous tubing

### Box 17-11 Formulas for Intravenous Calculations

#### Flow Rates

$$\frac{\text{Total volume} \times \text{drop factor}}{\text{Time in minutes}} = \text{Drops per minute}$$

#### Infusion Time

$$\frac{\text{Total volume to infuse}}{\text{Milliliters per hour being infused}} = \text{Infusion time}$$

#### Number of Milliliters per Hour

$$\frac{\text{Total volume in milliliters}}{\text{Number of hours}} = \text{Number of milliliters per hour}$$

1. Intravenous tubing sets are calibrated in drops per milliliter; this calibration is needed for calculating flow rates.
2. A standard or macrodrip set is used for routine adult IV administrations; depending on the manufacturer and type of tubing, the set will require 10, 15, or 20 gtt to equal 1 mL.
3. A minidrip or microdrip set is used when more exact measurements are needed, such as in intensive care units and pediatric units.
4. In a minidrip or microdrip set, 60 gtt is usually equal to 1 mL.
5. The calibration, in drops per milliliter, is written on the IV tubing package.

### XIII. CALCULATION OF INFUSIONS ORDERED BY UNIT DOSAGE PER HOUR

- A.** The most common medications that will be ordered by **unit** dosage per hour and run by continuous infusion are heparin sodium and regular insulin.
- B.** Calculation of these infusions can be done by a two-step process (Box 17-12).
1. Determine the amount of medication per 1 mL.
  2. Determine the infusion rate or milliliters per hour.

### MORE QUESTIONS ON THE CD!

#### Practice Questions: Alternate Item Format (Fill-In-The-Blank)

- 141.** A physician's prescription reads 1000 mL of normal saline (NS) to infuse over 12 hours. The drop factor is 15 drops (gtt)/1 mL. A nurse prepares to set the flow rate at how many drops per minute? (Round answer to the nearest whole number.)  
Answer: \_\_\_\_\_ drops per minute
- 142.** A physician's prescription reads to administer an intravenous (IV) dose of 400,000 units of penicillin G benzathine (Bicillin). The label on the 10-mL ampule sent from the pharmacy reads penicillin G benzathine (Bicillin), 300,000 units/mL. A nurse prepares how much medication to administer the correct dose? (Round answer to the nearest tenth position.)  
Answer: \_\_\_\_\_ mL
- 143.** A physician's prescription reads potassium chloride 30 mEq to be added to 1000 mL normal saline (NS) and to be administered over a

#### Box 17-12 Infusions Ordered by Unit Dosage per Hour

Calculation of these problems can be done by a two-step process:

1. Determine the amount of medication per 1 mL.
2. Determine the infusion rate or milliliters per hour.

##### Problem 1

Order: Continuous heparin sodium by IV at 1000 units per hour

Available: IV bag of 500 mL D<sub>5</sub>W with 20,000 units of heparin sodium

How many milliliters per hour are required to administer the correct dose?

##### Solution

Step 1: Calculate the amount of medication (units) per milliliter (mL).

$$\frac{\text{Known amount of medication in solution}}{\text{Total volume of diluent}} = \text{Amount of medication per milliliter}$$

$$\frac{20,000 \text{ units}}{500 \text{ mL}} = 40 \text{ units/1 mL}$$

Step 2: Calculate milliliters per hour.

$$\frac{\text{Dose per hour desired}}{\text{Concentration per milliliter}} = \text{Infusion rate, or mL/hr}$$

$$\frac{1000 \text{ units}}{40 \text{ units}} = 25 \text{ mL/hr}$$

##### Problem 2

Order: Continuous regular insulin by IV at 10 units per hour  
Available: IV bag of 100 mL NS with 50 units regular insulin  
How many milliliters per hour are required to administer the correct dose?

##### Solution

Step 1: Calculate the amount of medication (units) per milliliter.

$$\frac{\text{Known amount of medication in solution}}{\text{Total volume of diluent}} = \text{Amount of medication per milliliter}$$

$$\frac{50 \text{ units}}{100 \text{ mL}} = 0.5 \text{ units/1 mL}$$

Step 2: Calculate milliliters per hour.

$$\frac{\text{Dose per hour desired}}{\text{Concentration per milliliter}} = \text{Infusion rate, or mL/hr}$$

$$\frac{10 \text{ units}}{0.5 \text{ units/mL}} = 20 \text{ mL/hr}$$

10-hour period. The label on the medication bottle reads 40 mEq/20 mL. A nurse prepares how many milliliters of potassium chloride to administer the correct dose of medication?

Answer: \_\_\_\_\_ mL

**144.** A physician's prescription reads clindamycin phosphate (Cleocin Phosphate) 0.3 g in 50 mL normal saline (NS) to be administered intravenously over 30 minutes. The medication label reads clindamycin phosphate (Cleocin Phosphate) 900 mg in 6 mL. A nurse prepares how many milliliters of the medication to administer the correct dose?

Answer: \_\_\_\_\_ mL

**145.** A physician's prescription reads phenytoin (Dilantin) 0.2 g orally twice daily. The medication label states 100-mg capsules. A nurse prepares how many capsule(s) to administer one dose?

Answer: \_\_\_\_\_ capsule(s)

**146.** A physician prescribes 1000 mL of  $\frac{1}{2}$  normal saline (NS) to infuse over 8 hours. The drop factor is 15 drops (gtt)/1 mL. The nurse sets the flow rate at how many drops per minute? (Round answer to the nearest whole number.)

Answer: \_\_\_\_\_ drops per minute

**147.** A physician prescribes heparin sodium, 1300 units/hr by continuous intravenous (IV) infusion. The pharmacy prepares the medication and delivers an IV bag labeled heparin sodium 20,000 units/250 mL D<sub>5</sub>W. An infusion pump must be used to administer the medication. The nurse sets the infusion pump at how many milliliters per hour to deliver 1300 units/hr? (Round answer to the nearest whole number.)

Answer: \_\_\_\_\_ mL per hour

**148.** A physician prescribes 3000 mL of D<sub>5</sub>W to be administered over a 24-hour period. A nurse determines that how many milliliters per hour will be administered to the client?

Answer: \_\_\_\_\_ mL per hour

**149.** Gentamicin sulfate, 80 mg in 100 mL normal saline (NS), is to be administered over 30 minutes.

The drop factor is 10 drops (gtt)/mL. A nurse sets the flow rate at how many drops per minute? (Round answer to the nearest whole number.)

Answer: \_\_\_\_\_ drops per minute

**150.** A physician's prescription reads levothyroxine (Synthroid), 150 mcg orally daily. The medication label reads Synthroid, 0.1 mg/tablet. A nurse administers how many tablet(s) to the client?

Answer: \_\_\_\_\_ tablet(s)

**151.** Cefuroxime sodium, 1 g in 50 mL normal saline (NS), is to be administered over 30 minutes. The drop factor is 15 drops (gtt)/mL. A nurse sets the flow rate at how many drops per minute?

Answer: \_\_\_\_\_ drops per minute

**152.** A physician prescribes 1000 mL D<sub>5</sub>W to infuse at a rate of 125 mL/hr. A nurse determines that it will take how many hours for 1 L to infuse?

Answer: \_\_\_\_\_ hour(s)

**153.** A physician prescribes 1 unit of packed red blood cells to infuse over 4 hours. The unit of blood contains 250 mL. The drop factor is 10 drops (gtt)/1 mL. A nurse prepares to set the flow rate at how many drops per minute? (Round answer to the nearest whole number.)

Answer: \_\_\_\_\_ drops per minute

**154.** A physician's prescription reads morphine sulfate, 8 mg stat. The medication ampule reads morphine sulfate, 10 mg/mL. A nurse prepares how many milliliters to administer the correct dose?

Answer: \_\_\_\_\_ mL

**155.** A physician prescribes regular insulin, 8 units/hr by continuous intravenous (IV) infusion. The pharmacy prepares the medication and then delivers an IV bag labeled 100 units of regular insulin in 100 mL normal saline (NS). An infusion pump must be used to administer the medication. The nurse sets the infusion pump at how many milliliters per hour to deliver 8 units/hr?

Answer: \_\_\_\_\_ mL

## ANSWERS: ALTERNATE ITEM FORMAT (FILL-IN-THE-BLANK)

**141. 21**

**Rationale:** Use the intravenous (IV) flow rate formula.

**Formula:**

$$\frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in minutes}} = \text{Drops per minute}$$

$$\frac{1000 \text{ mL} \times 15 \text{ gtt}}{720 \text{ minutes}} = \frac{15,000}{720} = 20.8, \text{ or } 21 \text{ gtt/min}$$

**Test-Taking Strategy:** Use the formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. Remember to round the answer to the nearest whole number. Review the formula

to calculate IV infusion rates if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1007). St Louis: Mosby.

### 142. 1.3

**Rationale:** Use the medication dose formula.

**Formula:**

$$\frac{\text{Desired} \times \text{mL}}{\text{Available}} = \text{Milliliters per dose}$$

$$\frac{400,000 \text{ units} \times 1 \text{ mL}}{300,000 \text{ units}} = \text{Milliliters per dose}$$

$$\frac{400,000}{300,000} = 1.33 = 1.3 \text{ mL}$$

**Test-Taking Strategy:** Follow the formula for the calculation of the correct medication dose. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. Remember to round the answer to the nearest tenth position. If you had difficulty with this question, review the formula for calculating medication doses.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Kee, J. & Marshall, S. (2009). *Clinical calculations: With applications to general and specialty areas* (6th ed., p. 86). St. Louis: Saunders.

### 143. 15

**Rationale:** Use the medication calculation formula.

**Formula:**

$$\frac{\text{Desired} \times \text{mL}}{\text{Available}} = \text{Milliliters per dose}$$

$$\frac{30 \text{ mEq} \times 20 \text{ mL}}{40 \text{ mEq}} = 15 \text{ mL}$$

**Test-Taking Strategy:** Follow the formula for the calculation of the correct medication dose. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. If you had difficulty with this question, review the formula for calculating medication doses.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Kee, J. & Marshall, S. (2009). *Clinical calculations: With applications to general and specialty areas* (6th ed., p. 86). St. Louis: Saunders.

### 144. 2

**Rationale:** You must convert 0.3 g to milligrams. In the metric system, to convert larger to smaller, multiply by 1000 or move the decimal three places to the right. Therefore

0.3 g = 300 mg. Following conversion from grams to milligrams, use the formula to calculate the correct dose.

**Formula:**

$$\frac{\text{Desired} \times \text{mL}}{\text{Available}} = \text{Milliliters per dose}$$

$$\frac{300 \text{ mg} \times 6 \text{ mL}}{900 \text{ mg}} = \frac{1800}{900} = 2 \text{ mL}$$

**Test-Taking Strategy:** In this medication calculation problem, first you must convert grams to milligrams. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. If you had difficulty with this question, review the formula for calculating medication doses.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Kee, J. & Marshall, S. (2009). *Clinical calculations: With applications to general and specialty areas* (6th ed., p. 86). St. Louis: Saunders.

### 145. 2

**Rationale:** You must convert 0.2 g to milligrams. In the metric system, to convert larger to smaller, multiply by 1000 or move the decimal three places to the right. Therefore 0.2 g equals 200 mg. After conversion from grams to milligrams, use the formula to calculate the correct dose.

**Formula:**

$$\frac{\text{Desired} \times \text{Capsule(s)}}{\text{Available}} = \text{Capsule(s) per dose}$$

$$\frac{200 \text{ mg} \times 1 \text{ capsule}}{100 \text{ mg}} = 2 \text{ capsules}$$

**Test-Taking Strategy:** In this medication calculation problem, first you must convert grams to milligrams. Once you have done the conversion and reread the medication calculation problem, you will know that two capsules is the correct answer. Recheck your work using a calculator and make sure that the answer makes sense. If you had difficulty with this question, review the formula for calculating medication doses.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Kee, J. & Marshall, S. (2009). *Clinical calculations: With applications to general and specialty areas* (6th ed., p. 86). St. Louis: Saunders.

### 146. 31

**Rationale:** Use the intravenous (IV) flow rate formula.

**Formula:**

$$\frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in minutes}} = \text{Drops per minute}$$

$$\frac{1000 \text{ mL} \times 15 \text{ gtt}}{480 \text{ minutes}} = \frac{15,000}{480} = 31.2, \text{ or } 31 \text{ gtt/min}$$

**Test-Taking Strategy:** Use the formula for calculating IV flow rates when answering the question. Once you have performed

the calculation, verify your answer using a calculator and make sure that the answer makes sense. Remember to round the answer to the nearest whole number. Review the formula for calculating IV infusion rates if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1007). St Louis: Mosby.

### 147. 16

**Rationale:** Calculation of this problem can be done using a two-step process. First, you need to determine the amount of heparin sodium in 1 mL. The next step is to determine the infusion rate, or milliliters per hour.

**Step 1:**

$$\frac{\text{Known amount of medication in solution}}{\text{Total volume of diluent}} = \text{Amount of medication per milliliter}$$

$$\frac{20,000 \text{ units}}{250 \text{ mL}} = 80 \text{ units/mL}$$

**Step 2:**

$$\frac{\text{Dose per hour desired}}{\text{Concentration per milliliter}} = \text{Infusion rate, or mL/hr}$$

$$\frac{1300 \text{ units}}{80 \text{ units/mL}} = 16.25, \text{ or } 16 \text{ mL/hr}$$

**Test-Taking Strategy:** Read the question carefully, noting that two steps can be used to solve this medication problem. Follow the formula, verify your answer using a calculator, and make sure that the answer makes sense. Remember to round the answer to the nearest whole number. If you had difficulty with this question, learn these steps. These steps can be used for similar medication problems related to the administration of heparin sodium or regular insulin by IV infusion.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Kee, J., & Marshall, S. (2009). *Clinical calculations: With applications to general and specialty areas* (4th ed., p. 236). St. Louis: Saunders.

### 148. 125

**Rationale:** Use the intravenous (IV) formula to determine milliliters per hour.

**Formula:**

$$\frac{\text{Total volume in milliliters}}{\text{Number of hours}} = \text{Milliliters per hour}$$

$$\frac{3000 \text{ mL}}{24 \text{ hours}} = 125 \text{ mL/hr}$$

**Test-Taking Strategy:** Read the question carefully, noting that the question is asking about milliliters per hour to be administered to the client. Use the formula for calculating milliliters per hour. Once you have performed the calculation,

verify your answer using a calculator and make sure that the answer makes sense. Review the IV formula for calculating milliliters per hour if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1007). St Louis: Mosby.

### 149. 33

**Rationale:** Use the intravenous (IV) flow rate formula.

**Formula:**

$$\frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in minutes}} = \text{Drops per minute}$$

$$\frac{100 \text{ mL} \times 10 \text{ gtt}}{30 \text{ minutes}} = \frac{1000}{30} = 33.3, \text{ or } 33 \text{ gtt/min}$$

**Test-Taking Strategy:** Use the formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. Remember to round the answer to the nearest whole number. Review the formula for calculating IV infusion rates if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1007). St Louis: Mosby.

### 150. 1.5

**Rationale:** You must convert 150 mcg to milligrams. In the metric system, to convert smaller to larger, divide by 1000 or move the decimal three places to the left. Therefore 150 mcg equals 0.15 mg. Next, use the formula to calculate the correct dose.

**Formula:**

$$\frac{\text{Desired}}{\text{Available}} \times \text{Tablet} = \text{Tablets per dose}$$

$$\frac{0.15 \text{ mg}}{0.1 \text{ mg}} \times 1 \text{ tablet} = 1.5 \text{ tablets}$$

**Test-Taking Strategy:** In this medication calculation problem, first you must convert micrograms to milligrams. Next, follow the formula for the calculation of the correct dose, verify your answer using a calculator, and make sure that the answer makes sense. If you had difficulty with this question, review the formula for calculating medication doses.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Kee, J., & Marshall, S. (2009). *Clinical calculations: With applications to general and specialty areas* (6th ed., p. 86). St. Louis: Saunders.

### 151. 25

**Rationale:** Use the intravenous (IV) flow rate formula.

**Formula:**

$$\frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in minutes}} = \text{Drops per minute}$$

$$\frac{50 \text{ mL} \times 15 \text{ gtt}}{30 \text{ minutes}} = \frac{750}{30} = 25 \text{ gtt/min}$$

**Test-Taking Strategy:** Use the formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. Review the formula for calculating IV infusion rates if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1007). St Louis: Mosby.

**152. 8**

**Rationale:** You must determine that 1 L equals 1000 mL. Next, use the formula for determining infusion time in hours.

**Formula:**

$$\frac{\text{Total volume to infuse}}{\text{Milliliters per hour being infused}} = \text{Infusion time}$$

$$\frac{1000 \text{ mL}}{125 \text{ mL}} = 8 \text{ hours}$$

**Test-Taking Strategy:** Read the question carefully, noting that the question is asking about infusion time in hours. First, convert 1 L to milliliters. Next, use the formula for determining infusion time in hours. Verify your answer using a calculator and make sure that the answer makes sense. Review the IV formula for calculating infusion time if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1007). St Louis: Mosby.

**153. 10**

**Rationale:** Use the IV flow rate formula.

**Formula:**

$$\frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in minutes}} = \text{Drops per minute}$$

$$\frac{250 \text{ mL} \times 10 \text{ gtt}}{240 \text{ minutes}} = \frac{2500}{240} = 10.4, \text{ or } 10 \text{ gtt/min}$$

**Test-Taking Strategy:** Use the formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. Remember to round the answer to the nearest whole number. Review the formula for calculating IV infusion rates if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1007). St Louis: Mosby.

**154. 0.8**

**Rationale:** Use the formula to calculate the correct dose.

**Formula:**

$$\frac{\text{Desired} \times \text{mL}}{\text{Available}} = \text{Milliliters per dose}$$

$$\frac{8 \text{ mg} \times 1 \text{ mL}}{10 \text{ mg}} = 0.8 \text{ mL}$$

**Test-Taking Strategy:** Follow the formula for the calculation of the correct dose. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. If you had difficulty with this question, review the formula for calculating medication doses.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Medications/Blood & IV Therapy

**Reference:** Kee, J. & Marshall, S. (2009). *Clinical calculations: With applications to general and specialty areas* (6th ed., p. 86). St. Louis: Saunders.

**155. 8**

**Rationale:** Calculation of this problem can be done using a two-step process. First, you need to determine the amount of regular insulin in 1 mL. The next step is to determine the infusion rate, or milliliters per hour.

**Formula:****Step 1:**

$$\frac{\text{Known amount of medication in solution}}{\text{Total volume of diluent}} = \text{Amount of medication per milliliter}$$

$$\frac{100 \text{ units}}{100 \text{ mL}} = 1 \text{ unit/mL}$$

**Step 2:**

$$\frac{\text{Dose per hour desired}}{\text{Concentration per milliliter}} = \text{Infusion rate, or milliliters per hour}$$

$$\frac{8 \text{ units}}{1 \text{ unit/mL}} = 8 \text{ mL/hr}$$

**Test-Taking Strategy:** Read the question carefully, noting that two steps can be used to solve this medication problem. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. These steps can be used for similar medication problems related to the administration of heparin sodium or regular insulin by IV infusion. Learn these steps if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Need:** Physiological Integrity

# Cardiopulmonary Resuscitation Guidelines for Health Care Providers

## PYRAMID TERMS

**abdominal thrust maneuver** Method to relieve a foreign body airway obstruction.

**automated external defibrillator** Machine that converts ventricular fibrillation into a perfusing rhythm and allows for early defibrillation by first responders.

**basic life support** Provision of oxygen to the brain, heart, and other vital organs until help arrives.

**cardiopulmonary resuscitation** An interchangeable term for basic life support.

**head tilt–chin lift** Preferred method to open a victim’s airway.

**jaw thrust maneuver** Method used to open a victim’s airway if a neck injury is suspected.

## Health Promotion and Maintenance

Performing the techniques of physical assessment  
Teaching significant others to perform Lay Rescuer CPR and the abdominal thrust maneuver

## Psychosocial Integrity

Considering the client’s cultural, religious, and spiritual preferences  
Discussing end-of-life and grief and loss issues  
Providing emotional support to significant others

## Physiological Integrity

Administering emergency medications and intravenous solutions  
Documenting the client’s response to basic life support (BLS) measures  
Handling medical emergencies  
Identifying alterations in the cardiopulmonary system  
Performing CPR or the abdominal thrust maneuver  
Using special equipment

### I. CARDIOPULMONARY RESUSCITATION (Box 18-1)

- A. CPR is providing oxygen to the brain, heart, and other vital organs until help arrives.
- B. CPR is also known as BLS.

### II. ADULT CPR GUIDELINES FOR THE HEALTH CARE PROVIDER (Box 18-2 and Table 18-1; see Priority Nursing Actions on p. 204)

- A. Description: An adult is defined as a person who is an adolescent or older (for lay rescuers, adults are defined as those 8 years of age or older).

 Remember the ABCDs of CPR—airway, breathing, circulation, and defibrillation or definitive treatment.

- B. Airway
  - 1. For the HCP, assessment is the first step of the nursing process; assessing a victim of sudden illness or accident for unconsciousness is the initial action (assess for 5 to 10 seconds)

## THE PYRAMID TO SUCCESS

The Pyramid to Success focuses on emergency care guidelines and procedures performed by the health care provider (HCP). These include cardiopulmonary resuscitation (CPR), the abdominal thrust maneuver, and use of the automated external defibrillator (AED). In addition to CPR guidelines for the HCP, the American Heart Association has also developed CPR guidelines for the lay rescuer and guidelines for performing Hands-Only CPR. For information on lay rescuer CPR guidelines and Hands-Only CPR, access the American Heart Association Web site at [www.americanheart.org](http://www.americanheart.org).

## CLIENT NEEDS

### Safe and Effective Care Environment

Acting as an advocate regarding the client’s wishes  
Considering ethical and legal responsibilities  
Establishing priorities  
Following advance directives regarding the client’s documented requests  
Implementing standard and transmission-based precautions and surgical asepsis techniques  
Upholding client’s rights

### Box 18-1 The ABCDs of Cardiopulmonary Resuscitation for the Health Care Provider

A: Airway

B: Breathing

C: Circulation

D: Defibrillation or definitive treatment

Each step of the ABCDs of cardiopulmonary resuscitation begins with assessment.

### Box 18-2 Pyramid Points: When to Stop CPR

Avoid interruptions in cardiopulmonary resuscitation (CPR).

Stop CPR only if the following occur(s):

Pulse and respiration return.

Emergency medical help arrives.

The automated external defibrillator is administered.

A physician declares the victim deceased.

*Additional Pyramid Point:* In a non-health care setting, another indication to stop CPR is that the lone rescuer was exhausted and physically unable to continue performing CPR.

**TABLE 18-1** Summary of Cardiopulmonary Resuscitation ABCD Guidelines for Infants, Children, and Adults

| Maneuver*  | Adult†   | Child‡   | Infant‡   |
|--|--|--|---|
| Activate (call) emergency response number (one rescuer)            | Call when victim is found unresponsive<br>HCP: If asphyxial arrest is likely, call after five cycles (2 min) of cardiopulmonary resuscitation (CPR)  | Call after performing five cycles of CPR<br>For sudden unwitnessed collapse, call after verifying that victim is unresponsive  | Call after performing five cycles of CPR<br>For sudden unwitnessed collapse, call after verifying that victim is unresponsive |
| Airway breaths   | Head tilt–chin lift (HCP: If trauma is suspected, use jaw thrust)<br>Two effective breaths at 1 sec per breath   | Head tilt–chin lift (HCP: If trauma is suspected, use jaw thrust)<br>Two effective breaths at 1 sec per breath   | Head tilt–chin lift (HCP: If trauma is suspected, use jaw thrust)<br>Two effective breaths at 1 sec per breath                |
| HCP: Rescue breathing without chest compressions                   | 10-12 breaths/min (one breath every 5-6 sec)   | 12-20 breaths/min (one breath every 3-5 sec)   | 12-20 breaths/min (one breath every 3-5 sec)  |
| HCP: Rescue breathing for CPR with advanced airway                 | 8-10 breaths/min (one breath every 6-8 sec)  | 8-10 breaths/min (one breath every 6-8 sec)  | 8-10 breaths/min (one breath every 6-8 sec)   |
| Foreign body airway obstruction                                    | Abdominal thrusts  | Back slaps and chest thrusts   | Back slaps and chest thrusts  |
| <b>CIRCULATION</b>   |  |  |   |
| HCP: Pulse check (10 sec or less)                                  | Carotid artery   | HCP can use femoral artery in child  | Brachial or femoral artery  |
| Compression landmarks  | Center of chest, between nipples   | Center of chest, between nipples   | Just below nipple line  |
| Compression method:<br>Push hard and fast<br>Allow complete recoil | Two hands: Heel of one hand, other hand on top   | Two hands: Heel of one hand with second on top <i>or</i><br>One hand: Heel of one hand only  | One rescuer: two fingers<br>HCP, two rescuers: Two-thumb–encircling hands technique   |
| Compression depth  | 1½-2 inches  | Approximately ⅓ to ½ the depth of the chest  | Approximately ⅓ to ½ the depth of the chest   |
| Compression rate   | Approximately 100 per minute   | Approximately 100 per minute   | Approximately 100 per minute  |
| Compression-to-ventilation ratio                                   | 30:2 (one or two rescuers)   | 30:2 (single rescuer)<br>HCP: 15:2 (two rescuers)  | 30:2 (single rescuer)<br>HCP: 15:2 (two rescuers)   |
| <b>DEFIBRILLATION</b>  |  |  |   |
| Automatic external defibrillator (AED)                             | Use adult pads<br>Do not use child pads or a child system<br>HCP: For out-of-hospital response, you may provide five cycles (2 min) of CPR before shock if response time is longer than 4-5 min and arrest was not witnessed | HCP: Use AED as soon as possible for sudden and in-hospital collapse<br>All: After five cycles of CPR (out of hospital)<br>Use child pads and system for child 1-8 yr old if available<br>If child pads and system are not available, use adult AED and pads | No recommendation for infants younger than 1 yr old   |

\*Maneuver performed only by health care provider indicated by HCP.

†For lay rescuers, adults are defined as those 8 years of age or older; for HCPs, adolescent or older. For lay rescuers, children are those 1 to 8 years of age; for HCPs, 1 year to adolescent.

‡For all rescuers, infants are defined as those younger than 1 year of age.

Reprinted with permission. 2005 American Heart Association Guidelines for Cardiopulmonary Resuscitation and Emergency Cardiovascular Care, Part 3: Overview of CPR. *Circulation*. 2005;112:IV-12–IV-18. ©2005 American Heart Association, Inc.

2. Gently shake the victim's shoulders and ask, "Are you OK?"; be alert to the potential for a head or neck injury.
3. Call the emergency response number when the victim is found unconscious; for the HCP, if asphyxial arrest is likely, call after five cycles (2 minutes) of CPR.
4. Place the victim in a supine position on a firm, flat surface (logroll the victim, using spine precautions).
  - a. One-person rescue: The rescuer is positioned on his or her knees, perpendicular to the victim's sternum and facing the victim.
  - b. Two-person rescue: One rescuer faces the victim, kneeling perpendicular to the victim's head, maintains an open airway, monitors the carotid pulse, and performs the rescue breathing; the second rescuer moves to the opposite side and faces the victim, kneeling perpendicular to the victim's sternum, and performs the chest compressions.
  - c. When two rescuers are present during CPR, the rescuers should rotate the compressor role every 2 minutes.
  - d. The rescuers apply gloves and face shields, if available.

▲ For the HCP, determining unresponsiveness of the victim is the first action.

5. Open the airway.
6. The **head tilt–chin lift** is the preferred method for opening the airway; for the HCP, if the victim has a neck injury, the **jaw thrust maneuver** is used to open the airway (Figs. 18-1 and 18-2).
7. Look for foreign material, liquids, or solids in the victim's mouth; wipe out any foreign material.

▲ **FIGURE 18-1** Opening the airway using the head tilt–chin lift maneuver. (From Lewis, S., Heitkemper, M., Dirksen, S., O'Brien, P., & Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

▲ If a neck injury is suspected, the jaw thrust maneuver is used to open the victim's airway.

### C. Breathing

1. Assess breathing and maintain an open airway.
2. The rescuer places his or her ear over the victim's nose and mouth and looks for the chest to rise and fall, listens for air moving in and out of the lungs, and feels for the flow of air (Fig. 18-3).
3. For the breathing victim, do the following:
  - a. Place the victim on his or her side if no cervical trauma is suspected; logroll the victim onto the side as a unit (without twisting) to help maintain an open airway and decrease the risk of aspiration.
  - b. If trauma or injury is suspected, do not move the victim.
4. For the nonbreathing victim, do the following:
  - a. Maintain the **head tilt–chin lift**, pinch the nostrils closed, and give two, effective breaths

▲ **FIGURE 18-2** Opening the airway using the jaw thrust maneuver. (From Harkreader, H., Hogan, M., & Thobaben, M. [2007]. *Fundamentals of nursing: Caring and clinical judgment* [3rd ed.]. St. Louis: Saunders. Used with permission of the American Heart Association. [1992]. Guidelines for cardiopulmonary resuscitation and emergency cardiac care: An international consensus on science and circulation, *Circulation*, 102[Suppl], 217-222.)

▲ **FIGURE 18-3** Listening and feeling for exhalation. (From Christensen, B., and Kockrow, E. [2011]. *Foundations and adult health nursing* [6th ed.]. St. Louis: Mosby.)

at 1 second per breath; thereafter, if rescue breathing is delivered without chest compressions, give 10 to 12 breaths per minute (one breath every 5 to 6 seconds) (Fig. 18-4).

- b. Avoid delivering breaths that are too large or too forceful.
- c. Try to use a resuscitation bag or face shield, if available, ensuring an adequate air seal; allow the victim to exhale fully between breaths.
- d. If unsuccessful at giving the breath, reposition the victim's head and try again (improper chin and head position is a common cause of difficulty in ventilating the victim).
- e. If still unsuccessful, check the victim's mouth for a foreign body or for loose dentures (remove dentures only if they interfere with the mouth seal), clear the airway, and try to ventilate again.
- f. Be alert to gastric distention when giving ventilations.

**!** When performing CPR, if you are unsuccessful at giving a breath, reposition the victim's head and try again.

5. Mouth to nose: This method is recommended when ventilating through the victim's mouth is impossible, the mouth cannot be opened, the mouth is seriously injured, or a tight mouth-to-mouth seal is difficult to achieve.
6. Mouth to stoma (advanced airway)
  - a. This method is used for the victim who has had a laryngectomy or has an advanced

**▲ FIGURE 18-4** The chin is lifted and brought forward; the nostrils are then closed and two effective breaths are given at 1 second per breath (From Lewis, S., Heitkemper, M., Dirksen, S., O'Brien, P., & Bucher, L. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

airway such as tracheostomy; to be effective, an adequate seal over the victim's mouth and nose is necessary.

- b. With an advanced airway (endotracheal tube, laryngeal airway, tracheostomy, esophagotracheal Combitube), 8 to 10 breaths per minute (one breath every 6 to 8 seconds) is delivered
- D. Circulation**
1. Palpate the carotid artery to assess circulation; always check for the absence of a pulse before beginning chest compressions (Fig. 18-5).
  2. Maintain an open airway and palpate for a carotid pulse for 10 seconds or less.
  3. If there is a pulse, continue to give 10 to 12 breaths per minute.
  4. If there is no pulse, chest compressions should begin.
- E. Chest compression landmarks: center of the chest, between the nipples**

**!** To produce as much blood flow as possible, allow the chest to recoil (return to normal position) completely after delivery of each breath and each compression.

**▲ FIGURE 18-5** Locating carotid artery. (From Monahan, F., Sands, J., Neighbors, M., Marek, J., & Green, C. [2007]. *Phipps' medical-surgical nursing: Health and illness perspectives* [8th ed.]. St. Louis: Mosby.)

**F. Chest compression method (Fig. 18-6)**

1. The rescuer uses two hands; the heel of one hand is placed on the landmark and the other hand is placed on top.
2. The rescuer should push hard and fast and avoid interrupted compressions (every time that chest compressions are stopped, blood flow stops as well).
3. The rescuer should allow for complete recoil between compressions.
4. Compression depth should be 1½ to 2 inches.
5. Compression rate is approximately 100 times per minute.
6. The compression-to-ventilation ratio is 30:2 (for either one or two rescuers).

**▲ FIGURE 18-6** Chest compression—proper hand position for an adult. (From Perry, A., & Potter, P. [2010]. *Clinical nursing skills & techniques* [7th ed.]. St. Louis: Mosby.)

### PRIORITY NURSING ACTIONS!

#### Actions for the Health Care Provider for Performing Adult CPR

1. Determine unconsciousness.
2. Open the client's airway.
3. Determine breathlessness.
4. Initiate breathing.
5. Check for a pulse at the carotid artery.
6. Perform chest compressions.

The sequence for basic CPR for health care providers is as follows. After determining unconsciousness, the airway is opened and breathlessness is determined. Next, the health care provider delivers effective breaths that produce a visible rise in the chest, followed by assessing the carotid artery for presence of a pulse. In the absence of any pulse, chest compressions are provided at an adequate rate and depth that will allow adequate chest recoil, with minimal interruptions in chest compressions.

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 731). St. Louis: Mosby.

**G. Complications of chest compressions**

1. Laceration of internal organs
2. Punctured lungs
3. Fractured ribs or sternum

**▲** When performing chest compressions, push hard and fast, and avoid interrupted compressions.

### III. PEDIATRIC CPR GUIDELINES FOR THE HEALTH CARE PROVIDER

**A. Description**

1. For HCPs, a child is defined as a person from 1 year to adolescent; for lay rescuers, children are 1 to 8 years of age.
2. For both HCPs and lay rescuers, an infant is defined as a person younger than 1 year of age.
3. For an unresponsive infant or child, the lone (one rescuer) HCP should perform five cycles (about 2 minutes of CPR) and then call the emergency response number; the HCP must assess the most likely cause of the arrest.
4. If the infant or child has a sudden witnessed collapse, the collapse is likely to be cardiac in origin (hypoxic cardiac arrest); in this situation, the emergency response number should be called after verifying that the victim is unresponsive.

**B. Airway**

1. Assess unresponsiveness.
2. Use the **head tilt–chin lift** to open the airway (the HCP would use the **jaw thrust maneuver** if neck trauma is suspected).

**C. Breathing**

1. Breathing victim: Keep the airway open.
2. Nonbreathing victim
  - a. Deliver two initial effective breaths (breaths that cause a visible chest rise) to the infant or child at 1 second per breath; 12 to 20 breaths per minute are then delivered (one breath every 3 to 5 seconds)
  - b. With the infant or small child, provide ventilations by mouth to mouth and nose.
  - c. With the larger child, provide ventilations by mouth to mouth.
  - d. For the child or infant with an advanced airway, 8 to 10 breaths per minute (one breath every 6 to 8 seconds) are delivered.

**D. Circulation**

1. Assess circulation for no more than 10 seconds.
2. If the victim is older than 1 year, assess circulation via the carotid artery (HCP can use the femoral pulse in a child).
3. If the victim is younger than 1 year, assess circulation via the brachial artery (HCP can use the femoral pulse in a child).
4. If there is a pulse, continue to give 12 to 20 breaths per minute (one breath every 3 to 5 seconds).
5. If there is no pulse, begin chest compressions.

 The chest compression landmark for a child is in the center of the chest between the nipples. For the infant, the landmark is just below the nipple line.

#### 6. Chest compression method

- Child: Use of two hands with the heel of one hand on the chest and the second hand on top; or use one hand with the heel of one hand only on the chest.
- Infant: One rescuer uses two fingers; for HCPs with two rescuers present, use two-thumb-encircling hands technique.
- Compression depth:  $\frac{1}{3}$  to  $\frac{1}{2}$  the depth of the chest
- Compression rate: Approximately 100 per minute
- Compression-to-ventilation ratio: 30:2 for a single rescuer; for the HCP, 15:2 for two rescuers

### IV. AUTOMATED EXTERNAL DEFIBRILLATOR BY THE HEALTH CARE PROVIDER

#### A. Description

- The automated external defibrillator (AED) is used to convert ventricular fibrillation into a perfusing rhythm.
- The AED differentiates nonventricular from ventricular fibrillation rhythms and allows for early defibrillation by first responders.
- The use of AEDs is recommended for children in cardiac arrest 1 year of age and older (not recommended for infants younger than 1 year).
- For sudden witnessed arrest in the child or adult in the out-of-hospital setting, the HCP should phone the emergency response number, retrieve the AED, and return to the victim to perform CPR and use the AED.

#### B. Adult

- Adult pads need to be used (child pads or a child system cannot be used on an adult).
- Out-of-hospital response: Provide five cycles (2 minutes) of CPR before defibrillating if response time was longer than 4 to 5 minutes and the arrest was not witnessed.

#### C. Child

- Child pads and child system are used for the child 1 to 8 years of age, if available (if child pads and system are not available, adult AED and pads are used).
- Out-of-hospital response: Provide five cycles of CPR before defibrillating (for sudden and in-hospital collapse, use AED as soon as possible).

 When using the AED on an adult, do not use the child pads; these pads will not provide an effective shock.

#### D. Interventions

- Attach AED pads to the victim.
- Turn on the AED and push the button to activate the analyzer.

- Follow instructions given for the AED, usually “assess,” “stand back,” “shock,” and “reassess.”
- CPR guidelines to treat cardiac arrest associated with ventricular fibrillation or pulseless ventricular tachycardia recommend the delivery of single shocks followed immediately by a period of CPR; interruptions of chest compressions to check circulation should not be done until about five cycles or approximately 2 minutes of CPR have been provided after the shock.

### V. FOREIGN BODY AIRWAY OBSTRUCTION (FBAO)

#### A. General guidelines

- The HCP needs to distinguish choking victims who require treatment (abdominal thrusts or back slaps and chest thrusts) from those who do not (mild versus severe airway obstruction).
- Signs of severe airway obstruction include poor air exchange and increased breathing difficulty, a silent cough, cyanosis, or inability to speak or breathe.
- Every time the airway is opened (with a **head tilt–chin lift**) to deliver rescue breaths, the rescuer should look in the mouth and remove an object only if one is seen.
- Abdominal thrusts are used for the adult; back slaps and chest thrusts are used for the child and infant.

 Blind finger sweeps in the mouth of a victim with a foreign body airway obstruction (FBAO) should not be performed because of the risk of pushing the object further into the airway.

#### B. Conscious adult

- Ask the victim, “Are you choking?” (the victim will not be able to speak or cough if he or she is choking); if the victim nods “yes,” help is needed.
- Relieve the obstruction by the **abdominal thrust maneuver** (Box 18-3 and Fig. 18-7).
- Continue abdominal thrusts until the object is dislodged or the victim becomes unconscious.

#### C. Unconscious adult

- Assess unconsciousness.
- Call for help.

#### Box 18-3 Abdominal Thrust Maneuver

Stand behind the victim.  
Place arms around the victim’s waist.  
Make a fist.  
Place the thumb side of the fist just above the umbilicus (belly button) and well below the xiphoid process.  
Perform five quick in and up abdominal thrusts (between the umbilicus and the xiphoid process).  
Use chest thrusts for the obese or the advanced pregnancy victim.

▲ **FIGURE 18-7** Abdominal thrust maneuver. (From Christensen, B., & Kockrow, E. [2006]. *Foundations of nursing* [5th ed.]. St. Louis: Mosby.)

▲ **FIGURE 18-8** Clearing airway obstruction in an infant. (From Christensen, B., & Kockrow, E. [2006]. *Foundations of nursing* [5th ed.]. St. Louis: Mosby.)

3. Perform the **head tilt–chin lift** technique.
4. Open the airway and look in the mouth; remove an object only if one is seen.
5. Attempt ventilation.
6. Reposition the head if unsuccessful; reattempt ventilation.
7. Relieve the obstruction by the **abdominal thrust maneuver** with five abdominal thrusts.
8. Reattempt ventilation.
9. Repeat the sequence of **head tilt–chin lift**, breaths, and **abdominal thrust maneuver** until successful.
10. Be sure to assess for the victim's carotid pulse and for the presence of spontaneous respirations.
11. Perform rescue breathing or CPR, if required.

▲ **To perform the abdominal thrust maneuver on an adult, straddle the victim's thighs, place the heel of one hand on top of the other, between the umbilicus and xiphoid process, and give five abdominal thrusts in and up with the heel of the bottom hand.**

#### D. Choking child or infant

1. FBAO requiring intervention is when signs of severe airway obstruction exist.
2. For the conscious child:
  - a. Assess for obstruction by asking the child, "Are you choking?" If the victim nods "yes," help is needed.
  - b. Relieve the obstruction by the **abdominal thrust maneuver** until the obstruction is dislodged or the child becomes unconscious.
3. For the unconscious child, do the following:
  - a. Assess unconsciousness.
  - b. Open the airway by the **head tilt–chin lift** technique.

- c. Check for breathing and look for a foreign object (remove only if seen).
- d. Attempt ventilation.
- e. If unsuccessful, reposition the head; reattempt ventilation.
- f. Relieve the obstruction by using the **abdominal thrust maneuver**.
- g. Look in the mouth and remove a foreign object only if one is seen.
- h. Reattempt ventilation.
- i. Repeat the sequence.
4. For the conscious infant, do the following:
  - a. Assess for obstruction and note if mild or severe airway obstruction exists.
  - b. Relieve the obstruction by five back slaps and five chest thrusts (Fig. 18-8).
  - c. Straddle the infant over the arm, place the infant's head lower than the trunk, and support the head firmly, holding the jaw.
  - d. Give five back slaps with the heel of the hand between the shoulder blades.
  - e. Turn the infant; place the head lower than the trunk.
  - f. Give five chest thrusts at the same location as for chest compressions.
  - g. Check for the object and remove, if visible.
  - h. Continue until the object is removed or the infant becomes unconscious.
5. For the unconscious infant, do the following:
  - a. Assess unconsciousness by gentle taps.
  - b. Open the airway by the **head tilt–chin lift** technique and check for breathing.
  - c. Look in the mouth and remove any visualized foreign object every time the airway is opened.
  - d. Attempt ventilation.
  - e. Reposition the head if unsuccessful; reattempt ventilation.

- f. Relieve the obstruction by five back slaps and five chest thrusts.
- g. Reattempt ventilation and repeat the sequence.

 In an infant, deliver five back slaps and then five chest thrusts to remove the foreign body from the airway.

## VI. PREGNANT OR OBESE VICTIM

### A. Abdominal thrust maneuver and relieving a FBAO

1. Place the arms under the woman's axillae and across the chest.
2. Place the thumb side of a clenched fist against the middle of the sternum, and place the other hand over the fist.
3. Perform backward chest thrusts until the foreign body is expelled or until the woman becomes unconscious.
4. If she becomes unconscious, place her on her back.

 If the victim of FBAO is pregnant, remember to place a wedge, such as a pillow or rolled blanket, under the right abdominal flank and hip to displace the uterus to the left side of the abdomen. This prevents supine hypotension.

5. If unable to ventilate, position the hands as for chest compressions and deliver chest thrusts firmly to remove the obstruction.

### B. Defibrillation in the pregnant client: If defibrillation is needed, place the paddles one rib interspace higher than usual because the heart is displaced slightly by the enlarged uterus.

the airway. The nurse opens the airway in this victim by using which method?

1. Flexed position
2. Head tilt–chin lift
3. Jaw thrust maneuver
4. Modified head tilt–chin lift

### 158. A nurse understands that which of the following is a correct guideline for adult cardiopulmonary resuscitation (CPR) for a health care provider?

1. One breath should be given for every five compressions.
2. Two breaths should be given for every 15 compressions.
3. Initially, two quick breaths should be given as rapidly as possible.
4. Each rescue breath should be given over 1 second and should produce a visible chest rise.

### 159. A nurse attempts to relieve an airway obstruction on a 3-year-old conscious child. The nurse performs this maneuver correctly by standing behind the child, placing her arms under the child's axillae and around the child, and positioning her hands to deliver the thrusts between the:

1. Groin and the abdomen
2. Umbilicus and the groin
3. Lower abdomen and the chest
4. Umbilicus and the xiphoid process

### 160. A nurse is performing cardiopulmonary resuscitation (CPR) on a 7-year-old child. The nurse delivers how many breaths per minute to the child?

1. 6
2. 8
3. 10
4. 20

### 161. A nurse is performing cardiopulmonary resuscitation (CPR) on an infant. When performing chest compressions, the nurse compresses at least:

1. 60 times per minute
2. 80 times per minute
3. 100 times per minute
4. 160 times per minute

### 162. A nurse is teaching cardiopulmonary resuscitation (CPR) to a group of nursing students. The nurse asks a student to describe the reason why blind finger sweeps are avoided in infants. The nurse determines that the student understands this reason if the student makes which statement?

1. "The object may have been swallowed."
2. "The infant may bite down on the finger."
3. "The mouth is too small to see the object."
4. "The object may be forced back farther into the throat."

## MORE QUESTIONS ON THE CD!

### Practice Questions

**156.** A nurse on the day shift walks into a client's room and finds the client unresponsive. The client is not breathing and does not have a pulse, and the nurse immediately calls out for help. The next nursing action is which of the following?

1. Open the airway.
2. Give the client oxygen.
3. Start chest compressions.
4. Ventilate with a mouth-to-mask device.

**157.** A nurse witnesses a neighbor's husband sustain a fall from the roof of his house. The nurse rushes to the victim and determines the need to open

**163.** A nurse is performing cardiopulmonary resuscitation (CPR) on an adult client. When performing chest compressions, the nurse should depress the sternum:

1.  $\frac{3}{4}$  to 1 inch
2.  $\frac{1}{2}$  to  $\frac{3}{4}$  inch
3.  $1\frac{1}{2}$  to 2 inches
4.  $2\frac{1}{2}$  to 3 inches

**164.** A nursing instructor asks a nursing student to describe the procedure for performing abdominal thrusts on an unconscious pregnant woman at 8 months' gestation. The student describes a component of the procedure the procedure correctly if the student states that he will:

1. Place his hands in the pelvis to perform the thrusts.
2. Perform abdominal thrusts until the object is dislodged.

3. Perform left lateral abdominal thrusts until the object is dislodged.
4. Place a rolled blanket under the right abdominal flank and hip area.

### Alternate Item Format: Prioritizing (Ordered Response)

**165.** A nursing student is asked to describe the correct steps for performing abdominal thrusts on an unconscious adult. Number in order of priority the steps for performing this procedure. (Number 1 is the first step and number 5 is the last step.)

- \_\_\_\_\_ Open the airway
- \_\_\_\_\_ Attempt ventilation
- \_\_\_\_\_ Assess unconsciousness
- \_\_\_\_\_ Perform abdominal thrusts
- \_\_\_\_\_ Look in the mouth and remove the object blocking the airway if seen

## ANSWERS

### 156. 1

**Rationale:** The next nursing action would be to open the airway. Ventilation cannot be initiated unless the airway is opened. Chest compressions are started after opening the airway and initiating ventilation. Oxygen may be helpful at some point, but the airway is opened first.

**Test-Taking Strategy:** Visualize the steps of cardiopulmonary resuscitation (CPR) to answer the question. Recalling the ABCDs—airway, breathing, circulation, defibrillation or definitive treatment—will assist in directing you to option 1. Review the steps of CPR if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Critical Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 136). St. Louis: Saunders.

### 157. 3

**Rationale:** If a neck injury is suspected, the jaw thrust maneuver is used to open the airway. The head tilt–chin lift maneuver produces hyperextension of the neck and could cause complications if a neck injury is present. A flexed position is an inappropriate position for opening the airway.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 2 and 4 first because they are comparable or alike. Next, eliminate option 1 because this position would not open the airway. If you had difficulty with this question, review the appropriate methods to open an airway.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Critical Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 136). St. Louis: Saunders.

### 158. 4

**Rationale:** In adult CPR, each rescue breath should be given over 1 second and should produce a visible chest rise. Excessive ventilation (too many breaths per minute or breaths that are too large or forceful) may be harmful and should not be performed. Health care providers should employ a 30:2 compression-to-ventilation ratio for the adult victim. Options 1, 2, and 3 are incorrect.

**Test-Taking Strategy:** Read each option carefully. Noting the words *visible chest rise* in option 4 will direct you to this option. Review CPR guidelines for the adult if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Critical Care

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., pp. 731, 734). St. Louis: Mosby.

### 159. 4

**Rationale:** To perform abdominal thrusts on a child, the rescuer stands behind the victim and places the arms directly under the victim's axillae and around the victim. The rescuer places the thumb side of one fist against the victim's abdomen in the midline, slightly above the umbilicus and well below the tip of the xiphoid process. The rescuer grasps the fist with the other hand and delivers up to five thrusts. One must take care not to touch the xiphoid process or the lower margins of the rib cage because force applied to these structures may damage internal organs. Options 1, 2, and 3 are incorrect hand placements.

**Test-Taking Strategy:** Use the process of elimination, noting the age of the child. Eliminate options 1 and 2 first because they are comparable or alike locations. From the remaining options, considering the anatomical location and the effect of the maneuver in dislodging an obstruction will direct you to option 4. If you had difficulty with this question, review the correct hand placement for performing abdominal thrusts.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Critical Care

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., pp. 809–810). St. Louis: Mosby.

#### 160. 4

**Rationale:** In a child between the ages of 1 and 8 years, 12 to 20 breaths per minute are delivered. Options 1, 2, and 3 are incorrect.

**Test-Taking Strategy:** Use the process of elimination and note the age of the child. Recalling the normal respiratory rate in a child at this age will assist in directing you to option 4. If you had difficulty with this question, review CPR guidelines for a child.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Critical Care

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 858). St. Louis: Saunders.

#### 161. 3

**Rationale:** In an infant, the rate of chest compressions is at least 100 times per minute. Options 1 and 2 identify rates that are too low, and option 4 identifies a rate that is too high.

**Test-Taking Strategy:** Use the process of elimination, considering the normal heart rate of an infant. Eliminate options 1 and 2 because of the low rates identified in the options. Eliminate option 4 because this rate would be much too rapid for an infant. If you had difficulty with this question, review CPR for an infant.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Critical Care

**Reference:** Lowdermilk, D., & Perry, S. (2007). *Maternity & women's health care* (9th ed., p. 753). St. Louis: Mosby.

#### 162. 4

**Rationale:** Blind finger sweeps are not recommended for infants and children because of the risk of forcing the object farther down into the airway. Options 1, 2, and 3 are not related directly to the subject of the question, a blocked airway.

**Test-Taking Strategy:** Use the ABCDs—airway, breathing, circulation, and defibrillation or definitive treatment—to answer this question. Also focus on the subject of the question, a blocked airway. Option 4 addresses the concern of airway patency. If you had difficulty with this question, review obstructed airway management for an infant or a child.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Critical Care

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 859). St. Louis: Saunders.

#### 163. 3

**Rationale:** When performing CPR on an adult client, the sternum is depressed 1½ to 2 inches. Options 1 and 2 identify

compression depths that would be ineffective in an adult. Option 4 identifies a depth that could cause injury to the client.

**Test-Taking Strategy:** Note the strategic word *adult* in the question. Consider the normal body structure of an adult to assist in directing you to option 3. If you had difficulty with this question, review the procedure for performing adult CPR.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Critical Care

**Reference:** Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 731). St. Louis: Mosby.

#### 164. 4

**Rationale:** To perform abdominal thrusts on an unconscious woman in an advanced gestational stage of pregnancy, the woman is placed on her back. A wedge, such as a pillow or rolled blanket, is placed under the right abdominal flank and hip to displace the uterus to the left side of the abdomen. This prevents supine hypotension that can occur if the gravid uterus rests on the aorta. Options 1, 2, and 3 are incorrect and can harm the woman and the fetus.

**Test-Taking Strategy:** Note that the victim is an unconscious pregnant woman at 8 months' gestation. Recall the causes associated with supine hypotension and vena caval syndrome to assist in directing you to option 4. Review the principles associated with performing abdominal thrusts on a pregnant woman if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Critical Care

**Reference:** Lowdermilk, D., & Perry, A. (2007). *Maternity & women's health care* (9th ed., p. 861). St. Louis: Mosby.

### ALTERNATE ITEM FORMAT: PRIORITIZING (ORDERED RESPONSE)

#### 165. 2, 4, 1, 5, 3

**Rationale:** For health care providers, the sequence for removing a foreign body airway obstruction in an adult is as follows. After determining unconsciousness, the airway is opened and the rescuer looks into the mouth of the victim and removes the object blocking the airway if it is seen. Next, the health care provider attempts to ventilate the victim. If unsuccessful, the victim's head is repositioned and ventilation is reattempted. Five abdominal thrusts are then delivered. The sequence is repeated until successful.

**Test-Taking Strategy:** Visualize the procedure; the ABCs can be used as a guide in performing this procedure. Remember that determining unconsciousness is the first action. Next, open the airway; otherwise, you would not be able to look into the victim's mouth. Breathe: Attempt ventilation. Finally, perform the abdominal thrusts. Review the procedure for performing abdominal thrusts if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Critical Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 597). St. Louis: Saunders.

# Perioperative Nursing Care

## PYRAMID TERMS

**atelectasis** A collapsed or airless state of the lung that may be the result of airway obstruction caused by accumulated secretions or failure of the client to deep breathe or ambulate about after surgery; a postoperative complication that usually occurs 1 to 2 days after surgery.

**extended postoperative stage** The period of at least 1 to 4 days after surgery.

**immediate postoperative stage** The period of 1 to 4 hours after surgery.

**intermediate postoperative stage** The period of 4 to 24 hours after surgery.

**perioperative nursing** Nursing care given before (preoperative), during (intraoperative), and after surgery (postoperative).

**wound dehiscence** Separation of the wound edges.

**wound evisceration** Protrusion of internal organs through an incision.

Ensuring that advance directives documents are in the client's medical record  
Establishing priorities  
Informing the client of the surgical process  
Maintaining continuity of care and initiating referrals to home care and other support services  
Maintaining confidentiality  
Maintaining standard and transmission based precautions and surgical asepsis  
Obtaining informed consent for the surgical procedure  
Preventing a surgical infection  
Providing safety to the medicated client

## Health Promotion and Maintenance

Discussing expected body image changes  
Identifying lifestyle choices  
Performing techniques of physical assessment  
Providing client and family teaching related to the prescribed discharge plan  
Providing health and wellness teaching to prevent complications

## Psychosocial Integrity

Assessing psychosocial concerns  
Assisting the client to develop coping methods  
Communicating therapeutically  
Considering cultural practices when planning care  
Identifying support systems  
Identifying unexpected body image changes  
Promoting an environment that will allow the client to express concerns

## Physiological Integrity

Administering intravenous (IV) fluids and blood products safely  
Administering preoperative and postoperative medications safely  
Initiating nursing interventions when surgical complications arise  
Monitoring for unexpected responses to treatments and procedures

## THE PYRAMID TO SUCCESS

Pyramid Points focus on teaching the client and family or significant other in the preoperative stage, preparing the client for the operative procedure, ensuring that prescribed preoperative tests and procedures such as x-ray films or laboratory studies have been performed, and ensuring that the results of the tests and procedures are within expected ranges and are documented. In the postoperative stage, Pyramid Points focus on monitoring for surgical complications and on the implementation of initial nursing measures if a complication arises. Because many surgical procedures are performed through ambulatory care units (1-day stay units), Pyramid Points also focus on preparing the client for discharge, teaching related to the prescribed treatments and medications, follow-up care, and the mobilization of home care support services.

## CLIENT NEEDS

### Safe and Effective Care Environment

Acting as an advocate and upholding client's rights  
Collaboration with the interdisciplinary team

Monitoring for surgical complications  
 Monitoring for wound infection  
 Providing basic care and comfort  
 Providing respiratory therapy and other prescribed therapies

## I. PREOPERATIVE CARE

 A client may return home shortly after having a surgical procedure because many surgical procedures are done through ambulatory care or 1-day stay surgical units. Perioperative care procedures apply even when the client returns home the same day of the surgical procedure.

### A. Obtaining informed consent

1. The surgeon is responsible for obtaining the consent for surgery.
2. Minors (clients younger than 18 years old) may need a parent or legal guardian to sign the consent form.
3. Older clients may need a legal guardian to sign the consent form.
4. No sedation should be administered to the client before the client signs the consent.
5. The nurse may witness the client's signing of the consent form, but the nurse must be sure that the client has understood the surgeon's explanation of the surgery.
6. The nurse needs to document the witnessing of the signing of the consent form after the client acknowledges understanding the procedure.

### B. Nutrition

1. Review the physician's prescriptions regarding the NPO status before surgery.
2. Withhold solid foods and liquids as prescribed to avoid aspiration; usually for 6 to 8 hours before general anesthesia and for approximately 3 hours before surgery with local anesthesia.
3. Insert an IV line and administer IV fluids, if prescribed; IV catheter size should be large enough to administer blood products if they are required.
4. Administer parenteral nutrition (PN) as prescribed; usually PN is prescribed for clients who are malnourished, have protein or metabolic deficiencies from underlying disease, or cannot ingest foods.

### C. Elimination

1. If the client is to have intestinal or abdominal surgery, then an enema, laxative, or both may be prescribed the day or night before surgery.
2. The client should void immediately before surgery.
3. Insert a Foley catheter, if prescribed; Foley catheters should be emptied immediately before surgery, and the nurse should document the amount and characteristics of the urine.

### D. Surgical site

1. Clean the surgical site with a mild antiseptic or antibacterial soap the night before surgery, as prescribed.
2. Shave the operative site, as prescribed; shaving may be done in the operative area.

 Hair on the head or face (including the eyebrows) should be shaved only if prescribed.

### E. Preoperative client teaching

1. Inform the client about what to expect postoperatively.
2. Inform the client to notify the nurse if the client experiences any pain postoperatively and that pain medication will be prescribed and given as the client requests.
3. Demonstrate the use of a patient-controlled analgesia pump if prescribed.
4. Inform the client that requesting an opioid after surgery will not make the client a drug addict.
5. Instruct the client to use noninvasive pain relief techniques such as relaxation, distraction techniques, and guided imagery before the pain occurs and as soon as the pain is noticed.
6. The nurse should instruct the client not to smoke (for at least 24 hours before surgery); discuss smoking cessation treatments and programs.
7. Instruct the client in deep-breathing and coughing techniques, use of incentive spirometry, and the importance of performing the techniques postoperatively to prevent the development of pneumonia and **atelectasis** (Box 19-1).
8. Instruct the client in leg and foot exercises to prevent venous stasis of blood and to facilitate venous blood return (Fig. 19-1; see Box 19-1).
9. Instruct the client in how to splint an incision, turn, and reposition (Fig. 19-2; see Box 19-1).
10. Inform the client of any invasive devices that may be needed after surgery, such as a nasogastric tube, drain, Foley catheter, epidural catheter, or IV or subclavian lines.
11. Instruct the client not to pull on any of the invasive devices; they will be removed as soon as possible.

### F. Psychosocial preparation

1. Be alert to the client's level of anxiety.
2. Answer any questions or concerns that the client may have regarding surgery.
3. Allow time for privacy for the client to prepare for surgery psychologically.
4. Provide support and assistance as needed.
5. Take cultural aspects into consideration when providing care (Box 19-2)

**Box 19-1 Client Teaching****Deep-Breathing and Coughing Exercises**

Instruct the client that a sitting position gives the best lung expansion for coughing and deep-breathing exercises.

Instruct the client to breathe deeply three times, inhaling through the nostrils and exhaling slowly through pursed lips.

Instruct the client that the third breath should be held for 3 seconds; then the client should cough deeply three times.

The client should perform this exercise every 1 to 2 hours.

**Incentive Spirometry**

Instruct the client to assume a sitting or upright position.

Instruct the client to place the mouth tightly around the mouthpiece.

Instruct the client to inhale slowly to raise and maintain the flow rate indicator, usually between the 600 and 900 marks on the device.

Instruct the client to hold the breath for 5 seconds and then to exhale through pursed lips.

Instruct the client to repeat this process 10 times every hour.

**Leg and Foot Exercises**

**Gastrocnemius (calf) pumping:** Instruct the client to move both ankles by pointing the toes up and then down.

**Quadriceps (thigh) setting:** Instruct the client to press the back of the knees against the bed and then to relax the knees; this contracts and relaxes the thigh and calf muscles to prevent thrombus formation.

**Foot circles:** Instruct the client to rotate each foot in a circle.

**Hip and knee movements:** Instruct the client to flex the knee and thigh and to straighten the leg, holding the position for 5 seconds before lowering (not performed if the client is having abdominal surgery or if the client has a back problem).

**Splinting the Incision**

If the surgical incision is abdominal or thoracic, instruct the client to place a pillow, or one hand with the other hand on top, over the incisional area.

During deep breathing and coughing, the client presses gently against the incisional area to splint or support it.

**Essential**

Gastrocnemius (calf) pumping

Quadriceps (thigh) setting

**Desirable**

Foot circles

Hip and knee movements

▲ **FIGURE 19-1** Postoperative leg exercises. (From Lewis, S., Heitkemper, M., & Dirksen, S. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

▲ **FIGURE 19-2** Techniques for splinting a wound when coughing. (From Lewis, S., Heitkemper, M., & Dirksen, S. [2007]. *Medical-surgical nursing: Assessment and management of clinical problems* [7th ed.]. St. Louis: Mosby.)

### Box 19-2 Cultural Aspects of Perioperative Nursing Care

Cultural assessment includes questions related to:

- Primary language spoken
- Feelings related to surgery and pain
- Pain management
- Expectations
- Support systems
- Feelings toward self
- Cultural practices and beliefs

Allow a family member to be present when and if appropriate.

Secure the help of a professional interpreter to communicate with non-English-speaking clients.

Use pictures or phrase cards to communicate and assess the non-English-speaking client's perception of pain or other feelings.

Provide preoperative and postoperative educational materials in the appropriate language.

Modified from Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1375). St. Louis: Mosby.

### Box 19-3 Medical Conditions That Increase Risk During Surgery

Bleeding disorders such as thrombocytopenia, hemophilia  
Diabetes mellitus

Chronic pain

Heart disease, such as a recent myocardial infarction, dysrhythmia, heart failure, or peripheral vascular disease

Obstructive sleep apnea

Upper respiratory infection

Liver disease

Fever

Chronic respiratory disease, such as emphysema, bronchitis, or asthma

Immunological disorders, such as leukemia, infection with human immunodeficiency virus, acquired immunodeficiency syndrome, bone marrow depression, or use of chemotherapy or immunosuppressive agents

Abuse of street drugs

Modified from Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1370). St. Louis: Mosby.

#### G. Preoperative checklist

1. Ensure that the client is wearing an identification bracelet.
2. Assess for allergies, including an allergy to latex (see Chapter 70 for information on latex allergy).
3. Review the preoperative checklist to be sure that each item is addressed before the client is transported to surgery.
4. Follow agency policies regarding preoperative procedures including informed consents, preoperative checklists, prescribed laboratory or radiological tests, or any other preoperative procedure.
5. Ensure that informed consent forms have been signed for the operative procedure, any blood transfusions, disposal of a limb, or surgical sterilization procedures.
6. Ensure that a history and physical examination have been completed and documented in the client's record (Box 19-3).
7. Ensure that consultation requests have been completed and documented in the client's record.
8. Ensure that prescribed laboratory results are documented in the client's record.
9. Ensure that the electrocardiogram and chest radiography reports are documented in the client's record.
10. Ensure that a blood type, screen, and cross-match are performed and documented in the client's record.
11. Remove jewelry, makeup, dentures, hairpins, nail polish (depending on agency procedures), glasses, and prostheses.

12. Document that valuables have been given to the client's family members or locked in the hospital safe.
13. Document the last time that the client ate or drank.
14. Document that the client voided before surgery.
15. Document that the prescribed preoperative medications were given (Box 19-4).
16. Monitor and document the client's vital signs.

#### H. Preoperative medications

1. Prepare to administer preoperative medications as prescribed before surgery.
2. Instruct the client about the desired effects of the preoperative medication.

 After administering the preoperative medications, keep the client in bed with the side rails up. Place the call bell next to the client; instruct the client not to get out of bed and to call for assistance if needed.

#### I. Arrival in the operating room

1. Guidelines to eliminate wrong site and wrong procedure surgery
  - a. The surgeon meets with the client in the preoperative area and uses indelible ink to mark the operative site.
  - b. In the operating room, the nurse and surgeon ensure and reconfirm that the operative site has been appropriately marked.
  - c. Just before starting the surgical procedure, a time out is conducted with all members of

**Box 19-4 Substances That Can Affect the Client in Surgery****Antibiotics**

Antibiotics potentiate the action of anesthetic agents.

**Anticholinergics**

Medications with anticholinergic effects increase the potential for confusion.

**Anticoagulants**

Anticoagulants alter normal clotting factors and increase the risk of hemorrhaging.

Aspirin (acetylsalicylic acid) and nonsteroidal anti-inflammatory drugs are commonly used medications that can alter clotting mechanisms.

These medications should be discontinued at least 48 hours before surgery or as specified by the surgeon.

**Anticonvulsants**

Long-term use of certain anticonvulsants can alter the metabolism of anesthetic agents.

**Antidepressants**

Antidepressants may lower the blood pressure during anesthesia.

**Antidysrhythmics**

Antidysrhythmic medications reduce cardiac contractility and impair cardiac conduction during anesthesia.

**Antihypertensives**

Antihypertensive medications can interact with anesthetic agents and cause bradycardia, hypotension, and impaired circulation.

**Corticosteroids**

Corticosteroids cause adrenal atrophy and reduce the ability of the body to withstand stress.

Before and during surgery, dosages may be increased temporarily.

**Diuretics**

Diuretics potentiate electrolyte imbalances after surgery.

**Herbal Substances**

Herbal substances can interact with anesthesia and cause a variety of adverse effects. These substances may need to be stopped at a specific time before surgery. During the preoperative period, the client needs to be asked if he or she is taking an herbal substance.

**Insulin**

The need for insulin after surgery in a diabetic may be reduced because the client's nutritional intake is decreased, or the need for insulin may be increased because of the stress response and intravenous administration of glucose solutions.

Modified from Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1373). St. Louis: Mosby.

the operative team present to identify the appropriate surgical site again.

- When the client arrives in the operating room, the operating room nurse will verify the identification bracelet with the client's verbal response and will review the client's chart.
- The client's chart will be checked for completeness and reviewed for informed consent forms, history and physical examination, and allergic reaction information.
- Physicians' prescriptions will be verified and implemented.
- The IV line may be initiated at this time (or in the preoperative area), if prescribed.
- The anesthesia team will administer the prescribed anesthesia.

 Verification of the client and the surgical operative site is critical.

**II. POSTOPERATIVE CARE****A. Description**

- Immediate postoperative stage:** The period of 1 to 4 hours after surgery
- Intermediate postoperative stage:** The period of 4 to 24 hours after surgery
- Extended postoperative stage:** The period of at least 1 to 4 days after surgery

**B. Respiratory system**

 Assess breath sounds—stridor, wheezing, or a crowing sound can indicate partial obstruction, bronchospasm, or laryngospasm; crackles or rhonchi may indicate pulmonary edema.

- Monitor vital signs.
- Monitor airway patency and ensure adequate ventilation (prolonged mechanical ventilation during anesthesia may affect postoperative lung function).
- Remember that extubated clients who are lethargic may not be able to maintain an airway.
- Monitor for secretions; if the client is unable to clear the airway by coughing, suction the secretions from the client's airway. 
- Observe chest movement for symmetry and the use of accessory muscles.
- Monitor oxygen administration if prescribed.
- Monitor pulse oximetry.
- Encourage deep breathing and coughing exercises as soon as possible after surgery.
- Note the rate, depth, and quality of respirations; the respiratory rate should be greater than 10 and less than 30 breaths/min. 
- Monitor for signs of respiratory distress, **atelectasis**, or other respiratory complications. 

**C. Cardiovascular system**

1. Monitor circulatory status, such as skin color, peripheral pulses, capillary refill, and for the absence of edema, numbness, and tingling.
2. Monitor for bleeding.
3. Assess the pulse for rate and rhythm (a bounding pulse may indicate hypertension, fluid overload, or client anxiety).
4. Monitor for signs of hypertension and hypotension.
5. Monitor for cardiac dysrhythmias.
6. Monitor for signs of thrombophlebitis, particularly in clients who were in the lithotomy position during surgery.
7. Encourage the use of antiembolism stockings, if prescribed, to promote venous return, strengthen muscle tone, and prevent pooling of blood in the extremities.

**D. Musculoskeletal system**

1. Assess the client for movement of the extremities.
2. Review physician's prescriptions regarding client positioning or restrictions.
3. Encourage ambulation if prescribed; before ambulation, instruct the client to sit at the edge of the bed with his or her feet supported to assume balance.
4. Unless contraindicated, place the client in a low Fowler's position after surgery to increase the size of the thorax for lung expansion.
5. Avoid positioning the postoperative client in a supine position until pharyngeal reflexes have returned; if the client is comatose or semicomatose, position on the side (additionally, an oral airway may be needed).
6. If the client is unable to get out of bed, turn the client every 1 to 2 hours.

**E. Neurological system**

1. Assess level of consciousness.
2. Make frequent periodic attempts to awaken the client until the client awakens.
3. Orient the client to the environment.
4. Speak in a soft tone; filter out extraneous noises in the environment.
5. Maintain the client's body temperature and prevent heat loss by providing the client with warm blankets and raising the room temperature as necessary.

**F. Temperature control**

1. Monitor temperature.
2. Monitor for signs of hypothermia that may result from anesthesia, a cool operating room, or exposure of the skin and internal organs during surgery.
3. Apply warm blankets and continue oxygen as prescribed if the client experiences shivering.

▲ **FIGURE 19-3** Montgomery straps may be used when frequent dressing changes are anticipated to help prevent skin irritation from frequent tape removal. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care*. [6th ed.]. St. Louis: Saunders.)

**G. Integumentary system**

1. Assess surgical site, drains, and wound dressings (serous drainage may occur from an incision, but if excessive bleeding occurs from the site, notify the physician).
2. Assess the skin for redness, abrasions, or breakdown that may have resulted from surgical positioning.
3. Monitor body temperature and wound for signs of infection.
4. Maintain a dry, intact dressing.
5. Change dressings as prescribed, noting the amount of bleeding or drainage, odor, and intactness of sutures or staples (Fig. 19-3).
6. Wound drains should be patent; prepare to assist with the removal of drains (as prescribed by the physician) when the drainage amount becomes insignificant.
7. An abdominal binder may be prescribed for obese and debilitated individuals to prevent dehiscence of the incision.

**H. Fluid and electrolyte balance**

1. Monitor IV fluid administration as prescribed.
2. Record intake and output.
3. Monitor for signs of fluid or electrolyte imbalances.

**I. Gastrointestinal system**

1. Monitor intake and output and for nausea and vomiting.
2. Maintain patency of the nasogastric tube if present.
3. Monitor for abdominal distention.
4. Monitor for passage of flatus and return of bowel sounds.
5. Administer frequent oral care, at least every 2 hours.

6. Maintain the NPO status until the gag reflex and peristalsis return.
7. When oral fluids are permitted, start with ice chips and water.
8. Ensure that the client advances to clear liquids and then to a regular diet, as prescribed and as the client can tolerate.

**!** To prevent aspiration, turn the client to a side-lying position if vomiting occurs; have suctioning equipment available and ready to use.

#### J. Renal system

1. Assess the bladder for distention.
2. Monitor urine output (urinary output should be at least 30 mL/hr).
3. If the client does not have a Foley catheter, the client is expected to void within 6 to 8 hours postoperatively depending on the type of anesthesia administered; ensure that the amount is at least 200 mL.

#### K. Pain management

1. Assess the type of anesthetic used and preoperative medication that the client received, and note whether the client received any pain medications in the postanesthesia period.
2. Assess for pain and inquire about the type and location of pain; ask the client to rate the degree of pain on a scale of 1 to 10, with 10 being the most severe.
3. If the client is unable to rate the pain with a numerical pain scale, then use a descriptor scale that lists words that describe different levels of pain intensity, such as *no pain*, *mild pain*, *moderate pain*, and *severe pain*.
4. Monitor for objective data related to pain, such as facial expressions, body gestures, increased pulse rate, increased blood pressure, and increased respirations.
5. Inquire about the effectiveness of the last pain medication.
6. Administer pain medication as prescribed.
7. Ensure that the client with a patient-controlled analgesia pump understands how to use it.
8. If an opioid has been prescribed, after the initial administration, assess the client every 30 minutes for respiratory rate and pain relief.
9. Use noninvasive measures to relieve postoperative pain, including provision of distraction, comfort measures, positioning, backrubs, and a quiet and restful environment.
10. Document effectiveness of the pain medication and noninvasive pain relief measures.

**!** Consider cultural practices and beliefs when planning pain management.

### III. PNEUMONIA AND ATELECTASIS

#### A. Description (Box 19-5; Fig. 19-4)

1. **Pneumonia:** An inflammation of the alveoli caused by an infectious process that may develop 3 to 5 days postoperatively as a result of infection, aspiration, or immobility
2. **Atelectasis:** A collapsed or airless state of the lung that may be the result of airway obstruction caused by accumulated secretions or failure of the client to deep breathe or ambulate about after surgery; a postoperative complication that usually occurs 1 to 2 days after surgery

#### B. Assessment

1. Assess for factors that may increase the risk of pneumonia and **atelectasis**.
2. Assess for dyspnea and increased respiratory rate.
3. Assess for crackles over involved lung area.

#### Box 19-5 Postoperative Complications

Pneumonia and atelectasis  
 Hypoxemia  
 Pulmonary embolism  
 Hemorrhage  
 Shock  
 Thrombophlebitis  
 Urinary retention  
 Constipation  
 Paralytic ileus  
 Wound infection  
 Wound dehiscence  
 Wound evisceration

**▲ FIGURE 19-4** Postoperative atelectasis. **A**, Normal bronchiole and alveoli. **B**, Mucous plug in bronchiole. **C**, Collapse of alveoli caused by atelectasis following absorption of air. (From Lewis, S., Heitkemper, M., & Dirksen, S. [2004]. *Medical-surgical nursing: Assessment and management of clinical problems* [6th ed.]. St. Louis: Mosby.)

4. Assess for elevated temperature.
5. Assess for productive cough and chest pain.

**C. Interventions**

1. Assess lung and breath sounds.
2. Reposition the client every 1 to 2 hours.
3. Encourage the client to deep breathe, cough, and use the incentive spirometer.
4. Provide chest physiotherapy and postural drainage, as prescribed.
5. Encourage fluid intake and early ambulation.
6. Use suction to clear secretions if the client is unable to cough.

#### IV. HYPOXEMIA

**A. Description:** An inadequate concentration of oxygen in arterial blood; in the postoperative client, hypoxemia can be due to shallow breathing from the effects of anesthesia or medications.

**B. Assessment**

1. Restlessness
2. Dyspnea
3. Diaphoresis
4. Tachycardia
5. Hypertension
6. Cyanosis

**C. Interventions**

1. Monitor for signs of hypoxemia.
2. Notify the physician.
3. Monitor lung sounds and pulse oximetry.
4. Administer oxygen as prescribed.
5. Encourage deep breathing and coughing and use of the incentive spirometer.
6. Turn and reposition the client frequently; encourage ambulation.

#### V. PULMONARY EMBOLISM

**A. Description:** An embolus blocking the pulmonary artery and disrupting blood flow to one or more lobes of the lung.

**B. Assessment**

1. Sudden dyspnea
2. Sudden sharp chest or upper abdominal pain
3. Cyanosis
4. Tachycardia
5. A drop in blood pressure

**C. Interventions**

1. Notify the physician immediately because pulmonary embolism may be life-threatening and requires emergency action.
2. Monitor vital signs.
3. Administer oxygen and medications as prescribed.

#### VI. HEMORRHAGE

**A. Description:** The loss of a large amount of blood externally or internally in a short time period.

**B. Assessment**

1. Restlessness
2. Weak and rapid pulse
3. Hypotension
4. Tachypnea
5. Cool, clammy skin
6. Reduced urine output

**C. Interventions**

1. Provide pressure to the site of bleeding.
2. Notify the physician.
3. Administer oxygen, as prescribed.
4. Administer IV fluids and blood, as prescribed.
5. Prepare the client for a surgical procedure, if necessary.

#### VII. SHOCK

**A. Description:** Loss of circulatory fluid volume, which usually is caused by hemorrhage.

**B. Assessment:** Similar to assessment findings in hemorrhage

**C. Interventions**

1. If shock develops, elevate the legs.
2. Notify the physician.
3. Determine and treat the cause of shock.
4. Administer oxygen, as prescribed.
5. Monitor level of consciousness.
6. Monitor vital signs for increased pulse or decreased blood pressure.
7. Monitor intake and output.
8. Assess color, temperature, turgor, and moisture of the skin and mucous membranes.
9. Administer IV fluids, blood, and colloid solutions, as prescribed.

**!** If the client had spinal anesthesia, do not elevate the legs any higher than placing them on the pillow; otherwise, the diaphragm muscles needed for effective breathing could be impaired.

#### VIII. THROMBOPHLEBITIS

**A. Description**

1. Thrombophlebitis is an inflammation of a vein, often accompanied by clot formation.
2. Veins in the legs are affected most commonly.

**B. Assessment**

1. Vein inflammation
2. Aching or cramping pain
3. Vein feels hard and cord-like and is tender to touch
4. Elevated temperature

**C. Interventions**

1. Monitor legs for swelling, inflammation, pain, tenderness, venous distention, and cyanosis; notify the physician if any of these signs are present.
2. Elevate the extremity 30 degrees without allowing any pressure on the popliteal area.

3. Encourage the use of antiembolism stockings as prescribed; remove stockings twice a day to wash and inspect the legs.
4. Use an intermittent pulsatile compression device as prescribed (Fig. 19-5).
5. Perform passive range-of-motion exercises every 2 hours if the client is confined to bedrest.
6. Encourage early ambulation, as prescribed.
7. Do not allow the client to dangle the legs.
8. Instruct the client not to sit in one position for an extended period of time.
9. Administer anticoagulants such as heparin sodium or warfarin (Coumadin), as prescribed.

## IX. URINARY RETENTION

### A. Description

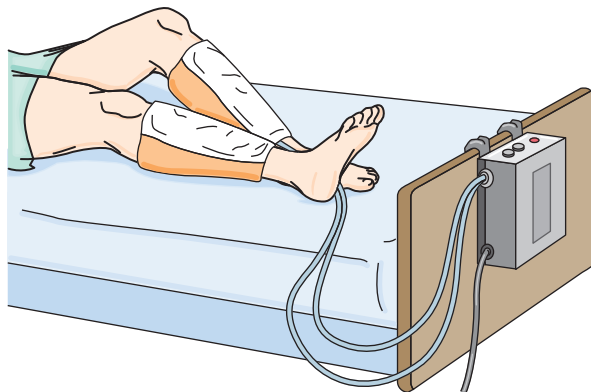

1. Urinary retention is an involuntary accumulation of urine in the bladder as a result of loss of muscle tone.
2. It is caused by the effects of anesthetics or opioid analgesics and appears 6 to 8 hours after surgery.

### B. Assessment

1. Inability to void
2. Restlessness and diaphoresis
3. Lower abdominal pain
4. Distended bladder
5. Hypertension
6. On percussion, bladder sounds like a drum

### C. Interventions

1. Monitor for voiding.
2. Assess for a distended bladder.
3. Encourage ambulation when prescribed.
4. Encourage fluid intake unless contraindicated.
5. Assist the client to void by helping to stand.
6. Provide privacy.
7. Pour warm water over the perineum or allow the client to hear running water to promote voiding.
8. Contact the physician and catheterize the client as prescribed after all noninvasive techniques have been attempted.

**▲ FIGURE 19-5** Intermittent pulsatile compression device. (From Monahan, F., Sands, J., Neighbors, M., Marek, J., & Green, C. [2007]. *Phipps' medical-surgical nursing: Health and illness perspectives* [8th ed.]. St. Louis: Mosby.)

## X. CONSTIPATION

### A. Description

1. Constipation is an abnormal infrequent passage of stool.
2. When the client resumes a solid diet postoperatively, failure to pass stool within 48 hours may indicate constipation.

### B. Assessment

1. Absence of bowel movements
2. Abdominal distention
3. Anorexia, headache, and nausea

### C. Interventions

1. Assess bowel sounds.
2. Encourage fluid intake up to 3000 mL/day unless contraindicated.
3. Encourage early ambulation.
4. Encourage consumption of fiber foods unless contraindicated.
5. Provide privacy and adequate time for bowel elimination.
6. Administer stool softeners and laxatives, as prescribed.

## XI. PARALYTIC ILEUS

### A. Description

1. Paralytic ileus is failure of appropriate forward movement of bowel contents.
2. The condition may occur as a result of anesthetic medications or of manipulation of the bowel during the surgical procedure.

### B. Assessment

1. Vomiting postoperatively
2. Abdominal distention
3. Absence of bowel sounds, bowel movement, or flatus

### C. Interventions

1. Monitor intake and output.
2. Maintain NPO status until bowel sounds return.
3. Maintain patency of a nasogastric tube if in place.
4. Encourage ambulation.
5. Administer IV fluids or PN, as prescribed.
6. Administer medications as prescribed to increase gastrointestinal motility and secretions.
7. If ileus occurs, it is treated first nonsurgically with bowel decompression by insertion of a nasogastric tube attached to intermittent or constant suction.

**▲** Vomiting postoperatively, abdominal distention, and absence of bowel sounds may be signs of paralytic ileus.

## XII. WOUND INFECTION

### A. Description

1. Wound infection may be caused by poor aseptic technique or a contaminated wound before

surgical exploration; existing client conditions such as diabetes mellitus or immunocompromise may place the client at risk.

2. Infection usually occurs 3 to 6 days after surgery.
3. Purulent material may exit from the drains or separated wound edges.

#### B. Assessment

1. Fever and chills
2. Warm, tender, painful, and inflamed incision site
3. Edematous skin at the incision and tight skin sutures
4. Elevated white blood cell count

#### C. Interventions

1. Monitor temperature.
2. Monitor incision site for approximation of suture line, edema, or bleeding, and signs of infection (*REEDA*: redness, erythema, ecchymosis, drainage, approximation of the wound edges); notify the physician if signs of wound infection are present.
3. Maintain patency of drains, and assess drainage amount, color, and consistency.
4. Maintain asepsis and change the dressing, as prescribed.
5. Administer antibiotics, as prescribed.

### XIII. WOUND DEHISCENCE AND EVISCERATION (Fig. 19-6)

#### A. Description

1. **Wound dehiscence** is separation of the wound edges at the suture line; it usually occurs 6 to 8 days after surgery.
2. **Wound evisceration** is protrusion of the internal organs through an incision; it usually occurs 6 to 8 days after surgery.
3. Evisceration is most common among obese clients, clients who have had abdominal surgery, or those who have poor wound-healing ability.

**▲ FIGURE 19-6** Complications of wound healing. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care*. [6th ed.]. St. Louis: Saunders.)

4. **Wound evisceration** is an emergency.

#### B. Assessment: Dehiscence

1. Increased drainage
2. Opened wound edges
3. Appearance of underlying tissues through the wound

#### C. Assessment: Evisceration

1. Discharge of serosanguineous fluid from a previously dry wound
2. The appearance of loops of bowel or other abdominal contents through the wound
3. Client reports feeling a popping sensation after coughing or turning

#### D. Interventions (see Priority Nursing Actions)

1. Place the client in a low Fowler's position with the knees bent to prevent abdominal tension on an abdominal suture line.
2. Cover the wound with a sterile normal saline dressing.
3. Notify the physician.
4. Prevent wound infection through strict asepsis.

### PRIORITY NURSING ACTIONS!

#### Actions to Take if Evisceration Occurs

1. Call for help; ask that the physician be notified and that needed supplies be brought to the client's room.
2. Stay with the client.
3. While waiting for supplies to arrive, place the client in a low Fowler's position with the knees bent.
4. Cover the wound with a sterile normal saline dressing and keep the dressing moist.
5. Take vital signs and monitor the client closely for signs of shock.
6. Prepare the client for surgery as necessary.
7. Document the occurrence, actions taken, and the client's response.

Wound evisceration is protrusion of the internal organs through an incision; it usually occurs 6 to 8 days after surgery. Evisceration is most common among obese clients, clients who have had abdominal surgery, or those who have poor wound-healing ability. Wound evisceration is an emergency. The nurse immediately calls for help and asks that the physician be notified and that needed supplies (vital sign measurement devices, sterile normal saline, and dressings) be brought to the client's room. The nurse stays with the client and while waiting for supplies to arrive, places the client in a low Fowler's position with the knees bent to prevent abdominal tension on an abdominal suture line. The nurse covers the wound with a sterile normal saline dressing as soon as supplies are available and keeps the dressing moist. Vital signs are monitored closely, and the client is monitored for signs of shock. The client is prepared for surgery if necessary. The nurse also documents the occurrence, actions taken, and client's response.

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care*. (7th ed., p. 296). St. Louis: Saunders.

5. Administer antiemetics as prescribed to prevent vomiting and further strain on the abdominal incision.
6. Instruct the client to splint the abdominal incision when coughing; this action assists in preventing or worsening these complications.
7. Prepare the client for surgery as necessary.

#### XIV. AMBULATORY SURGERY

- A.** General criteria for client discharge
1. Client is alert and oriented.
  2. Client has voided.
  3. Client has no respiratory distress.
  4. Client is able to ambulate, swallow, and cough.
  5. Client has minimal pain.
  6. Client is not vomiting.
  7. Client has minimal, if any, bleeding from the incision site.
  8. Client has a responsible adult available to drive the client home.
  9. The surgeon has signed a release form.

- B.** Discharge teaching (Box 19-6)
1. Discharge teaching should be performed before the date of the scheduled procedure.
  2. Provide written instructions to the client and family regarding the specifics of care.
  3. Instruct the client and family about postoperative complications that can occur.
  4. Provide appropriate resources for home care support.
  5. Instruct the client not to drive, make important decisions, or sign any legal documents for 24 hours after receiving general anesthesia.
  6. Instruct the client to call the surgeon, ambulatory center, or emergency department if postoperative problems occur.
  7. Instruct the client to keep follow-up appointments with the surgeon.

#### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 166.** A nurse has just reassessed the condition of a postoperative client who was admitted 1 hour ago to the surgical unit. The nurse plans to monitor which of the following parameters most carefully during the next hour?
1. Urinary output of 20 mL/hr
  2. Temperature of 37.6° C (99.6° F)
  3. Blood pressure of 100/70 mm Hg
  4. Serous drainage on the surgical dressing
- 167.** A postoperative client asks a nurse why it is so important to deep breathe and cough after surgery. When formulating a response, the nurse incorporates the understanding that retained pulmonary secretions in a postoperative client can lead to:
1. Pneumonia
  2. Fluid imbalance
  3. Pulmonary embolism
  4. Carbon dioxide retention
- 168.** A nurse is developing a plan of care for a client scheduled for surgery. The nurse should include which activity in the nursing care plan for the client on the day of surgery?
1. Have the client void immediately before going into surgery.
  2. Avoid oral hygiene and rinsing with mouthwash.
  3. Verify that the client has not eaten for the last 24 hours.
  4. Report immediately any slight increase in blood pressure or pulse.

#### Box 19-6 Postoperative Discharge Teaching

Assess the client's readiness to learn, educational level, and desire to change or modify lifestyle.

Assess the need for resources needed for home care.

Demonstrate care of the incision and how to change the dressing.

Instruct the client to cover the incision with plastic if showering is allowed.

Be sure the client is provided with a 48-hour supply of dressings for home use.

Instruct the client on the importance of returning to the physician's office for follow-up.

Instruct the client that sutures usually are removed in the physician's office 7 to 10 days after surgery.

Inform the client that staples are removed 7 to 14 days after surgery and that the skin may become slightly reddened when they are ready to be removed.

Steri-Strips may be applied to provide extra support after the sutures are removed.

Instruct the client on the use of medications, their purpose, dosages, administration, and side effects.

Instruct the client on diet and to drink six to eight glasses of liquid a day.

Instruct the client about activity levels and to resume normal activities gradually.

Instruct the client to avoid lifting for 6 weeks if a major surgical procedure was performed.

Instruct the client with an abdominal incision not to lift anything weighing 10 pounds or more and not to engage in any activities that involve pushing or pulling.

The client usually can return to work in 6 to 8 weeks depending on the procedure and as prescribed by the physician.

Instruct the client about the signs and symptoms of complications and when to call a physician.

- 169.** A client with a perforated gastric ulcer is scheduled for surgery. The client cannot sign the operative consent form because of sedation from opioid analgesics that have been administered. The nurse should take which appropriate action in the care of this client?
1. Obtain a court order for the surgery.
  2. Send the client to surgery without the consent form being signed.
  3. Have the hospital chaplain sign the informed consent immediately.
  4. Obtain a telephone consent from a family member, following agency policy.
- 170.** A preoperative client expresses anxiety to a nurse about upcoming surgery. Which response by the nurse is most likely to stimulate further discussion between the client and the nurse?
1. "If it's any help, everyone is nervous before surgery."
  2. "I will be happy to explain the entire surgical procedure to you."
  3. "Can you share with me what you've been told about your surgery?"
  4. "Let me tell you about the care you'll receive after surgery and the amount of pain you can anticipate."
- 171.** A nurse is conducting preoperative teaching with a client about the use of an incentive spirometer. The nurse should include which piece of information in discussions with the client?
1. Inhale as rapidly as possible.
  2. Keep a loose seal between the lips and the mouthpiece.
  3. After maximum inspiration, hold the breath for 15 seconds and exhale.
  4. The best results are achieved when sitting up or with the head of the bed elevated 45 to 90 degrees.
- 172.** A nurse has conducted preoperative teaching for a client scheduled for surgery in 1 week. The client has a history of arthritis and has been taking acetylsalicylic acid (aspirin). The nurse determines that the client needs additional teaching if the client states:
1. "Aspirin can cause bleeding after surgery."
  2. "Aspirin can cause my ability to clot blood to be abnormal."
  3. "I need to continue to take the aspirin until the day of surgery."
  4. "I need to check with my physician about the need to stop the aspirin before the scheduled surgery."
- 173.** A nurse assesses a client's surgical incision for signs of infection. Which finding by the nurse would be interpreted as a normal finding at the surgical site?
1. Red, hard skin
  2. Serous drainage
  3. Purulent drainage
  4. Warm, tender skin
- 174.** A nurse is monitoring the status of a postoperative client. The nurse would become most concerned with which of the following signs that could indicate an evolving complication?
1. Increasing restlessness
  2. A pulse of 86 beats/min
  3. Blood pressure of 110/70 mm Hg
  4. Hypoactive bowel sounds in all four quadrants
- 175.** A nurse is reviewing a physician's prescription sheet for a preoperative client that states that the client must be NPO after midnight. The nurse would telephone the physician to clarify that which of the following medications should be given to the client and not withheld?
1. Prednisone
  2. Ferrous sulfate
  3. Cyclobenzaprine (Flexeril)
  4. Conjugated estrogen (Premarin)
- 176.** A client who has undergone preadmission testing has had blood drawn for serum laboratory studies, including a complete blood count, coagulation studies, and electrolytes and creatinine levels. Which of the following laboratory results should be reported to the surgeon's office by the nurse, knowing that it could cause surgery to be postponed?
1. Sodium, 141 mEq/L
  2. Hemoglobin, 8.0 g/dL
  3. Platelets, 210,000/mm<sup>3</sup>
  4. Serum creatinine, 0.8 mg/dL
- 177.** A nurse receives a telephone call from the post-anesthesia care unit stating that a client is being transferred to the surgical unit. The nurse plans to do which of the following first on arrival of the client?
1. Assess the patency of the airway.
  2. Check tubes or drains for patency.
  3. Check the dressing to assess for bleeding.
  4. Assess the vital signs to compare with preoperative measurements.

### Alternate Item Format: Multiple Response

**178.** A client who has had abdominal surgery complains of feeling as though “something gave way” in the incisional site. The nurse removes the dressing and notes the presence of a loop of bowel protruding through the incision. Which nursing interventions should the nurse take? Select all that apply.

- 1. Contact the surgeon.
- 2. Instruct the client to remain quiet.
- 3. Prepare the client for wound closure.
- 4. Document the findings and actions taken
- 5. Place a sterile saline dressing and ice packs over the wound.
- 6. Place the client in a supine position without a pillow under the head.

## ANSWERS

### 166. 1

**Rationale:** Urine output should be maintained at a minimum of 30 mL/hr for an adult. An output of less than 30 mL for each of 2 consecutive hours should be reported to the physician. A temperature higher than 37.7° C (100° F) or lower than 36.1° C (97° F) and a falling systolic blood pressure, lower than 90 mm Hg, are usually considered reportable immediately. The client’s preoperative or baseline blood pressure is used to make informed postoperative comparisons. Moderate or light serous drainage from the surgical site is considered normal.

**Test-Taking Strategy:** To answer this question correctly, you must know the normal ranges for temperature, blood pressure, urinary output, and wound drainage. Through the process of elimination, you then can determine that the urinary output is the only observation that is not within the normal range. Review expected postoperative assessment findings if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Perioperative Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 290). St. Louis: Saunders.

### 167. 1

**Rationale:** Postoperative respiratory problems are atelectasis, pneumonia, and pulmonary emboli. Pneumonia is the inflammation of lung tissue that causes productive cough, dyspnea, and lung crackles. Fluid imbalance can be a deficit or excess related to fluid loss or overload. Pulmonary embolus occurs as a result of a blockage of the pulmonary artery that disrupts blood flow to one or more lobes of the lung; this is usually due to clot formation. Carbon dioxide retention results from an inability to exhale carbon dioxide in conditions such as chronic obstructive pulmonary disease.

**Test-Taking Strategy:** Use the process of elimination. Focus on the relationship between the words *deep breathe* and *cough* in the question and pneumonia in the correct option. Review the postoperative complications if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Perioperative Care

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 58). St. Louis: Mosby.

### 168. 1

**Rationale:** The nurse would assist the client to void immediately before surgery so that the bladder will be empty. A slight increase in blood pressure and pulse is common during the preoperative period and is usually the result of anxiety. The client usually has a restriction of food and fluids for 6 to 8 hours before surgery instead of 24 hours. Oral hygiene is allowed, but the client should not swallow any water.

**Test-Taking Strategy:** Use the process of elimination and read each option carefully. Eliminate option 4 because of the words *immediately* and *slight*. Eliminate option 3, knowing that the client should be NPO for 6 to 8 hours before surgery. There is no useful reason for option 2; in fact, oral hygiene may make the client feel more comfortable. Review general preoperative care measures if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Perioperative Care

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 199). St. Louis: Saunders.

### 169. 4

**Rationale:** Every effort should be made to obtain permission from a responsible family member to perform surgery if the client is unable to sign the consent form. A telephone consent must be witnessed by two persons who hear the family member’s oral consent. The two witnesses then sign the consent with the name of the family member, noting that an oral consent was obtained. Consent is not informed if it is obtained from a client who is confused, unconscious, mentally incompetent, or under the influence of sedatives. In an emergency, a client may be unable to sign and family members may not be available. In this situation, a physician is permitted legally to perform surgery without consent. Options 1 and 3 are not appropriate in this situation. Also, agency policies regarding informed consent should always be followed.

**Test-Taking Strategy:** Focus on the data in the question. Eliminate options 1 and 3 first. Option 1 will delay necessary surgery and option 3 is inappropriate. Select option 4 over option 2 because it is the most appropriate of the options presented and it is legally acceptable to obtain a telephone permission from a family member if it is witnessed by two persons. Review the procedures for obtaining informed consent if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Perioperative Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 254). St. Louis: Saunders.

### 170. 3

**Rationale:** Explanations should begin with the information that the client knows. By providing the client with individualized explanations of care and procedures, the nurse can assist the client in handling anxiety and fear for a smooth preoperative experience. Clients who are calm and emotionally prepared for surgery withstand anesthesia better and experience fewer postoperative complications. Options 1, 2, and 4 will produce anxiety in the client.

**Test-Taking Strategy:** Use the process of elimination. Note that the question contains the strategic words *most likely* and *stimulate further discussion*. Use the steps of the nursing process and therapeutic communication techniques. Option 3 addresses assessment and is the only therapeutic response. If this question was difficult, review the principles of therapeutic communication and the measures to relieve anxiety.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Fundamental Skills—Perioperative Care

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 193). St. Louis: Saunders.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., pp. 352–356). St. Louis: Mosby.

### 171. 4

**Rationale:** For optimal lung expansion with the incentive spirometer, the client should assume the semi-Fowler's or high Fowler's position. The mouthpiece should be covered completely and tightly while the client inhales slowly, with a constant flow through the unit. The breath should be held for 5 seconds before exhaling slowly.

**Test-Taking Strategy:** Use the process of elimination and visualize the procedure for using the incentive spirometer. Options 1, 2, and 3 are incorrect steps regarding incentive spirometer use. If you had difficulty with this question, review the correct procedure related to the use of an incentive spirometer.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Perioperative Care

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1382). St. Louis: Mosby.

### 172. 3

**Rationale:** Anticoagulants alter normal clotting factors and increase the risk of bleeding after surgery. Aspirin has properties that can alter the clotting mechanism and should be discontinued at least 48 hours before surgery. However, the client should always check with his or her physician regarding when to stop taking the aspirin when a surgical procedure is scheduled. Options 1, 2, and 4 are accurate client statements.

**Test-Taking Strategy:** Note the strategic words *the client needs additional teaching*. These words indicate a negative event query and that you need to select the incorrect client statement. Eliminate options 1 and 2 first because they are comparable or alike. From the remaining options, recalling that

aspirin has properties that can alter the clotting mechanism will direct you to option 3. If you had difficulty with this question, review the medications that affect the client preparing for surgery.

**Level of Cognitive Ability:** Evaluation

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Perioperative Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 254). St. Louis: Saunders.

### 173. 2

**Rationale:** Serous drainage is an expected finding at a surgical site. The other options indicate signs of wound infection. Signs and symptoms of infection include warm, red, and tender skin around the incision. Purulent material may exit from drains or from separated wound edges. Infection may be caused by poor aseptic technique or a contaminated wound before surgical exploration; existing client conditions such as diabetes mellitus or immunocompromise may place the client at risk. Wound infection usually appears 3 to 6 days after surgery. The client also may have a fever and chills.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *normal finding*. Recalling the signs of a wound infection and noting these strategic words will direct you to option 2. Review the signs of a wound infection if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Perioperative Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 291). St. Louis: Saunders.

### 174. 1

**Rationale:** Increasing restlessness is a sign that requires continuous and close monitoring because it could indicate a potential complication, such as hemorrhage, shock, or pulmonary embolism. Hypoactive bowel sounds heard in all four quadrants are a normal occurrence. A blood pressure of 110/70 mm Hg with a pulse of 86 beats/min is within normal limits.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *indicate an evolving complication*. Eliminate each of the incorrect options because they are normal expected findings. If you had difficulty with this question, review the normal expected postoperative findings and the signs and symptoms of postoperative complications.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Perioperative Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 293). St. Louis: Saunders.

### 175. 1

**Rationale:** Prednisone is a corticosteroid. With prolonged use, corticosteroids cause adrenal atrophy, which reduces the ability of the body to withstand stress. When stress is severe, corticosteroids are essential to life. Before and during

surgery, dosages may be increased temporarily. Ferrous sulfate is an oral iron preparation used to treat iron deficiency anemia. Cyclobenzaprine (Flexeril) is a skeletal muscle relaxant. Conjugated estrogen (Premarin) is an estrogen used for hormone replacement therapy in postmenopausal women. These last three medications may be withheld before surgery without undue effects on the client.

**Test-Taking Strategy:** Use the process of elimination and knowledge about medications that may have special implications for the surgical client. Remember that when stress is severe, corticosteroids are essential to life. Review the effects of corticosteroids on the surgical client if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Fundamental Skills—Perioperative Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 254). St. Louis: Saunders.

### 176. 2

**Rationale:** Routine screening tests include a complete blood count, serum electrolyte analysis, coagulation studies, and a serum creatinine test. The complete blood count includes the hemoglobin analysis. All these values are within normal range except the hemoglobin. If a client has a low hemoglobin level, the surgery likely could be postponed by the surgeon.

**Test-Taking Strategy:** Use the process of elimination and knowledge of the normal laboratory values. The only option that identifies an abnormal laboratory value is option 2. Review these laboratory values if you had difficulty answering this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Perioperative Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 251). St. Louis: Saunders.

### 177. 1

**Rationale:** The first action of the nurse is to assess the patency of the airway and respiratory function. If the airway is not patent, the nurse must take immediate measures for the survival of the client. The nurse then takes vital signs followed by checking the dressing and the tubes or drains. Options 2,

3, and 4 are all nursing actions that should be performed after a patent airway has been established.

**Test-Taking Strategy:** Use the principles of prioritization when answering this question. Remember the ABCs—airway, breathing, and circulation. Ensuring airway patency is the first action to be taken; therefore option 1 is correct. Review the initial care of the postoperative client if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Perioperative Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 289). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 178. 1, 2, 3, 4

**Rationale:** Wound dehiscence is the separation of the wound edges. Wound evisceration is protrusion of the internal organs through an incision. If wound dehiscence or evisceration occurs, the nurse should call for help, stay with the client, and ask another nurse to contact the surgeon and obtain needed supplies to care for the client. The nurse places the client in a low Fowler's position, and the client is kept quiet, and instructed not to cough. Protruding organs are covered with a sterile saline dressing. Ice is not applied because of its vasoconstrictive effect. The treatment for evisceration is usually immediate wound closure under local or general anesthesia. The nurse also documents the findings and actions taken.

**Test-Taking Strategy:** Focus on the information in the question to determine that the client is experiencing wound evisceration. Visualizing this occurrence will assist you in determining that the client would not be placed supine and that ice packs would not be placed on the incision. Review the interventions for the client with wound evisceration if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Perioperative Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., pp. 291–292). St. Louis: Saunders.

# Positioning Clients

## PYRAMID TERMS

**body mechanics** The coordinated efforts of the musculoskeletal and nervous systems to maintain balance, posture, and body alignment during lifting, bending, and moving to perform activities safely.

**ergonomic principles** The anatomical, physiological, psychological, and mechanical principles affecting the efficient and safe use of an individual's energy.

**Fowler's position** The client is supine and the head of the bed is elevated to 45 to 60 degrees.

**high Fowler's position** The client is supine and the head of the bed is elevated to 90 degrees.

**lateral (side-lying) position** The client is lying on the side and the head and shoulders are aligned with the hips and the spine and are parallel to the edge of the mattress. The head, neck, and upper arm are supported by a pillow. The lower shoulder is pulled forward slightly and, along with the elbow, flexed at 90 degrees. The legs are flexed or extended. A pillow is placed to support the back.

**lithotomy position** The client is lying on the back with the hips and knees flexed at right angles and the feet in stirrups.

**prone position** The client is lying on the abdomen with head turned to the side.

**reverse Trendelenburg's position** The bed is tilted so that the client's foot of the bed is down.

**semi-Fowler's position (low Fowler's)** The client is supine and the head of the bed is elevated about 30 degrees.

**Sims' position** The client is lying on the side with the body turned prone at 45 degrees. The lower leg is extended, with the upper leg flexed at the hip and knee to a 45- to 90-degree angle.

**supine position** The client is lying on the back. The head and shoulders usually are elevated slightly (depending on the client's condition) with a small pillow. The arms and legs are extended, and the legs are slightly abducted.

**Trendelenburg's position** The bed is tilted so that the client's head of the bed is down. This position is contraindicated in clients with head injuries, increased intracranial pressure, spinal cord injuries, and certain respiratory and cardiac disorders.

## THE PYRAMID TO SUCCESS

Nursing responsibility includes positioning clients safely and appropriately to provide safety and comfort. Knowledge regarding the client position required for a certain procedure or condition is expected. The nurse has the responsibility to reduce the likelihood and prevent the development of complications related to an existing condition, prescribed treatment, or medical or surgical procedure. The nurse must review the physician's prescriptions after treatments or procedures and take note of instructions regarding positioning and mobility (Figs. 20-1 and 20-2). The nurse must also be aware of various body pressure points when clients are positioned in the lying or sitting position (Fig. 20-3).

## CLIENT NEEDS

### Safe and Effective Care Environment

- Establishing priorities
- Ensuring environmental and personal safety
- Ensuring home safety
- Positioning the client appropriately and safely
- Preventing accidents and injuries
- Providing protective measures
- Using equipment safely
- Using ergonomic principles and body mechanics when moving a client

### Health Promotion and Maintenance

- Information regarding the need for prescribed therapies
- Performing the techniques of physical assessment

### Psychosocial Integrity

- Assisting the client to use coping mechanisms
- Keeping the family informed of client progress
- Providing support to the client

## Physiological Integrity

Assessing the mobility and immobility level of the client  
 Preventing the complications of immobility  
 Providing comfort measures for rest and sleep  
 Providing nutrition and oral intake

▲ **FIGURE 20-1** Common bed positions. (Potter, P., & Perry, A. [2009]. *Fundamentals of nursing* [7th ed.]. St. Louis: Mosby.)

Providing personal hygiene as needed  
 Using assistive devices

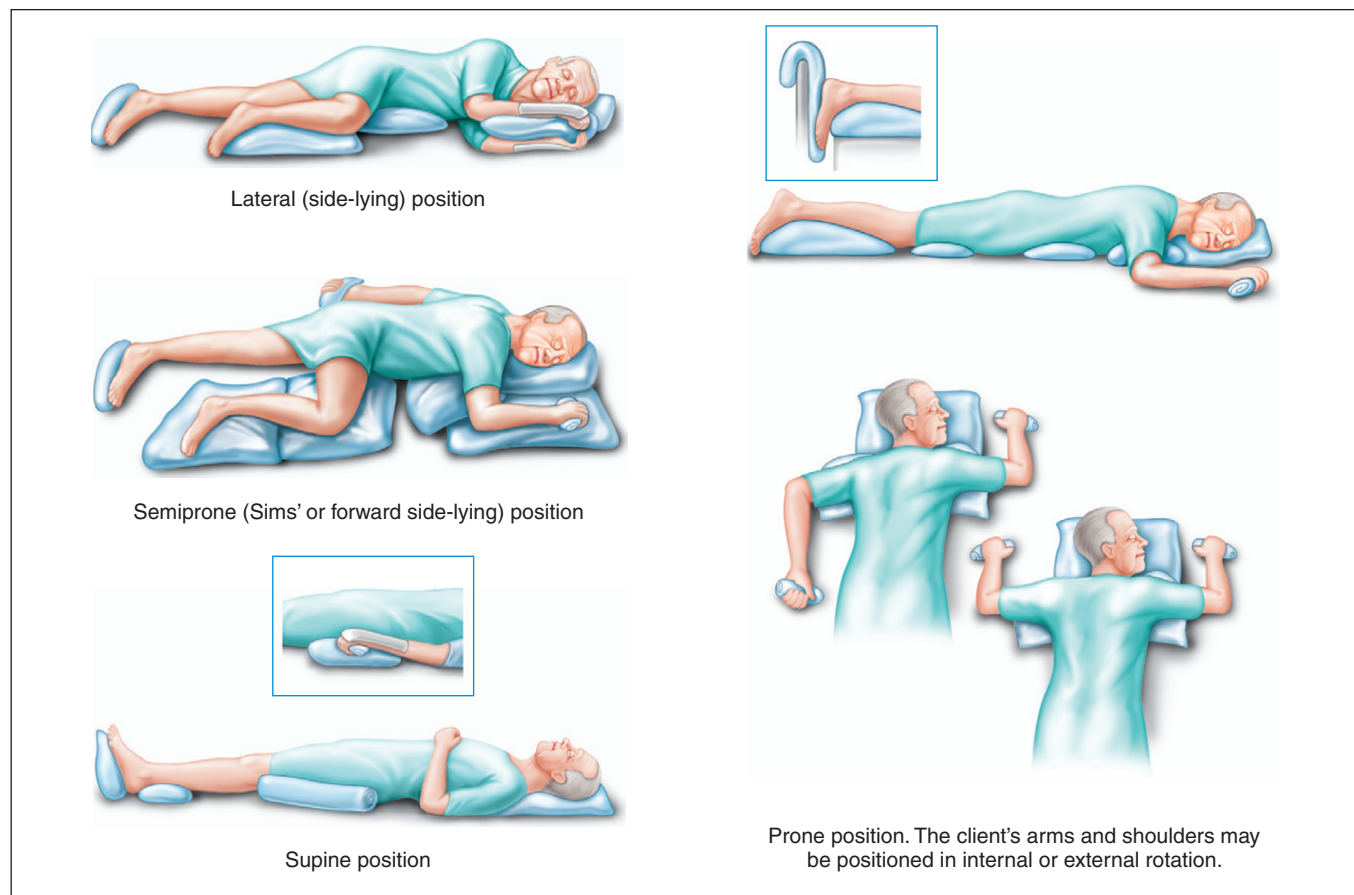

### I. GUIDELINES FOR POSITIONING

- A. Client safety and comfort**
1. Position client in a safe and appropriate manner to provide safety and comfort.
  2. Select a position that will prevent the development of complications related to an existing condition, prescribed treatment, or medical or surgical procedure.
- B. Ergonomic principles** related to **body mechanics** (Box 20-1)

▲ Always review the physician's prescription, especially after treatments or procedures, and take note of instructions regarding positioning and mobility.

### II. POSITIONS TO ENSURE SAFETY AND COMFORT

- A. Integumentary system**
1. Autograft: After surgery, the site is immobilized usually for 3 to 7 days to provide the time needed for the graft to adhere and attach to the wound bed.

▲ **FIGURE 20-2** Common client positions. (From Harkreader, H., Hogan, M., & Thobaben, M. [2007]. *Fundamentals of nursing: Caring and clinical judgment* [3rd ed.]. St. Louis: Saunders.)

2. Burns of the face and head: Elevate the head of the bed to prevent or reduce facial, head, and tracheal edema.
3. Circumferential burns of the extremities: Elevate the extremities above the level of the heart to prevent or reduce dependent edema.
4. Skin graft: Elevate and immobilize the graft site to prevent movement and shearing of the

### Box 20-1 Body Mechanics (Ergonomic Principles) for Health Care Workers

When planning to move a client, arrange for adequate help. Use mechanical aids if help is unavailable. Encourage the client to assist as much as possible. Keep the back, neck and pelvis, and feet aligned. Avoid twisting.

Flex knees, and keep feet wide apart.

Position self close to the client (or object being lifted).

Use arms and legs (not back).

Slide client toward yourself using a pull sheet. When transferring a client onto a stretcher, a slide board is more appropriate.

Set (tighten) abdominal and gluteal muscles in preparation for the move.

Person with the heaviest load coordinates efforts of team involved by counting to three.

Modified from Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed.). St. Louis: Mosby.

graft and disruption of tissue; avoid weight-bearing.

#### B. Reproductive system

##### 1. Mastectomy

- a. Position the client with the head of the bed elevated at least 30 degrees (**semi-Fowler's position**), with the affected arm elevated on a pillow to promote lymphatic fluid return after the removal of axillary lymph nodes.
- b. Turn the client only to the back and unaffected side.

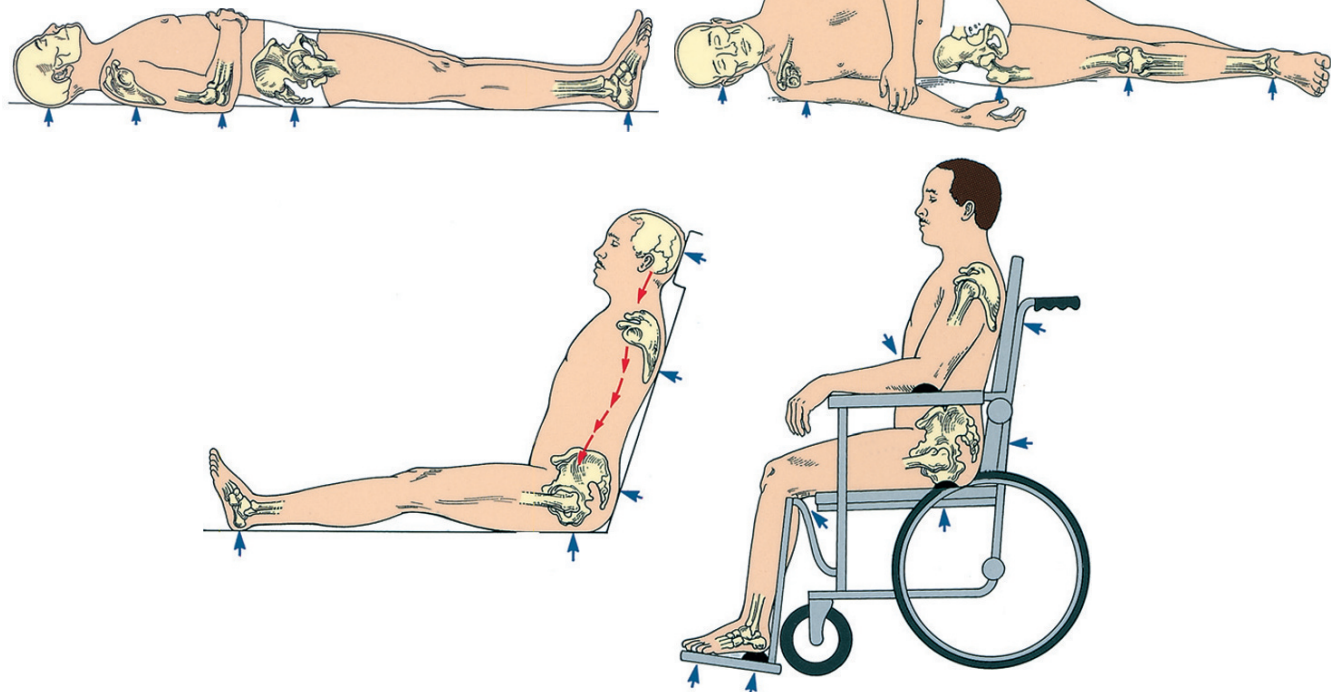

2. Perineal and vaginal procedures: Place the client in the **lithotomy position** (Fig. 20-4).

#### C. Endocrine system

1. Hypophysectomy: Elevate the head of the bed to prevent increased intracranial pressure.

▲ **FIGURE 20-4** Lithotomy position for examination. (From Potter, P., & Perry, A. [2009]. *Fundamentals of nursing* [7th ed.]. St. Louis: Mosby.)

▲ **FIGURE 20-3** Pressure points in lying and sitting position. (From Elkin, M., Perry, A., & Potter, P. [2007] *Nursing interventions and clinical skills* [4th ed.]. St. Louis: Mosby.)

2. Thyroidectomy
  - a. Place the client in the **semi-Fowler's to Fowler's position** to reduce swelling and edema in the neck area.
  - b. Sandbags or pillows may be used to support the client's head or neck.

#### D. Gastrointestinal system

1. Hemorrhoidectomy: Assist the client to a **lateral (side-lying) position** to prevent pain and bleeding.
2. Gastroesophageal reflux disease: **Reverse Trendelenburg's position** may be prescribed to promote gastric emptying and prevent esophageal reflux.
3. Liver biopsy (see Priority Nursing Actions)

### PRIORITY NURSING ACTIONS!

#### Actions to Take for a Client Undergoing a Liver Biopsy

1. Explain the procedure to the client.
2. Ensure that an informed consent has been obtained.
3. Position the client supine, with the right side of the upper abdomen exposed; the client's right arm is raised and extended behind the head and over the left shoulder.
4. Remain with the client during the procedure.
5. After the procedure, assist the client into a right lateral (side-lying) position and place a small pillow or folded towel under the puncture site.
6. Monitor vital signs closely after the procedure and monitor for signs of bleeding.
7. Document appropriate information about the procedure, client's tolerance, and postprocedure assessment findings.

For the client undergoing a liver biopsy (or any invasive procedure), the procedure is explained to the client and an informed consent is obtained. The client is positioned supine, with the right side of the upper abdomen exposed (liver is located on the right side), and the right arm is raised and extended behind the head and over the left shoulder. This position provides for maximal exposure of the right intercostal spaces. The nurse remains with the client during the procedure to provide emotional support and comfort. After the procedure, the client is assisted into a right lateral (side-lying) position and a small pillow or folded towel is placed under the puncture site for at least 3 hours to provide pressure to the site and prevent bleeding. Vital signs are monitored closely after the procedure and the client is monitored for signs of bleeding. The nurse documents appropriate information about the procedure, the client's tolerance, and postprocedure assessment findings.

**Reference:** Pagana, K., & Pagana, T. (2009). *Mosby's diagnostic and laboratory test reference* (9th ed. pp. 604–605). St. Louis: Mosby.

- a. During the procedure, do the following:
    - (1) Position the client supine, with the right side of the upper abdomen exposed.
    - (2) The client's right arm is raised and extended behind the head and over the left shoulder.
    - (3) The liver is located on the right side; this position provides for maximal exposure of the right intercostal spaces.
  - b. After the procedure, do the following:
    - (1) Assist the client into a right **lateral (side-lying) position**.
    - (2) Place a small pillow or folded towel under the puncture site for at least 3 hours to provide pressure to the site and prevent bleeding.
4. Paracentesis: Client is usually positioned in a **semi-Fowler's position** in bed, or sitting upright on the side of the bed or in a chair with the feet supported; client is assisted to a position of comfort following the procedure.
  5. Nasogastric tube
    - a. Insertion
      - (1) Position the client in a **high Fowler's position** with the head tilted forward.
      - (2) This position will assist to close the trachea and open the esophagus.
    - b. Irrigations and tube feedings
      - (1) Elevate the head of the bed 30 to 45 degrees (**semi-Fowler's to Fowler's position**) to prevent aspiration.
      - (2) Maintain head elevation for 1 hour after an intermittent feeding.
      - (3) The head of the bed should remain elevated for continuous feedings.

 If the client receiving a continuous tube feeding needs to be placed in a supine position when providing care, such as when giving a bed bath or changing linens, shut off the feeding to prevent aspiration. Remember to turn the feeding back on and check the rate of flow when the client is placed back into the semi-Fowler's or Fowler's position.

6. Rectal enema and irrigations: Place the client in the left **Sims' position** to allow the solution to flow by gravity in the natural direction of the colon.
7. Sengstaken-Blakemore and Minnesota tubes
  - a. Not commonly used because they are uncomfortable for the client and can cause complications, but their use may be necessary when other interventions are not feasible.
  - b. If prescribed, maintain elevation of the head of the bed to enhance lung expansion and reduce portal blood flow, permitting effective esophagogastric balloon tamponade.

-  **E. Respiratory system**
1. Chronic obstructive pulmonary disease: In advanced disease, place the client in a sitting position, leaning forward, with the client's arms over several pillows or an overbed table; this position will assist the client to breathe easier.
  2. Laryngectomy (radical neck dissection): Place the client in a **semi-Fowler's** or **Fowler's position** to maintain a patent airway and minimize edema.
  3. Bronchoscopy postprocedure: Place the client in a **semi-Fowler's position** to prevent choking or aspiration resulting from an impaired ability to swallow.
  4. Postural drainage: The lung segment to be drained should be in the uppermost position; **Trendelenburg's position** may be used.
  5. Thoracentesis
    - a. During the procedure, to facilitate removal of fluid from the pleural space, position the client sitting on the edge of the bed and leaning over the bedside table with the feet supported on a stool, or lying in bed on the unaffected side with the head of the bed elevated about 45 degrees (**Fowler's position**).
    - b. After the procedure, assist the client to a position of comfort.
-  **Always check the physician's prescription regarding positioning for the client who had a thoracotomy, lung wedge resection, lobectomy of the lung, or pneumonectomy.**
- F. Cardiovascular system**
1. Abdominal aneurysm resection
    - a. After surgery, limit elevation of the head of the bed to 45 degrees (**Fowler's position**) to avoid flexion of the graft.
    - b. The client may be turned from side to side.
  2. Amputation of the lower extremity
    - a. During the first 24 hours after amputation, elevate the foot of the bed (the stump is supported with pillows but not elevated because of the risk of flexion contractures) to reduce edema.
    - b. Consult with the physician and, if prescribed, position the client in a **prone position** twice a day for a 20- to 30-minute period to stretch muscles and prevent flexion contractures of the hip.
  3. Arterial vascular grafting of an extremity
    - a. To promote graft patency after the procedure, bedrest usually is maintained for approximately 24 hours and the affected extremity is kept straight.
    - b. Limit movement and avoid flexion of the hip and knee.
4. Cardiac catheterization 
- a. If the femoral artery was accessed for the procedure, the client is maintained on bedrest for 4 to 6 hours (time for bedrest may vary depending on physician preference and if a vascular closure device was used); the client may turn from side to side.
  - b. The affected extremity is kept straight and the head is elevated no more than 30 degrees (some physicians prefer the flat position) until hemostasis is adequately achieved.
5. Congestive heart failure and pulmonary edema:  Position the client upright, preferably with the legs dangling over the side of the bed, to decrease venous return and lung congestion.
-  **Most often, clients with respiratory and cardiac disorders should be positioned with the head of the bed elevated.**
6. Peripheral arterial disease 
- a. Obtain the physician's prescription for positioning.
  - b. Because swelling can prevent arterial blood flow, clients may be advised to elevate their feet at rest, but they should not raise their legs above the level of the heart because extreme elevation slows arterial blood flow; some clients may be advised to maintain a slightly dependent position to promote perfusion.
7. Deep vein thrombosis
- a. If the extremity is red, edematous, and painful, and if traditional heparin sodium therapy may be initiated, bedrest with leg elevation may be prescribed for the client.
  - b. Clients receiving low-molecular-weight heparin usually can be out of bed after 24 hours if pain level permits.
8. Varicose veins: Leg elevation above heart level usually is prescribed; the client also is advised to minimize prolonged sitting or standing during daily activities.
9. Venous insufficiency and leg ulcers: Leg elevation usually is prescribed.
- G. Sensory system** 
1. Cataract surgery: Postoperatively, elevate the head of the bed (**semi-Fowler's** to **Fowler's position**) and position the client on the back or the nonoperative side to prevent the development of edema at the operative site.
  2. Retinal detachment
    - a. If the detachment is large, bedrest and bilateral eye patching may be prescribed to minimize eye movement and prevent extension of the detachment.
    - b. Restrictions in activity and positioning following repair of the detachment depends on

the physician's preference and the surgical procedure performed.

#### H. Neurological system

1. Autonomic dysreflexia: Elevate the head of the bed to a **high Fowler's position** to assist with adequate ventilation and assist in the prevention of hypertensive stroke.

 If autonomic dysreflexia occurs, immediately place the client in a high Fowler's position.

2. Cerebral aneurysm: Bedrest is maintained with the head of the bed elevated 30 to 45 degrees (**semi-Fowler's to Fowler's position**) to prevent pressure on the aneurysm site.

#### 3. Cerebral angiography

- a. Maintain bedrest for the length of time as prescribed.
- b. The extremity into which the contrast medium was injected is kept straight and immobilized for about 6 to 8 hours.

#### 4. Brain attack (stroke)

- a. In clients with hemorrhagic strokes, the head of the bed is usually elevated to 30 degrees to reduce intracranial pressure and to facilitate venous drainage.
- b. For clients with ischemic strokes, the head of the bed is usually kept flat.
- c. Maintain the head in a midline, neutral position to facilitate venous drainage from the head.
- d. Avoid extreme hip and neck flexion; extreme hip flexion may increase intrathoracic pressure, whereas extreme neck flexion prohibits venous drainage from the brain.

#### 5. Craniotomy

- a. The client should not be positioned on the site that was operated on, especially if the bone flap has been removed, because the brain has no bony covering on the affected site.
- b. Elevate the head of the bed 30 to 45 degrees (**semi-Fowler's to Fowler's position**) and maintain the head in a midline, neutral position to facilitate venous drainage from the head.
- c. Avoid extreme hip and neck flexion.

#### 6. Laminectomy

- a. Logroll the client.
- b. When the client is out of bed, the client's back is kept straight (the client is placed in a straight-backed chair) with the feet resting comfortably on the floor.

#### 7. Increased intracranial pressure

- a. Elevate the head of the bed 30 to 45 degrees (**semi-Fowler's to Fowler's position**) and maintain the head in a midline, neutral position to facilitate venous drainage from the head.

- b. Avoid extreme hip and neck flexion.

 Do not place a client with a head injury in a flat or Trendelenburg's position because of the risk of increased intracranial pressure.

#### 8. Lumbar puncture

- a. During the procedure, assist the client to the **lateral (side-lying) position**, with the back bowed at the edge of the examining table, the knees flexed up to the abdomen, and the neck flexed so that the chin is resting on the chest.
- b. After the procedure, place the client in the **supine position** for 4 to 12 hours, as prescribed.

#### 9. Myelogram postprocedure

- a. The head position varies according to the dye used.
- b. The head is usually elevated if an oil-based or water-soluble contrast agent is used and the head is usually positioned lower than the trunk if air contrast is used.

#### 10. Spinal cord injury

- a. Immobilize the client on a spinal backboard, with the head in a neutral position, to prevent incomplete injury from becoming complete.
- b. Prevent head flexion, rotation, or extension; the head is immobilized with a firm, padded cervical collar.
- c. Logroll the client; no part of the body should be twisted or turned, nor should the client be allowed to assume a sitting position.

#### I. Musculoskeletal system

##### 1. Total hip replacement

- a. Positioning depends on the surgical techniques used, the method of implantation, and the prosthesis.
- b. Avoid extreme internal and external rotation.
- c. Avoid adduction; side-lying on the operative side is not allowed (unless specifically prescribed by the physician).
- d. Maintain abduction when the client is in a **supine position** or positioned on the nonoperative side.
- e. Place a pillow between the client's legs to maintain abduction; instruct the client not to cross the legs (Box 20-2).
- f. Check the physician's prescriptions regarding elevation of the head of the bed; flexion usually is limited to 60 degrees during the first postoperative week (usually 90 degrees for 2 to 3 months thereafter).

2. Devices used to promote proper positioning (see Box 20-2)

**Box 20-2 Devices Used for Proper Positioning****Bed Boards**

These plywood boards are placed under the entire surface area of the mattress and are useful for increasing back support and body alignment.

**Foot Boots**

Foot boots are made of rigid plastic or heavy foam and keep the foot flexed at the proper angle. They should be removed two or three times a day to assess skin integrity and joint mobility.

**Hand Rolls**

Hand rolls maintain the fingers in a slightly flexed and functional position and keep the thumb slightly adducted in opposition to the fingers.

**Hand-Wrist Splints**

These splints are individually molded for the client to maintain proper alignment of the thumb in slight adduction and the wrist in slight dorsiflexion.

**Pillows**

Pillows provide support, elevate body parts, splint incisional areas, and reduce postoperative pain during activity, coughing, or deep breathing. They should be of the appropriate size for the body part to be positioned.

**Sandbags**

Sandbags are soft devices filled with a substance that can be shaped to body contours to provide support. They

immobilize extremities and maintain specific body alignment.

**Side Rails**

These bars, positioned along the sides of the length of the bed, ensure client safety and are useful for increasing mobility. They also provide assistance in rolling from side to side or sitting up in bed.

**Trapeze Bar**

This bar descends from a securely fastened overhead bar attached to the bed frame. It allows the client to use the upper extremities to raise the trunk off the bed, assists in transfer from the bed to a wheelchair, and helps the client perform upper arm strengthening exercises.

**Trochanter Rolls**

These rolls prevent external rotation of the legs when the client is in the supine position. To form a roll, use a cotton bath blanket or a sheet folded lengthwise to a width extending from the greater trochanter of the femur to the lower border of the popliteal space.

**Wedge Pillow**

This triangular pillow is made of heavy foam and is used to maintain the legs in abduction following total hip replacement surgery.

Modified from Potter, P., & Pery, A. (2009). *Fundamentals of nursing* (7th ed.). St. Louis: Mosby.

**MORE QUESTIONS ON THE CD!****Practice Questions**

- 179.** A client is being prepared for a thoracentesis. A nurse assists the client to which position for the procedure?
1. Lying in bed on the affected side
  2. Lying in bed on the unaffected side
  3. Sims' position with the head of the bed flat
  4. Prone with the head turned to the side and supported by a pillow
- 180.** A nurse is preparing to insert a nasogastric tube into a client. The nurse places the client in which position for insertion?
1. Right side
  2. Low Fowler's
  3. High Fowler's
  4. Supine with the head flat
- 181.** A nurse develops a plan of care for a client with deep vein thrombosis. Which client position or activity in the plan will be included?
1. Out-of-bed activities as desired
  2. Bedrest with the affected extremity kept flat
  3. Bedrest with elevation of the affected extremity
  4. Bedrest with the affected extremity in a dependent position
- 182.** The nurse is caring for a client who is 1 day postoperative for a total hip replacement. Which is the best position in which the nurse should place the client?
1. Side-lying on the operative side
  2. On the nonoperative side with the legs abducted
  3. Side-lying with the affected leg internally rotated
  4. Side-lying with the affected leg externally rotated
- 183.** A nurse is providing instructions to a client and the family regarding home care after right eye cataract removal. Which statement by the client would indicate an understanding of the instructions?
1. "I should not sleep on my left side."
  2. "I should not sleep on my right side."
  3. "I should not sleep with my head elevated."
  4. "I should not wear my glasses at any time."

- 184.** A nurse is administering a cleansing enema to a client with a fecal impaction. Before administering the enema, the nurse places the client in which position?
1. Left Sims' position
  2. Right Sims' position
  3. On the left side of the body, with the head of the bed elevated 45 degrees
  4. On the right side of the body, with the head of the bed elevated 45 degrees
- 185.** A client has just returned to a nursing unit after an above-knee amputation of the right leg. A nurse places the client in which position?
1. Prone
  2. Reverse Trendelenburg's
  3. Supine, with the amputated limb flat on the bed
  4. Supine, with the amputated limb supported with pillows
- 186.** A nurse is caring for a client with a severe burn who is scheduled for an autograft to be placed on the lower extremity. The nurse develops a postoperative plan of care for the client and includes which of the following in the plan?
1. Maintain the client in a prone position.
  2. Elevate and immobilize the grafted extremity.
  3. Maintain the surgical extremity in a flat position.
  4. Keep the surgical extremity covered with a blanket.
- 187.** A nurse is preparing to care for a client who has returned to the nursing unit following cardiac catheterization performed through the femoral artery. The nurse checks the physician's prescription and plans to allow which client position or activity following the procedure?
1. Bedrest in high Fowler's position
  2. Bedrest with bathroom privileges only
  3. Bedrest with head elevation at 60 degrees
  4. Bedrest with head elevation no greater than 30 degrees

### Alternate Item Format: Multiple Response

- 188.** The nurse is caring for a client following a supratentorial craniotomy in which a large tumor was removed from the left side. Select the positions in which the nurse can safely place the client. Select all that apply.
- 1. On the left side
  - 2. With the neck flexed
  - 3. Supine on the left side
  - 4. With extreme hip flexion
  - 5. In a semi-Fowler's position
  - 6. With the head in a midline position

## ANSWERS

### 179. 2

**Rationale:** To facilitate removal of fluid from the chest, the client is positioned sitting at the edge of the bed leaning over the bedside table, with the feet supported on a stool or lying in bed on the unaffected side with the head of the bed elevated 30 to 45 degrees. The prone and Sims' positions are inappropriate positions for this procedure.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 1 first because, if the client was lying on the affected side, it would be difficult to perform the procedure. Option 3 can be eliminated next because the Sims' position is used primarily for rectal enemas or irrigations. Next, visualize the prone position. In the prone position, the client is lying on the abdomen, which is not an appropriate position for this procedure. Review the procedure for a thoracentesis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Chernecky, C., & Berger, B. (2008). *Laboratory tests and diagnostic procedures* (5th ed., p. 1063). St. Louis: Saunders.

### 180. 3

**Rationale:** During insertion of a nasogastric tube, the client is placed in a sitting or high Fowler's position to reduce the risk of pulmonary aspiration if the client should vomit. Options 1, 2, and 4 will not facilitate insertion of the tube or prevent aspiration.

**Test-Taking Strategy:** Use the process of elimination. Recalling that a concern with insertion of a nasogastric tube is pulmonary aspiration will direct you to option 3. Review the procedure for inserting a nasogastric tube if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1204). St. Louis: Mosby.

### 181. 3

**Rationale:** For the client with deep vein thrombosis, elevation of the affected leg facilitates blood flow by the force of gravity and also decreases venous pressure, which in turn relieves edema and pain. Bedrest is indicated to prevent emboli and to prevent pressure fluctuations in the venous system that occur with walking.

**Test-Taking Strategy:** Use the process of elimination. Focus on the client's diagnosis and think about the principles related to gravity flow and edema to answer the question. If you had difficulty with this question review nursing care for a client with a venous disorder.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 818). St. Louis: Saunders.

### 182. 2

**Rationale:** Positioning following a total hip replacement depends on the surgical techniques used, the method of implantation, the prosthesis, and physician's preference. Abduction is maintained when the client is in a supine position or positioned on the nonoperative side. Internal and external rotation, adduction, or side-lying on the operative side (unless specifically prescribed by the physician) is avoided. Options 1, 3, and 4 are incorrect positions for this client.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding care of clients following total hip replacement to answer this question. Options 3 and 4 can be eliminated first because of the words *internally rotated* and *externally rotated*. From the remaining options, eliminate option 1 because lying on the operative side can disrupt the replacement. Review positioning after total hip replacement if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 480–481). St. Louis: Saunders.

### 183. 2

**Rationale:** After cataract surgery, the client should not sleep on the side of the body that was operated on to prevent edema formation and intraocular pressure. The client also should be placed in a semi-Fowler's position to assist in minimizing edema and intraocular pressure. During the day, the client may wear glasses or a protective shield; at night, the protective shield alone is sufficient.

**Test-Taking Strategy:** Use the process of elimination. Remember to instruct the client to remain off the operative side and to rest with the head elevated to minimize edema formation. This will assist you when answering questions related to cataract surgery. Review postoperative instructions for the client following cataract surgery if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1706). St. Louis: Saunders.

### 184. 1

**Rationale:** For administering an enema, the client is placed in a left Sims' position so that the enema solution can flow by gravity in the natural direction of the colon. The head of the bed is not elevated in the Sims' position.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the anatomy of the bowel to answer the question. This will assist in eliminating options 2 and 4. Visualize the procedure for administering an enema and eliminate option 3 because the head of the bed should be flat during enema administration. Review the procedure for administering an enema if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1200). St. Louis: Mosby.

### 185. 4

**Rationale:** The amputated limb is usually supported on pillows for the first 24 hours following surgery to promote venous return and decrease edema. After the first 24 hours, the amputated limb usually is placed flat on the bed to reduce hip contracture. Edema also is controlled by limb-wrapping techniques. Additionally, it is important to check physician prescriptions regarding positioning following amputation. Options 1, 2, and 3 are inappropriate positions for the client immediately after surgery.

**Test-Taking Strategy:** Use the process of elimination. The subject of this question is that the client has just returned from surgery. Using basic principles related to immediate postoperative care will assist in directing you to option 4. If you had difficulty with this question, review postoperative positioning following amputation.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1321). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1202). St. Louis: Saunders.

### 186. 2

**Rationale:** Autografts placed over joints or on lower extremities are elevated and immobilized following surgery for 3 to 7 days, depending on the surgeon's preference. This period of immobilization allows the autograft time to adhere and attach to the wound bed, and the elevation minimizes edema. Keeping the client in a prone position and covering the extremity with a blanket can disrupt the graft site.

**Test-Taking Strategy:** Use the process of elimination. Options 1 and 4 can be eliminated first because a prone position and a blanket can disrupt a graft easily. From the remaining options, recall the principles related to gravity and edema to assist in directing you to option 2. Review care for the client following an autograft if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1265). St. Louis: Saunders.

#### 187. 4

**Rationale:** After cardiac catheterization, the extremity into which the catheter was inserted is kept straight for 4 to 6 hours. The client is maintained on bedrest for 4 to 6 hours (time for bedrest may vary depending on physician preference and if a vascular closure device was used) and the client may turn from side to side. The head is elevated no more than 30 degrees (although some physicians prefer the flat position) until hemostasis is adequately achieved.

**Test-Taking Strategy:** Use the process of elimination. Knowing that the head of the bed should not be elevated more than 30 degrees will assist in eliminating options 1 and 3. Remembering that bathroom privileges are not allowed in the immediate postcatheterization period will assist in eliminating option 2. If you had difficulty with this question, review care after cardiac catheterization.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 7240). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 188. 5, 6

**Rationale:** Clients who have undergone supratentorial surgery should have the head of the bed elevated 30 degrees to promote venous drainage from the head. The client is positioned to avoid extreme hip or neck flexion and the head is maintained in a midline neutral position. If a large tumor has been removed, the client should be placed on the nonoperative side to prevent displacement of the cranial contents.

**Test-Taking Strategy:** Focus on the data in the question. Remember that a primary concern is the risk for increased intracranial pressure. Therefore use concepts related to preventing increased intracranial pressure to answer this question. Also remember that with *supratentorial* surgery, the head is usually kept “up” and that the client is placed on the nonoperative side. Review positioning for a client after craniotomy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1932). St. Louis: Saunders.

# Care of a Client With a Tube

## PYRAMID TERMS

**chest tube** Tube that returns negative pressure to the intrapleural space; used to remove abnormal accumulations of air and fluid from the pleural space.

**endotracheal tube** Tube used to maintain a patent airway; indicated when a client needs mechanical ventilation.

**tracheostomy** An opening made surgically directly into the trachea to establish an airway. A tracheostomy tube is inserted into the opening and the tube attaches to the mechanical ventilator or another type of oxygen delivery device.

## THE PYRAMID TO SUCCESS

The Pyramid to Success focuses on the common types of tubes used in the medical-surgical and acute care clinical settings. The NCLEX-RN examination is likely to address content areas related to the appropriate care of certain tubes and the immediate interventions required if a complication arises. Focus on the specific assessment points related to the specific type of tube. Review procedures for inserting a particular tube, verifying correct placement, and administering medications or feedings, if appropriate. Remember that for certain types of tubes such as endotracheal, tracheostomy, urinary and renal, and chest tubes, implementing and maintaining surgical asepsis is critical. Pyramid Points also focus on interventions associated with complications or emergencies.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Acting as a client advocate
- Collaborating with members of the health care team
- Ensuring that advance directives are in the client's medical record
- Ensuring client's rights
- Establishing priorities
- Handling of hazardous and infectious materials
- Maintaining standard and transmission-based precautions as well as surgical asepsis

- Obtaining informed consent for invasive procedures
- Providing continuity of care
- Using equipment safely

### Health Promotion and Maintenance

- Assisting the client to accept lifestyle changes
- Preventing disease
- Providing the client and family education regarding care at home
- Performing techniques of physical assessment

### Psychosocial Integrity

- Discussing situational role changes
- Identifying cultural, religious, and spiritual influences on health
- Identifying support systems
- Monitoring for sensory and perceptual alterations
- Providing home care services

### Physiological Integrity

- Administering medications
- Initiating emergency interventions for complications
- Implementing measures to ensure basic care and comfort
- Monitoring for potential complications associated with the tube
- Monitoring laboratory values
- Preparing for diagnostic tests to confirm accurate placement of a tube
- Providing nutrition and oral hydration
- Providing respiratory care

### I. NASOGASTRIC TUBES

- A.** Description
  - These are tubes used to intubate the stomach.
  - The tube is inserted from the nose to the stomach.
- B.** Purpose
  - To decompress the stomach by removing fluids or gas to promote abdominal comfort

2. To allow surgical anastomoses to heal without distention
3. To decrease the risk of aspiration
4. To administer medications to clients who are unable to swallow
5. To provide nutrition by acting as a temporary feeding tube
6. To irrigate the stomach and remove toxic substances, such as in poisoning

### C. Types of tubes

1. Levin tube (Fig. 21-1)
  - a. Single-lumen nasogastric tube
  - b. Used to remove gastric contents via intermittent suction or to provide tube feedings
2. Salem sump tube: A Salem sump is a double-lumen nasogastric tube with an air vent (pigtail) used for decompression with intermittent continuous suction (see Fig. 21-1).

|   |   |   |  |
|---|---|---|--|
| <p>Large suction lumen<br/>Lavage/vent lumen<br/>Open eyes</p>  | <p><b>Lavacuator tube</b><br/>An orogastric tube with a large suction lumen and a smaller lavage/vent lumen that provides continuous suction because irrigating solution enters the lavage lumen while stomach contents are removed through the suction lumen. Used to remove toxic substances from the stomach. An ewald tube is similar but has a single lumen.</p> |   | <p><b>Cantor tube</b><br/>A single-lumen long tube with a small inflatable bag at the distal end. A special substance (tungsten) is injected with a needle (gauge 21 or smaller or balloon may leak) and syringe into the bag of the tube.</p>   |
| <p>Open eyes along tube<br/>Solid tip</p>   | <p><b>Levin tube</b><br/>A plastic or rubber single-lumen tube with a solid tip that may be inserted into the stomach via the nose or mouth. Used to drain fluid and gas from the stomach.</p>  | <p>Gastric balloon inflation lumen<br/>Gastric aspiration lumen<br/>Esophageal balloon inflation lumen<br/>Esophageal balloon<br/>Gastric balloon</p> | <p><b>Sengstaken-Blakemore tube</b><br/>A three-lumen tube. Two ports inflate an esophageal and a gastric balloon for tamponade, and the third is used for nasogastric suction. This tube does not provide esophageal suction, but a nasogastric tube may be inserted in the opposite naris or the mouth and allowed to rest on top of the esophageal balloon. Esophageal suction is then possible, reducing the risk of aspiration.</p> |
| <p>Large suction tube<br/>Small vent tube<br/>Open eyes</p>   | <p><b>Salem sump tube</b><br/>A double-lumen tube. The small vent tube within the large suction tube prevents mucosal suction damage by maintaining the pressure in open eyes at the distal end of the tube at less than 25 mm Hg.</p>  | <p>Stylet<br/>Access port<br/>Exit port<br/>Weighted tip</p>  | <p><b>Weighted flexible feeding tube with stylet</b><br/>Access port with irrigation adaptor allows maintenance of the tube without disconnecting the feeding set.</p>   |
| <p>Open eye for drainage<br/>Balloon filled with a special substance<br/>Length markings<br/>Two lumens</p> | <p><b>Miller-Abbott tube</b><br/>A long double-lumen tube used to drain and decompress the small intestine. One lumen leads to a balloon that is filled with a special substance (tungsten) once it is in the stomach; the second is for irrigation and drainage.</p>   |   |  |

▲ **FIGURE 21-1** Comparison of design and function of selected gastrointestinal tubes. (Modified from Monahan, F., & Neighbors, M. [1998]. *Medical-surgical nursing* [2nd ed.]. St. Louis: Saunders.)

 The air vent on a Salem sump tube is not to be clamped and is to be kept above the level of the stomach. If leakage occurs through the air vent, instill 30 mL of air into the air vent and irrigate the main lumen with normal saline (NS).

**D.** Intubation procedures (Box 21-1)

**E.** Irrigation

1. Assess placement before irrigating (see Box 21-1).
2. Perform irrigation every 4 hours to assess and maintain the patency of the tube.
3. Gently instill 30 to 50 mL of water or NS (depending on agency policy) with an irrigation syringe.
4. Pull back on the syringe plunger to withdraw the fluid to check patency; repeat if the tube flow is sluggish.

- F.** Removal of a nasogastric tube: Ask the client to take a deep breath and hold; remove the tube slowly and evenly over the course of 3 to 6 seconds (coil the tube around the hand while removing it).

## II. GASTROINTESTINAL TUBE FEEDINGS

**A.** Types of tubes and anatomical placement

1. Nasogastric: Nose to stomach
2. Nasoduodenal-nasojejunal: Nose to duodenum or jejunum
3. Gastrostomy: Stomach
4. Jejunostomy: Jejunum

**B.** Types of administration

1. Bolus
  - a. A bolus resembles normal meal feeding patterns.
  - b. Formula is administered over a 30- to 60-minute period every 3 to 6 hours; the amount of formula is prescribed by the physician.
2. Continuous
  - a. Feeding is administered continually for 24 hours.
  - b. An infusion feeding pump regulates the flow.
3. Cyclical
  - a. Feeding is administered in the daytime or nighttime for approximately 8 to 16 hours.
  - b. An infusion feeding pump regulates the flow.

### Box 21-1 Nasogastric Tubes: Intubation Procedures

1. Follow agency procedures.
2. Explain the procedure and its potential discomfort to the client.
3. Position the client with pillows behind the shoulders.
4. Determine which nostril is more patent.
5. Measure the length of the tube from the bridge of the nose to the earlobe to the xiphoid process and indicate this length with a piece of tape on the tube.
6. If the client is conscious and alert, have him or her swallow or drink water (follow agency procedure).
7. Lubricate the tip of the tube with water-soluble lubricant.
8. Gently insert the tube into the nasopharynx and advance the tube.
9. When the tube nears the back of the throat (first black measurement on the tube) instruct the client to swallow or drink sips of water (unless contraindicated). If resistance is met, then slowly rotate and aim the tube downward and toward the closer ear; in the intubated or semiconscious client, flex the head toward the chest while passing the tube.
10. Immediately withdraw the tube if any change is noted in the client's respiratory status.
11. Following insertion, obtain an abdominal x-ray study to confirm placement of the tube.
12. Connect the tube to suction, to either the intermittent or continuous suction setting, as prescribed.
13. Secure the tube to the client's nose with adhesive tape and to the client's gown (follow agency procedure and check for client allergy to tape).
14. Observe the client for nausea, vomiting, abdominal fullness, or distention and monitor output.
15. Check residual volumes every 4 hours, before each feeding, and before giving medications. Aspirate all stomach contents (residual) and measure the amount. Reinstill residual contents to prevent excessive fluid and electrolyte losses, unless the residual contents appear abnormal and the volume is large (follow agency procedure). Withhold the feeding if the amount is more than 100 mL or according to agency or nutritional consult recommendations.
16. Before the instillation of any substance through the tube (i.e., irrigation solution, feeding, medications) aspirate stomach contents and test the pH (a pH of 3.5 or lower indicates that the tip of the tube is in a gastric location).
17. If irrigation is indicated, use normal saline solution (check agency procedure).
18. Observe the client for fluid and electrolyte balance.
19. Instruct the client about movement to prevent nasal irritation and dislodgment of the tube.
20. On a daily basis, remove the adhesive tape that is securing the tube to the nose and clean and dry the skin; then reapply the tape.

*Note:* Gastrostomy or jejunostomy tubes are surgically inserted. A dressing is placed at the site of insertion. The dressing needs to be removed, the skin needs to be cleansed (with a solution determined by the physician or agency procedure), and a new sterile dressing needs to be applied every 8 hours (or as specified by agency policy). The skin at the insertion site is checked for signs of infection or other abnormalities, such as leakage of the feeding solution.

c. Feedings at night allow for more freedom during the day.

### C. Administration of feedings

1. Check the physician's prescription and agency policy regarding residual amounts; usually, if the residual is less than 100 mL, feeding is administered; large-volume aspirates indicate delayed gastric emptying and place the client at risk for aspiration.
2. Assess bowel sounds; hold the feeding and notify the physician if bowel sounds are absent.
3. Position the client in a high Fowler's position; if comatose, place in high-Fowler's and on the right side.
4. Assess tube placement by aspirating gastric contents and measuring the pH (should be 3.5 or lower).
5. Aspirate all stomach contents (residual), measure the amount, and return the contents to the stomach to prevent electrolyte imbalances.
6. Warm the feeding to room temperature to prevent diarrhea and cramps.
7. Use an infusion feeding pump for continuous or cyclic feedings.
8. For bolus feeding, maintain the client in a high Fowler's position for 30 minutes after the feeding.
9. For a continuous feeding, keep the client in a semi-Fowler's position at all times.

### D. Precautions

 Always assess the placement of a gastrointestinal tube before instilling feeding solutions, medications, or any other solution. If the tube is incorrectly placed the client is at risk for aspiration.

1. Change the feeding container and tubing every 24 hours.
2. Do not hang more solution than required for a 4-hour period; this prevents bacterial growth.
3. Check the expiration date on the formula before administering.
4. Shake the formula well before pouring it into the container (feeding bag).
5. Always assess bowel sounds; do not administer any feedings if bowel sounds are absent.
6. Administer the feeding at the prescribed rate or via gravity flow (intermittent bolus feedings) with a 50- to 60-mL syringe with the plunger removed.
7. Gently flush with 30 to 50 mL of water or normal saline (depending on agency policy) with the irrigation syringe after the feeding.

### E. Prevention of complications

1. Diarrhea
  - a. Assess the client for lactose intolerance.
  - b. Use fiber-containing feedings.
  - c. Administer feeding slowly and at room temperature.
2. Aspiration
  - a. Verify tube placement.

b. Do not administer the feeding if residual is more than 100 mL (check physician's prescription and agency policy).

- c. Keep the head of the bed elevated.
  - d. If aspiration occurs, suction as needed, assess respiratory rate, auscultate lung sounds, monitor temperature for aspiration pneumonia, and prepare to obtain chest radiograph.
3. Clogged tube
    - a. Use liquid forms of medication, if possible.
    - b. Flush the tube with 30 to 50 mL of water or NS (depending on agency policy) before and after medication administration and before and after bolus feeding.
    - c. Flush with water every 4 hours for continuous feeding.
  4. Vomiting
    - a. Administer feedings slowly and, for bolus feedings, make feeding last for at least 30 minutes.
    - b. Measure abdominal girth.
    - c. Do not allow the feeding bag to empty.
    - d. Do not allow air to enter the tubing.
    - e. Administer the feeding at room temperature.
    - f. Elevate the head of the bed.
    - g. Administer antiemetics as prescribed.

If the client vomits, stop the tube feeding and place the client in a side-lying position; suction the client as needed.

### F. Administration of medications (see Priority Nursing Actions)

#### PRIORITY NURSING ACTIONS!

##### Actions for Administering Medications via a Nasogastric or Gastrostomy Tube

1. Check the physician's prescription.
2. Prepare the medication for administration.
3. Ensure that the medication prescribed can be crushed or if it is a capsule that it can be opened; use elixir forms of medications if available.
4. Dissolve crushed medication or capsule contents in 15 to 30 mL of water.
5. Verify the client's identity and explain the procedure to the client.
6. Check tube placement and residual contents before instilling the medication; check for bowel sounds.
7. Draw up the medication into a catheter-tip syringe, clear excess air from the syringe, and insert the medication into the tube.
8. Flush with 30 to 50 mL of water or normal saline (NS), depending on agency policy.
9. Clamp the tube for 30 to 60 minutes, depending on medication and agency policy.
10. Document the administration of the medication and any other appropriate information.

The nurse always checks the physician's prescription before administering any medication to a client. Once the prescription is verified, the medication is prepared for administration. The nurse determines the reason for administration, checks for any contraindications to administering the medication, and for any potential interactions. When preparing medications for administration through a nasogastric or gastrostomy tube, the nurse needs to ensure that the medication prescribed can be crushed or if it is a capsule that it can be opened. Whole tablets or capsules cannot be administered through a tube because they can cause a tube blockage. Elixir forms of medications can also be used if available. The nurse then dissolves the crushed medication or capsule contents in 15 to 30 mL of water. Client identity is always verified before medication administration and the procedure is explained to the client. The nurse checks tube placement and residual contents before instilling the medication and checks for bowel sounds. The nurse also performs any additional assessments, such as checking the apical heart rate for cardiac medications or checking the blood pressure for antihypertensives. The medication is drawn up into a catheter-tip syringe, excess air is removed from the syringe, and the medication is inserted into the tube. The tube is flushed with 30 to 50 mL of water or NS (depending on agency policy) to ensure that all medication has been instilled. The tube is then clamped for 30 to 60 minutes (depending on the medication and agency policy) to ensure it is absorbed (if the tube is not clamped and is reattached to suction then the medication will be aspirated out with the suction). The nurse then documents the administration of the medication and any other appropriate information.

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 719). St. Louis: Mosby.

### III. INTESTINAL TUBES

#### A. Description

1. The intestinal tube is passed nasally into the small intestine.
2. The tube may be used to decompress the bowel or to remove accumulated intestinal secretions when other interventions to decompress the bowel are not effective.
3. The tube enters the small intestine through the pyloric sphincter because of the weight of a small bag containing tungsten at the end.

#### B. Types of tubes include the Cantor tube (single lumen) or the Miller-Abbott tube (double lumen) (see Fig. 21-1)

#### C. Interventions

1. Assess the physician's prescriptions and agency policy for advancement and removal of the tube.
2. Position the client on the right side to facilitate passage of the weighted bag in the tube through the pylorus of the stomach and into the small intestine.

3. Do not secure the tube to the face with tape until it has reached final placement (may take several hours) in the intestines.
4. Radiography is performed to verify desired placement.
5. Monitor drainage from the tube.
6. If the tube becomes blocked, notify the physician. A small amount of air injected into the lumen may be prescribed to clear the tube; do not irrigate the tube with air or fluid without a prescription from the physician.
7. Assess the abdomen and measure abdominal girth.
8. To remove the tube, the tungsten is removed from the balloon portion of the tube with a syringe; the tube is removed gradually (6 inches every hour) as prescribed by the physician.
9. Dispose of the tube and tungsten in the appropriate manner as per agency policy.

### IV. ESOPHAGEAL AND GASTRIC TUBES

#### A. Description

1. May be used to apply pressure against bleeding esophageal veins to control the bleeding when other interventions are not effective or they are contraindicated.
2. Not used if the client has ulceration or necrosis of the esophagus or has had previous esophageal surgery because of the risk of rupture

#### B. Sengstaken-Blakemore tube and Minnesota tube (see Fig. 21-1)

1. The Sengstaken-Blakemore tube is a triple-lumen gastric tube with an inflatable esophageal balloon, an inflatable gastric balloon, and a gastric aspiration lumen.
2. The gastric balloon applies pressure at the cardioesophageal junction to compress gastric varices directly and to decrease blood flow to esophageal varices; traction is applied to maintain the gastric balloon in place.
3. The esophageal balloon directly compresses esophageal varices.
4. If bleeding is not stopped with inflation of the gastric balloon, the esophageal balloon is inflated to 25 to 45 mm Hg as prescribed.
5. A radiograph of the upper abdomen and chest confirms placement.
6. Gastric contents are aspirated by gastric lavage or intermittent suction via the gastric aspiration port.
7. With the Sengstaken-Blakemore tube, a nasogastric tube also is inserted in the opposite naris to collect secretions that accumulate above the esophageal balloon.
8. The Minnesota tube is a modified Sengstaken-Blakemore tube with an additional lumen (a four-lumen gastric tube) for aspirating esophagopharyngeal secretions.

### C. Interventions

1. Check patency and integrity of all balloons before insertion.
2. Label each lumen.
3. Place the client in the upright or Fowler's position for insertion.
4. Immediately after insertion, prepare for radiography to verify placement.
5. Maintain head elevation once the tube is in place.
6. Double-clamp the balloon ports to prevent air leaks.
7. Keep scissors at the bedside at all times; monitor for respiratory distress, and if it occurs, cut the tubes to deflate balloons.
8. To prevent ulceration or necrosis of the esophagus, release esophageal pressure at intervals as prescribed and per agency policy.
9. Monitor for increased bloody drainage, which may indicate persistent bleeding.
10. Monitor for signs of esophageal rupture, which includes a drop in blood pressure, increased heart rate, and back and upper abdominal pain. (Esophageal rupture is an emergency, and signs of esophageal rupture must be reported to the physician immediately.)

### V. LAVAGE TUBES

- A. Description: Used to remove toxic substances from the stomach
- B. Types of tubes
  1. Lavacuator (see Fig. 21-1)
    - a. The Lavacuator is an orogastric tube with a large suction lumen and a smaller lavage-lumen that provides continuous suction.
    - b. Irrigation solution enters the lavage lumen while stomach contents are removed through the suction lumen.
  2. Ewald tube: A single-lumen large tube used for rapid one-time irrigation and evacuation

### VI. URINARY AND RENAL TUBES

- A. Types of urinary catheters
  1. Single lumen: Usually used for straight catheterization to empty the client's bladder or to check the residual amount of urine after the client voids.
  2. Double lumen: Used when an indwelling catheter is needed for continuous bladder drainage; one lumen is for drainage and the other is for balloon inflation.
  3. Triple lumen: Used when bladder irrigation and drainage is necessary; one lumen is for instilling the bladder irrigant solution, one lumen is for continuous bladder drainage, and one lumen is for balloon inflation.

4. Strict aseptic technique is necessary for insertion and care of the catheter.

### B. Routine urinary catheter care

1. Use gloves and wash the perineal area with warm soapy water.
2. With the nondominant hand, pull back the labia or foreskin to expose the meatus (in the adult male, return the foreskin to its normal position).
3. Cleanse along the catheter with soap and water.
4. Anchor the catheter to the thigh.
5. Maintain the catheter bag below the level of the bladder.

### C. Ureteral and nephrostomy tubes

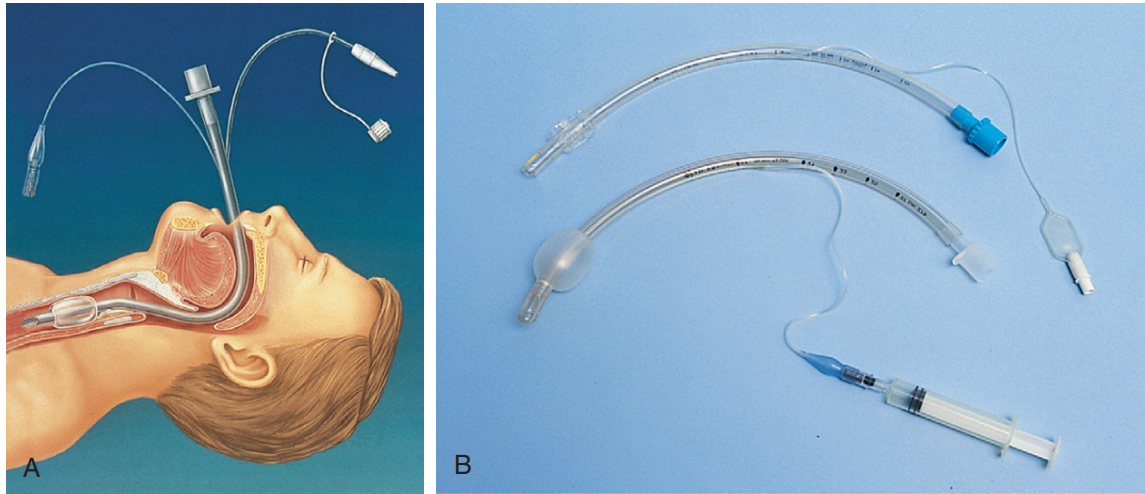

1. Never clamp the tube.
2. Maintain patency.
3. Irrigate only if prescribed by a physician, using strict aseptic technique; a maximum of 5 mL of sterile normal saline is instilled slowly and gently.
4. If patency cannot be established with the prescribed irrigation, immediately notify the physician.

 If the client has a ureteral or nephrostomy tube, monitor output closely; urine output of less than 30 mL/hr or lack of output for more than 15 minutes should be reported to the physician immediately.

### VII. RESPIRATORY SYSTEM TUBES

#### A. Endotracheal tubes (Fig. 21-2)

1. Description
  - a. The **endotracheal tube** is used to maintain a patent airway.
  - b. **Endotracheal tubes** are indicated when the client needs mechanical ventilation.
  - c. If the client requires an artificial airway for longer than 10 to 14 days, a **tracheostomy** may be created to avoid mucosal and vocal cord damage that can be caused by the **endotracheal tube**.
  - d. The cuff (located at the distal end of the tube), when inflated, produces a seal between the trachea and the cuff to prevent aspiration and ensure delivery of a set tidal volume when mechanical ventilation is used; an inflated cuff also prevents air from passing to the vocal cords, nose, or mouth.
  - e. The pilot balloon permits air to be inserted into the cuff, prevents air from escaping, and is used as a guideline for determining the presence or absence of air in the cuff.
  - f. The universal adapter enables attachment of the tube to mechanical ventilation tubing or other types of oxygen delivery systems.
  - g. Types of tubes: Orotracheal and nasotracheal
2. Orotracheal tubes
  - a. Inserted through the mouth and allows use of a larger diameter tube and reduces the work of breathing.

▲ **FIGURE 21-2** **A**, Endotracheal (ET) tube with inflated cuff. **B**, ET tubes with uninflated and inflated cuffs and syringe for inflation (From Perry, A., & Potter, P. [2010]. *Clinical nursing skills & techniques* [7th ed.]. St. Louis: Mosby.)

- b. Indicated when the client has a nasal obstruction or a predisposition to epistaxis.
  - c. Uncomfortable and can be manipulated by the tongue, causing airway obstruction; an oral airway may be needed to keep the client from biting on the tube.
3. Nasotracheal tubes
- a. Inserted through a nostril; this smaller tube increases resistance and the client's work of breathing.
  - b. Its use is avoided in clients with bleeding disorders.
  - c. It is more comfortable for the client, and the client is unable to manipulate the tube with the tongue.
4. Interventions
- a. Placement is confirmed by chest x-ray film (correct placement is 1 to 2 cm above the carina).
  - b. Assess placement by auscultating both sides of the chest while manually ventilating with a resuscitation (Ambu) bag (if breath sounds and chest wall movement are absent in the left side, the tube may be in the right main stem bronchus).
  - c. Perform auscultation over the stomach to rule out esophageal intubation.
  - d. If the tube is in the stomach, louder breath sounds will be heard over the stomach than over the chest, and abdominal distention will be present.
  - e. Secure the tube with adhesive tape immediately after intubation.
  - f. Monitor the position of the tube at the lip or nose.
  - g. Monitor skin and mucous membranes.
  - h. Suction the tube only when needed.
  - i. The oral tube needs to be moved to the opposite side of the mouth daily to prevent pressure and necrosis of the lip and mouth area, prevent nerve damage, and facilitate inspection and cleaning of the mouth; moving the tube to the opposite side of the mouth should be done by two health care providers.
  - j. Prevent dislodgment and pulling or tugging on the tube; suction, coughing, and speaking attempts by the client place extra stress on the tube and can cause dislodgment.
  - k. Assess the pilot balloon to ensure that the cuff is inflated; maintain cuff inflation, which creates a seal and allows complete mechanical control of respiration.
  - l. Monitor cuff pressures at least every 8 hours per agency procedure to ensure that they do not exceed 20 mm Hg (an aneroid pressure manometer is used to measure cuff pressures); minimal leak and occlusive techniques are used for cuff inflation to check cuff pressures.
5. Minimal leak technique
- a. This is used for cuff inflation and checking cuff pressures for cuffs without pressure relief valves.
  - b. Inflate the cuff until a seal is established; no harsh sound should be heard through a stethoscope placed over the trachea when the client breathes in, but a slight air leak on peak inspiration is present and can be heard.
  - c. The client cannot make verbal sounds, and no air is felt coming out of the client's mouth.
6. Occlusive technique
- a. This is used for cuff inflation and checking cuff pressures for cuffs with pressure relief valves.
  - b. Provides an adequate seal in the trachea at the lowest possible cuff pressure.

⚠ A resuscitation (Ambu) bag needs to be kept at the bedside of a client with an endotracheal tube or a tracheostomy tube at all times.

c. Uses same procedure as minimal leak technique, without an air leak.

## 7. Extubation

- Hyperoxygenate the client and suction the **endotracheal tube** and the oral cavity.
- Place the client in a semi-Fowler's position.
- Deflate the cuff; have the client inhale and, at peak inspiration, remove the tube, suctioning the airway through the tube while pulling it out.
- After removal, instruct the client to cough and deep breathe to assist in removing accumulated secretions in the throat.
- Apply oxygen therapy, as prescribed.
- Monitor for respiratory difficulty; contact the physician if respiratory difficulty occurs.

g. Inform the client that hoarseness or a sore throat is normal and that the client should limit talking if it occurs.

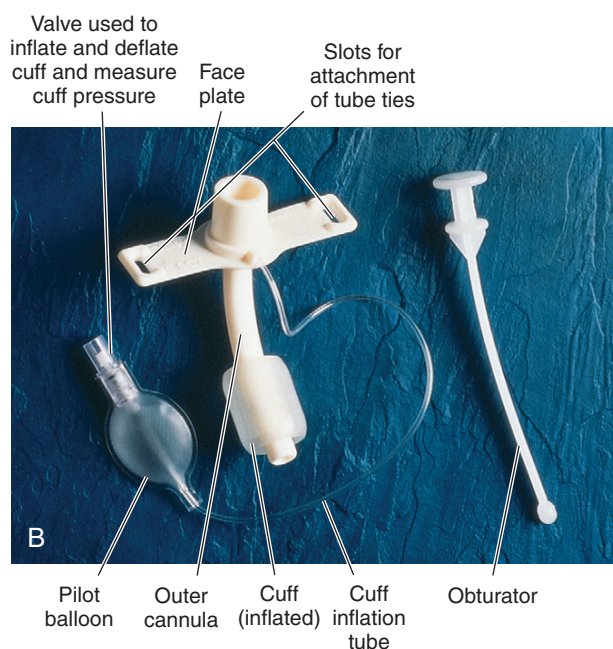

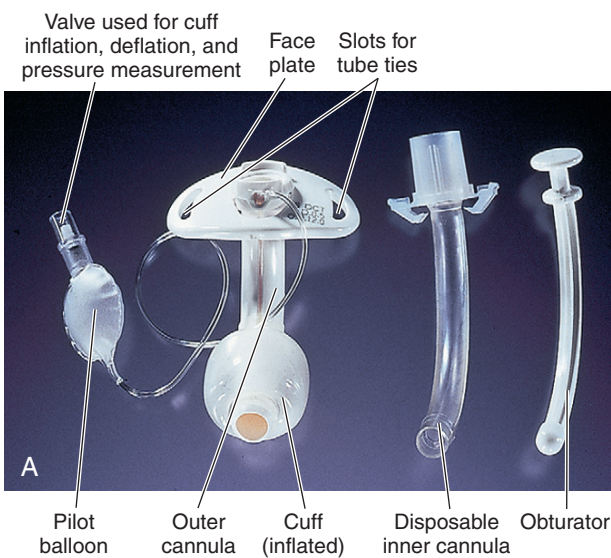

## B. Tracheostomy (Fig. 21-3)

### 1. Description

- A **tracheostomy** is an opening made surgically directly into the trachea to establish an airway; **tracheostomy** tube is inserted into the opening and the tube attaches to the mechanical ventilator or another type of oxygen delivery device.
- The **tracheostomy** can be temporary or permanent. (See Box 21-2 for types of tracheostomies.)

### 2. Interventions

- Assess respirations and for bilateral breath sounds.
- Monitor arterial blood gases and pulse oximetry.
- Encourage coughing and deep breathing.
- Maintain a semi-Fowler's to high Fowler's position.
- Monitor for bleeding, difficulty with breathing, absence of breath sounds, and crepitus (subcutaneous emphysema), which are indications of hemorrhage or pneumothorax.
- Provide respiratory treatments as prescribed.
- Suction fluids as needed; hyperoxygenate the client before suctioning.
- If the client is allowed to eat, sit the client up for meals and ensure that the cuff is inflated (if the tube is not capped) for meals and for 1 hour after meals to prevent aspiration.
- Monitor cuff pressures as prescribed.
- Assess the stoma and secretions for blood or purulent drainage.

**▲ FIGURE 21-3** Tracheostomy tubes. **A**, Double-lumen cuffed tracheostomy tube with disposable inner cannula. **B**, Single-lumen cannula cuffed tracheostomy tube. **C**, Double-lumen cuffed fenestrated tracheostomy tube with plug (red cap). (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care* [6th ed.]. St. Louis: Saunders.)

- k. Follow the physician's prescriptions and agency policy for cleaning the **tracheostomy** site and inner cannula (many inner cannulas are disposable); usually, half-strength hydrogen peroxide is used.
  - l. Administer humidified oxygen as prescribed, because the normal humidification process is bypassed in a client with a **tracheostomy**.
  - m. Obtain assistance in changing **tracheostomy** ties; after placing the new ties, cut and remove the old ties holding the **tracheostomy** in place (some securing devices are soft and made with Velcro to hold the tube in place).
  - n. Keep a resuscitation (Ambu) bag, obturator, clamps, and a spare tracheostomy tube of the same size at the bedside.
3. Complications of a **tracheostomy** (Box 21-3; Table 21-1)

### Box 21-2 Some Types of Tracheostomy Tubes

#### Double-Lumen Tube

The double-lumen tube has the following parts:

**Outer cannula**—fits into the stoma and keeps the airway open. The face plate indicates the size and type of tube and has small holes on both sides for securing the tube with tracheostomy ties or another device.

**Inner cannula**—fits snugly into the outer cannula and locks into place. It provides the universal adaptor for use with the ventilator and other respiratory therapy equipment. Some may be removed, cleaned, and reused; others are disposable.

**Obturator**—a stylet with a smooth end used to facilitate the direction of the tube when inserting or changing a tracheostomy tube. The obturator is removed immediately after tube placement and is always kept with the client and at the bedside in case of accidental decannulation.

**Cuff**—when inflated, seals the airway. The cuffed tube is used for mechanical ventilation, preventing aspiration of oral or gastric secretions, or for the client receiving a tube feeding to prevent aspiration. A pilot balloon attached to the outside of the tube indicates the presence or absence of air in the cuff.

#### Single-Lumen Tube

The single-lumen tube is similar to the double-lumen tube except that there is no inner cannula. More intensive nursing care is required with this tube because there is no inner cannula to ensure a patent lumen.

#### Fenestrated Tube

The fenestrated tube has a precut opening (fenestration) in the upper posterior wall of the outer cannula. The tube is used to wean the client from a tracheostomy by ensuring that the client can tolerate breathing through his or her natural airway before the entire tube is removed. This tube allows the client to speak.

#### Cuffed Fenestrated Tube

The cuffed fenestrated tube facilitates mechanical ventilation and speech and often is used for clients with spinal cord paralysis or neuromuscular disease who do not require ventilation at all times. When not on the ventilator, the client can have the cuff deflated and the tube capped (see Fig. 21-3 for fenestrated cuffed tube with red cap) for speech. A cuffed fenestrated tube is never used in weaning from a tracheostomy because the cuff, even fully deflated, may partially obstruct the airway.

### Box 21-3 Complications of a Tracheostomy

#### Tube Obstruction

##### Assessment

Difficulty in breathing

Noisy respirations

Difficulty in inserting the suction catheter

Thick, dry secretions

Unexplained peak pressures if client is on a mechanical ventilator

##### Prevention and Interventions

Assist the client to cough and deep breathe.

Provide humidification and suctioning.

Clean the inner cannula regularly.

The physician repositions or replaces the tube if obstruction occurs as a result of cuff prolapse over the end of the tube.

#### Tube Dislodgment

##### Prevention and Interventions

Secure the tube in place. Minimize manipulation and traction on the tube. Ensure that the client does not pull on the tube. Ensure that a tracheostomy tube of the same type and size is at the client's bedside.

Be familiar with institutional policy regarding replacement of a tracheostomy tube as a nursing procedure.

During the first 72 hours following surgical placement of the tracheostomy, the nurse manually ventilates the client by using a manual resuscitation (Ambu) bag while another nurse calls the Rapid Response team for help.

After 72 hours following surgical placement of the tracheostomy:

- Extend the client's neck and open the tissues of the stoma to secure the airway.
- Grasp the retention sutures (if they are present) to spread the opening.
- Use a tracheal dilator (curved clamp) to hold the stoma open.
- Prepare to insert a tracheostomy tube; place the obturator into the tracheostomy tube, replace the tube, and remove the obturator.
- Maintain ventilation by resuscitation (Ambu) bag.
- Assess airflow and bilateral breath sounds.
- If unable to secure an airway, call the Rapid Response team and the anesthesiologist.

**TABLE 21-1** Complications of a Tracheostomy

| Complications and Description   | Manifestations  | Management   | Prevention   |
|---|---|--|--|
| Tracheomalacia: Constant pressure exerted by the cuff causes tracheal dilation and erosion of cartilage.  | An increased amount of air is required in the cuff to maintain the seal.<br>A larger tracheostomy tube is required to prevent an air leak at the stoma.<br>Food particles are seen in tracheal secretions.<br>The client does not receive the set tidal volume on the ventilator.     | No special management is needed unless bleeding occurs.  | Use an uncuffed tube as soon as possible.<br>Monitor cuff pressure and air volume closely to detect changes.   |
| Tracheal stenosis: Narrowed tracheal lumen is the result of scar formation from irritation of tracheal mucosa by the cuff.  | Stenosis is usually seen after the cuff is deflated or the tracheostomy tube is removed.<br>The client has increased coughing, inability to expectorate secretions, or difficulty in breathing and talking.   | Tracheal dilation or surgical intervention is used.  | Prevent pulling of and traction on the tracheostomy tube.<br>Properly secure the tube in the midline position.<br>Maintain cuff pressure.<br>Minimize oronasal intubation time.                |
| Tracheoesophageal fistula (TEF): Excessive cuff pressure causes erosion of the posterior wall of the trachea. A hole is created between the trachea and the anterior esophagus. The client at highest risk also has a nasogastric tube present. | Similar to tracheomalacia:<br>1. Food particles are seen in tracheal secretions.<br>2. Increased air in cuff is needed to achieve a seal.<br>3. The client has increased coughing and choking while eating.<br>4. The client does not receive the set tidal volume on the ventilator. | Manually administer oxygen by mask to prevent hypoxemia.<br>Use a small soft feeding tube instead of a nasogastric tube for tube feedings.<br>A gastrostomy or jejunostomy may be performed.<br>Monitor the client with a nasogastric tube closely; assess for TEF and aspiration. | Maintain cuff pressure.<br>Monitor the amount of air needed for inflation to detect changes.<br>Progress to a deflated or cuffless tube as soon as possible.                                   |
| Trachea-innominate artery fistula: A malpositioned tube causes its distal tip to push against the lateral wall of the trachea. Continued pressure causes necrosis and erosion of the innominate artery. <i>This is a medical emergency.</i>     | The tracheostomy tube pulsates in synchrony with the heartbeat.<br>There is heavy bleeding from the stoma.<br><i>This is a life-threatening complication.</i>   | Remove the tracheostomy tube immediately.<br>Apply direct pressure to the innominate artery at the stoma site.<br>Prepare the client for immediate repair surgery.   | Use the correct tube size, length, and maintain the tube in midline position.<br>Prevent pulling or tugging of the tracheostomy tube.<br>Immediately notify the physician of a pulsating tube. |

From Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed.). St. Louis: Saunders.

 **Never insert a decannulation plug into a tracheostomy tube until the cuff is deflated and the inner cannula is removed; prior insertion prevents airflow to the client.**

## VIII. CHEST TUBE DRAINAGE SYSTEM

### A. Description

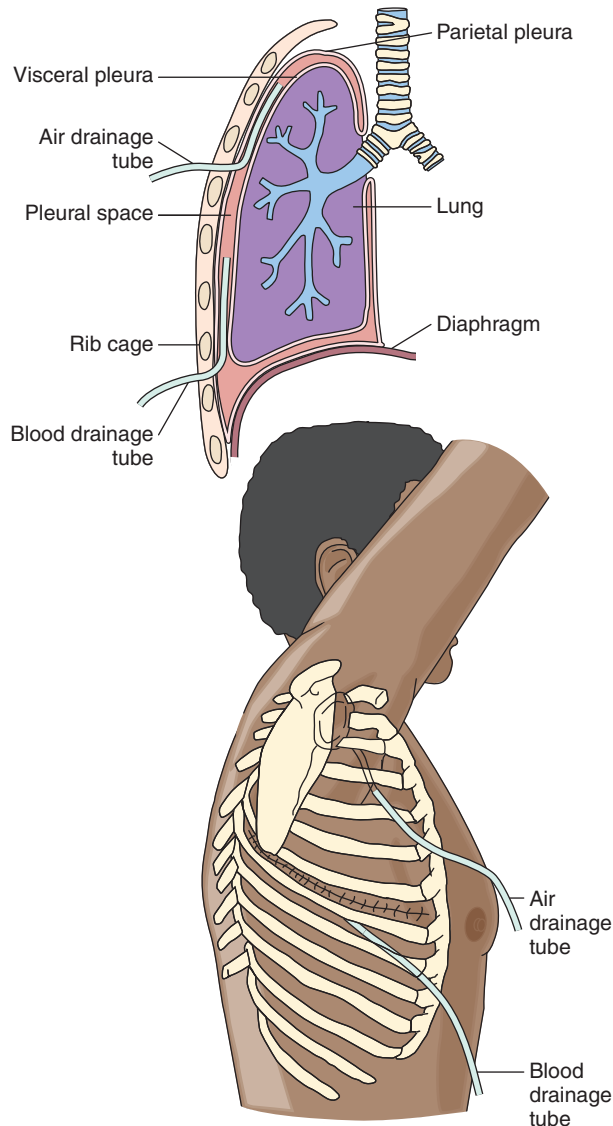

1. The **chest tube** drainage system returns negative pressure to the intrapleural space.
2. The system is used to remove abnormal accumulations of air and fluids from the pleural space (Fig. 21-4).

### B. Drainage collection chamber (Fig. 21-5)

1. The drainage collection chamber is located where the **chest tube** from the client connects to the system.
2. Drainage from the tube drains into and collects in a series of calibrated columns in this chamber.

### C. Water seal chamber (see Fig. 21-5)

1. The tip of the tube is underwater, allowing fluid and air to drain from the pleural space and preventing air from entering the pleural space.
2. Water oscillates (moves up as the client inhales and moves down as the client exhales).

▲ **FIGURE 21-4** Chest tube placement. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care*. [6th ed.]. St. Louis: Saunders.)

3. Excessive bubbling indicates an air leak in the **chest tube** system.
- D.** Suction control chamber (see Fig. 21-5)
1. The suction control chamber provides the suction, which can be controlled to provide negative pressure to the chest.
  2. This chamber is filled with various levels of water to achieve the desired level of suction; without this control, lung tissue could be sucked into the **chest tube**.
  3. Gentle bubbling in this chamber indicates that there is suction and does not indicate that air is escaping from the pleural space.
- E.** Dry suction system
1. This is another type of a chest drainage system and because this is a dry suction system, absence of bubbling is noted in the suction control chamber.

▲ **FIGURE 21-5** The Pleur-Evac drainage system, a commercial three-bottle chest drainage device. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient centered collaborative care* [6th ed.]. St. Louis: Saunders.)

2. A knob on the collection device is used to set the prescribed amount of suction; then the wall suction source dial is turned until a small orange floater valve appears in the window (when the orange floater valve is in the window, the correct amount of suction is applied).
- F.** Portable chest drainage system: Small and portable chest drainage systems are also available and are dry systems that use a control flutter valve to prevent the backflow of air into the client's lung; principles of gravity and pressure, and the nursing care involved are the same for all types of systems and these systems allow greater ambulation and allow the client to go home with the **chest tubes** in place.
- G.** Interventions
1. Collection chamber
    - a. Monitor drainage; notify the physician if drainage is more than 70 to 100 mL/hr or if drainage becomes bright red or increases suddenly.
    - b. Mark the **chest tube** drainage in the collection chamber at 1- to 4-hour intervals, using a piece of tape.
  2. Water seal chamber
    - a. Monitor for fluctuation of the fluid level in the water seal chamber.
    - b. Fluctuation in the water seal chamber stops if the tube is obstructed, if a dependent loop exists, if the suction is not working properly, or if the lung has reexpanded.

- c. If the client has a known pneumothorax, intermittent bubbling in the water seal chamber is expected as air is drained from the chest, but continuous bubbling indicates an air leak in the system.
  - d. Notify the physician if there is continuous bubbling in the water seal chamber.
3. Suction control chamber: Gentle (not vigorous) bubbling should be noted in the suction control chamber.
  4. An occlusive sterile dressing is maintained at the insertion site.
  5. A chest radiograph assesses the position of the tube and determines whether the lung has reexpanded.
  6. Assess respiratory status and auscultate lung sounds.
  7. Monitor for signs of extended pneumothorax or hemothorax.
  8. Keep the drainage system below the level of the chest and the tubes free of kinks, dependent loops, or other obstructions.
  9. Ensure that all connections are secure.
  10. Encourage coughing and deep breathing.
  11. Change the client's position frequently to promote drainage and ventilation.
  12. Do not strip or milk a **chest tube** unless specifically directed to do so by a physician and if agency policy allows it.
  13. Keep a clamp (may be needed if the system needs to be changed) and a sterile occlusive dressing at the bedside at all times.
  14. Never clamp a **chest tube** without a written prescription from the physician; also, determine agency policy for clamping a **chest tube**.
  15. If the drainage system cracks or breaks, insert the **chest tube** into a bottle of sterile water, remove the cracked or broken system, and replace it with a new system.
  16. When the **chest tube** is removed, the client is asked to take a deep breath and hold it, and the tube is removed; a dry sterile dressing, petroleum gauze dressing, or Telfa dressing (depending on the physician's preference) is taped in place after removal of the **chest tube**.
  17. Depending on the physician's preference, when the **chest tube** is removed, the client may be asked to take a deep breath, exhale, and bear down (Valsalva maneuver).

 If the chest tube is pulled out of the chest accidentally, pinch the skin opening together, apply an occlusive sterile dressing, cover the dressing with overlapping pieces of 2-inch tape, and call the physician immediately.

## MORE QUESTIONS ON THE CD!

### Practice Questions

189. A nurse is preparing to remove a nasogastric tube from a client. The nurse should instruct the client to do which of the following just before the nurse removes the tube?
  1. Exhale.
  2. Inhale and exhale quickly.
  3. Take and hold a deep breath.
  4. Perform a Valsalva maneuver.
190. A nurse is preparing to administer medication through a nasogastric tube that is connected to suction. To administer the medication, the nurse would:
  1. Position the client supine to assist in medication absorption.
  2. Aspirate the nasogastric tube after medication administration to maintain patency.
  3. Clamp the nasogastric tube for 30 to 60 minutes following administration of the medication.
  4. Change the suction setting to low intermittent suction for 30 minutes after medication administration.
191. A nurse is assessing for correct placement of a nasogastric tube. The nurse aspirates the stomach contents and checks the contents for pH. The nurse verifies correct tube placement if which pH value is noted?
  1. 3.5
  2. 7.0
  3. 7.35
  4. 7.5
192. A nurse caring for a client with a chest tube turns the client to the side and the chest tube accidentally disconnects. The initial nursing action is to:
  1. Call the physician.
  2. Place the tube in a bottle of sterile water.
  3. Immediately replace the chest tube system.
  4. Place a sterile dressing over the disconnection site.
193. A registered nurse is preparing to insert a nasogastric tube in an adult client. To determine the accurate measurement of the length of the tube to be inserted, the nurse should:
  1. Mark the tube at 10 inches.
  2. Mark the tube at 32 inches.
  3. Place the tube at the tip of the nose and measure by extending the tube to the earlobe and then down to the xiphoid process.

4. Place the tube at the tip of the nose and measure by extending the tube to the earlobe and then down to the top of the sternum.
- 194.** A nurse is inserting a nasogastric tube in an adult client. During the procedure, the client begins to cough and has difficulty breathing. Which of the following is the appropriate nursing action?
1. Quickly insert the tube.
  2. Notify the physician immediately.
  3. Remove the tube and reinsert when the respiratory distress subsides.
  4. Pull back on the tube and wait until the respiratory distress subsides.
- 195.** A nurse is assisting a physician with the removal of a chest tube. The nurse should instruct the client to:
1. Exhale slowly.
  2. Stay very still.
  3. Inhale and exhale quickly.
  4. Perform the Valsalva maneuver.
- 196.** While changing the tapes on a tracheostomy tube, the client coughs and the tube is dislodged. The initial nursing action is to:
1. Call the physician to reinsert the tube.
  2. Grasp the retention sutures to spread the opening.
  3. Call the respiratory therapy department to reinsert the tracheotomy.
  4. Cover the tracheostomy site with a sterile dressing to prevent infection.
- 197.** A nurse is caring for a client immediately after removal of the endotracheal tube. The nurse reports which of the following signs immediately if experienced by the client?
1. Stridor
  2. Occasional pink-tinged sputum
  3. Respiratory rate of 24 breaths/min
  4. A few basilar lung crackles on the right
- 198.** The nurse checks for residual before administering a bolus tube feeding to a client with a nasogastric tube and obtains a residual amount of 150 mL. What is the appropriate action for the nurse to take?
1. Hold the feeding.
  2. Reinstill the amount and continue with administering the feeding.
  3. Elevate the client's head at least 45 degrees and administer the feeding.
  4. Discard the residual amount and proceed with administering the feeding.
- 199.** A nurse caring for a client with a pneumothorax and who has had a chest tube inserted notes continuous gentle bubbling in the suction control chamber. What action is appropriate?
1. Do nothing, because this is an expected finding.
  2. Immediately clamp the chest tube and notify the physician.
  3. Check for an air leak because the bubbling should be intermittent.
  4. Increase the suction pressure so that the bubbling becomes vigorous.

### Alternate Item Format: Multiple Response

- 200.** A nurse is assessing the functioning of a chest tube drainage system in a client who has just returned from the recovery room following a thoracotomy with wedge resection. Select the expected assessment findings. **Select all that apply.**
- 1. Excessive bubbling in the water seal chamber
  - 2. Vigorous bubbling in the suction control chamber
  - 3. 50 mL of drainage in the drainage collection chamber
  - 4. Drainage system maintained below the client's chest
  - 5. Occlusive dressing in place over the chest tube insertion site
  - 6. Fluctuation of water in the tube in the water seal chamber during inhalation and exhalation

## ANSWERS

### 189. 3

**Rationale:** When the nurse removes a nasogastric tube, the client is instructed to take and hold a deep breath. This will close the epiglottis. This allows for easy withdrawal through the esophagus into the nose. The nurse removes the tube with one smooth, continuous pull. Therefore, options 1, 2, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject, removing a nasogastric tube. Visualize the

procedure as a guide, considering what each action identified in the options would produce. Review the procedure for removing a nasogastric tube if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1209). St. Louis: Mosby.

**190. 3**

**Rationale:** If a client has a nasogastric tube connected to suction, the nurse should wait 30 to 60 minutes before reconnecting the tube to the suction apparatus to allow adequate time for medication absorption. Aspirating the nasogastric tube will remove the medication just administered. Low intermittent suction also will remove the medication just administered. The client should not be placed in the supine position because of the risk for aspiration.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 2 and 4 first because these actions are comparable or alike and will produce the same effect. Recalling that the client should not be placed in a supine position will assist in eliminating option 1. If you had difficulty with this question, review the procedure for administering medications through a nasogastric tube.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., pp. 718, 1208). St. Louis: Mosby.

**191. 1**

**Rationale:** If the nasogastric tube is in the stomach, the pH of the contents will be acidic. Gastric aspirates have acidic pH values and should be 3.5 or lower. Option 2 indicates a slightly acidic pH. Option 3 indicates a neutral pH. Option 4 indicates an alkaline pH.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *verifies*. Recalling that gastric contents are acidic will direct you to option 1. If you had difficulty with this question, review the procedure for assessing nasogastric tube placement.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1206). St. Louis: Mosby.

**192. 2**

**Rationale:** If the chest drainage system is disconnected, the end of the tube is placed in a bottle of sterile water held below the level of the chest. The system is replaced if it breaks or cracks or if the collection chamber is full. Placing a sterile dressing over the disconnection site will not prevent complications resulting from the disconnection. The physician may need to be notified, but this is not the initial action.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *initial* in the question. This indicates that a nursing action is required that will prevent a serious complication as a result of the disconnection. Eliminate options 1 and 3 because these actions delay required and immediate intervention. From the remaining options, recalling the complications that can occur from a disconnection will direct you to option 2. Review interventions related to the complications of a chest tube if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Critical Care

**References:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 648). St. Louis: Saunders.

Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 955). St. Louis: Mosby.

**193. 3**

**Rationale:** Measuring the length of a nasogastric tube needed is done by placing the tube at the tip of the client's nose and extending the tube to the earlobe and then down to the xiphoid process. The average length for an adult is about 22 to 26 inches. Therefore options 1, 2, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination and visualize this procedure. Eliminate options 1 and 2 first because 10 inches is short and 32 inches is too long. Remember the abbreviation NEX, which stands for nose, earlobe, and xiphoid process, to assist in answering questions similar to this one. Review the procedure for measuring the length of a nasogastric tube for insertion if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1205). St. Louis: Mosby.

**194. 4**

**Rationale:** During the insertion of a nasogastric tube, if the client experiences difficulty breathing or any respiratory distress, withdraw the tube slightly, stop the tube advancement, and wait until the distress subsides. Options 2 and 3 are unnecessary. Quickly inserting the tube is not an appropriate action because, in this situation, it may be likely that the tube has entered the bronchus.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 1 first because of the word *quickly*. Visualizing the procedure and anticipating potential complications will assist in eliminating options 2 and 3 as unnecessary actions. Review the procedure and cautions related to inserting a nasogastric tube if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 1206). St. Louis: Mosby.

**195. 4**

**Rationale:** When the chest tube is removed, the client is asked to perform the Valsalva maneuver (take a deep breath, exhale, and bear down). The tube is quickly withdrawn, and an airtight dressing is taped in place. An alternative instruction is to ask the client to take a deep breath and hold the breath while the tube is removed. Options 1, 2, and 3 are incorrect client instructions.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject. Visualize the procedure, client

instructions, and the effect of each of the actions in the options to answer correctly. If you had difficulty with this question, review the procedure for removal of a chest tube.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1624). St. Louis: Saunders.

### 196. 2

**Rationale:** If the tube is dislodged accidentally, the initial nursing action is to grasp the retention sutures and spread the opening. If agency policy permits, the nurse then attempts immediately to replace the tube. Covering the tracheostomy site will block the airway. Options 1 and 3 will delay treatment in this emergency situation.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 3 first because they are comparable or alike and will delay the immediate intervention needed. Eliminate option 4 because this action will block the airway. If you had difficulty with this question, review the intervention required if a tracheostomy tube dislodges.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Critical Care

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., p. 1546). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 580). St. Louis: Saunders.

### 197. 1

**Rationale:** Following removal of the endotracheal tube the nurse monitors the client for respiratory distress. The nurse reports stridor to the physician immediately. This is a high-pitched, coarse sound that is heard with the stethoscope over the trachea. Stridor indicates airway edema and places the client at risk for airway obstruction. Options 2, 3, and 4 are not signs that require immediate notification of the physician.

**Test-Taking Strategy:** Use the process of elimination. Recall that the prime danger after removal of an artificial airway is the client's inability to maintain a patent airway and breathe independently. In comparing each of the options with this risk in mind, eliminate options 2, 3, and 4. Because stridor indicates laryngeal edema and possible airway obstruction, it is the symptom that must be reported immediately. Review care to the client following removal of an endotracheal tube if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Critical Care

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 697). St. Louis: Saunders.

### 198. 1

**Rationale:** Unless specifically indicated, residual amounts more than 100 mL require holding the feeding. Therefore options 2, 3, and 4 are incorrect. Additionally, the feeding is not discarded unless its contents are abnormal in color or characteristics.

**Test-Taking Strategy:** Use the process of elimination and note that the residual amount is 150 mL. Also note that options 2, 3, and 4 are comparable or alike and indicate administering the feeding. If you had difficulty with this question, review nursing interventions for clients with nasogastric tubes.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1399). St. Louis: Saunders.

### 199. 1

**Rationale:** Continuous gentle bubbling should be noted in the suction control chamber. Option 2 is incorrect. Chest tubes should only be clamped to check for an air leak or when changing drainage devices (according to agency policy). Option 3 is incorrect. Bubbling should be continuous in the suction control chamber and not intermittent. Option 4 is incorrect because bubbling should be gentle. Increasing the suction pressure only increases the rate of evaporation of water in the drainage system.

**Test-Taking Strategy:** Use the process of elimination and think about the physiology associated with each chamber of the chest tube drainage system. Remember that continuous gentle bubbling in the suction control chamber is expected. If you had difficulty with this question, review nursing interventions and expected findings for clients with chest tubes.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Safety/Infection Control

**References:** Black, J., & Hawks, J. (2009). *Medical-surgical nursing: Clinical management for positive outcomes* (8th ed., pp. 1622–1623). St. Louis: Saunders.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1399). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 200. 3, 4, 5, 6

**Rationale:** The bubbling of water in the water seal chamber indicates air drainage from the client and usually is seen when intrathoracic pressure is higher than atmospheric pressure, and may occur during exhalation, coughing, or sneezing. Excessive bubbling in the water seal chamber may indicate an air leak, an unexpected finding. Fluctuation of water in the tube in the water seal chamber during inhalation and exhalation is expected. An absence of fluctuation may indicate that the chest tube is obstructed or that the lung has reexpanded and that no more air is leaking into

the pleural space. Gentle (not vigorous) bubbling should be noted in the suction control chamber. A total of 50 mL of drainage is not excessive in a client returning to the nursing unit from the recovery room. Drainage that is more than 70 to 100 mL/hr is considered excessive and requires physician notification. The chest tube insertion site is covered with an occlusive (airtight) dressing to prevent air from entering the pleural space. Positioning the drainage system below the client's chest allows gravity to drain the pleural space.

**Test-Taking Strategy:** Thinking about the physiology associated with the functioning of a chest tube drainage system

will assist in answering this question. The words *excessive bubbling* and *vigorous bubbling* will assist in eliminating these assessment findings. Review care for the client with a chest tube drainage system if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Safety/Infection Control

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 648). St. Louis: Saunders.

# UNIT V

## Maternity Nursing

### PYRAMID TERMS

**amniotic fluid** Pale, straw-colored fluid in which the fetus floats. It serves as a cushion against injury from sudden blows or movements and helps maintain a constant body temperature for the fetus. The fetus modifies the amniotic fluid through the processes of swallowing, urinating, and movement through the respiratory tract.

**ballottement** Rebounding of the fetus against the examiner's finger on palpation. When the examiner taps the cervix, the fetus floats upward in the amniotic fluid. The examiner feels a rebound when the fetus falls back.

**Chadwick's sign** Violet coloration of the mucous membranes of the cervix, vagina, and vulva that occurs at about 4 weeks of pregnancy caused by increased vascularity. This is considered a probable sign of pregnancy.

**delivery** Actual event of birth; the expulsion or extraction of the neonate.

**embryo** Stage of fetal development that lasts from day 15 until approximately 8 weeks after conception or until the embryo measures 3 cm from crown to rump.

**fertilization** Uniting of the sperm and ovum, which occurs within 12 hours of ovulation and within 2 to 3 days of insemination, the average duration of viability for the ovum and sperm.

**Goodell's sign** Softening of the cervix that occurs at the beginning of the second month of gestation. This is considered a probable sign of pregnancy.

**gravida** A pregnant woman; called gravida I (primigravida) during the first pregnancy, gravida II during the second pregnancy, and so on.

**Hegar's sign** Compressibility and softening of the lower uterine segment that occurs at about week 6 of gestation. This is considered a probable sign of pregnancy.

**implantation** Embedding of the fertilized ovum in the uterine mucosa 6 to 10 days after conception.

**infant** A human born alive; also, a human from 28 days of age until the first birthday.

**labor** Coordinated sequence of rhythmic involuntary uterine contractions resulting in effacement and dilation of the cervix, followed by expulsion of the products of conception.

**lecithin-to-sphingomyelin (L/S) ratio** Ratio of two components of amniotic fluid, used for predicting fetal lung maturity; normal L/S ratio in amniotic fluid is 2:1 or greater when the fetal lungs are mature.

**lochia** Discharge from the uterus that consists of blood from the vessels of the placental site and debris from the decidua; lasts for 2 to 6 weeks after delivery.

**Nägele's rule** Determines the estimated date of birth based on the premise that the woman has a 28-day menstrual cycle. Add 7 days to the first day of the last menstrual period; subtract 3 months and add 1 year. Alternatively, add 7 days to the last menstrual period and count forward 9 months.

**newborn** A human from the time of birth to the twenty-eighth day of life; also called neonate.

**parity** Number of pregnancies that have reached viability regardless of whether the fetus was born alive or stillborn.

**placenta** Organ that provides for the exchange of nutrients and waste products between the fetus and the mother and produces hormones to maintain pregnancy. The placenta develops by the third month of gestation and is also called afterbirth.

**quickenig** Maternal perception of fetal movement for the first time, occurring usually in the sixteenth to twentieth week of pregnancy.

**surfactant** Phospholipid that is necessary to keep the fetal lung alveoli from collapsing; amount is usually sufficient after 32 weeks' gestation.

**uterus** Organ located behind the symphysis pubis, between the bladder and the rectum. It has four parts—fundus (upper part), corpus (body), isthmus (lower segment), and cervix.

**vagina** Tubular structure located behind the bladder and in front of the rectum; it extends from the cervix to the vaginal opening in the perineum. It functions as the outflow tract for menstrual fluid and for vaginal and cervical secretions, the birth canal, and the organ for coitus.

**viability** Capability of the fetus to survive outside the uterus; about 22 to 24 weeks of gestation or fetal weight more than 500 g.

## PYRAMID TO SUCCESS

The Pyramid to Success focuses on the physiological and psychosocial aspects related to the experience of pregnancy, delivery, and the postpartum period. Pyramid Points begin with the assessment and knowledge of expected findings of the pregnant client and fetus during the antepartum period. Instructing the pregnant client in measures that promote a healthy environment for the mother and the fetus is included. The focus is on the importance of antepartum follow-up, nutrition, and interventions for common discomforts that occur during pregnancy. Knowledge of the purpose of the commonly prescribed diagnostic tests and procedures in the antepartum period is also part of the Pyramid to Success. The focus is on disorders that can occur during pregnancy, particularly gestational hypertension and diabetes mellitus. The labor and delivery process and the immediate interventions for conditions in which the maternal or fetal status is compromised, such as prolapsed cord or altered fetal heart rate, is part of the Pyramid to Success. Review of the fetus of a mother with human immunodeficiency virus or acquired immunodeficiency syndrome or a substance-abusing mother is recommended. The Pyramid to Success also includes a focus on the normal expectations of the postpartum period and the complications that can occur during this time. The next Pyramid Point focuses on the normal physical assessment findings and early identification of disorders in the neonate. The last Pyramid Point in this unit focuses on maternity and newborn medications.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Consulting with other health care team members
- Delegating client care activities
- Establishing priorities of care
- Handling hazardous and infectious materials safely
- Maintaining confidentiality
- Managing the health care environment
- Obtaining informed consent for diagnostic tests and procedures

- Providing continuity of client care
- Upholding client's rights
- Using surgical asepsis when providing care
- Using standard and transmission-based precautions when providing care

### Health Promotion and Maintenance

- Assessing for growth and development
- Discussing expected body image changes with the client
- Discussing family planning and birthing and parenting issues
- Identifying at-risk clients during pregnancy
- Identifying health and wellness concepts and providing health care screening
- Identifying high-risk behaviors
- Identifying lifestyle choices
- Performing techniques of physical assessment
- Providing antepartum, intrapartum, postpartum, and newborn care
- Teaching regarding antepartum, intrapartum, and postpartum care
- Teaching regarding care to the newborn

### Psychosocial Integrity

- Considering cultural, religious, and spiritual influences regarding birth and motherhood
- Discussing situational role changes in the family
- Ensuring therapeutic interactions within the family
- Identifying available support systems
- Identifying coping mechanisms

### Physiological Integrity

- Providing nonpharmacological comfort interventions and pharmacological pain management during labor
- Identifying the action and contraindications for prescribed pharmacological agents
- Monitoring for side effects and adverse effects related to prescribed pharmacological and parenteral therapies
- Calculating medication dosages and administering medications safely
- Monitoring for expected outcomes and effects related to pharmacological and parenteral therapies
- Instructing the client about prescribed diagnostic tests and procedures
- Providing interventions for unexpected events during pregnancy
- Monitoring the client during the labor and delivery process
- Monitoring for normal expectations during pregnancy
- Teaching the client about nutrition during pregnancy and in the postpartum period
- Teaching the client about the physiological changes that occur during pregnancy

# Female Reproductive System

## I. REPRODUCTIVE STRUCTURES (Fig. 22-1)

- A. Ovaries**
  1. Form and expel ova
  2. Secrete estrogen and progesterone
- B. Fallopian tubes**
  1. Muscular tubes (oviducts) approximate to the ovaries and connected to the **uterus**
  2. Tubes that propel the ova from the ovaries to the **uterus**
- C. Uterus**
  1. Muscular, pear-shaped cavity in which the fetus develops
  2. Cavity from which menstruation occurs
- D. Cervix**
  1. The internal os of the cervix opens into the body of the uterine cavity.
  2. The cervical canal is located between the internal os and the external os.
  3. The external cervical os opens into the **vagina**.
- E. Vagina**
  1. Muscular tube that extends from the cervix to the vaginal opening in the perineum
  2. Known as the birth canal
  3. Passage between the cervical os and the external environment
    - a. Passageway for menstrual blood flow
    - b. Passageway for fetus
    - c. Passageway for penis for intercourse

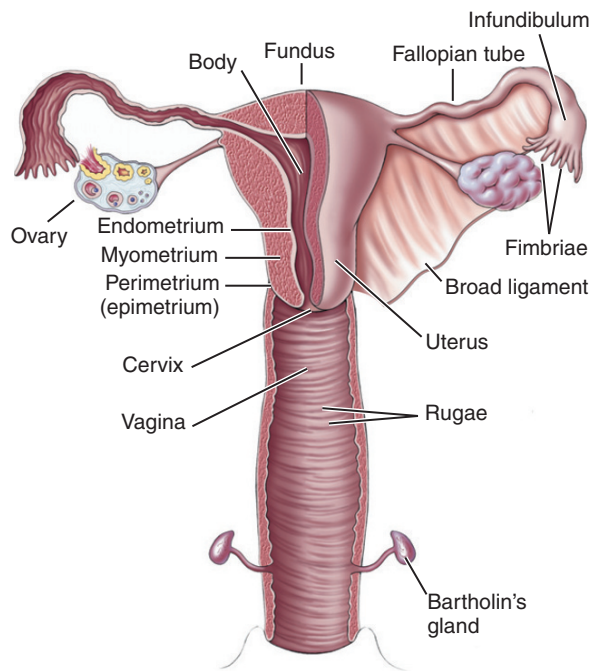

## II. MENSTRUAL CYCLE (Box 22-1)

- A. Ovarian hormones**
  1. Ovarian hormones include follicle-stimulating hormone (FSH) and luteinizing hormone (LH).
  2. The hormones are released by the anterior pituitary gland.
  3. The hormones produce changes in the ovaries.
  4. Secretion of ovarian hormones leads to changes in the endometrium.
  5. The menstrual cycle, the regularly recurring physiological changes in the endometrium that culminate in its shedding, may vary in length, with the average length being about 28 days.
- B. Ovarian and uterine phases (see Box 22-1)**

## III. FEMALE PELVIS AND MEASUREMENTS

- A. True pelvis**
    1. Lies below the pelvic brim
    2. Consists of the pelvic inlet, midpelvis, and pelvic outlet
  - B. False pelvis**
    1. Is the shallow portion above the pelvic brim
    2. Supports the abdominal viscera
  - C. Types of pelvis**
    1. Gynecoid
      - a. Normal female pelvis
      - b. Transversely rounded or blunt
-  **The gynecoid pelvis is most favorable for successful labor and birth.**
- 2. Anthropoid
    - a. Oval shape
    - b. Adequate outlet, with a narrow pubic arch
  - 3. Android
    - a. Heart-shaped or angulated
    - b. Resembles a male pelvis
    - c. Not favorable for **labor** and birth
    - d. Narrow pelvic planes can cause slow descent and midpelvic arrest.
  - 4. Platypelloid
    - a. Flat with an oval inlet
    - b. Wide transverse diameter, but short anteroposterior diameter, making **labor** and birth difficult
- D. Pelvic inlet diameters**
  1. Anteroposterior diameters
    - a. Diagonal conjugate: Distance from the lower margin of the symphysis pubis to the sacral promontory
    - b. True conjugate or conjugate vera: Distance from the upper margin of the symphysis pubis to the sacral promontory
    - c. Obstetric conjugate: The smallest front-to-back distance through which the fetal head must pass in moving through the pelvic inlet
  2. Transverse diameter: The largest of the pelvic inlet diameters; located at right angles to the true conjugate

3. Oblique (diagonal) diameter: Not clinically measurable
4. Posterior sagittal diameter: Distance from the point where the anteroposterior and transverse

▲ **FIGURE 22-1** Female reproductive organs. (From Herlihy, B., & Maebius, N. [2007]. *The human body in health and illness* [3rd ed.] St. Louis: Saunders.)

diameters cross each other to the middle of the sacral promontory

- E. Pelvic midplane diameters
  1. Transverse diameter (interspinous diameter)
  2. Midplane normally is the largest plane and has the longest diameter.
- F. Pelvic outlet diameters
  1. Transverse (intertuberous diameter)
  2. Outlet presents the smallest plane of the pelvic canal.

#### IV. FERTILIZATION AND IMPLANTATION

##### A. Fertilization

1. **Fertilization** occurs in the ampulla of the fallopian (uterine) tube.
2. **Fertilization** occurs when sperm and ovum unite.
3. When fertilized, the membrane of the ovum undergoes changes that prevent entry of other sperm.
4. Each reproductive cell carries 23 chromosomes.
5. Sperm carry an X or a Y chromosome—XY, male; XX, female.

##### B. Implantation

1. The zygote is propelled toward the **uterus**.
2. The zygote implants 6 to 8 days after ovulation.

### Box 22-1 Menstrual Cycle

#### Ovarian Changes

##### Preovulatory Phase

Hypothalamus releases gonadotropin-releasing hormone through the portal system to the anterior pituitary system. Secretion of follicle-stimulating hormone (FSH) by the anterior lobe of the pituitary gland stimulates growth of follicles. Most follicles die, leaving one to mature into a large graafian follicle. Estrogen produced by the follicle stimulates increased secretions of luteinizing hormone (LH) by the anterior lobe of the pituitary gland. The follicle ruptures and releases an ovum into the peritoneal cavity.

##### Luteal Phase

Luteal phase begins with ovulation. Body temperature decreases and then increases by 0.5° F to 1° F around the time of ovulation. Corpus luteum is formed from follicle cells that remain in the ovary after ovulation. Corpus luteum secretes estrogen and progesterone during the remaining 14 days of the cycle. Corpus luteum degenerates if the ovum is not fertilized, and secretion of estrogen and progesterone declines. Decline of estrogen and progesterone stimulates the anterior pituitary to secrete more FSH and LH, initiating a new reproductive cycle.

#### Uterine Changes

##### Menstrual Phase

Menstrual phase consists of 4 to 6 days of bleeding as the endometrium breaks down because of the decreased levels of estrogen and progesterone. The level of FSH increases, enabling the beginning of a new cycle.

##### Proliferative Phase

Proliferative phase lasts about 9 days. Estrogen stimulates proliferation and growth of the endometrium. As estrogen increases, it suppresses secretion of FSH and increases secretion of LH. Secretion of LH stimulates ovulation and the development of the corpus luteum. Ovulation occurs between days 12 and 16. Estrogen level is high, and progesterone level is low.

##### Secretory Phase

Secretory phase lasts about 12 days and follows ovulation. This phase is initiated in response to the increase in LH level. The graafian follicle is replaced by the corpus luteum. The corpus luteum secretes progesterone and estrogen. Progesterone prepares the endometrium for pregnancy if a fertilized ovum is implanted.

3. The blastocyst secretes chorionic gonadotropin to ensure that the corpus luteum remains viable and secretes estrogen and progesterone for the first 2 to 3 months of gestation.

- B.** Embryonic period: Beginning at day 15 through approximately the eighth week after conception  
**C.** Fetal period: Beginning at the ninth week after conception and ending with birth

## V. FETAL DEVELOPMENT (Box 22-2)

- A.** Pre-embryonic period: First 2 weeks after conception

## VI. FETAL ENVIRONMENT

- A.** Amnion  
 1. Encloses the amniotic cavity

### Box 22-2 Fetal Development

#### Pre-embryonic Period

First 2 weeks after conception

#### Embryonic Period

Beginning day 15 through approximately week 8 after conception

#### Fetal Period

Week 9 after conception to birth

#### Week 1

Blastocyst is free-floating.

#### Weeks 2 to 3

Embryo is 1.5 to 2 mm in length.

Lung buds appear

Blood circulation begins.

Heart is tubular and begins to beat.

Neural plate becomes brain and spinal cord.

#### Week 5

Embryo is 0.4 to 0.5 cm in length.

Embryo is 0.4 g.

Double heart chambers are visible.

Heart is beating.

Limb buds form.

#### Week 8

Embryo is 3 cm in length.

Embryo is 2 g.

Eyelids begin to fuse.

Circulatory system through umbilical cord is well established.

Every organ system is present.

#### Week 12

Fetus is 6 to 9 cm in length.

Fetus is 19 g.

Face is well formed

Limbs are long and slender.

Kidneys begin to form urine.

Spontaneous movements occur.

Heartbeat is detected by Doppler transducer between 10 and 12 weeks.

Sex is visually recognizable.

#### Week 16

Fetus is 11.5 to 13.5 cm in length.

Fetus is 100 g.

Active movements are present.

Fetal skin is transparent.

Lanugo hair begins to develop.

Skeletal ossification occurs.

#### Week 20

Fetus is 16 to 18.5 cm in length.

Fetus is 300 g.

Lanugo covers the entire body.

Fetus has nails.

Muscles are developed.

Enamel and dentin are depositing.

Heartbeat is detected by regular (nonelectronic) fetoscope.

#### Week 24

Fetus is 23 cm in length.

Fetus is 600 g.

Hair on head is well formed.

Skin is reddish and wrinkled.

Reflex hand grasp functions.

Vernix caseosa covers entire body.

Fetus has ability to hear.

#### Week 28

Fetus is 27 cm in length.

Fetus is 1100 g.

Limbs are well flexed.

Brain is developing rapidly.

Eyelids open and close.

Lungs are developed sufficiently to provide gas exchange (lecithin forming).

If born, neonate can breathe at this time.

#### Week 32

Fetus is 31 cm in length.

Fetus is 1800 to 2100 g.

Bones are fully developed.

Subcutaneous fat has collected.

Lecithin-to-sphingomyelin (L/S) ratio is 1.2:1.

#### Week 36

Fetus is 35 cm in length.

Fetus is 2200 to 2900 g.

Skin is pink and body is rounded.

Skin is less wrinkled.

Lanugo is disappearing.

L/S ratio is greater than 2:1.

#### Week 40

Fetus is 40 cm in length.

Fetus is more than 3200 g.

Skin is pinkish and smooth.

Lanugo is present on upper arms and shoulders.

Vernix caseosa decreases.

Fingernails extend beyond fingertips.

Sole (plantar) creases run down to the heel.

Testes are in the scrotum.

Labia majora are well developed.

2. Is the inner membrane that forms about the second week of embryonic development
3. Forms a fluid-filled sac that surrounds the **embryo** and later the fetus

**B. Chorion**

1. Is the outer membrane
2. Becomes vascularized and forms the fetal part of the **placenta**

**C. Amniotic fluid**

1. Consists of 800 to 1200 mL by the end of pregnancy
2. Surrounds, cushions, and protects the fetus and allows for fetal movement
3. Maintains the body temperature of the fetus
4. Contains fetal urine and is a measure of fetal kidney function
5. The fetus modifies the **amniotic fluid** through the processes of swallowing, urinating, and movement through the respiratory tract.

**D. Placenta**

1. The **placenta** provides for exchange of nutrients and waste products between the fetus and mother
2. The **placenta** begins to form at **implantation**; the structure is complete by week 12.
3. It produces hormones to maintain pregnancy and assumes full responsibility for the production of these hormones by the twelfth week of gestation.
4. In the third trimester, transfer of maternal immunoglobulin provides the fetus with passive immunity to certain diseases for the first few months after birth.
5. By week 10 to 12, genetic testing can be done via chorionic villus sampling (CVS).

 Large particles such as bacteria cannot pass through the placenta, but nutrients, drugs, antibodies, and viruses can pass through the placenta.

## VII. FETAL CIRCULATION

**A. Umbilical cord**

1. It contains two arteries and one vein.
2. The arteries carry deoxygenated blood and waste products from the fetus.
3. The vein carries oxygenated blood and provides oxygen and nutrients to the fetus.

**B. Fetal heart rate (FHR)**

1. FHR depends on gestational age; FHR is 160 to 170 beats/min in the first trimester, but slows with fetal growth to 120 to 160 beats/min near or at term.
2. FHR is about twice the maternal heart rate.

**C. Fetal circulation bypass (Fig. 22-2)**

1. Fetal circulation bypass is present because of nonfunctioning lungs.

2. Bypasses must close after birth to allow blood to flow through the lungs and the liver.
3. The ductus arteriosus connects the pulmonary artery to the aorta, bypassing the lungs.
4. The ductus venosus connects the umbilical vein and the inferior vena cava, bypassing the liver.
5. The foramen ovale is the opening between the right and left atria of the heart, bypassing the lungs.

 The fetal heart rate is 160 to 170 beats/min in the first trimester, but slows with fetal growth to 120 to 160 beats/min near or at term. The physician must be notified if the fetal heart rate is outside these parameters.

## VIII. FAMILY PLANNING

**A. Description**

1. Involves choosing when to have children
2. Includes contraception, prevention of pregnancy, and methods to achieve pregnancy

**B. Birth control**

1. The focus of counseling on contraception must meet the needs and feelings of the woman and her partner.
2. Several factors should be considered when choosing a method of birth control, including effectiveness, safety, and personal preference.
3. The woman's preferences are most important, and cultural practices and beliefs and religious or other personal beliefs may affect the choice of contraceptives.
4. Other factors that bear on selection of a contraceptive method include family-planning goals, age, frequency of intercourse, and the individual's capacity for compliance.
5. If planning goals have already been met, sterilization of either the male or female partner may be desirable (it is important for the couple to understand that tubal reconstruction may be unsuccessful).
6. For women who frequently engage in coitus, oral contraceptives or a long-term method such as implants or an intrauterine device (IUD) may be considered.
7. When sexual activity is limited, use of spermicide, condoms, or a diaphragm may be most appropriate.
8. Because some methods have adverse effects, an informed consent form may be needed.
9. For additional information on the use of contraceptives, see Chapter 55.

**C. Infertility**

1. Infertility is the involuntary inability to conceive when desired.

▲ **FIGURE 22-2** Fetal circulation. Three shunts (ductus venosus, ductus arteriosus, and foramen ovale) allow most blood from the placenta to bypass the fetal lungs and liver. (From McKinney, E., James, S., Murray, S., & Ashwill, J. [2009]. *Maternal-child nursing* [3rd ed.]. St. Louis: Saunders.)

2. Some factors contributing to infertility in men include abnormalities of the sperm, abnormal erections or ejaculations, or abnormalities of the seminal fluid.
3. Some factors that contribute to infertility in women include disorders of ovulation or abnormalities of the fallopian tubes or cervix.
4. Several diagnostic tests are available to determine the probable cause of infertility and the therapy recommended may depend on the cause of the infertility.
5. Infertility options
  - a. Options include medication, surgical procedures, or therapeutic insemination.
  - b. Other therapies are available, such as in vitro **fertilization**, surrogate mothers, or embryo hosts.
  - c. Adoption may also be an option.
6. The nurse needs to provide support to the couple in their decision-making process and during therapy.

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 201.** A nursing student is preparing a prenatal class on the process of fetal circulation. The nursing instructor asks the student specifically to describe the process through the umbilical cord. Which of the following statements from the student is correct?
1. "The one artery carries freshly oxygenated blood and nutrient-rich blood back from the placenta to the fetus."
  2. "The two arteries carry freshly oxygenated blood and nutrient-rich blood back from the placenta to the fetus."
  3. "The two arteries in the umbilical cord carry deoxygenated blood and waste products away from the fetus to the placenta."
  4. "The two veins in the umbilical cord carry blood that is high in carbon dioxide and

other waste products away from the fetus to the placenta.”

- 202.** A nursing student is assigned to care for a client in labor. A nursing instructor asks the student to describe fetal circulation, specifically the ductus venosus. The nursing instructor determines that the student understands fetal circulation if the student states that the ductus venosus:
1. Connects the pulmonary artery to the aorta
  2. Is an opening between the right and left atria
  3. Connects the umbilical vein to the inferior vena cava
  4. Connects the umbilical artery to the inferior vena cava
- 203.** A pregnant client tells the clinic nurse that she wants to know the sex of her baby as soon as it can be determined. The nurse understands that the client should be able to find out at 12 weeks' gestation because by the end of the twelfth week:
1. The sex of the fetus can be determined by the appearance of the external genitalia.
  2. The sex of the fetus can be determined because the external genitalia begins to differentiate.
  3. The sex of the fetus can be determined because the testes are descended into the scrotal sac.
  4. The sex of the fetus can be determined because the internal differences in males and females become apparent.
- 204.** A nurse is performing an assessment on a client who is at 38 weeks' gestation and notes that the fetal heart rate is 174 beats/min. On the basis of this finding, the appropriate nursing action is to:
1. Notify the physician.
  2. Document the finding.
  3. Check the mother's heart rate.
  4. Tell the client that the fetal heart rate is normal.
- 205.** A nurse is conducting a prenatal class on the female reproductive system. When a client in the class asks why the fertilized ovum stays in the fallopian tube for 3 days, the nurse responds that the reason for this is that it:
1. Promotes the fertilized ovum's chances of survival
  2. Promotes the fertilized ovum's exposure to estrogen and progesterone
  3. Promotes the fertilized ovum's normal implantation in the top portion of the uterus
  4. Promotes the fertilized ovum's exposure to luteinizing hormone and follicle-stimulating hormone
- 206.** A nursing instructor is reviewing the menstrual cycle with a nursing student who will be conducting a prenatal teaching session. The instructor asks the student to describe the follicle-stimulating hormone (FSH) and the luteinizing hormone (LH). The student accurately responds by stating that:
1. FSH and LH are secreted by the adrenal glands.
  2. FSH and LH are released from the anterior pituitary gland.
  3. FSH and LH are secreted by the corpus luteum of the ovary.
  4. FSH and LH stimulate the formation of milk during pregnancy.
- 207.** A couple comes to the family planning clinic and asks about sterilization procedures. Which question by the nurse would determine if this method of family planning would be appropriate?
1. "Has either of you ever had surgery?"
  2. "Do you plan to have any other children?"
  3. "Does either of you have diabetes mellitus?"
  4. "Does either of you have problems with high blood pressure?"
- 208.** A nurse should explain which of the following to a pregnant client found to have a gynecoid pelvis?
1. That her type of pelvis has a narrow pubic arch
  2. That her type of pelvis is the most favorable for labor and birth
  3. That her type of pelvis is a wide pelvis, but has a short diameter
  4. That she will need a cesarean section because this type of pelvis is not favorable for a normal labor and vaginal delivery
- 209.** A nurse explains some of the purposes of the placenta to a client during a prenatal visit. The nurse determines that the client understands some of these purposes when the client states that the placenta:
1. Cushions and protects the baby.
  2. Maintains the temperature of the baby.
  3. Is the way the baby gets food and oxygen.
  4. Prevents all antibodies and viruses from passing to the baby.

### Alternate Item Format: Multiple Response

- 210.** A nursing instructor asks a nursing student to list the functions of the amniotic fluid. The student responds correctly by stating that which of the

following are functions of amniotic fluid? Select all that apply.

- 1. Allows for fetal movement
- 2. Is a measure of kidney function
- 3. Surrounds, cushions, and protects the fetus

- 4. Maintains the body temperature of the fetus
- 5. Prevents large particles such as bacteria from passing to the fetus
- 6. Provides an exchange of nutrients and waste products between the mother and the fetus

## ANSWERS

### 201. 3

**Rationale:** Blood pumped by the embryo's heart leaves the embryo through two umbilical arteries. When oxygenated, the blood is returned by one umbilical vein. Arteries carry deoxygenated blood and waste products from the fetus, and veins carry oxygenated blood and provide oxygen and nutrients to the fetus.

**Test-Taking Strategy:** Recall that three umbilical vessels are within the umbilical cord (two arteries and one vein) and that the veins carry oxygenated blood and the arteries carry deoxygenated blood. If you had difficulty with this question, review fetal circulation.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 245–246). St. Louis: Saunders.

### 202. 3

**Rationale:** The ductus venosus connects the umbilical vein to the inferior vena cava. Options 1, 2, and 4 are incorrect. The foramen ovale is a temporary opening between the right and left atria. The ductus arteriosus joins the aorta and the pulmonary artery.

**Test-Taking Strategy:** Focus on the subject, the description of the ductus venosus. Note the relationship of the word *venosus* in the question and *vein* in the correct option. Remember that the ductus venosus connects the umbilical vein to the inferior vena cava. Review fetal circulation if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Intrapartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 180). St. Louis: Mosby.

### 203. 1

**Rationale:** By the end of the twelfth week, the external genitalia of the fetus have developed to such a degree that the sex of the fetus can be determined visually. Option 2 (differentiation of the external genitalia) occurs at the end of the ninth week. Option 3 occurs at the end of the thirty-eighth week (testes descend into the scrotal sac). Option 4 occurs at the end of the seventh week (internal differences in the male and female).

**Test-Taking Strategy:** Use knowledge regarding fetal development to answer this question. Remember that the sex of the fetus can be recognizable visually by the appearance of the external genitalia by gestational week 12. If you had difficulty with this question, review fetal development.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 237). St. Louis: Saunders.

### 204. 1

**Rationale:** The fetal heart rate (FHR) depends on gestational age and ranges from 160 to 170 beats/min in the first trimester, but slows with fetal growth to 120 to 160 beats/min near or at term. At or near term, if FHR is less than 120 beats/min or more than 160 beats/min with the uterus at rest, the fetus may be in distress. Because the FHR is increased from the reference range, the nurse should notify the physician. Options 3 and 4 are inappropriate actions based on the information in the question. Although the nurse documents the findings, based on the information in the question, the physician needs to be notified.

**Test-Taking Strategy:** Use the process of elimination and note the FHR and that the client is at 38 weeks of gestation. Remember that normal FHR at or near term is 120 to 160 beats/min. Review FHR if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 261). St. Louis: Saunders.

### 205. 3

**Rationale:** The tubal isthmus remains contracted until 3 days after conception to allow the fertilized ovum to develop within the tube. This initial growth of the fertilized ovum promotes its normal implantation in the fundal portion of the uterine corpus. Estrogen is a hormone produced by the ovarian follicles, corpus luteum, adrenal cortex, and placenta during pregnancy. Progesterone is a hormone secreted by the corpus luteum of the ovary, adrenal glands, and placenta during pregnancy. Luteinizing hormone and follicle-stimulating hormone are excreted by the anterior pituitary gland. The survival of the fertilized ovum does not depend on it staying in the fallopian tube for 3 days.

**Test-Taking Strategy:** Use knowledge of the anatomy and physiology of the female reproductive system. Remember that fertilization occurs in the fallopian tube and the fertilized ovum remains in the fallopian tube for about 3 days. This promotes its normal implantation. If you had difficulty with this question, review anatomy and physiology of the reproductive system.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 233). St. Louis: Saunders.

### 206. 2

**Rationale:** Follicle-stimulating hormone and luteinizing hormone, when stimulated by gonadotropin-releasing hormone from the hypothalamus, are released from the anterior pituitary gland to stimulate follicular growth and development, growth of the graafian follicle, and production of progesterone. Options 1, 3, and 4 are incorrect.

**Test-Taking Strategy:** Use your knowledge of anatomy and physiology concepts, recalling that follicle-stimulating hormone and luteinizing hormone are released from the anterior pituitary gland. If you had difficulty with this question, review the menstrual cycle.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 219). St. Louis: Saunders.

### 207. 2

**Rationale:** Sterilization is a method of contraception for couples who have completed their families. It should be considered a permanent end to fertility because reversal surgery is not always successful. The nurse would ask the couple about their plans for having children in the future. Options 1, 3, and 4 are unrelated to this procedure.

**Test-Taking Strategy:** Focus on the subject, sterilization procedure. Noting the relationship between the word *sterilization* and option 2 will direct you to this option. Review the effects of sterilization if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 154). St. Louis: Mosby.

### 208. 2

**Rationale:** A gynecoid pelvis is a normal female pelvis and is the most favorable for successful labor and birth. An android pelvis (resembling a male pelvis) would be unfavorable for labor because of the narrow pelvic planes. An anthropoid pelvis has an outlet that is adequate, with a normal or moderately narrow pubic arch. A platypelloid pelvis (flat pelvis) has a wide transverse diameter, but the anteroposterior diameter is short, making the outlet inadequate.

**Test-Taking Strategy:** Use knowledge of the anatomy of the female pelvis to answer the question. Recalling that the gynecoid pelvis is the normal female pelvis will direct you to the correct option. Review female pelvic types if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 381). St. Louis: Mosby.

### 209. 3

**Rationale:** The placenta provides an exchange of oxygen, nutrients, and waste products between the mother and the fetus. The amniotic fluid surrounds, cushions, and protects the fetus and maintains the body temperature of the fetus. Nutrients, drugs, antibodies, and viruses can pass through the placenta.

**Test-Taking Strategy:** Focus on the subject, the purpose of the placenta. Remember that the placenta provides oxygen and nutrients. If you had difficulty with this question, review the structure and function of the placenta and amniotic fluid.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 177–179). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 210. 1, 2, 3, 4

**Rationale:** The amniotic fluid surrounds, cushions, and protects the fetus. It allows the fetus to move freely, maintains the body temperature of the fetus, and helps assess kidney function because it contains urine from the fetus. The placenta prevents large particles such as bacteria from passing to the fetus and provides an exchange of nutrients and waste products between the mother and the fetus.

**Test-Taking Strategy:** Focus on the subject of the question: the functions of amniotic fluid. Visualizing the location of the amniotic fluid will assist in answering this question. If you had difficulty with this question, review the function of the amniotic fluid.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 175). St. Louis: Mosby.

# Obstetrical Assessment

## I. GESTATION

- A. Time from **fertilization** of the ovum until the estimated date of confinement or estimated date of **delivery**
-  B. About 280 days
-  C. **Nägele's rule** for estimating the date of confinement (**delivery**) (Box 23-1)
  1. Use of **Nägele's rule** requires that the woman have a regular 28-day menstrual cycle.
  2. Add 7 days to the first day of the last menstrual period, subtract 3 months, and then add 1 year to that date; alternatively, add 7 days to the date of the last menstrual period and count forward 9 months.

## II. GRAVIDITY AND PARITY

- A. **Gravidity**
  1. **Gravida** refers to a pregnant woman.
  2. Gravidity refers to the number of pregnancies.
  3. Nulligravida is a woman who has never been pregnant.
  4. Primigravida is a woman who is pregnant for the first time.
  5. Multigravida is a woman in at least her second pregnancy.
- B. **Parity**
  1. **Parity** is the number of births (not the number of fetuses, e.g., twins) carried past 20 weeks' gestation, whether or not the fetus was born alive.
  2. Nullipara is a woman who has not had a birth at more than 20 weeks of gestation.
  3. Primipara is a woman who has had one birth that occurred after the twentieth week of gestation.
  -  4. Multipara is a woman who has had two or more pregnancies to the stage of fetal viability.
- C. Use of GTPAL: Pregnancy outcomes can be described with the acronym *GTPAL* (Box 23-2).
  1. *G* is gravidity, the number of pregnancies, including the present one.
  2. *T* is term births, the number born at term (longer than 37 weeks' gestation).

### Box 23-1 Nägele's Rule for Estimating the Date of Confinement (Delivery)

|  |                    |
|--|--------------------|
| First day of last menstrual period       | September 12, 2011 |
| Add 7 days                               | September 19, 2011 |
| Subtract 3 months                        | June 19, 2011      |
| Add 1 year                               | June 19, 2012      |
| Estimated date of confinement (delivery) | June 19, 2012      |

### Box 23-2 Describing Pregnancy Outcome with GTPAL

- G** Gravidity
- T** Term births
- P** Preterm births
- A** Abortions or miscarriages
- L** Current living children

**Example:** A woman is pregnant for the fourth time. She had one elective abortion in the first trimester, a daughter who was born at 40 weeks' gestation, and a son who was born at 36 weeks' gestation. She is gravida (G) 4, parity (number of births carried past 20 weeks) 2, and term (T) 1 (the daughter born at 40 weeks); preterm (P), 1 (the son born at 36 weeks); abortion (A), 1 (the abortion is counted in the gravidity, but is not included in the parity because it occurred before 20 weeks); living children (L), 2.

$$\text{GTPAL} = 4, 1, 1, 1, 2$$

3. *P* is preterm births, the number born before 37 weeks' gestation.
4. *A* is abortions or miscarriages, the number of abortions or miscarriages (included in **gravida** if before 20 weeks' gestation; included in **parity** if past 20 weeks' gestation). A termination of the pregnancy after 20 weeks is referred to as a "therapeutic termination."
5. *L* is the number of current living children.

### III. PREGNANCY SIGNS

- A. Presumptive signs
  1. Amenorrhea
  2. Nausea and vomiting
  3. Increased size and increased feeling of fullness in breasts
  4. Pronounced nipples
  5. Urinary frequency
  6. **Quickening**: The first perception of fetal movement by the mother may occur the sixteenth to twentieth week of gestation.
  7. Fatigue
  8. Discoloration of the vaginal mucosa
- B. Probable signs
  1. Uterine enlargement
  2. **Hegar's sign**: Compressibility and softening of the lower uterine segment that occurs at about week 6
  3. **Goodell's sign**: Softening of the cervix that occurs at the beginning of the second month
  4. **Chadwick's sign**: Violet coloration of the mucous membranes of the cervix, **vagina**, and vulva that occurs at about week 4
  5. **Ballottement**: Rebounding of the fetus against the examiner's fingers on palpation
  6. Braxton Hicks contractions (irregular painless contractions that may occur intermittently throughout pregnancy)
  7. Positive pregnancy test for determination of the presence of human chorionic gonadotropin
- C. Positive signs (diagnostic)
  1. Fetal heart rate detected by electronic device (Doppler transducer) at 10 to 12 weeks and by nonelectronic device (fetoscope) at 20 weeks of gestation
  2. Active fetal movements palpable by examiner
  3. Outline of fetus via radiography or ultra-sonography

### IV. FUNDAL HEIGHT (Box 23-3)

- A. Fundal height is measured to evaluate the gestational age of the fetus.
- B. During the second and third trimesters (weeks 18 to 30), fundal height in centimeters approximately equals fetal age in weeks  $\pm 2$  cm (Fig. 23-1).
- C. At 16 weeks, the fundus can be found approximately halfway between the symphysis pubis and the umbilicus.
- D. At 20 to 22 weeks, the fundus is approximately at the location of the umbilicus.

#### Box 23-3 Measuring Fundal Height

1. Place the client in the supine position.
2. Place the end of the tape measure at the level of the symphysis pubis.
3. Stretch the tape to the top of the uterine fundus.
4. Note and record the measurement.

- E. At 36 weeks, the fundus is at the xiphoid process.

**!** When assessing fundal height, monitor the client closely for supine hypotension when placed in the supine position.

### V. MATERNAL RISK FACTORS

- A. Maternal age: Women younger than 20 years and older than 35 years are at risk for adverse perinatal outcomes.
- B. Adolescent pregnancy
  1. Factors that result in adolescent pregnancy include the early onset of menarche, changing sexual behaviors in this age group, problems with family relationships, poverty, and lack of knowledge of reproduction and birth control.
  2. Major concerns related to adolescent pregnancy include poor nutritional status; emotional and behavioral difficulties; lack of support systems; increased risk of stillbirth; low-birth-weight **infants**; fetal mortality; cephalopelvic disproportion; and increased risk of maternal complications, such as hypertension, anemia, prolonged **labor**, and infections.
  3. The role of the nurse in reducing risks and consequences of adolescent pregnancy is twofold—first, to encourage early and continued prenatal care, and second, to refer the adolescent, if necessary, for appropriate assistance, which can help counter the effects of a negative socioeconomic environment.

**▲ FIGURE 23-1** Height of fundus by weeks of normal gestation with a single fetus. *Dashed line*, Height after lightening (descent of the fetus toward the pelvic inlet before labor). (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed.] St. Louis: Mosby.)

- C.** Nutrition: Adequate nutrition is necessary for normal fetal growth and development.

 **Women of childbearing age should take folic acid supplements to prevent neural tube defects and orofacial clefts in the fetus.**

- D.** Genetic considerations: Genetic abnormalities such as defective genes or transmissible inherited disorders can result in congenital anomalies; the nurse should perform a genetic risk assessment to determine an inheritable risk.

- E.** Health care: Failure to seek and obtain prenatal care, including dental care, increases the risk for preterm birth and low birth weight.

- F.** Abuse and violence: Physical abuse and violence can increase the risk for abruptio placentae, preterm birth, and infections from unwanted and forced sex.

- G.** Medical conditions: Concurrent medical conditions, such as but not limited to diabetes mellitus, hypertensive disorder, or cardiac disease, increase the risk of pregnancy.

- H.** German measles (rubella): Maternal infection during the first 8 weeks of gestation carries the highest rate of fetal infection.

- I.** Sexually transmitted infections

1. Syphilis

- Organism may cross the **placenta**.
- Infection usually leads to spontaneous abortions and increases the incidence of mental subnormality and physical deformities.

2. Condyloma acuminatum (human papillomavirus)

- Transmission may occur during vaginal birth.
- Infection is associated with the development of epithelial tumors of the mucous membranes of the larynx in children.

3. Gonorrhea

- Fetus is contaminated at the time of **delivery**.
- Maternal infection may result in postpartum infection of the **neonate**.
- Risks to the **neonate** include ophthalmia neonatorum, pneumonia, and sepsis.

4. Chlamydial infection

- Transmission may occur during vaginal birth and can result in neonatal conjunctivitis or pneumonitis.
- Infection can cause premature rupture of the membranes, premature labor, and postpartum endometritis.

5. Trichomoniasis: Associated with premature rupture of the membranes and postpartum endometritis

- J.** Human immunodeficiency virus (HIV)

- HIV is transmitted through blood; blood products; and other bodily fluids, such as urine, semen, and vaginal secretions; the virus is also transmitted through exposure to infected secretions during birth and through breast milk.

- Repeated exposure to the virus during pregnancy through unsafe sex practices or intravenous drug use can increase the risk of transmission to the fetus.

- Perinatal administration of zidovudine may be recommended to decrease the risk of transmission of HIV from mother to fetus.

- K.** Substance abuse

- Substance abuse threatens normal fetal growth and successful term completion of the pregnancy.

- Substance abuse places the pregnancy at risk for fetal growth restriction, abruptio placentae, and fetal bradycardia.

- Many substances cross the **placenta** and can be teratogenic; no drugs, including tobacco and over-the-counter medications, should be taken unless prescribed by a health care provider.

- Smoking (tobacco) can result in low birth weight, a higher incidence of birth defects, and stillbirths.

- Physical signs of drug abuse may include dilated or contracted pupils, fatigue, track (needle) marks, skin abscesses, inflamed nasal mucosa, and inappropriate behavior by the mother.

- Consumption of alcohol during pregnancy may lead to fetal alcohol syndrome and can cause jitteriness, physical abnormalities, congenital anomalies, and growth deficits in the **newborn**.

- L.** Viral hepatitis (see Chapter 25 for information regarding hepatitis B infection)

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 211.** A nurse is performing an assessment of a pregnant client who is at 28 weeks of gestation. The nurse measures the fundal height in centimeters and expects the finding to be which of the following?

- 22 cm
- 30 cm
- 36 cm
- 40 cm

- 212.** A nurse is collecting data during an admission assessment of a client who is pregnant with twins. The client has a healthy 5-year-old child who was delivered at 38 weeks and tells the nurse that she does not have a history of any type of abortion or fetal demise. The nurse would document the GTPAL for this client as

- G = 3, T = 2, P = 0, A = 0, L = 1
- G = 2, T = 1, P = 0, A = 0, L = 1
- G = 1, T = 1, P = 1, A = 0, L = 1
- G = 2, T = 0, P = 0, A = 0, L = 1

- 213.** A pregnant client is seen in a health care clinic for a regular prenatal visit. The client tells the nurse that she is experiencing irregular contractions, and the nurse determines that she is experiencing Braxton Hicks contractions. Based on this finding, which nursing action is appropriate?
1. Contact the physician.
  2. Instruct the client to maintain bedrest for the remainder of the pregnancy.
  3. Inform the client that these contractions are common and may occur throughout the pregnancy.
  4. Call the maternity unit and inform them that the client will be admitted in a prelabor condition.
- 214.** A nurse is providing instructions to a pregnant client with genital herpes about the measures that are needed to protect the fetus. The nurse tells the client that:
1. Total abstinence from sexual intercourse is necessary during the entire pregnancy.
  2. Sitz baths need to be taken every 4 hours while awake if vaginal lesions are present.
  3. Daily administration of acyclovir (Zovirax) is necessary during the entire pregnancy.
  4. A cesarean section will be necessary if vaginal lesions are present at the time of labor.
- 215.** A nurse is reviewing the record of a client who has just been told that a pregnancy test is positive. The physician has documented the presence of Goodell's sign. The nurse determines that this sign indicates:
1. A softening of the cervix
  2. The presence of fetal movement
  3. The presence of human chorionic gonadotropin in the urine
  4. A soft blowing sound that corresponds to the maternal pulse during auscultation of the uterus
- 216.** A client arrives at the clinic for the first prenatal assessment. The client tells a nurse that the first day of her last menstrual period was October 19, 2012. Using Nägele's rule, the nurse determines the estimated date of confinement is:
1. July 12, 2012
  2. July 26, 2013
  3. August 12, 2013
  4. August 26, 2013
- 217.** A nurse-midwife is assessing a pregnant client for the presence of ballottement. To make this determination, the nurse-midwife does which of the following?
1. Auscultates for fetal heart sounds
  2. Assesses the cervix for compressibility
  3. Palpates the abdomen for fetal movement
  4. Initiates a gentle upward tap on the cervix
- 218.** A pregnant client asks a nurse in the clinic when she will be able to begin to feel the fetus move. The nurse responds by telling the mother that fetal movements will be noted between which of the following weeks of gestation?
1. 6 and 8
  2. 8 and 10
  3. 10 and 12
  4. 16 and 20
- 219.** A nurse is performing an assessment of a primigravida who is being evaluated in a clinic during her second trimester of pregnancy. Which of the following indicates an abnormal physical finding that necessitates further testing?
1. Quickening
  2. Braxton Hicks contractions
  3. Fetal heart rate of 180 beats/min
  4. Consistent increase in fundal height

### Alternate Item Format: Multiple Response

- 220.** A nurse is assisting in performing an assessment on a client who suspects that she is pregnant and is checking the client for probable signs of pregnancy. Which of the following are probable signs of pregnancy? **Select all that apply.**
- 1. Ballottement
  - 2. Chadwick's sign
  - 3. Uterine enlargement
  - 4. Braxton Hicks contractions
  - 5. Fetal heart rate detected by a nonelectronic device
  - 6. Outline of fetus via radiography or ultrasonography

## ANSWERS

### 211. 2

**Rationale:** During the second and third trimesters (weeks 18 to 30), fundal height in centimeters approximately equals the fetus' age in weeks  $\pm$  2 cm. At 16 weeks, the fundus can be located halfway between the symphysis pubis and the

umbilicus. At 20 to 22 weeks, the fundus is at the umbilicus. At 36 weeks, the fundus is at the xiphoid process.

**Test-Taking Strategy:** Focus on the subject: the location of fundal height. Remember that during the second and third trimesters (weeks 18 to 30), fundal height in centimeters approximately equals the fetus' age in weeks  $\pm$  2 cm. If you

are unfamiliar with this assessment technique and expected findings related to fundal height, review this content area.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 243). St. Louis: Mosby.

### 212. 2

**Rationale:** Pregnancy outcomes can be described with the acronym *GTPAL*. *G* is gravidity, the number of pregnancies; *T* is term births, the number born at term (longer than 37 weeks); *P* is preterm births, the number born before 37 weeks' gestation; *A* is abortions or miscarriages, the number of abortions or miscarriages (included in gravida if before 20 weeks' gestation; included in parity [number of births] if past 20 weeks' gestation); and *L* is the number of current living children. A woman who is pregnant with twins and has a child has a gravida of 2. Because the child was delivered at 38 weeks, the number of term births is 1, and the number of preterm births is 0. The number of abortions is 0, and the number of living children is 1.

**Test-Taking Strategy:** Focus on the data in the question. Recalling the meaning of the acronym *GTPAL* will direct you to option 2. If you had difficulty answering this question, review the *GTPAL* method of describing pregnancy outcomes.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 262). St. Louis: Saunders.

### 213. 3

**Rationale:** Braxton Hicks contractions are irregular, painless contractions that may occur intermittently throughout pregnancy. Because Braxton Hicks contractions may occur and are normal in some pregnant women during pregnancy, options 1, 2, and 4 are unnecessary and inappropriate actions.

**Test-Taking Strategy:** Use the process of elimination. Options 1 and 4 are comparable or alike and can be eliminated first. From the remaining options, knowing that Braxton Hicks contractions are common and normal and can occur throughout pregnancy will assist in directing you to option 3. Review the physiology associated with Braxton Hicks contractions if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 261, 348). St. Louis: Saunders.

### 214. 4

**Rationale:** For women with active lesions, either recurrent or primary at the time of labor, delivery should be by cesarean

section to prevent the fetus from being in contact with the genital herpes. The safety of acyclovir has not been established during pregnancy, and it should be used only when a life-threatening infection is present. Clients should be advised to abstain from sexual contact while the lesions are present. If this is an initial infection, clients should continue to abstain until they become culture-negative because prolonged viral shedding may occur in such cases. Keeping the genital area clean and dry promotes healing.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 3 first because of the close-ended word *entire* in these options. From the remaining options, recalling that the lesions should be kept clean and dry to promote healing will assist in eliminating option 2. If you had difficulty with this question, review the content related to genital herpes as a maternal risk factor.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Antepartum

**Reference:** From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 106). St. Louis: Mosby.

### 215. 1

**Rationale:** At the beginning of the second month of gestation, the cervix becomes softer as a result of increased vascularity and hyperplasia, which cause Goodell's sign. Cervical softening is noted by the examiner during pelvic examination. Goodell's sign does not indicate the presence of fetal movement. Human chorionic gonadotropin noted in maternal urine is a probable sign of pregnancy. A soft blowing sound that corresponds to the maternal pulse may be auscultated over the uterus and is caused by blood circulating through the placenta.

**Test-Taking Strategy:** Think about the physiological findings in Goodell's sign to answer this question. Remember that Goodell's sign refers to a softening of the cervix. If you had difficulty with this question, review the changes in the cervix that occur during pregnancy.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 214). St. Louis: Mosby.

### 216. 2

**Rationale:** Accurate use of Nägele's rule requires that the woman have a regular 28-day menstrual cycle. Add 7 days to the first day of the last menstrual period, subtract 3 months, and then add 1 year to that date: first day of the last menstrual period, October 19, 2012; add 7 days, October 26, 2012; subtract 3 months, July 26, 2012; add 1 year, July 26, 2013.

**Test-Taking Strategy:** Use knowledge regarding Nägele's rule to answer this question. This rule requires addition and subtraction, so read all the options carefully, noting the dates and years in the options, before selecting an answer. Review Nägele's rule if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 230). St. Louis: Mosby.

#### 217. 4

**Rationale:** Ballottement is a technique of palpating a floating structure by bouncing it gently and feeling it rebound. In the technique used to palpate the fetus, the examiner places a finger in the vagina and taps gently upward, causing the fetus to rise. The fetus then sinks, and the examiner feels a gentle tap on the finger. Options 1, 2, and 3 are not assessment techniques to check for ballottement. Option 2 is related to Hegar's sign. Options 1 and 3 are a part of fetal assessment.

**Test-Taking Strategy:** Focus on the subject: ballottement. Recalling the definition of ballottement—that it is a technique of palpating a floating structure by bouncing it gently and feeling it rebound—will direct you to option 4. Review this assessment technique if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 215). St. Louis: Mosby.

#### 218. 4

**Rationale:** Quickening is fetal movement and may occur by the 16 to 20 week's gestation. The expectant mother first notices subtle fetal movements during this time, which gradually increase in intensity. Options 1, 2, and 3 are incorrect time frames because quickening does not occur this early during pregnancy.

**Test-Taking Strategy:** Use knowledge regarding the occurrence of quickening. In this situation, selecting the option that indicates the greatest length of gestational time is best. Review the process of quickening and its occurrence if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 237). St. Louis: Saunders.

#### 219. 3

**Rationale:** The normal range of the fetal heart rate depends on gestational age. The heart rate is usually 160 to 170 beats/min in the first trimester and slows with fetal growth. Near and at term, the fetal heart rate ranges from 120 to 160 beats/min. Options 1, 2, and 4 are normal expected findings.

**Test-Taking Strategy:** Note the strategic words *indicates an abnormal physical finding*, and note that the client is in the second trimester of pregnancy. Recalling the normal fetal heart rate will direct you to option 3. Review normal assessment findings in pregnancy if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 261). St. Louis: Saunders.

### ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

#### 220. 1, 2, 3, 4

**Rationale:** The probable signs of pregnancy include uterine enlargement, Hegar's sign (compressibility and softening of the lower uterine segment that occurs at about week 6), Goodell's sign (softening of the cervix that occurs at the beginning of the second month), Chadwick's sign (violet coloration of the mucous membranes of the cervix, vagina, and vulva that occurs at about week 4), ballottement (rebounding of the fetus against the examiner's fingers on palpation), Braxton Hicks contractions, and a positive pregnancy test for the presence of human chorionic gonadotropin. Positive signs of pregnancy include fetal heart rate detected by electronic device (Doppler transducer) at 10 to 12 weeks and by non-electronic device (fetoscope) at 20 weeks of gestation, active fetal movements palpable by the examiner, and an outline of the fetus by radiography or ultrasonography.

**Test-Taking Strategy:** Focusing on the subject, probable signs of pregnancy, will assist in answering this question. Remember that detection of the fetal heart rate and an outline of the fetus via radiography or ultrasonography are positive signs of pregnancy. Review the probable signs of pregnancy if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 260). St. Louis: Saunders.

# Prenatal Period

## I. PHYSIOLOGICAL MATERNAL CHANGES

### A. Cardiovascular system

1. Circulating blood volume increases, plasma increases, and total red blood cell volume increases (total volume increases by approximately 40% to 50%).
2. Physiological anemia occurs as the plasma increase exceeds the increase in production of red blood cells.
3. Iron requirements are increased.
4. Heart size increases, and the heart is elevated slightly upward and to the left because of displacement of the diaphragm as the **uterus** enlarges (Fig. 24-1).
5. Retention of sodium and water may occur.

### B. Respiratory system

1. Oxygen consumption increases by approximately 15% to 20%.
2. Diaphragm is elevated because of the enlarged **uterus** (see Fig. 24-1).
3. Shortness of breath may be experienced.

**!** During pregnancy, a woman's pulse rate may increase about 10 to 15 beats/min, the blood pressure slightly decreases in the second trimester, and the respiratory rate remains unchanged or slightly increases.

### C. Gastrointestinal system

1. Nausea and vomiting may occur as a result of the secretion of human chorionic gonadotropin; it subsides by the third month.
2. Poor appetite may occur because of decreased gastric motility.
3. Alterations in taste and smell may occur.
4. Constipation may occur because of an increase in progesterone production or pressure of the **uterus** resulting in decreased gastrointestinal motility.
5. Flatulence and heartburn may occur because of decreased gastrointestinal motility and slowed emptying of the stomach caused by an increase in progesterone production.

6. Hemorrhoids may occur because of increased venous pressure.
7. Gum tissue may become swollen and easily bleed because of increasing levels of estrogen.
8. Ptyalism (excessive secretion of saliva) may occur because of increasing levels of estrogen.

### D. Renal system

1. Frequency of urination increases in the first and third trimesters because of increased bladder sensitivity and pressure of the enlarging **uterus** on the bladder.
2. Decreased bladder tone may occur and is caused by an increase in progesterone and estrogen levels; bladder capacity increases in response to increasing levels of progesterone.
3. Renal threshold for glucose may be reduced.

### E. Endocrine system

1. Basal metabolic rate increases and metabolic function increases.
2. The anterior lobe of the pituitary gland enlarges.
3. The thyroid enlarges slightly, and thyroid activity increases.
4. The parathyroid increases in size.
5. Aldosterone levels gradually increase.
6. Body weight increases.
7. Water retention is increased, which can contribute to weight gain.

### F. Reproductive system

#### 1. Uterus

- a. **Uterus** enlarges, increasing in mass from approximately 60 to 1000 g as a result of hyperplasia (influence of estrogen) and hypertrophy.
  - b. Size and number of blood vessels and lymphatics increase.
  - c. Irregular contractions occur.
2. Cervix
    - a. Cervix becomes shorter, more elastic, and larger in diameter.
    - b. Endocervical glands secrete a thick mucous plug, which is expelled from the canal when dilation begins.
    - c. Increased vascularization and an increase in estrogen cause softening and a violet

**▲ FIGURE 24-1** Changes in position of heart, lungs, and thoracic cage in pregnancy. *Broken line*, nonpregnant state; *solid line*, change that occurs in pregnancy. (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed.]. St. Louis: Mosby.)

discoloration known as Chadwick's sign, which occurs at about 4 weeks of gestation.

3. Ovaries
  - a. A major function of the ovaries is to secrete progesterone for the first 6 to 7 weeks of pregnancy.
  - b. The maturation of new follicles is blocked.
  - c. The ovaries cease ovum production.
4. Vagina
  - a. Hypertrophy and thickening of the muscle occur.
  - b. An increase in vaginal secretions is experienced; secretions are usually thick, white, and acidic.
5. Breasts: Breast changes occur because of the increasing effects of estrogen and progesterone (Fig. 24-2).
  - a. Breast size increases, and breasts may be tender.
  - b. Nipples become more pronounced.
  - c. The areolae become darker in color.
  - d. Superficial veins become prominent.
  - e. Hypertrophy of Montgomery's follicles occurs.
  - f. Colostrum may leak from the breast.

#### G. Skin

1. Some changes occur because the levels of melanocyte-stimulating hormone increase as a result of an increase in estrogen and progesterone levels; these changes include the following:
  - a. Increased pigmentation

**▲ FIGURE 24-2** Enlarged breasts in pregnancy with venous network and darkened areolae and nipples. (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed.]. St. Louis: Mosby.)

**▲ FIGURE 24-3** Striae gravidarum and linea nigra in a dark-skinned woman. (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed.]. St. Louis: Mosby. Courtesy Shannon Perry, Phoenix, AZ.)

- b. Dark streak down the midline of the abdomen (linea nigra) (Fig. 24-3)
  - c. Chloasma (mask of pregnancy)—a blotchy brownish hyperpigmentation, over the forehead, cheeks, and nose
  - d. Reddish purple stretch marks (striae) on the abdomen, breasts, thighs, and upper arms (see Fig. 24-3)
2. Vascular spider nevi may occur on the neck, chest, face, arms, and legs.
  3. Rate of hair growth may increase.
- H. Skeletal system:** Changes in the center of gravity begin in the second trimester and are caused by the hormones relaxin and progesterone.

**▲** During pregnancy, postural changes occur as the increased weight of the uterus causes a forward pull of the bony pelvis. It is important for the nurse to encourage the client to implement measures that maintain correct posture to prevent a backache.

## II. PSYCHOLOGICAL MATERNAL CHANGES

- A. Ambivalence**
1. Ambivalence occurs early in pregnancy, even when the pregnancy is planned.
  2. The mother may experience a dependence-independence conflict and ambivalence related to role changes.
  3. The father may experience ambivalence related to the new role that he is assuming, increased financial responsibilities, and sharing the wife's attention with the child.
- B. Acceptance:** Factors that may be related to acceptance of the pregnancy are the woman's readiness for the experience and her identification with the motherhood role.
- C. Emotional lability**
1. Emotional lability may be manifested by frequent changes of emotional states or extremes in emotional states.
  2. These emotional changes are common, but the mother may think that these changes are abnormal.
- D. Body image changes**
1. The changes in a woman's perception of her image during pregnancy occur gradually and may be positive or negative.
  2. The physical changes and symptoms that the woman experiences during pregnancy contribute to her body image.
- E. Relationship with the fetus**
1. The woman may daydream to prepare for motherhood and think about the maternal qualities that she would like to possess.
  2. The woman first accepts the biological fact that she is pregnant.
  3. The woman next accepts the growing fetus as distinct from herself and a person to nurture.
  4. Finally, the woman prepares realistically for the birth and parenting of the child.

## III. DISCOMFORTS OF PREGNANCY

- A. Nausea and vomiting**
1. Occurs in the first trimester and subsides by the third month
  2. Caused by elevated levels of human chorionic gonadotropin and changes in carbohydrate metabolism
  3. Interventions
    - a. Eating dry crackers before arising
    - b. Avoiding brushing teeth immediately after arising
    - c. Eating small, frequent, low-fat meals during the day
    - d. Drinking liquids between meals rather than at meals
    - e. Avoiding fried foods and spicy foods
    - f. Asking the physician or nurse-midwife about acupressure (some types may require a prescription)

g. Asking the physician or nurse-midwife about the use of herbal remedies

- B. Syncope**
1. Usually occurs in the first trimester; supine hypotension occurs particularly in the second and third trimesters
  2. May be triggered hormonally or caused by the increased blood volume, anemia, fatigue, sudden position changes, or lying supine
  3. Interventions
    - a. Sitting with the feet elevated
    - b. Changing positions slowly

**!** The nurse needs to instruct the pregnant woman to avoid lying in the supine position, particularly in the second and third trimesters. The supine position places the woman at risk for supine hypotension, which occurs as a result of pressure of the uterus on the inferior vena cava.

- C. Urinary urgency and frequency**
1. Usually occurs in the first and third trimesters
  2. Caused by pressure of the **uterus** on the bladder
  3. Interventions
    - a. Drinking adequate amounts of fluid during the day
    - b. Limiting fluid intake in the evening
    - c. Voiding at regular intervals
    - d. Sleeping side-lying at night
    - e. Wearing perineal pads, if necessary
    - f. Performing Kegel exercises
- D. Breast tenderness**
1. Can occur in the first through the third trimesters
  2. Caused by increased levels of estrogen and progesterone
  3. Interventions
    - a. Wearing a supportive bra
    - b. Avoiding the use of soap on the nipples and areolar area to prevent drying of skin
- E. Increased vaginal discharge**
1. Can occur in the first through the third trimesters
  2. Caused by hypertrophy and thickening of the vaginal mucosa and increased mucus production
  3. Interventions
    - a. Using proper cleansing and hygiene techniques
    - b. Wearing cotton underwear
    - c. Avoiding douching
    - d. Consulting the physician or nurse-midwife if infection is suspected
- F. Nasal stuffiness**
1. Occurs in the first through third trimesters
  2. Results from increased estrogen, which causes swelling of the nasal tissues and dryness
  3. Interventions
    - a. Encouraging the use of a humidifier
    - b. Avoiding the use of nasal sprays or antihistamines (the physician or nurse-midwife should be consulted about their use)

**G. Fatigue**

1. Occurs usually in the first and third trimesters
2. Usually results from hormonal changes
3. Interventions
  - a. Arranging frequent rest periods throughout the day
  - b. Using correct posture and body mechanics
  - c. Obtaining regular exercise
  - d. Performing muscle relaxation and strengthening exercises for the legs and hip joints
  - e. Avoiding eating and drinking foods containing stimulants throughout the pregnancy

**H. Heartburn**

1. Occurs in the second and the third trimesters
2. Results from increased progesterone levels, decreased gastrointestinal motility, esophageal reflux, and displacement of the stomach by the enlarging **uterus**
3. Interventions
  - a. Eating small, frequent meals
  - b. Sitting upright for 30 minutes after a meal
  - c. Drinking milk between meals
  - d. Avoiding fatty and spicy foods
  - e. Performing tailor-sitting exercises
  - f. Consulting with the physician or nurse-midwife about the use of antacids

**I. Ankle edema**

1. Usually occurs in the second and the third trimesters
2. Results from vasodilation, venous stasis, and increased venous pressure below the **uterus**
3. Interventions
  - a. Elevating the legs at least twice a day and when resting
  - b. Sleeping in a side-lying position
  - c. Wearing supportive stockings or support hose
  - d. Avoiding sitting or standing in one position for long periods

**J. Varicose veins**

1. Usually occur in the second and the third trimesters
2. Result from weakening walls of the veins or valves and venous congestion
3. Interventions
  - a. Wearing supportive stockings or support hose
  - b. Elevating the feet when sitting
  - c. Lying with the feet and hips elevated
  - d. Avoiding long periods of standing or sitting
  - e. Moving about while standing to improve circulation
  - f. Avoiding leg crossing
  - g. Avoiding constricting articles of clothing such as knee-high stockings

**K. Headaches**

1. Usually occur in the second and the third trimesters
2. Result from changes in blood volume and vascular tone

**3. Interventions**

- a. Changing position slowly
- b. Applying a cool cloth to the forehead
- c. Eating a small snack
- d. Using acetaminophen (Tylenol) only if prescribed by the physician or nurse-midwife

**L. Hemorrhoids**

1. Usually occur in the second and the third trimesters
2. Result from increased venous pressure and constipation
3. Interventions
  - a. Soaking in a warm sitz bath
  - b. Sitting on a soft pillow
  - c. Eating high-fiber foods and drinking sufficient fluids to avoid constipation
  - d. Increasing exercise, such as walking
  - e. Applying ointments, suppositories, or compresses as prescribed by the physician or nurse-midwife

**M. Constipation**

1. Usually occurs in the second and the third trimesters
2. Results from an increase in progesterone production, decreased intestinal motility, displacement of the intestines, pressure of the **uterus**, and taking iron supplements
3. Interventions
  - a. Eating high-fiber foods
  - b. Drinking sufficient fluids
  - c. Exercising regularly
  - d. Consulting with the physician or nurse-midwife about interventions such as the use of stool softeners, laxatives, or enemas

**N. Backache**

1. Usually occurs in the second and the third trimesters
2. Caused by an exaggerated lumbosacral curve resulting from an enlarged **uterus**
3. Interventions
  - a. Obtaining rest
  - b. Using correct posture and body mechanics
  - c. Wearing low-heeled, comfortable, and supportive shoes
  - d. Performing pelvic tilt (rock) exercises and conscious relaxation exercises
  - e. Sleeping on a firm mattress

**O. Leg cramps**

1. Usually occur in the second and the third trimesters
2. Result from an altered calcium-phosphorus balance and pressure of the **uterus** on nerves or from fatigue
3. Interventions
  - a. Getting regular exercise, especially walking
  - b. Dorsiflexing the foot of the affected leg
  - c. Increasing calcium intake

- P. Shortness of breath**
1. Can occur in the second and the third trimesters
  2. Results from pressure on the diaphragm from the enlarged **uterus**
  3. Interventions
    - a. Taking frequent rest periods
    - b. Sitting and sleeping with the head elevated or on the side
    - c. Avoiding overexertion

#### IV. ANTEPARTUM DIAGNOSTIC TESTING

 The usual schedule for antepartum health care visits is every 4 weeks for the first 28 to 32 weeks, every 2 weeks from 32 to 36 weeks, and every week from 36 to 40 weeks.

-  **A. Blood type and Rh factor**
1. ABO typing is performed to determine the woman's blood type in the ABO antigen system.
  2. Rh typing is done to determine the woman's blood type in the rhesus antigen system. (Rh positive indicates the presence of the antigen; Rh negative indicates the absence of the antigen.)
  3. If the client is Rh negative and has a negative antibody screen, she will need repeat antibody screens and should receive Rh<sub>o</sub>(D) immune globulin (RhoGAM) at 28 weeks' gestation.

-  **B. Rubella titer**
1. If the client has a negative titer (less than 1:8), indicating susceptibility to the rubella virus, she should receive the appropriate immunization postpartum.
  2. The client must be using effective birth control at the time of the immunization and must be counseled not to become pregnant for 1 to 3 months after immunization (as specified by health care provider) and to avoid contact with anyone who is immunocompromised.
  3. If the rubella vaccine is administered at the same time as Rh<sub>o</sub>(D) immune globulin, it may not be effective.

 Rubella vaccine is not given during pregnancy because the live attenuated virus may cross the placenta and present a risk to the developing fetus.

- C. Hemoglobin and hematocrit levels**
1. Hemoglobin and hematocrit levels decline during gestation as a result of increased plasma volume.
  2. A decrease in the hemoglobin level to less than 10 g/dL or in the hematocrit level to less than 30% indicates anemia.
- D. Papanicolaou's smear** is done during the initial prenatal examination to screen for cervical neoplasia.
- E. Sexually transmitted infections** (Table 24-1)
- F. Sickle cell screening**
1. Screening is indicated for clients at risk for sickle cell disease.

**TABLE 24-1** Monitoring for Sexually Transmitted Infections

| Disease                                     | Laboratory Test   |
|---|---|
| Gonorrhea                                   | Vaginal culture is done during initial prenatal examination to screen for gonorrhea. Culture may be repeated during third trimester in high-risk clients  |
| Syphilis                                    | Culture is done of lesions (if present) during initial prenatal examination to screen for syphilis. Diagnosis depends on microscopic examination of primary and secondary lesion tissue and serology (Venereal Disease Research Laboratory [VDRL] or rapid plasma reagin [RPR] test) during latency and late infection. Culture may be repeated during third trimester in high-risk clients |
| Condyloma acuminatum (human papillomavirus) | Culture is indicated for clients with positive history or with active lesions. Test is performed to determine route of delivery. Weekly cultures may be done at week 35 or 36 of pregnancy until delivery   |
| <i>Chlamydia</i>                            | Vaginal culture is indicated for all pregnant clients if client is in a high-risk group or if infants from previous pregnancies have developed neonatal conjunctivitis or pneumonia   |
| Trichomoniasis                              | Normal saline wet smear of vaginal secretions is checked for presence of protozoa. Associated with premature rupture of membranes and postpartum endometritis   |

2. A positive test may indicate a need for further screening.
- G. Tuberculin skin test**
1. The health care provider may prefer to perform this skin test after **delivery**.
  2. A positive skin test indicates the need for a chest radiograph (using an abdominal lead shield) to rule out active disease; in a pregnant client, chest radiography would not be performed until after 20 weeks of gestation (after the fetal organs are formed).
  3. Converters to positive may be referred for treatment with medication after **delivery**.
- H. Hepatitis B surface antigens**
1. Testing for hepatitis antigens is recommended for all women because of the prevalence of the disease in the general population.
  2. Vaccination for hepatitis B antigen may be specifically indicated for the following:

- a. Health care workers
  - b. Intravenous drug users
  - c. Clients born in Asia, Africa, Haiti, or the Pacific islands
  - d. Clients with previously undiagnosed jaundice or chronic liver disease
  - e. Clients with tattoos
  - f. Clients with histories of blood transfusions
  - g. Clients with histories of multiple episodes of sexually transmitted infections
  - h. Clients who have been rejected previously as blood donors
  - i. Clients with histories of dialysis or renal transplantation
  - j. Clients from households having members infected with hepatitis B or hemodialysis clients
3. Hepatitis B vaccine is not contraindicated during pregnancy and may be recommended by the health care provider
  4. See Chapter 56 for additional information about hepatitis.
- I. Urinalysis and urine culture**
1. A urine specimen for glucose and protein determinations should be obtained at every antepartum visit.
  2. Glycosuria is a common result of decreased renal threshold that occurs during pregnancy.
  3. If glycosuria persists, it may indicate diabetes.
  4. White blood cells in the urine may indicate infection.
  5. Ketonuria may result from insufficient food intake or vomiting.
  6. Levels of 2+ to 4+ protein in the urine may indicate infection or preeclampsia.
- J. Ultrasonography**
1. Outlines and identifies fetal and maternal structures
  2. Assists in confirming gestational age and estimated date of **delivery** and evaluating **amniotic fluid** volume (**amniotic fluid** index), which is done via special measurements
  3. May be done abdominally or transvaginally during pregnancy
  4. Interventions
    - a. If an abdominal ultrasound is being performed, the woman may need to drink water to fill the bladder before the procedure to obtain a better image of the fetus.
    - b. If a transvaginal ultrasound is being performed, a lubricated probe is inserted into the **vagina**.
    - c. The client should be informed that the test presents no known risks to the client or the fetus.
- K. Biophysical profile**
1. Noninvasive assessment of the fetus that includes fetal breathing movements, fetal movements, fetal tone, **amniotic fluid** index, and fetal heart rate patterns via a nonstress test
  2. Normal fetal biophysical activities indicate that the central nervous system is functional and that the fetus is not hypoxemic
- L. Doppler blood flow analysis:** Noninvasive (ultrasonography) method of studying the blood flow in the fetus and **placenta**
- M. Percutaneous umbilical blood sampling**
1. Percutaneous umbilical blood sampling is performed if fetal blood sampling is necessary; it involves insertion of a needle directly into the fetal umbilical vessel under ultrasound guidance.
  2. Fetal heart rate monitoring is necessary for 1 hour after the procedure, and a follow-up ultrasound to check for bleeding or hematoma formation is done 1 hour after the procedure.
- N. Alpha-fetoprotein screening**
1. Assesses the quantity of fetal serum proteins; elevated levels of protein are associated with open neural tube and abdominal wall defects
  2. Can detect spina bifida and Down syndrome
  3. Interventions
    - a. Alpha-fetoprotein level is determined by a maternal blood sample drawn between 16 and 18 weeks' gestation.
    - b. If the level is elevated and the gestation is less than 18 weeks, a second sample is drawn and screened.
    - c. An ultrasound is performed for elevated levels to rule out fetal abnormalities or multiple gestation.
- O. Chorionic villus sampling**
1. The physician aspirates a small sample of chorionic villus tissue at 10 to 13 weeks' gestation.
  2. The test is performed for the purpose of detecting genetic abnormalities.
  3. Interventions
    - a. Obtain informed consent.
    - b. The client may need to drink water to fill the bladder before the procedure to aid in the visualization of the **uterus** for catheter insertion.
    - c. Obtain baseline vital signs and fetal heart rate; monitor frequently after the procedure.
    - d. Rh-negative women may be given Rh<sub>0</sub>(D) immune globulin because chorionic villus sampling increases the risk of Rh sensitization.
- P. Amniocentesis**
1. Aspiration of **amniotic fluid**; best performed between 15 and 20 weeks of pregnancy because **amniotic fluid** volume is adequate and many viable fetal cells are present in the fluid by this time
  2. Performed to determine genetic disorders, metabolic defects, and fetal lung maturity
  3. Risks
    - a. Maternal hemorrhage
    - b. Infection

- c. Rh isoimmunization
  - d. Abruptio placentae
  - e. **Amniotic fluid** emboli
  - f. Premature rupture of the membranes
4. Interventions
- a. Obtain informed consent.
  - b. If less than 20 weeks' gestation, the client should have a full bladder to support the **uterus**; if performed after 20 weeks' gestation, the client should have an empty bladder to minimize chance of puncture.
  - c. Prepare the client for ultrasonography, which is performed to locate the **placenta** and avoid puncture.
  - d. Obtain baseline vital signs and fetal heart rate; monitor every 15 minutes.
  - e. Position the client supine during the examination and on the left side after the procedure.

 After chorionic villus sampling and amniocentesis, instruct the client that if chills, fever, bleeding, leakage of fluid at the needle insertion site, decreased fetal movement, uterine contractions, or cramping occurs, she must notify the physician or nurse-midwife.

**Q.** Kick counts (fetal movement counting)

1. The client sits quietly or lies down on her side and counts fetal kicks for a period of time, as instructed.
2. Instruct the client to notify the physician or nurse-midwife if there are fewer than 10 kicks in a 12-hour period or as instructed by the physician or nurse-midwife.

**R.** Fern test

1. The fern test is a microscopic slide test to determine the presence of **amniotic fluid** leakage.

2. Using sterile technique, a specimen is obtained from the external os of the cervix and vaginal pool and is examined on a slide under a microscope.
3. A fern-like pattern produced by the effects of salts of the **amniotic fluid** indicates the presence of **amniotic fluid**.
4. Interventions
  - a. Position the client in the dorsal lithotomy position.
  - b. Instruct the client to cough, which causes the **amniotic fluid** to leak from the **uterus** if the membranes are ruptured.

**S.** Nitrazine test 

1. A nitrazine test strip is used to detect the presence of **amniotic fluid** in vaginal secretions.
2. Vaginal secretions have a pH of 4.5 to 5.5 and do not affect the nitrazine strip or swab.
3. **Amniotic fluid** has a pH of 7.0 to 7.5 and turns the nitrazine strip or swab blue.
4. Interventions
  - a. Position the client in the dorsal lithotomy position.
  - b. Touch the test tape to the fluid.
  - c. Assess the test tape for a blue-green, blue-gray, or deep blue color, which indicates that the membranes are ruptured causing leakage of **amniotic fluid**.

**T.** Nonstress test (Box 24-1)

**U.** Contraction stress test (Box 24-2)

**V. NUTRITION** 

**A.** General guidelines 

1. A MyPyramid Web site designed specifically for pregnant and breast-feeding mothers provides unique, individualized nutrition guidance to

### Box 24-1 Nonstress Test

#### Description

Test is performed to assess placental function and oxygenation.

Test determines fetal well-being.

Test evaluates fetal heart rate (FHR) response to fetal movement.

#### Interventions

An external ultrasound transducer and tocodynamometer are applied to the client, and a tracing of at least 20 minutes' duration is obtained so that FHR and uterine activity can be observed.

Baseline blood pressure is obtained, and blood pressure is monitored frequently.

The client is placed in the lateral (side-lying) position to avoid vena cava compression.

The client may be asked to press a button every time she feels fetal movement; the monitor records a mark at

each point of fetal movement, which is used as a reference point to assess FHR response.

#### Results

##### **Reactive Nonstress Test (Normal, Negative)**

"Reactive" indicates a healthy fetus.

The result requires two or more FHR accelerations of at least 15 beats/min, lasting at least 15 seconds from the beginning of the acceleration to the end, in association with fetal movement, during a 20-minute period.

##### **Nonreactive Nonstress Test (Abnormal)**

No accelerations or accelerations of less than 15 beats/min or lasting less than 15 seconds in duration occur during a 40-minute observation.

##### **Unsatisfactory**

The result cannot be interpreted because of the poor quality of the FHR tracing.

**Box 24-2 Contraction Stress Test****Description**

- Test assesses placental oxygenation and function.
- Test determines fetal ability to tolerate labor and determines fetal well-being.
- Fetus is exposed to the stress of contractions to assess the adequacy of placental perfusion under simulated labor conditions.
- Test is performed if nonstress test is abnormal.

**Interventions**

External fetal monitor is applied to the client, and a 20- to 30-minute baseline strip is recorded.

The uterus is stimulated to contract by the administration of a dilute dose of oxytocin (Pitocin) or by having the client use nipple stimulation until three palpable contractions with a duration of 40 seconds or more in a 10-minute period have been achieved.

Frequent maternal blood pressure readings are done, and the mother is monitored closely while increasing doses of oxytocin are given.

**Results****Negative Contraction Stress Test (Normal)**

A negative result is represented by no late decelerations of fetal heart rate (FHR).

**Positive Contraction Stress Test (Abnormal)**

A positive result is represented by late decelerations of FHR, with 50% or more of the contractions in the absence of hyperstimulation of the uterus.

**Equivocal**

An equivocal result contains decelerations, but with less than 50% of the contractions, or uterine activity shows a hyperstimulated uterus.

**Unsatisfactory**

An unsatisfactory result means that adequate uterine contractions cannot be achieved, or FHR tracing is of insufficient quality for adequate interpretation.

meet the needs of the pregnant woman. The woman should be assisted with accessing this site and preparing a nutritional plan (<http://www.mypyramid.gov>).

2. The average expected weight gain during pregnancy is 25 to 35 lb for women with a normal prepregnancy weight.
  3. An increase of about 300 cal/day is needed during pregnancy.
  4. Calorie needs are greater in the last two trimesters than in the first.
  5. An increase of about 500 cal/day is needed during lactation.
  6. A diet high in folic acid and folic acid supplements are recommended.
  7. A diet high in folic acid is necessary for all women of childbearing age to prevent neural tube defects and orofacial clefts in the fetus.
  8. At least 8 to 10 (8-oz) glasses of fluid are needed each day, of which 4 to 6 glasses should be water.
  9. Sodium is not restricted unless specifically prescribed by the physician or nurse-midwife.
- B. Vegetarianism (see Box 12-9)**
1. Ensure that the client eats a sufficient amount of varied foods to meet normal nutrient and energy needs.
  2. Clients should be educated about consuming complementary proteins over the course of each day to ensure that all essential amino acids are provided.
  3. Potential deficiencies in vegetarian diets include energy, protein, vitamin B<sub>12</sub>, zinc, iron, calcium,

omega-3 fatty acids, and vitamin D (if limited exposure to sunlight).

4. Protein consumption can be increased by consumption of a variety of vegetable protein sources based on whole grains, legumes, seeds, nuts, and vegetables combined to provide all essential amino acids.
  5. To enhance absorption of iron, vegetarians should include a good source of iron and vitamin C with each meal.
  6. Foods commonly eaten include tofu, tempeh, soy milk and soy products, meat analogues, legumes, nuts and seeds, sprouts, and a variety of fruits and vegetables.
- C. Lactose intolerance**
1. Lactose consumed by an individual with lactose intolerance can cause abdominal distention, discomfort, nausea, vomiting, cramps, and loose stools.
  2. Clients with lactose intolerance need to incorporate sources of calcium other than dairy products into their dietary patterns regularly.
  3. Milk may be tolerated in cooked form, such as in custards or fermented dairy products.
  4. Cheese and yogurt sometimes are tolerated.
  5. Lactase, an enzyme, may be prescribed and is taken before ingesting milk or milk products.
  6. Lactase-treated milk or lactose-free products are also available commercially.
- D. Pica**
1. Pica refers to eating nonfood substances, such as dirt, clay, starch, and freezer frost.

2. The cause is unknown; cultural values, such as beliefs regarding the effect of a material on the mother or fetus, may make pica a common practice.
  3. Iron deficiency anemia may occur as a result of pica.
- E.** Cultural considerations: See Chapter 6 for information on cultural considerations in nutrition.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 221.** A nurse is providing instructions to a pregnant client who is scheduled for an amniocentesis. The nurse tells the client that:
1. Strict bed rest is required after the procedure.
  2. An informed consent needs to be signed before the procedure.
  3. Hospitalization is necessary for 24 hours after the procedure.
  4. A fever is expected after the procedure because of the trauma to the abdomen.
- 222.** A pregnant client in the first trimester calls a nurse at a health care clinic and reports that she has noticed a thin, colorless vaginal drainage. The nurse should make which statement to the client?
1. "Come to the clinic immediately."
  2. "Report to the emergency department at the maternity center immediately."
  3. "The vaginal discharge may be bothersome, but is a normal occurrence."
  4. "Use tampons if the discharge is bothersome, but to be sure to change the tampons every 2 hours."
- 223.** A nurse has performed a nonstress test on a pregnant client and is reviewing the fetal monitor strip. The nurse interprets the test as reactive and understands that this indicates:
1. Normal findings
  2. Abnormal findings
  3. The need for further evaluation
  4. That the findings on the monitor were difficult to interpret
- 224.** A nonstress test is performed on a client who is pregnant, and the results of the test indicate nonreactive findings. The physician prescribes a contraction stress test, and the results are documented as negative. A nurse interprets the finding of the contraction stress test as indicating:
1. A normal test result
  2. An abnormal test result
  3. A high risk for fetal demise
  4. The need for a cesarean delivery
- 225.** A pregnant client tells a nurse that she has been craving "unusual foods." The nurse gathers additional assessment data from the client and discovers that the client has been ingesting daily amounts of white clay dirt from her backyard. Laboratory studies are performed on the client. The nurse reviews the results and determines that which of the following indicates a physiological consequence of the client's practice?
1. Hematocrit 38%
  2. Glucose 86 mg/dL
  3. Hemoglobin 9.1 g/dL
  4. White blood cell count 12,400/mm<sup>3</sup>
- 226.** A pregnant client asks a nurse about the types of exercises that are allowable during pregnancy. The nurse should instruct the client that the safest exercise to engage in is which of the following?
1. Swimming
  2. Scuba diving
  3. Low-impact gymnastics
  4. Bicycling with the legs in the air
- 227.** A physician has prescribed transvaginal ultrasonography for a client in the first trimester of pregnancy and the client asks a nurse about the procedure. The nurse tells the client that:
1. The procedure takes about 2 hours.
  2. It will be necessary to drink 1 to 2 quarts of water before the examination.
  3. Gel is spread over the abdomen, and a round disk transducer will be moved over the abdomen to obtain the picture.
  4. The probe that will be inserted into the vagina will be covered with a disposable cover and coated with a gel.
- 228.** A clinic nurse has instructed a pregnant client in measures to prevent varicose veins during pregnancy. Which statement by the client indicates a need for further instructions?
1. "I should wear panty hose."
  2. "I should wear support hose."
  3. "I should wear flat nonslip shoes that have good support."
  4. "I should wear knee-high hose, but I should not leave them on longer than 8 hours."
- 229.** A pregnant client calls a clinic and tells a nurse that she is experiencing leg cramps that awaken

her at night. To provide relief from the leg cramps, the nurse tells the client the following:

1. "Bend your foot toward your body while flexing the knee when the cramps occur."
2. "Bend your foot toward your body while extending the knee when the cramps occur."
3. "Point your foot away from your body while flexing the knee when the cramps occur."
4. "Point your foot away from your body while extending the knee when the cramps occur."

**230.** A clinic nurse is providing instructions to a pregnant client regarding measures that assist in alleviating heartburn. Which statement by the client indicates an understanding of the instructions?

1. "I should avoid between-meal snacks."
2. "I should lie down for an hour after eating."
3. "I should use spices for cooking rather than using salt."
4. "I should avoid eating foods that produce gas, such as beans and some vegetables, and fatty foods such as deep-fried chicken."

**231.** A nurse in a health care clinic is instructing a pregnant client how to perform "kick counts." Which statement by the client indicates a need for further instructions?

1. "I will record the number of movements or kicks."
2. "I need to lie flat on my back to perform the procedure."
3. "If I count fewer than 10 kicks in a 12-hour period, I need to contact the physician."
4. "I should place my hands on the largest part of my abdomen and concentrate on the fetal movements to count the kicks."

**232.** A nurse is providing instructions regarding treatment of hemorrhoids to a client who is in the second trimester of pregnancy. Which statement by the client indicates a need for further instruction?

1. "I should avoid straining during bowel movements."
2. "I can gently replace the hemorrhoids into the rectum."
3. "I can apply ice packs to the hemorrhoids to reduce the swelling."

4. "I should apply heat packs to the hemorrhoids to help the hemorrhoids shrink."

**233.** A nurse is providing instructions to a client in the first trimester of pregnancy regarding measures to assist in reducing breast tenderness. The nurse tells the client to:

1. Avoid wearing a bra.
2. Wash the breasts with warm water and keep them dry.
3. Wear tight-fitting blouses or dresses to provide support.
4. Wash the nipples and areolar area daily with soap, and massage the breasts with lotion.

**234.** A nurse is describing cardiovascular system changes that occur during pregnancy to a client and understands that which finding would be normal for a client in the second trimester?

1. Increase in pulse rate
2. Increase in blood pressure
3. Frequent bowel elimination
4. Decrease in red blood cell production

### Alternate Item Format: Multiple Response

**235.** A rubella titer result of a 1-day postpartum client is less than 1:8, and a rubella virus vaccine is prescribed to be administered before discharge. The nurse provides which information to the client about the vaccine? **Select all that apply.**

- 1. Breast-feeding needs to be stopped for 3 months.
- 2. Pregnancy needs to be avoided for 1 to 3 months.
- 3. The vaccine is administered by the subcutaneous route.
- 4. A hypersensitivity reaction can occur if the client has an allergy to eggs.
- 5. Exposure to immunosuppressed individuals needs to be avoided.
- 6. The area of the injection needs to be covered with a sterile gauze for 1 week.

## ANSWERS

### 221. 2

**Rationale:** Because amniocentesis is an invasive procedure, informed consent needs to be obtained before the procedure. After the procedure, the client is instructed to rest, but may resume light activity after the cramping subsides. The client is instructed to keep the puncture site clean

and to report any complications, such as chills, fever, bleeding, leakage of fluid at the needle insertion site, decreased fetal movement, uterine contractions, or cramping. Amniocentesis is an outpatient procedure and may be done in a physician's private office or in a special prenatal testing unit. Hospitalization is not necessary after the procedure.

**Test-Taking Strategy:** Use the process of elimination. Recalling that this procedure is invasive will direct you to option 2. If you had difficulty with this question, review amniocentesis.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**References:** Chernecky, C., & Berger, B. (2008). *Laboratory tests and diagnostic procedures* (5th ed., p. 131). St. Louis: Saunders.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 17–18, 327–328). St. Louis: Saunders.

### 222. 3

**Rationale:** Leukorrhea begins during the first trimester. Many clients notice a thin, colorless or yellow vaginal discharge throughout pregnancy. Some clients become distressed about this condition, but it does not require that the client report to the health care clinic or emergency department immediately. If vaginal discharge is profuse, the client may use panty liners, but she should not wear tampons because of the risk of infection. If the client uses panty liners, she should change them frequently.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 2 first because they are comparable or alike indicating that the client requires medical attention. From the remaining options, recalling that this manifestation is a normal physiological occurrence or that tampons should be avoided will assist in directing you to the correct option. Review the normal occurrences related to vaginal discharge in a pregnant client if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 216). St. Louis: Mosby.

### 223. 1

**Rationale:** A reactive nonstress test is a normal result. To be considered reactive, the baseline fetal heart rate must be within normal range (120 to 160 beats/min) with good long-term variability. In addition, two or more fetal heart rate accelerations of at least 15 beats/min must occur, each with a duration of at least 15 seconds, in a 20-minute interval.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 2, 3, and 4 because they are comparable or alike indicating that an alteration from normal is present. If you had difficulty with this question and are unfamiliar with the interpretation of the results of a nonstress test, review this content.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 329). St. Louis: Saunders.

### 224. 1

**Rationale:** Contraction stress test results may be interpreted as negative (normal), positive (abnormal), or equivocal. A negative test result indicates that no late decelerations occurred in the fetal heart rate, although the fetus was stressed by three contractions of at least 40 seconds' duration in a 10-minute period. Options 2, 3, and 4 are incorrect interpretations.

**Test-Taking Strategy:** Use the process of elimination, noting that options 2, 3, and 4 are comparable or alike in that they indicate an abnormal test result finding. If you had difficulty with this question and are unfamiliar with the interpretation of the results of a contraction stress test, review this content.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 330–331). St. Louis: Saunders.

### 225. 3

**Rationale:** Pica cravings often lead to iron deficiency anemia, resulting in a decreased hemoglobin level. The laboratory values in options 1, 2, and 4 are normal for the pregnant client.

**Test-Taking Strategy:** Use the process of elimination, recalling that pica results in anemia. This will assist in eliminating options 2 and 4. From the remaining options, recall the normal laboratory values in a pregnant client to assist in directing you to option 3. Review the physiological effects of pica and the normal laboratory values in a pregnant client if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Maternity—Antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 285). St. Louis: Mosby.

### 226. 1

**Rationale:** Non-weight-bearing exercises are preferable to weight-bearing exercises during pregnancy. Exercises to avoid are shoulder standing and bicycling with the legs in the air because the knee-chest position should be avoided. Competitive or high-risk sports such as scuba diving, water skiing, downhill skiing, horseback riding, basketball, volleyball, and gymnastics should be avoided. Non-weight-bearing exercises such as swimming are allowable.

**Test-Taking Strategy:** Focus on the subject, safe exercise to engage in during pregnancy. Identify the activities or exercises that could cause an injury to the fetus. This should direct you to option 1. If you had difficulty with this question, review the teaching points related to exercising for a client who is pregnant.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 274). St. Louis: Saunders.

**227. 4**

**Rationale:** Transvaginal ultrasonography allows clear visibility of the uterus, gestational sac, embryo, and deep pelvic structures, such as the ovaries and fallopian tubes. The client is placed in a lithotomy position and a transvaginal probe, encased in a disposable cover and coated with a gel that provides lubrication and promotes conductivity, is inserted into the vagina. The client may feel more comfortable if she is allowed to insert the probe. The procedure takes about 10 to 15 minutes. Options 2 and 3 identify components of abdominal ultrasound.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *transvaginal ultrasonography*. Also, note the relationship of the name of the test and the description in the correct option. If you had difficulty with this question, review the procedure for transvaginal ultrasonography.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 194). St. Louis: Mosby.

**228. 4**

**Rationale:** Varicose veins often develop in the lower extremities during pregnancy. Any constrictive clothing, such as knee-high hose, impedes venous return from the lower legs and places the client at risk for developing varicosities. The client should be encouraged to wear support hose or panty hose. Flat nonslip shoes with proper support are important to assist the pregnant woman to maintain proper posture and balance and to minimize falls.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *a need for further instructions*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Focus on the subject of the question as it relates to preventing varicose veins. Recall that anything that constricts the lower vessels and impedes venous return from the lower legs would place the client at risk for varicosities. If you had difficulty with this question, review measures to prevent varicose veins.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 271). St. Louis: Saunders.

**229. 2**

**Rationale:** Leg cramps occur when the pregnant client stretches her leg and plantar flexes her foot. Dorsiflexion of the foot while extending the knee stretches the affected muscle, prevents the muscle from contracting, and stops the cramping. Options 1, 3, and 4 are not measures that provide relief from leg cramps.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject of the question, to provide relief from the leg cramps. Visualize each of the descriptions in the options to assist in directing you to option 2. If you had

difficulty with this question, review measures that assist in alleviating muscle cramps.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 270). St. Louis: Saunders.

**230. 4**

**Rationale:** Lying down is likely to lead to reflux of stomach contents, especially immediately after a meal. The client should be instructed to avoid spices, along with salt, because spices trigger heartburn. Salt produces edema. The client should be encouraged to eat between-meal snacks and should be instructed that to control heartburn, eating smaller, more frequent portions is preferred over eating three large meals. The client also should limit or avoid gas-producing and fatty foods.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *indicates an understanding of the instructions*. Recalling that the client needs to limit or avoid gas-producing and fatty foods will assist in directing you to option 4. If you had difficulty with this question, review the measures that alleviate heartburn in the pregnant client.

**Level of Cognitive Ability:** Evaluating

**Content Area:** Maternity—Antepartum

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 270). St. Louis: Saunders.

Nix, S. (2009). *Williams' basic nutrition and diet therapy* (13th ed., pp. 175–176). St. Louis: Mosby.

**231. 2**

**Rationale:** The client should sit or lie quietly on her side to perform kick counts. Lying flat on the back is not necessary to perform this procedure, can cause discomfort, and presents a risk of vena caval (supine hypotensive) syndrome. The client is instructed to place her hands on the largest part of the abdomen and concentrate on the fetal movements. The client records the number of movements felt during a specified time period. The client needs to notify the physician or nurse-midwife if there are fewer than 10 kicks in a 12-hour period or as instructed by the physician or nurse-midwife.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *a need for further instructions*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. If you are unfamiliar with this procedure, recalling that the risk of vena caval (supine hypotensive) syndrome exists when the client lies on her back will direct you to option 2. Review the procedure for kick counts if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 333). St. Louis: Saunders.

**232. 4**

**Rationale:** Measures that provide relief from hemorrhoids include avoiding constipation and straining during bowel movements; applying ice packs to reduce the hemorrhoidal swelling; gently replacing the hemorrhoids into the rectum; using stool softeners, ointments, or sprays as prescribed; and assuming certain positions to relieve pressure on the hemorrhoids. Heat packs increase the blood flow to the area and worsen the discomfort from hemorrhoids.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *need for further instruction*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Recalling the principles regarding heat and cold will assist in directing you to option 4. If you had difficulty with this question, review the measures for the treatment of hemorrhoids.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 271). St. Louis: Saunders.

**233. 2**

**Rationale:** The pregnant client should be instructed to wash the breasts with warm water and keep them dry. The client should be instructed to avoid using soap on the nipples and areolar area to prevent the drying of tissues. Wearing a supportive bra with wide adjustable straps can decrease breast tenderness. Tight-fitting blouses or dresses cause discomfort. The client is instructed to wear soft-textured clothing to decrease nipple tenderness and to use breast pads inside the bra to prevent leakage through the clothing if colostrum is a problem.

**Test-Taking Strategy:** Focusing on the subject of the question—reducing breast tenderness—and visualizing each of the measures identified in the options will direct you to option 2. Also, noting the word *warm* and the word *dry* in option 2 will direct you to this option. If you had difficulty with this question, review treatment measures for the client with breast tenderness.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 274). St. Louis: Saunders.

Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 217). St. Louis: Mosby.

**234. 1**

**Rationale:** Between 14 and 20 weeks' gestation, the pulse rate increases about 10 to 15 beats/min, which then persists to term. Options 2, 3, and 4 are incorrect. During pregnancy, the blood pressure usually is the same as the prepregnancy level, but then gradually decreases up to about 20 weeks of gestation. During the second trimester, systolic and diastolic pressures decrease by about 5 to 10 mm Hg. Constipation

may occur as a result of decreased gastrointestinal motility or pressure of the uterus. During pregnancy, there is an accelerated production of red blood cells.

**Test-Taking Strategy:** Focus on the subject of the question, the findings that would be considered normal for a client in her second trimester. Think about the physiological occurrences during pregnancy and remember that between 14 and 20 weeks' gestation, the pulse increases about 10 to 15 beats/min. If you had difficulty with this question, review normal physiological changes during the second trimester of pregnancy.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Content Area:** Maternity—Antepartum

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 266). St. Louis: Saunders.

Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 221). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

**235. 2, 3, 4, 5**

**Rationale:** Rubella vaccine is administered to women who have not had rubella or women who are not serologically immune. The vaccine may be administered in the immediate postpartum period to prevent the possibility of contracting rubella in future pregnancies. The live attenuated rubella virus is not communicable in breast milk; breast-feeding does not need to be stopped. The client is counseled not to become pregnant for 1 to 3 months after immunization as specified by the health care provider because of a possible risk to a fetus from the live virus vaccine; the client must be using effective birth control at the time of the immunization. The client should avoid contact with immunosuppressed individuals because of their low immunity toward live viruses and because the virus is shed in the urine and other body fluids. The vaccine is administered by the subcutaneous route. A hypersensitivity reaction can occur if the client has an allergy to eggs because the vaccine is made from duck eggs. There is no useful or necessary reason for covering the area of the injection with a sterile gauze.

**Test-Taking Strategy:** Focus on the subject: client instructions regarding the rubella vaccine. Recalling that the rubella vaccine is a live virus vaccine will assist in selecting options 2 and 5. Next, recalling the route of administration and the contraindications associated with its use will assist in selecting options 3 and 4. Review client instructions related to the rubella vaccine if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Postpartum

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 462). St. Louis: Saunders.

# Risk Conditions Related to Pregnancy

## I. ABORTION

- A.** Description: A pregnancy that ends before 20 weeks' gestation, spontaneously or electively
- B.** Types (Box 25-1)
- C.** Assessment
  1. Spontaneous vaginal bleeding occurs.
  2. Low uterine cramping or contractions occur.
  3. Blood clots or tissue through the vagina.
  4. Hemorrhage and shock can result if bleeding is excessive.
- D.** Interventions
  1. Maintain bed rest as prescribed.
  2. Monitor vital signs.
  3. Monitor for cramping and bleeding.
  4. Count perineal pads to evaluate blood loss, and save expelled tissues and clots.
  5. Maintain intravenous fluids as prescribed; monitor for signs of hemorrhage or shock.
  6. Prepare the client for dilation and curettage as prescribed for incomplete abortion.
  7. Rh<sub>o</sub>(D) immune globulin (RhoGAM) is prescribed for an Rh-negative woman.

## II. ANEMIA

- A.** Description
  1. Iron deficiency anemia is a condition that develops as a result of an inadequate amount of serum iron.
  2. Anemia predisposes the client to postpartum infection.
- B.** Assessment
  1. Fatigue
  2. Headache
  3. Pallor
  4. Tachycardia
  5. Hemoglobin value is usually less than 10 g/dL; hematocrit value is usually less than 30%.
- C.** Interventions
  1. Monitor hemoglobin and hematocrit levels every 2 weeks.
  2. Administer and instruct the client about iron and folic acid supplements.

### Box 25-1 Types of Abortions

|             |   |
|-------------|---|
| Spontaneous | Pregnancy ends because of natural causes  |
| Induced     | Therapeutic or elective reasons exist for terminating pregnancy   |
| Threatened  | Spotting and cramping without cervical change occur   |
| Inevitable  | Spotting and cramping occur and cervix begins to dilate and efface  |
| Incomplete  | Loss of some of the products of conception occurs, with part of the products retained (most often placenta is retained) |
| Complete    | Loss of all products of conception occurs   |
| Missed      | Products of conception are retained in utero after fetal death  |
| Habitual    | Spontaneous abortions occur in three or more successive pregnancies   |

3. Instruct the client to take iron with a source of vitamin C to increase its absorption and to avoid taking iron with tea.
4. Instruct the client to eat foods high in iron, folic acid, and protein.
5. Teach the client to monitor for signs and symptoms of infection.
6. Prepare to administer parenteral iron; this may be prescribed for severe anemia.
7. Prepare to administer blood transfusions for severe anemia, if prescribed.
8. Prepare for the administration of oxytocic medications in the postpartum period if excessive bleeding is a concern.

## III. CARDIAC DISEASE

- A.** Description: A pregnant client with cardiac disease may be unable physiologically to cope with the added plasma volume and increased cardiac output that occur during pregnancy; blood volume is at a maximum during the last weeks of the second trimester.
- B.** Maternal cardiac disease risk groups (Box 25-2)
- C.** Functional classification of heart disease (Box 25-3)

**Box 25-2 Maternal Cardiac Disease Risk Groups****Group I (Mortality Rate 1%)**

Corrected tetralogy of Fallot  
 Pulmonic or tricuspid disease  
 Mitral stenosis (classes I and II)  
 Patent ductus arteriosus  
 Ventricular septal defect  
 Atrial septal defect  
 Porcine valve

**Group II (Mortality Rate 5%-15%)**

Mitral stenosis with atrial fibrillation  
 Artificial heart valves  
 Mitral stenosis (classes III and IV)  
 Uncorrected tetralogy  
 Aortic coarctation (uncomplicated)  
 Aortic stenosis

**Group III (Mortality Rate 25%-50%)**

Aortic coarctation (complicated)  
 Myocardial infarction  
 Marfan syndrome  
 True cardiomyopathy  
 Pulmonary hypertension

Modified from Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 311). St. Louis: Mosby.

**D. Assessment**

1. Signs and symptoms of cardiac decompensation
  - a. Cough and respiratory congestion
  - b. Dyspnea and fatigue
  - c. Palpitations and tachycardia
  - d. Peripheral edema
  - e. Chest pain
2. Signs of respiratory infection
3. Signs of heart failure and pulmonary edema

**E. Interventions**

1. Monitor vital signs, fetal heart rate, and condition of the fetus.
2. Limit physical activities, and stress the need for sufficient rest.
3. Monitor for signs of cardiac stress and decompensation, such as cough, fatigue, dyspnea, chest pain, and tachycardia.
4. Encourage adequate nutrition to prevent anemia, which would worsen the cardiac status; additionally, a low-sodium diet may be prescribed to prevent fluid retention and heart failure.
5. Avoid excessive weight gain.
6. Monitor for signs of heart failure, pulmonary edema, and cardiac decompensation.
7. During **labor**, prepare to do the following:
  - a. Monitor vital signs frequently.
  - b. Place the client on a cardiac monitor and on an external fetal monitor.

**Box 25-3 New York Heart Association Functional Classification of Heart Disease\***

|           |   |
|-----------|---|
| Class I   | Uncompromised; no limitation of physical activity; asymptomatic with ordinary activity  |
| Class II  | Slightly compromised, requiring slight limitation of physical activity; client is comfortable at rest, but ordinary physical activity causes symptoms such as fatigue, dyspnea, palpitations, or anginal pain |
| Class III | Markedly compromised; marked limitation of physical activity; client is comfortable at rest, but less than ordinary activity causes excessive fatigue, palpitations, dyspnea, or anginal pain                 |
| Class IV  | Inability to perform any physical activity without discomfort; symptoms of cardiac insufficiency are present even at rest   |

\*Generally, maternal and fetal risks for classes I and II disease are small, but risks are greatly increased with classes III and IV.

Modified from Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 311). St. Louis: Mosby; and McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 646). St. Louis: Saunders.

- c. Maintain bed rest, with the client lying on her side with her head and shoulders elevated.
- d. Administer oxygen as prescribed.

 Excessive weight gain places stress on the heart. Additionally, obesity places the client at increased risk for complications during pregnancy.

**IV. CHORIOAMNIONITIS****A. Description**

1. Bacterial infection of the amniotic cavity; can result from premature rupture of the membranes, vaginitis, amniocentesis, or intrauterine procedures
2. May result in the development of postpartum endometritis

**B. Assessment**

1. Uterine tenderness and contractions
2. Elevated temperature
3. Maternal or fetal tachycardia
4. Foul odor to **amniotic fluid**
5. Leukocytosis

**C. Interventions**

1. Monitor maternal vital signs and fetal heart rate.
2. Monitor for uterine tenderness, contractions, and fetal activity.
3. Monitor results of blood cultures.
4. Prepare for amniocentesis to obtain **amniotic fluid** for Gram stain and leukocyte count.
5. Administer antibiotics as prescribed after cultures are obtained.
6. Administer oxytocic medications as prescribed to increase uterine tone.
7. Prepare to obtain neonatal cultures after **delivery**.

## V. DIABETES MELLITUS

### A. Description

1. Pregnancy places demands on carbohydrate metabolism and causes insulin requirements to change.
2. Maternal glucose crosses the **placenta**, but insulin does not.
3. During the first trimester, maternal insulin needs decrease.
4. During the second and third trimesters, increases in placental hormones cause an insulin-resistant state, requiring an increase in the client's insulin dose.
5. After placental **delivery**, placental hormone levels abruptly decrease and insulin requirements decrease.
6. The fetus produces its own insulin and pulls glucose from the mother, which predisposes the mother to hypoglycemic reactions.
7. The **newborn** of a diabetic mother may be large in size, but has functions related to gestational age rather than size.
8. The **newborn** of a diabetic mother is at risk for hypoglycemia, hyperbilirubinemia, respiratory distress syndrome, hypocalcemia, and congenital anomalies.

### B. Gestational diabetes mellitus

1. Gestational diabetes occurs in pregnancy (during the second or third trimester) in clients not previously diagnosed as diabetic and occurs when the pancreas cannot respond to the demand for more insulin.
2. Pregnant women should be screened for gestational diabetes between 24 and 28 weeks of pregnancy.
3. A 3-hour oral glucose tolerance test is performed to confirm gestational diabetes mellitus.
4. Gestational diabetes frequently can be treated by diet alone; however, some clients may need insulin.
5. Most women with gestational diabetes return to a euglycemic state after **delivery**; however, these individuals have an increased risk of developing diabetes mellitus in their lifetimes.

 Oral hypoglycemic agents are never prescribed for use during pregnancy.

### C. Predisposing conditions to gestational diabetes

1. Older than 35 years
2. Obesity
3. Multiple gestation
4. Family history of diabetes mellitus

### D. Assessment

1. Excessive thirst
2. Hunger
3. Weight loss
4. Frequent urination

5. Blurred vision
6. Recurrent urinary tract infections and vaginal yeast infections
7. Glycosuria and ketonuria
8. Signs of gestational hypertension
9. Polyhydramnios
10. Large fetus for gestational age

### E. Interventions

1. Employ diet, insulin (if diet cannot control blood glucose levels), exercise, and blood glucose determinations to maintain blood glucose levels between 65 mg/dL and 130 mg/dL.
2. Observe for signs of hyperglycemia, glycosuria and ketonuria, and hypoglycemia.
3. Monitor weight.
4. Increase calorie intake as prescribed, with adequate insulin therapy so that glucose moves into the cells.
5. Assess for signs of maternal complications such as preeclampsia (hypertension, proteinuria, and edema).
6. Monitor for signs of infection.
7. Instruct the client to report burning and pain on urination, vaginal discharge or itching, or any other signs of infection to the health care provider.
8. Assess fetal status and monitor for signs of fetal compromise.

### F. Interventions during **labor**

1. Monitor fetal status continuously for signs of distress and, if noted, prepare the client for immediate cesarean section.
2. Carefully regulate insulin and provide glucose intravenously as prescribed because **labor** depletes glycogen.

### G. Interventions during the postpartum period

1. Observe the mother closely for a hypoglycemic reaction because a precipitous decline in insulin requirements normally occurs (the mother may not require insulin for the first 24 hours).
2. Reregulate insulin needs as prescribed after the first day, according to blood glucose testing.
3. Assess dietary needs based on blood glucose testing and insulin requirements.
4. Monitor for signs of infection or postpartum hemorrhage.

## VI. DISSEMINATED INTRAVASCULAR COAGULATION (DIC)

- ### A. Description: DIC is a maternal condition in which the clotting cascade is activated, resulting in the formation of clots in the microcirculation (Fig. 25-1).

 The rapid and extensive formation of clots that occurs in DIC causes the platelets and clotting factors to be depleted; this results in bleeding and the potential vascular occlusion of organs from thromboembolus formation.

**B.** Predisposing conditions (Box 25-4)**C.** Assessment

1. Uncontrolled bleeding
2. Bruising, purpura, petechiae, and ecchymosis
3. Presence of occult blood in excretions such as stool
4. Hematuria, hematemesis, or vaginal bleeding
5. Signs of shock
6. Decreased fibrinogen level, platelet count, and hematocrit level
7. Increased prothrombin time and partial thromboplastin time, clotting time, and fibrin degradation products

**D.** Interventions

1. Remove underlying cause.
2. Monitor vital signs; assess for bleeding and signs of shock.
3. Prepare for oxygen therapy, volume replacement, blood component therapy, and possibly heparin therapy.

4. Monitor for complications associated with fluid and blood replacement and heparin therapy.
5. Monitor urine output and maintain at 30 mL/hr (renal failure is a complication of DIC).

**VII. ECTOPIC PREGNANCY****A.** Description

1. **Implantation** of the fertilized ovum outside of the uterine cavity
2. Most common location is the ampulla of the fallopian tube (Fig. 25-2)

**B.** Assessment

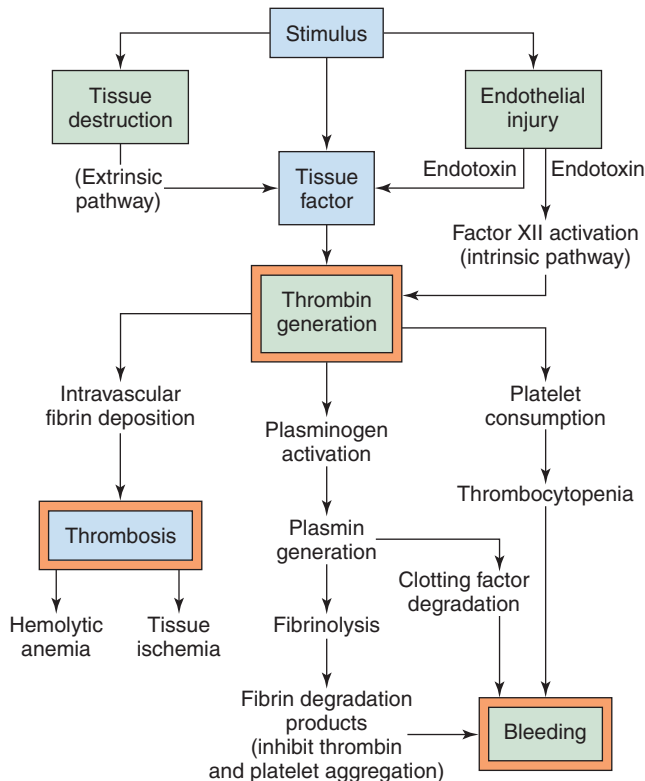

1. Missed menstrual period
2. Abdominal pain
3. Vaginal spotting to bleeding that is dark red or brown
4. Rupture: Increased pain, referred shoulder pain, signs of shock

**C.** Interventions

1. Obtain assessment data and vital signs.
2. Monitor bleeding and initiate measures to prevent rupture and shock.
3. Methotrexate (Trexall), a folic acid antagonist, may be prescribed to inhibit cell division in the developing **embryo**.
4. Prepare the client for laparotomy and removal of the pregnancy and tube, if necessary, or repair of the tube.
5. Administer antibiotics; Rh<sub>0</sub>(D) immune globulin is prescribed for Rh-negative women.

**VIII. ENDOMETRITIS****A.** Description

1. Endometritis is an infection of the lining of the **uterus** occurring in the postpartum period and caused by bacteria that invade the **uterus** at the placental site.

**▲ FIGURE 25-1** Pathophysiology of disseminated intravascular coagulation. (From Monahan, F., Sands, J., Neighbors, M., Marek, J., & Green, C. [2007]. *Phipps' medical-surgical nursing: Health and illness perspectives* [8th ed.]. St. Louis: Mosby.)

### Box 25-4 Predisposing Conditions for Disseminated Intravascular Coagulation

|                          |                          |
|--------------------------|--------------------------|
| Abruptio placentae       | Intrauterine fetal death |
| Amniotic fluid embolism  | Liver disease            |
| Gestational hypertension | Sepsis                   |

**▲ FIGURE 25-2** Sites of tubal ectopic pregnancy. Numbers indicate order of prevalence. (From McKinney, E., James, S., Murray, S., & Ashwill, J. [2009]. *Maternal-child nursing* [3rd ed.]. St. Louis: Saunders.)

- The infection may spread and involve the entire endometrium and cause peritonitis or pelvic thrombophlebitis.

#### B. Assessment

- Chills and fever
- Increased pulse
- Decreased appetite
- Headache
- Backache
- Prolonged, severe afterpains
- Tender, large **uterus**
- Foul odor to **lochia** or reddish brown **lochia**
- Ileus
- Elevated white blood cell count, with left shift of immature cells

#### C. Interventions

- Monitor vital signs.
- Position the client in Fowler's position to facilitate drainage of **lochia**.
- Provide a private room for the mother; inform the mother that isolation of the **newborn** from the mother is unnecessary.
- Instruct the mother in proper handwashing techniques.
- Initiate contact precautions as necessary.
- Monitor intake and output and encourage fluid intake.
- Administer antibiotics as prescribed.
- Administer comfort measures such as back rubs and position changes and pain medications as prescribed.
- Administer oxytocic medications as prescribed to improve uterine tone.

### IX. FETAL DEATH IN UTERO

#### A. Description

- Fetal death in utero refers to the death of a fetus after the twentieth week of gestation and before birth.
- The client can develop DIC if the dead fetus is retained in the **uterus** for 3 to 4 weeks or longer.

#### B. Assessment

- Absence of fetal movement
- Absence of fetal heart tones
- Maternal weight loss
- Lack of fetal growth or decrease in fundal height
- No evidence of fetal cardiac activity
- Other characteristics suggestive of fetal death noted on ultrasound

#### C. Interventions

- Prepare for the **delivery** of the fetus.
- Support the client's decision about **labor**, birth, and the postpartum period.
- Facilitate the grieving process as appropriate considering cultural practices and beliefs.
- Accept behaviors such as anger and hostility from the parents.
- Refer the parents to an appropriate support group.

Cultural and religious practices and beliefs are important to consider when caring for the parents of a fetus who has died. Be aware of the cultural and religious practices and beliefs of the client.

### X. HEPATITIS B

#### A. Description

- The risks of prematurity, low birth weight, and neonatal death increase if the mother has hepatitis B infection.
- Hepatitis is transmitted through blood, saliva, vaginal secretions, semen, and breast milk and across the placental barrier.

#### B. Interventions

- Minimize the risk for intrapartum ascending infections (limit the number of vaginal examinations).
- Remove maternal blood from the neonate immediately after birth.
- Suction the fluids from the neonate immediately after birth.
- Bathe the neonate before any invasive procedures.
- Clean and dry the face and eyes of the neonate before instilling eye prophylaxis.
- Infection of the neonate can be prevented by the administration of hepatitis B immune globulin and hepatitis B vaccine soon after birth.
- Discourage the mother from kissing the neonate until the neonate has received the vaccine.
- Inform the mother that the hepatitis B vaccine will be administered to the neonate and that a second dose should be administered at 1 month after birth and a third dose at 6 months after birth.

Support breast-feeding after neonatal treatment for hepatitis B; breast-feeding is not contraindicated if the neonate has been vaccinated.

### XI. HEMATOMA

#### A. Description

- Hematoma occurs following the escape of blood into the maternal tissue after **delivery**.
- Predisposing conditions include operative **delivery** with forceps or injury to a blood vessel.

#### B. Assessment (Box 25-5)

#### Box 25-5 Hematoma: Assessment Findings

Abnormal, severe pain  
 Pressure in perineal area (client states that she feels like she has to have a bowel movement)  
 Palpable, sensitive swelling in the perineal area, with discolored skin  
 Inability to void  
 Decreased hemoglobin and hematocrit levels  
 Signs of shock, such as pallor, tachycardia, and hypotension, if significant blood loss has occurred

-  **C. Interventions**
1. Monitor vital signs.
  2. Monitor client for abnormal pain, especially when forceps **delivery** has been performed.
  3. Apply ice to the hematoma site.
  4. Administer analgesics as prescribed.
  5. Monitor intake and output.
  6. Encourage fluids and voiding; prepare for urinary catheterization if the client is unable to void.
  7. Administer blood replacements as prescribed.
  8. Monitor for signs of infection, such as increased temperature, pulse rate, and white blood cell count.
  9. Administer antibiotics as prescribed because infection is common after hematoma formation.
  10. Prepare for incision and evacuation of the hematoma if necessary.

 **XII. HUMAN IMMUNODEFICIENCY VIRUS (HIV) AND ACQUIRED IMMUNODEFICIENCY SYNDROME (AIDS)**

- A. Description**
1. HIV is the causative agent of AIDS.
  2. Women infected with HIV may first show symptoms at the time of pregnancy or possibly develop life-threatening infections because normal pregnancy involves some suppression of the maternal immune system.
  3. Zidovudine (Retrovir) is recommended for the prevention of maternal-to-fetal HIV transmission and is administered orally beginning after 14 weeks' gestation, intravenously during **labor**, and in the form of syrup to the **newborn** for 6 weeks after birth.
- B. Transmission**
1. Sexual exposure to genital secretions of an infected person
  2. Parenteral exposure to infected blood and tissue
  3. Perinatal exposure of an **infant** to infected maternal secretions through birth or breast-feeding
- C. Risks to the mother:** A mother with HIV is managed as high risk because she is vulnerable to infections.
- D. Diagnosis**
1. Tests used to determine the presence of antibodies to HIV include enzyme-linked immunosorbent assay (ELISA), Western blot, and immunofluorescence assay (IFA).
  2. A single reactive ELISA test by itself cannot be used to diagnose HIV, and the test should be repeated with the same blood sample; if the result is again reactive, follow-up tests using Western blot or IFA should be done.
  3. A positive Western blot or IFA is considered confirmatory for HIV.
  4. A positive ELISA that fails to be confirmed by Western blot or IFA should not be considered

negative, and repeat testing should be done in 3 to 6 months.

5. See Chapter 11 for additional laboratory tests.

**E. Assessment (Box 25-6)**

**F. Interventions**

1. Prenatal period
  - a. Prevent opportunistic infections.
  - b. Avoid procedures that increase the risk of perinatal transmission, such as amniocentesis and fetal scalp sampling.
2. Intrapartum period
  - a. If the fetus has not been exposed to HIV in utero, the highest risk exists during **delivery** through the birth canal.
  - b. Avoid the use of internal scalp electrodes for monitoring of the fetus.
  - c. Avoid episiotomy to decrease the amount of maternal blood in and around the birth canal.
  - d. Avoid the administration of oxytocin (Pitocin) because contractions induced by oxytocin can be strong, causing vaginal tears or necessitating an episiotomy.
  - e. Place heavy absorbent pads under the mother's hips to absorb **amniotic fluid** and maternal blood.
  - f. Minimize the neonate's exposure to maternal blood and body fluids; promptly remove the neonate from the mother's blood after **delivery**.
  - g. Suction fluids from the neonate promptly.
  - h. Prepare to administer zidovudine as prescribed to the mother during **labor** and **delivery**.

**Box 25-6 Stages of Acquired Immunodeficiency Syndrome (AIDS)**

**Stage 1**

Fever  
Headache  
Lymphadenopathy  
Myalgia

**Stage 2**

Infection is active but asymptomatic and may remain so for years

Client may experience outbreak of herpes zoster (shingles)  
Client may experience transient thrombocytopenia

**Stage 3**

Client is symptomatic  
Immune dysfunction is evident  
All body systems can show signs of immune dysfunction  
Integumentary and gynecological problems are common

**Stage 4**

Advanced infection  
Client vulnerable to common bacterial infections  
Development of opportunistic infections  
Serious immune compromise

3. Postpartum period
  - a. Monitor for signs of infection.
  - b. Place the mother in protective isolation if she is immunosuppressed.
  - c. Restrict breast-feeding.
  - d. Instruct the mother to monitor for signs of infection and report any signs if they occur.

#### G. The **newborn** and HIV

1. Description
  - a. Neonates born to HIV-positive clients may test positive because antibodies received from the mother may persist for 18 months after birth; all neonates acquire maternal antibody to HIV infection, but not all acquire infection.
  - b. The use of antiviral medication, reduced exposure of the neonate to maternal blood and body fluids, and early identification of HIV in pregnancy reduce the risk of transmission to the neonate.
2. Interventions
  - a. Bathe the neonate carefully before any invasive procedure, such as the administration of vitamin K, heel sticks, or venipunctures; clean the umbilical cord stump meticulously every day until healed.
  - b. The **newborn** can room with the mother.
  - c. Administer zidovudine to the **newborn** as prescribed for the first 6 weeks of life.
  - d. All HIV-exposed **newborns** should be treated with medication to prevent infection by *Pneumocystis jiroveci*.
  - e. HIV culture is recommended at 1 and 4 months after birth; **infants** at risk for HIV infection should be seen by the physician at birth and 1 week, 2 weeks, 1 month, 2 months, and 4 months of age.
  - f. The child may be asymptomatic for the first several years of life and should be monitored for early signs of immunodeficiency

 **Infants at risk for HIV infection need to receive all recommended immunizations at the regular schedule; however, no live vaccines should be administered.**

### XIII. HYDATIDIFORM MOLE

#### A. Description

1. Hydatidiform mole is a form of gestational trophoblastic disease that occurs when the trophoblasts, which are the peripheral cells that attach the fertilized ovum to the uterine wall, develop abnormally.
2. The mole manifests as an edematous grape-like cluster that may be nonmalignant or may develop into choriocarcinoma.

#### B. Assessment

1. Fetal heart rate not detectable

2. Vaginal bleeding, which may occur by the fourth week or not until the second trimester; may be bright red or dark brown in color and may be slight, profuse, or intermittent
3. Symptoms of gestational hypertension, such as elevated blood pressure, edema, and proteinuria, before the twentieth week of gestation
4. Fundal height greater than expected for gestational date
5. Elevated human chorionic gonadotropin levels
6. Characteristic snowstorm pattern shown on ultrasound

#### C. Interventions

1. Prepare the client for uterine evacuation (before evacuation, diagnostic tests are done to detect metastatic disease).
2. Evacuation of the mole is done by vacuum aspiration; oxytocin is administered after evacuation to contract the **uterus**.
3. Monitor for postprocedure hemorrhage and infection.
4. Tissue is sent to the laboratory for evaluation, and follow-up is important to detect changes suggestive of malignancy.
5. Human chorionic gonadotropin levels are monitored every 1 to 2 weeks until normal prepregnancy levels are attained; levels are checked every 1 to 2 months for 1 year.
6. Instruct the client and her partner about birth control measures so that pregnancy can be prevented during the 1-year follow-up.

### XIV. HYPEREMESIS GRAVIDARUM

**A.** Description: Intractable nausea and vomiting during the first trimester that causes disturbances in nutrition and fluid and electrolyte balance

#### B. Assessment

1. Nausea most pronounced on arising; may occur at other times during the day
2. Persistent vomiting
3. Weight loss
4. Signs of dehydration
5. Fluid and electrolyte imbalances

#### C. Interventions

1. Initiate measures to alleviate nausea, including medication therapy; if unsuccessful, and weight loss and fluid and electrolyte imbalances occur, intravenously administered fluid and electrolyte replacement or parenteral nutrition may be necessary.
2. Monitor vital signs, intake and output, weight, and calorie count.
3. Monitor laboratory data and for signs of dehydration and electrolyte imbalances.
4. Monitor urine for ketones.
5. Monitor fetal heart rate, activity, and growth.

6. Encourage intake of small portions of food (low-fat, easily digestible carbohydrates, such as cereals, rice, and pasta).
7. Liquids should be taken between meals to avoid distending the stomach and triggering vomiting.
8. Encourage the client to sit upright after meals.

7. History of or family history of gestational hypertension

- D. Complications of gestational hypertension**
1. Abruptio placentae
  2. Disseminated intravascular coagulation
  3. Thrombocytopenia

**XV. GESTATIONAL HYPERTENSION**

- A. Description and types:** Hypertension can be mild or severe, leading to preeclampsia and then eclampsia (seizures) (Table 25-1).

Signs of preeclampsia are hypertension, generalized edema, and proteinuria.

- B. Assessment** (Table 25-2)

- C. Predisposing conditions**

1. Primigravida
2. Women younger than 19 years or older than 40 years
3. Chronic renal disease
4. Chronic hypertension
5. Diabetes mellitus
6. Rh incompatibility

**TABLE 25-1** Classification of Hypertensive Stages of Pregnancy

| Type  | Description   |
|---|---|
| <b>Gestational Hypertensive Disorders</b>         |   |
| Gestational hypertension                          | Blood pressure elevation detected first time after mid-pregnancy without proteinuria  |
| Transient hypertension                            | Gestational hypertension with no signs of preeclampsia present at time of birth and hypertension resolves by 12 weeks after birth   |
| Preeclampsia                                      | Pregnancy-specific syndrome that usually occurs after 20 weeks of gestation and is determined by gestational hypertension plus proteinuria                                      |
| Eclampsia   | Occurrence of seizures in a preeclamptic woman  |
| <b>Chronic Hypertensive Disorders</b>             |   |
| Chronic hypertension                              | Hypertension that is present and observable before pregnancy or that is diagnosed before week 20 of gestation   |
| Preeclampsia superimposed on chronic hypertension | Chronic hypertension with new proteinuria or exacerbation of hypertension (previously well controlled) or proteinuria, thrombocytopenia, or increases in hepatocellular enzymes |

Modified from Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 335). St. Louis: Mosby.

**TABLE 25-2** Mild Versus Severe Preeclampsia

| Parameter Evaluated   | Mild  | Severe   |
|---|---|--|
| Systolic blood pressure   | ≥140 but <160 mm Hg                                     | ≥160 mm Hg (two readings, 6 hr apart, while on bed rest) |
| Diastolic blood pressure  | ≥90 but <110 mm Hg                                      | ≥110 mm Hg   |
| Proteinuria (24-hr specimen is preferred to eliminate hour-to-hour variations)  | ≥0.3 but <2 g in 24-hr specimen (1+ on random dipstick) | ≥5 g in 24-hr specimen (≥3+ on random dipstick sample)   |
| Creatinine, serum (renal function)  | Normal  | Elevated (>1.2 mg/dL)                                    |
| Platelets   | Normal  | Decreased (<100,000 cells/mm <sup>3</sup> )              |
| Liver enzymes (alanine aminotransferase or aspartate aminotransferase)  | Normal or minimal increase in levels                    | Elevated levels  |
| Urine output  | Normal  | Oliguria common, often <500 mL/day                       |
| Severe, unremitting headache not attributable to other cause; mental confusion (cerebral edema)                                   | Absent  | Often present  |
| Persistent right upper quadrant or epigastric pain or pain penetrating to back (distention of liver capsule); nausea and vomiting | Absent  | May be present and often precedes seizure                |
| Visual disturbances (spots or “sparkles”; temporary blindness; photophobia)   | Absent to minimal                                       | Common   |
| Pulmonary edema; heart failure; cyanosis  | Absent  | May be present   |
| Fetal growth restriction  | Normal growth   | Growth restriction; reduced amniotic fluid volume        |

From McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 625). St. Louis: Saunders.

4. Placental insufficiency
  5. Intrauterine growth restriction
  6. Intrauterine fetal death
- E.** Interventions for mild hypertension
1. Monitor blood pressure.
  2. Monitor fetal activity and fetal growth.
  3. Encourage frequent rest periods, instructing the client to lie in the lateral position.
  4. Administer antihypertensive medications as prescribed; teach client about the importance of the medications.
  5. Monitor intake and output.
  6. Evaluate renal function through prescribed studies such as blood urea nitrogen, serum creatinine, and 24-hour urine levels for creatinine clearance and protein.

- F.** Interventions for mild preeclampsia
1. Provide bedrest and place the client in the lateral position.
  2. Monitor blood pressure and weight.
  3. Monitor neurological status because changes can indicate cerebral hypoxia or impending seizure.
  4. Monitor deep tendon reflexes and for the presence of clonus because hyperreflexia indicates increased central nervous system irritability (Box 25-7).
  5. Provide adequate fluids.
  6. Monitor intake and output; a urinary output of 30 mL/hr indicates adequate renal perfusion.
  7. Increase dietary protein and carbohydrates with no added salt.
  8. Administer medications as prescribed to reduce blood pressure; blood pressure should not be reduced drastically because placental perfusion can be compromised.
  9. Monitor for HELLP syndrome, a laboratory diagnosis for severe preeclampsia characterized by hemolysis, elevated liver enzyme levels, and low platelet count.

- G.** Interventions for severe preeclampsia
1. Maintain bed rest.
  2. Administer magnesium sulfate (use a controlled infusion device) as prescribed to prevent seizures; magnesium sulfate may be continued for 24 to 48 hours postpartum.
  3. Monitor for signs of magnesium toxicity, including flushing, sweating, hypotension, depressed deep tendon reflexes, and central nervous system depression including respiratory depression; keep antidote (calcium gluconate) at the client's bedside.
  4. Administer antihypertensives as prescribed.
  5. Prepare for the induction of **labor**.

- H.** Eclampsia
1. Assessment: Characterized by generalized seizures (Box 25-8)
  2. Interventions (see Priority Nursing Actions)

### Box 25-7 Assessment of Reflexes

#### Biceps

Position thumb over client's biceps tendon, supporting client's elbow with the palm of the hand  
Strike a downward blow over the thumb with percussion hammer

Normal response: Flexion of the arm at the elbow

#### Patellar

Position client with her legs dangling over the edge of the examining table or lying on her back with her legs slightly flexed

Strike patellar tendon just below kneecap with percussion hammer

Normal response: Extension or kicking out of the leg

#### Clonus

Position client with her legs dangling over the edge of examining table

Support the leg with one hand and sharply dorsiflex client's foot with the other hand

Maintain the dorsiflexed position for a few seconds and then release foot

Normal response (negative clonus response)

- Foot remains steady in dorsiflexed position
- No rhythmic oscillations or jerking of foot is felt
- When released, foot drops to plantar-flexed position with no oscillations

Abnormal response (positive clonus response)

- Rhythmic oscillations occur when foot is dorsiflexed
- Similar oscillations are noted when foot drops to plantar-flexed position

#### Grading Response

- 0 Reflex absent
- 1+ Reflex present but hypoactive
- 2+ Normal reflex
- 3+ Hyperactive reflex
- 4+ Hyperactive reflex with clonus present

### Box 25-8 Eclampsia

Seizure typically begins with twitching around the mouth  
Body then becomes rigid in a state of tonic muscular contractions that last 15 to 20 seconds

Facial muscles and then all body muscles alternately contract and relax in rapid succession (clonic phase may last about 1 minute)

Respiration ceases during seizure because diaphragm tends to remain fixed (breathing resumes shortly after the seizure)

Postictal sleep occurs

## XVI. INCOMPETENT CERVIX

### A. Description

1. Incompetent cervix refers to premature dilation of the cervix, which occurs most often in the fourth or fifth month of pregnancy and is associated with structural or functional defects of the cervix.

### PRIORITY NURSING ACTIONS!

#### Actions to Take in the Event of Eclampsia

1. Remain with the client and call for help.
2. Ensure an open airway, turn the client on her side, and administer oxygen by face mask at 8 to 10 L/min.
3. Monitor fetal heart rate patterns.
4. Administer medications to control the seizures as prescribed.
5. After the seizure, insert an oral airway and suction the client's mouth as needed.
6. Prepare for delivery of the fetus after stabilization of the client, if warranted.
7. Document occurrence, client's response, and outcome.

Eclampsia refers to the occurrence of a seizure. It is a potentially preventable extension of severe preeclampsia; early identification of preeclampsia in a pregnant client allows intervention before the condition reaches the seizure state. If eclampsia occurs, the nurse remains with the client and calls for help. The nurse ensures an open airway. If the client is not on her side already, the nurse attempts to turn the client on her side. The side-lying position permits greater circulation through the placenta and may help prevent aspiration. The nurse administers oxygen by face mask at 8 to 10 L/min to ensure adequate placental oxygenation. The nurse also notes the time the seizure began and the duration of the seizure and protects the client from injury during the event. The nurse monitors fetal heart rate patterns closely and administers medications as prescribed (magnesium sulfate may be prescribed). After the seizure, the nurse inserts an oral airway to maintain airway patency and suctions the client's mouth as needed. If warranted, the nurse prepares for the delivery of the fetus after stabilization of the client. The nurse documents the occurrence, the client's response, and the outcome.

Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 347). St. Louis: Mosby.

2. Treatment involves surgical placement of a cervical cerclage.

#### B. Assessment

1. Vaginal bleeding
2. Fetal membranes visible through the cervix

#### C. Interventions

1. Provide bed rest, hydration, and tocolysis, as prescribed, to inhibit uterine contractions.
2. Prepare for cervical cerclage (at 10 to 14 weeks' gestation) in which a band of fascia or nonabsorbable ribbon is placed around the cervix beneath the mucosa to constrict the internal os.
3. After cervical cerclage, the client is told to refrain from intercourse and to avoid prolonged standing and heavy lifting.

4. The cervical cerclage is removed at 37 weeks' gestation or left in place and a cesarean birth is performed; if removed, cerclage must be repeated with each successive pregnancy.
5. After placement of the cervical cerclage, monitor for contractions, rupture of the membranes, and signs of infection.
6. Instruct the client to report to the health care provider immediately any postprocedure vaginal bleeding or increased uterine contractions.

### XVII. INFECTIONS

#### A. Toxoplasmosis

1. Caused by infection with the intracellular protozoan parasite *Toxoplasma gondii*
2. Produces a rash and symptoms of acute, flu-like infection in the mother
3. Transmitted to the mother through raw meat or handling of cat litter of infected cats
4. Organism transmitted to the fetus across the **placenta**
5. Can cause spontaneous abortion in the first trimester

#### B. Rubella (German measles)

1. Teratogenic in the first trimester
2. Organism transmitted to the fetus across the **placenta**
3. Causes congenital defects of the eyes, heart, ears, and brain
4. If not immune (titer less than 1:8), the client should be vaccinated in the postpartum period; the client must wait 1 to 3 months (as specified by health care provider) before becoming pregnant.

#### C. Cytomegalovirus

1. Organism is transmitted through close personal contact; it is transmitted across the **placenta** to the fetus, or the fetus may be infected through the birth canal.
2. The mother may be asymptomatic; most **infants** are asymptomatic at birth.
3. Cytomegalovirus causes low birth weight, intrauterine growth restriction, enlarged liver and spleen, jaundice, blindness, hearing loss, and seizures.
4. Antiviral medications may be prescribed for severe infections in the mother, but these medications are toxic and may only temporarily suppress shedding of the virus.

#### D. Herpes simplex virus

1. Herpes simplex virus affects the external genitalia, **vagina**, and cervix and causes draining, painful vesicles.
2. Virus usually is transmitted to the fetus during birth through the infected **vagina** or via an ascending infection after rupture of the membranes.

3. No vaginal examinations are done in the presence of active vaginal herpetic lesions.
4. Herpes can cause death or severe neurological impairment in the **newborn**.
5. **Delivery** of the fetus is usually by cesarean section if active lesions are present in the **vagina**; **delivery** may be performed vaginally if the lesions are in the anal, perineal, or inner thigh area (strict precautions are necessary to protect the fetus during **delivery**).
6. Maintain contact precautions.

#### E. Group B streptococcus (GBS)

1. GBS is a leading cause of life-threatening perinatal infections.
2. The gram-positive bacterium colonizes the rectum, **vagina**, cervix, and urethra of pregnant and nonpregnant women.
3. Meningitis, fasciitis, and intra-abdominal abscess can occur in the pregnant client if she is infected at the time of birth.
4. Transmission occurs during vaginal **delivery**.
5. Early-onset **newborn** GBS occurs within the first week after birth, usually within 48 hours, and can include infections such as sepsis, pneumonia, or meningitis; permanent neurological disability can result.
6. Diagnosis of the mother is done via vaginal and rectal cultures at 35 to 37 weeks' gestation.
7. Antibiotics such as penicillin may be prescribed for the mother during **labor** and birth; intravenous antibiotics may be prescribed for infected **infants**.

### XVIII. MULTIPLE GESTATION

#### A. Description

1. Multiple gestation results from **fertilization** of two ova (fraternal or dizygotic) or a splitting of one fertilized ovum (identical or monozygotic).
2. Complications include spontaneous abortion, anemia, congenital anomalies, hyperemesis gravidarum, intrauterine growth restriction, gestational hypertension, polyhydramnios, postpartum hemorrhage, premature rupture of membranes, and preterm **labor** and **delivery**.

#### B. Assessment

1. Excessive fetal activity
2. **Uterus** large for gestational age
3. Palpation of three or four large parts in the **uterus**
4. Auscultation of more than one fetal heart rate
5. Excessive weight gain

#### C. Interventions

1. Monitor vital signs.
2. Monitor fetal heart rates, activity, and growth.
3. Monitor for cervical changes.
4. Prepare the client for ultrasound as prescribed.

5. Monitor for anemia; administer supplemental vitamins as prescribed.
6. Monitor for preterm **labor**, and treat preterm **labor** promptly.
7. Prepare for cesarean **delivery** for abnormal presentations.
8. Prepare to administer oxytocic medications after **delivery** to prevent postpartum hemorrhage from uterine overdistention.

### XIX. PYELONEPHRITIS

#### A. Description

1. Results from bacterial infections that extend upward from the bladder through the blood vessels and lymphatics
2. Frequently follows untreated urinary tract infections and is associated with increased incidence of anemia, low birth weight, gestational hypertension, premature **labor** and **delivery**, and premature rupture of the membranes

#### B. Assessment

1. Flank pain
2. Burning or painful urination
3. Increased frequency of urination
4. Chills, malaise, nausea, and vomiting
5. Increased temperature, pulse rate, and fetal heart rate
6. Uterine contractions
7. Elevated white blood cell count

#### C. Interventions

1. Monitor vital signs.
2. Monitor fetal heart rate.
3. Monitor for uterine contractions.
4. Encourage fluids; monitor intake and output.
5. Monitor renal function.
6. Administer antibiotics as prescribed.
7. Administer antipyretics such as acetaminophen (Tylenol) as prescribed.
8. Obtain urine cultures every 2 to 4 weeks after resolution of infection.

### XX. SEXUALLY TRANSMITTED INFECTIONS

#### A. *Chlamydia*

##### 1. Description

- a. Sexually transmitted pathogen associated with an increased risk for premature birth, stillbirth, neonatal conjunctivitis, and **newborn** chlamydial pneumonia
- b. Can cause salpingitis, pelvic abscesses, ectopic pregnancy, chronic pelvic pain, and infertility
- c. Diagnostic test is culture for *Chlamydia trachomatis*

##### 2. Assessment

- a. Usually asymptomatic
- b. Bleeding between periods or after coitus
- c. Mucoid or purulent cervical discharge
- d. Dysuria and pelvic pain

## 3. Interventions

- Screen the client to determine whether she is high risk; a vaginal culture is indicated for all pregnant clients if the client is in a high-risk group or if **infants** from previous pregnancies have developed neonatal conjunctivitis or pneumonia.
- Instruct the client in the importance of re-screening because reinfection can occur as the client nears term.
- Ensure that the sexual partner is treated.

 B. Syphilis

## 1. Description

- Syphilis is a chronic infectious disease caused by the organism *Treponema pallidum*.
- Transmission is by physical contact with syphilitic lesions, which usually are found on the skin, mucous membranes of the mouth, or genitals.
- The infection may cause abortion or premature **labor** and is passed to the fetus after the fourth month of pregnancy as congenital syphilis.

## 2. Assessment (Box 25-9)

## 3. Interventions

- Obtain a serum test (Venereal Disease Research Laboratory or rapid plasma reagin) for syphilis on the first prenatal visit; prepare to repeat the test at 36 weeks' gestation because the disease may be acquired after the initial visit.
- If the test result is positive, treatment with an antibiotic such as penicillin may be necessary.
- Instruct the client that treatment of her partner is necessary if infection is present.

**Box 25-9 Stages of Syphilis****Primary Stage**

Most infectious stage

Appearance of ulcerative, painless lesions produced by spirochetes at point of entry into the body

**Secondary Stage**

Highly infectious stage

Appearance of lesions about 6 weeks to 6 months after primary stage located anywhere on skin and mucous membranes

Generalized lymphadenopathy

**Tertiary Stage**

Entrance of spirochetes into internal organs, causing permanent damage; symptoms occur 10 to 30 years after untreated primary lesion

Invasion of central nervous system, causing meningitis, ataxia, general paresis, and progressive mental deterioration

Deleterious effects on aortic valve and aorta

C. Gonorrhea 

## 1. Description

- Gonorrhea is an infection caused by *Neisseria gonorrhoeae* that causes inflammation of the mucous membranes of the genital and urinary tracts.
- Transmission of the organism is by sexual intercourse.
- Infection may be transmitted to the **newborn's** eyes during **delivery**, causing blindness (ophthalmia neonatorum).

## 2. Assessment: Usually asymptomatic; vaginal discharge, urinary frequency, and lower abdominal pain possible

## 3. Interventions

- Obtain a vaginal culture during the initial prenatal examination to screen for gonorrhea; the culture may be repeated during the third trimester in high-risk clients.
- Instruct the client that treatment of her partner is necessary if infection is present.

D. Condyloma acuminatum (human papillomavirus) 

## 1. Description

- Condyloma acuminatum is caused by human papillomavirus.
- Infection affects the cervix, urethra, anus, penis, and scrotum.
- A culture is indicated for clients with a positive history or with active lesions, and weekly cultures may be done at week 35 or 36 of pregnancy until **delivery**; the test is performed to determine the route of **delivery**.
- Human papillomavirus is transmitted through sexual contact.

## 2. Assessment

- Infection produces small to large wart-like growths on the genitals.
- Cervical cell changes may be noted because human papillomavirus is associated with cervical malignancies.

## 3. Interventions

- Lesions are removed by the use of cytotoxic agents, cryotherapy, electrocautery, and laser.
- Encourage annual Papanicolaou smear.
- Sexual contact should be avoided until lesions are healed (condoms reduce transmission).

E. Trichomoniasis 

## 1. Description

- Trichomoniasis is caused by *Trichomonas vaginalis* and is transmitted via sexual contact.
- A normal saline wet smear of vaginal secretions indicates the presence of protozoa.
- Infection is associated with premature rupture of the membranes and postpartum endometritis.

2. Assessment
  - a. Yellowish to greenish, frothy, mucopurulent, copious, malodorous vaginal discharge
  - b. Inflammation of vulva, **vagina**, or both may occur
3. Interventions
  - a. Metronidazole (Flagyl) may be prescribed.
  - b. Sexual partner may need to be treated.

#### F. Bacterial vaginosis

1. Description
  - a. Caused by *Haemophilus vaginalis* (*Gardnerella vaginalis*) and transmitted via sexual contact
  - b. Associated with premature **labor** and birth
2. Assessment
  - a. Client complains of “fishy odor” to vaginal secretions and increased odor after intercourse.
  - b. Microscopic examination of vaginal secretions identifies the infection.
3. Interventions
  - a. Oral metronidazole (Flagyl) may be prescribed.
  - b. Sexual partner may need to be treated.

#### G. Vaginal candidiasis

1. Description
  - a. *Candida albicans* is the most common causative organism.
  - b. Predisposing factors include use of antibiotics, diabetes mellitus, and obesity.
  - c. Vaginal candidiasis is diagnosed by identifying spores of *Candida albicans*.
2. Assessment
  - a. Vulvar and vaginal pruritus
  - b. White, lumpy, cottage cheese–like discharge from **vagina**
3. Interventions
  - a. An antifungal vaginal preparation such as miconazole (Monistat) may be prescribed.
  - b. For extensive irritation and swelling, sitz baths may be prescribed.
  - c. Sexual partner may need to be treated.

### XXI. TUBERCULOSIS

#### A. Description

1. Highly communicable disease caused by *Mycobacterium tuberculosis*
2. Transmitted by the airborne route
3. Multidrug-resistant strains of tuberculosis can result from improper compliance, noncompliance with treatment programs, or development of mutations in tubercle bacillus.

#### B. Transmission

1. Transplacental transmission is rare.
2. Transmission can occur during birth through aspiration of infected **amniotic fluid**.
3. The **newborn** can become infected from contact with infected individuals.

- C. Risk to mother: Active disease during pregnancy has been associated with an increase in hypertensive disorders of pregnancy.
- D. Diagnosis: If a chest radiograph is required for the mother, it is done only after 20 weeks of gestation, and a lead shield for the abdomen is required.

Tuberculin skin testing is safe during pregnancy; however the health care provider may want to delay testing until after delivery.

#### E. Assessment

1. Mother
  - a. Possibly asymptomatic
  - b. Fever and chills
  - c. Night sweats
  - d. Weight loss
  - e. Fatigue
  - f. Cough with hemoptysis or green or yellow sputum
  - g. Dyspnea
  - h. Pleural pain
2. Neonate
  - a. Fever
  - b. Lethargy
  - c. Poor feeding
  - d. Failure to thrive
  - e. Respiratory distress
  - f. Hepatosplenomegaly
  - g. Meningitis
  - h. Disease may spread to all major organs

#### F. Interventions

1. Pregnant client
  - a. Administration of isoniazid (INH), pyrazinamide, and rifampin (Rifadin) daily for 9 months (as prescribed); ethambutol (Myambutol) is added if medication resistance is likely.
  - b. Pyridoxine (vitamin B<sub>6</sub>) should be administered with INH to the pregnant client to prevent fetal neurotoxicity caused by the INH.
  - c. Promote breast-feeding only if the client is noninfectious.
2. **Newborn**
  - a. Management focuses on preventing disease and treating early infection.
  - b. Skin testing is performed on the **infant** at birth, and the infant may be placed on INH therapy; the skin test is repeated in 3 to 4 months, and INH may be stopped if the skin test results remain negative.
  - c. If the skin test result is positive, the **infant** should receive INH for at least 6 months (as prescribed).
  - d. If the mother's sputum is free of organisms, the **infant** does not need to be isolated from the mother while in the hospital.

**XXII. URINARY TRACT INFECTION**

- A.** Description: A urinary tract infection can occur during pregnancy (pregnancy is a predisposing factor); if untreated, the client can develop pyelonephritis.
- B.** Predisposing conditions
1. History of urinary tract infections
  2. Sickle cell trait
  3. Poor hygiene
  4. Anemia
  5. Diabetes mellitus
- C.** Assessment
1. Possibly asymptomatic during pregnancy
  2. Burning and pain on urination
  3. Increased frequency of urination
  4. Lower abdominal pain and costovertebral angle tenderness
  5. Fever
  6. Proteinuria, hematuria, bacteriuria, and white blood cells in urine
- D.** Interventions
1. Monitor vital signs.
  2. Monitor fetal heart rate.
  3. Increase fluid intake and monitor intake and output.
  4. Monitor urine for consistency and odor.
  5. Monitor for signs and symptoms of pyelonephritis (dipstick test of urine for increase in protein, glucose, and ketone levels with each prenatal visit).
  6. Obtain urine sample for culture and sensitivity.
  7. Provide heat to lower abdomen or back.
  8. Administer antibiotics as prescribed.
  9. Instruct the client to complete the course of antibiotics if prescribed.
  10. Instruct the client regarding the need to repeat the culture after treatment is completed.

**MORE QUESTIONS ON THE CD!****Practice Questions**

- 236.** A nurse is providing instructions to a pregnant client with human immunodeficiency virus (HIV) infection regarding care to the newborn infant after delivery. The client asks the nurse about the feeding options that are available. The best response by the nurse is:
1. "You will need to bottle-feed the newborn infant."
  2. "You will need to feed the newborn infant by nasogastric tube feeding."
  3. "You will be able to breast-feed for 6 months and then will need to switch to bottle-feeding."
  4. "You will be able to breast-feed for 9 months and then will need to switch to bottle-feeding."
- 237.** A home care nurse visits a pregnant client who has a diagnosis of mild preeclampsia. Which assessment finding indicates a worsening of the preeclampsia and the need to notify the physician?
1. Urinary output has increased.
  2. Dependent edema has resolved.
  3. Blood pressure reading is at the prenatal baseline.
  4. The client complains of a headache and blurred vision.
- 238.** A stillborn infant was delivered in the birthing suite a few hours ago. After the delivery, the family remained together, holding and touching the infant. Which statement by the nurse would further assist the family in their initial period of grief?
1. "What can I do for you?"
  2. "Now you have an angel in heaven."
  3. "Don't worry, there is nothing you could have done to prevent this from happening."
  4. "We will see to it that you have an early discharge so that you don't have to be reminded of this experience."
- 239.** A nurse implements a teaching plan for a pregnant client who is newly diagnosed with gestational diabetes mellitus. Which statement made by the client indicates a need for further teaching?
1. "I should stay on the diabetic diet."
  2. "I should perform glucose monitoring at home."
  3. "I should avoid exercise because of the negative effects on insulin production."
  4. "I should be aware of any infections and report signs of infection immediately to my health care provider."
- 240.** A pregnant client in the last trimester has been admitted to the hospital with a diagnosis of severe preeclampsia. A nurse monitors for complications associated with the diagnosis and assesses the client for:
1. Enlargement of the breasts
  2. Complaints of feeling hot when the room is cool
  3. Periods of fetal movement followed by quiet periods
  4. Evidence of bleeding, such as in the gums, petechiae, and purpura
- 241.** A nurse in a maternity unit is reviewing the records of the clients on the unit. Which client would the nurse identify as being at the greatest risk for developing disseminated intravascular coagulation?
1. A primigravida with mild preeclampsia
  2. A primigravida who delivered a 10-lb infant 3 hours ago
  3. A gravida II who has just been diagnosed with dead fetus syndrome
  4. A gravida IV who delivered 8 hours ago and has lost 500 mL of blood

- 242.** A client in the first trimester of pregnancy arrives at a health care clinic and reports that she has been experiencing vaginal bleeding. A threatened abortion is suspected, and the nurse instructs the client regarding management of care. Which statement made by the client indicates a need for further instructions?
1. "I will watch for the evidence of the passage of tissue."
  2. "I will maintain strict bedrest throughout the remainder of the pregnancy."
  3. "I will count the number of perineal pads used on a daily basis and note the amount and color of blood on the pad."
  4. "I will avoid sexual intercourse until the bleeding has stopped, and for 2 weeks following the last evidence of bleeding."
- 243.** The nurse is assessing a pregnant client with type 1 diabetes mellitus about her understanding regarding changing insulin needs during pregnancy. The nurse determines that teaching is needed if the client makes which statement?
1. "I will need to increase my insulin dosage during the first 3 months of pregnancy."
  2. "My insulin dose will likely need to be increased during the second and third trimesters."
  3. "Episodes of hypoglycemia are more likely to occur during the first 3 months of pregnancy."
  4. "My insulin needs should return to normal within 7 to 10 days after birth if I am bottle-feeding."
- 244.** A pregnant client reports to a health care clinic, complaining of loss of appetite, weight loss, and fatigue. After assessment of the client, tuberculosis is suspected. A sputum culture is obtained and identifies *Mycobacterium tuberculosis*. The nurse provides instructions to the client regarding therapeutic management of the tuberculosis and the nurse tells the client that:
1. Therapeutic abortion is required.
  2. She will have to stay at home until treatment is completed.
  3. Medication will not be started until after delivery of the fetus.
  4. Isoniazid (INH) plus rifampin (Rifadin) will be required for 9 months.
- 245.** A nurse is providing instructions to a maternity client with a history of cardiac disease regarding appropriate dietary measures. Which statement, if made by the client, indicates an understanding of the information provided by the nurse?
1. "I should increase my sodium intake during pregnancy."
  2. "I should lower my blood volume by limiting my fluids."
  3. "I should maintain a low-calorie diet to prevent any weight gain."
  4. "I should drink adequate fluids and increase my intake of high-fiber foods."
- 246.** A clinic nurse is performing a psychosocial assessment of a client who has been told that she is pregnant. Which assessment finding indicates to the nurse that the client is at high risk for contracting human immunodeficiency virus (HIV)?
1. A client who has a history of intravenous drug use
  2. A client who has a significant other who is heterosexual
  3. A client who has a history of sexually transmitted diseases
  4. A client who has had one sexual partner for the past 10 years
- 247.** A nurse in a maternity unit is providing emotional support to a client and her husband who are preparing to be discharged from the hospital after the birth of a dead fetus. Which statement made by the client indicates a component of the normal grieving process?
1. "We want to attend a support group."
  2. "We never want to try to have a baby again."
  3. "We are going to try to adopt a child immediately."
  4. "We are okay, and we are going to try to have another baby immediately."
- 248.** A nurse evaluates the ability of a hepatitis B-positive mother to provide safe bottle-feeding to her infant during postpartum hospitalization. Which maternal action best exemplifies the mother's knowledge of potential disease transmission to the infant?
1. The mother requests that the window be closed before feeding.
  2. The mother holds the infant properly during feeding and burping.
  3. The mother tests the temperature of the formula before initiating feeding.
  4. The mother washes and dries her hands before and after self-care of the perineum and asks for a pair of gloves before feeding.

### Alternate Item Format: Multiple Response

**249.** A home care nurse is monitoring a pregnant client with gestational hypertension who is at risk for preeclampsia. At each home care visit, the nurse assesses the client for which classic signs of preeclampsia? **Select all that apply.**

- 1. Proteinuria
- 2. Hypertension
- 3. Low-grade fever
- 4. Generalized edema
- 5. Increased pulse rate
- 6. Increased respiratory rate

## ANSWERS

### 236. 1

**Rationale:** Perinatal transmission of human immunodeficiency virus (HIV) can occur during the antepartal period, during labor and birth, or in the postpartum period if the mother is breast-feeding. Clients who have HIV are advised not to breast-feed. There is no physiological reason why the newborn needs to be fed by nasogastric tube.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the transmission of HIV. Eliminate options 3 and 4 first because these options are comparable or alike in that they both address breast-feeding. From the remaining options, select option 1, knowing that it is unnecessary to feed the infant by nasogastric tube. Review feeding options for newborns of HIV-positive clients if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 751, 754). St. Louis: Saunders.

### 237. 4

**Rationale:** If the client complains of a headache and blurred vision, the physician should be notified because these are signs of worsening preeclampsia. Options 1, 2, and 3 are normal signs.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic word *worsening* in the question. Eliminate options 1, 2, and 3 because these options indicate normal findings. Review the signs that indicate a worsening of preeclampsia if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal-child nursing care* (4th ed., pp. 336, 342). St. Louis: Mosby.

### 238. 1

**Rationale:** When a loss or death occurs, the nurse should ensure that parents have been honestly told about the situation by their physician or others on the health care team. It is important for the nurse to be with the parents at this time and to use therapeutic communication techniques. The nurse must also consider cultural and religious practices and beliefs.

Option 1 provides a supportive, giving, and caring response. Options 2, 3, and 4 are blocks to communication and devalue the parents' feelings.

**Test-Taking Strategy:** Use the process of elimination and knowledge of therapeutic communication techniques to answer the question. Option 1 is the only option that reflects use of therapeutic communication techniques. Review these techniques and the nursing strategies for caring for parents who experience perinatal death if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Caring

**Content Area:** Maternity—Postpartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 601–602). St. Louis: Mosby.

### 239. 3

**Rationale:** Exercise is safe for a client with gestational diabetes mellitus and is helpful in lowering the blood glucose level. Dietary modifications are the mainstay of treatment, and the client is placed on a standard diabetic diet. Many clients are taught to perform blood glucose monitoring. If the client is not performing the blood glucose monitoring at home, it is performed at the clinic or health care provider's office. Signs of infection need to be reported to the health care provider.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *need for further teaching*. These words indicate a negative event query and the need to select an incorrect client statement. Noting these strategic words and the close-ended word *avoid* in option 3 will assist in answering the question. If you had difficulty with this question, review the teaching points for a client with gestational diabetes mellitus.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 641). St. Louis: Saunders.

### 240. 4

**Rationale:** Severe preeclampsia can trigger disseminated intravascular coagulation (DIC) because of the widespread damage to vascular integrity. Bleeding is an early sign of

DIC and should be reported to the health care provider if noted on assessment. Options 1, 2, and 3 are normal occurrences in the last trimester of pregnancy.

**Test-Taking Strategy:** Focus on the subject, a complication of severe preeclampsia. Eliminate options 1, 2, and 3 because they are normal occurrences in the last trimester of pregnancy. Review the assessment findings in DIC if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 367). St. Louis: Mosby.

### 241. 3

**Rationale:** In a pregnant client, disseminated intravascular coagulation (DIC) is a condition in which the clotting cascade is activated, resulting in the formation of clots in the microcirculation. Dead fetus syndrome is considered a risk factor for DIC. Severe preeclampsia is considered a risk factor for DIC; a mild case is not. Delivering a large infant is not considered a risk factor for DIC. Hemorrhage is a risk factor for DIC; however, a loss of 500 mL is not considered hemorrhage.

**Test-Taking Strategy:** Focus on the subject, the client at greatest risk for DIC. Think about the pathophysiology associated with DIC and recall that dead fetus syndrome is a risk factor. This will direct you to option 3. If you had difficulty answering this question, review the risk factors for DIC.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Maternity—Intrapartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal-child nursing care* (4th ed., p. 367). St. Louis: Mosby.

### 242. 2

**Rationale:** Strict bedrest throughout the remainder of the pregnancy is not required for a threatened abortion. The client is advised to curtail sexual activities until bleeding has ceased and for 2 weeks after the last evidence of bleeding or as recommended by the physician or other health care provider. The client is instructed to count the number of perineal pads used daily and to note the quantity and color of blood on the pad. The client also should watch for the evidence of the passage of tissue.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *need for further instructions* in the question. These words indicate a negative event query and the need to select an incorrect client statement. Noting the word *strict* in option 2 will assist in directing you to this option. Review therapeutic management for a threatened abortion if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 608). St. Louis: Saunders.

### 243. 1

**Rationale:** Insulin needs decrease in the first trimester of pregnancy because of increased insulin production by the pancreas and increased peripheral sensitivity to insulin. The statements in options 2, 3, and 4 are accurate and signify that the client understands control of her diabetes during pregnancy.

**Test-Taking Strategy:** Note the strategic words *teaching is needed*. These words indicate a negative event query and the need to select an incorrect client statement. Eliminate options 2, 3, and 4 because they are accurate statements. Remember that insulin needs decrease in the first trimester of pregnancy. Review the insulin needs of the pregnant client with diabetes mellitus if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 297–298). St. Louis: Mosby.

### 244. 4

**Rationale:** More than one medication may be used to prevent the growth of resistant organisms in a pregnant client with tuberculosis. Treatment must continue for a prolonged period. The preferred treatment for the pregnant client is isoniazid (INH) plus rifampin daily for 9 months. Ethambutol is added initially if medication resistance is suspected. Pyridoxine (vitamin B<sub>6</sub>) often is administered with INH to prevent fetal neurotoxicity. The client does not need to stay at home during treatment, and therapeutic abortion is not required.

**Test-Taking Strategy:** Focus on the subject, the therapeutic management for a client with tuberculosis. Recalling the pathophysiology associated with tuberculosis and its treatment will assist in eliminating options 1, 2, and 3. If you had difficulty with this question, review the treatment measures for the client with tuberculosis.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Antepartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 658). St. Louis: Saunders.

### 245. 4

**Rationale:** Valsalva maneuver should be avoided in clients with cardiac disease because it can cause blood to rush to the heart and overload the cardiac system. Constipation can cause the client to use Valsalva maneuver. High-fiber foods are important. A low-calorie diet is not recommended during pregnancy and could be harmful to the fetus. Diets low in fluid can cause a decrease in blood volume, which could deprive the fetus of nutrients, so adequate fluid intake and high-fiber foods are important. Sodium should be restricted as prescribed by the physician because excess

sodium would cause an overload to the circulating blood volume and contribute to cardiac complications.

**Test-Taking Strategy:** Use the process of elimination. Think about the physiology of the cardiac system, maternal and fetal needs, and the factors that increase the workload on the heart. This will direct you to option 4. If you had difficulty with this question, review nursing measures for a pregnant client with cardiac disease.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Maternity—Antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 314). St. Louis: Mosby.

#### 246. 1

**Rationale:** Human immunodeficiency virus (HIV) is transmitted by intimate sexual contact and the exchange of body fluids, exposure to infected blood, and passage from an infected woman to her fetus. Clients who fall into the high-risk category for HIV infection include individuals with persistent and recurrent sexually transmitted infections, individuals who have a history of multiple sexual partners, and individuals who have used intravenous drugs. A client with a heterosexual partner, particularly a client who has had only one sexual partner in 10 years, does not have a high risk for contracting HIV.

**Test-Taking Strategy:** Use the process of elimination. Recalling that exchange of blood and body fluids places the client at high risk for HIV infection will direct you to option 1. If you had difficulty with this question, review the risk factors for HIV.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 97). St. Louis: Mosby.

#### 247. 1

**Rationale:** A support group can help the parents work through their pain by nonjudgmental sharing of feelings. Option 1 identifies a statement that would indicate positive, normal grieving. Although the other options may indicate reactions of the client and significant other, they are not specifically a part of the normal grieving process.

**Test-Taking Strategy:** Read all the options carefully before selecting an answer and focus on the subject of the question, the normal grieving process. Note that options 2, 3, and 4 are comparable or alike in that they relate to childbearing. If you had difficulty with this question, review the components of the normal grieving process.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Caring

**Content Area:** Maternity—Postpartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 606). St. Louis: Mosby.

#### 248. 4

**Rationale:** Hepatitis B virus is highly contagious and is transmitted by direct contact with blood and body fluids of infected persons. The rationale for identifying childbearing clients with this disease is to provide adequate protection of the fetus and the newborn, to minimize transmission to other individuals, and to reduce maternal complications. Option 4 provides the best evaluation of maternal understanding of disease transmission. Option 1 will not affect disease transmission. Options 2 and 3 are appropriate feeding techniques for bottle-feeding, but do not minimize disease transmission for hepatitis B.

**Test-Taking Strategy:** Focus on the subject of the question, disease transmission to the infant. This focus and the process of elimination will direct you to option 4. Review measures to prevent transmission of hepatitis if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Maternity—Postpartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 750–751). St. Louis: Mosby.

### ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

#### 249. 1, 2, 4

**Rationale:** The three classic signs of preeclampsia are hypertension, generalized edema, and proteinuria. A low-grade fever, increased pulse rate, or increased respiratory rate is not associated with preeclampsia.

**Test-Taking Strategy:** Focus on the subject, the classic signs of preeclampsia. Thinking about the pathophysiology associated with preeclampsia will direct you to the correct options. Remember that the three classic signs of preeclampsia are hypertension, generalized edema, and proteinuria. Review the signs of preeclampsia if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Antepartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 337). St. Louis: Mosby.

# Labor and Delivery

## I. PROCESS OF LABOR—FOUR P's

### A. Description

1. **Labor:** Coordinated sequence of involuntary, intermittent uterine contractions
2. **Delivery:** Actual event of birth

 **B.** Four major factors (four P's) interact during normal childbirth; the four P's are interrelated and depend on each other for a safe **delivery** (Box 26-1).

### C. Powers: Uterine contractions

1. Forces acting to expel the fetus
2. Effacement: Shortening and thinning of the cervix during the first stage of **labor**
3. Dilation: Enlargement of cervical os and cervical canal during the first stage of **labor**
4. Pushing efforts of mother during the second stage

**D.** Passageway: The mother's rigid bony pelvis and the soft tissues of the cervix, pelvic floor, **vagina**, and introitus (external opening to the **vagina**)

**E.** Passenger: The fetus, membranes, and **placenta**

**F.** Psyche: A woman's emotional structure that can determine her entire response to **labor** and influence physiological and psychological functioning; the mother may experience anxiety or fear.

 **G.** Attitude

1. Attitude is the relationship of the fetal body parts to one another.
2. Normal intrauterine attitude is flexion, in which the fetal back is rounded, the head is forward on the chest, and the arms and legs are folded in against the body. The other attitude, extension, tends to present larger fetal diameters.

 **H.** Lie

1. Relationship of the spine of the fetus to the spine of the mother
2. Longitudinal or vertical (Fig. 26-1)
  - a. Fetal spine is parallel to the mother's spine.
  - b. Fetus is in cephalic or breech presentation.
3. Transverse or horizontal (see Fig. 26-1)
  - a. Fetal spine is at a right angle, or perpendicular, to the mother's spine.
  - b. Presenting part is the shoulder.
  - c. **Delivery** by cesarean section is necessary.

### Box 26-1 Four P's

Powers  
Passageway  
Passenger  
Psyche

**▲ FIGURE 26-1** Fetal lie. **A**, In a longitudinal lie, the long axis of the fetus is parallel to the long axis of the mother. **B**, In a transverse lie, the long axis of the fetus is at a right angle to the long axis of the mother. The mother's abdomen has a wide, short appearance. (From McKinney, E., James, S., Murray, S., & Ashwill, J. [2009]. *Maternal-child nursing* [3rd ed.]. St. Louis: Saunders.)

### I. Presentation

1. Portion of the fetus that enters the pelvic inlet first
2. Cephalic: Head first
  - a. Cephalic is the most common presentation.
  - b. Cephalic presentation has four variations—vertex, military, brow, and face.
3. Breech: Buttocks present first.
  - a. **Delivery** by cesarean section may be required, although vaginal birth is often possible.
  - b. Breech presentation has three variations—frank, full (complete), and footling

▲ **FIGURE 26-2** Fetal vertex (occiput) presentations in relation to the front, back, or side of the maternal pelvis. (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed.]. St. Louis: Mosby.)

#### 4. Shoulder

- a. Fetus is in a transverse lie, or the arm, back, abdomen, or side could present.
- b. If the fetus does not spontaneously rotate, or if it is impossible to turn the fetus manually, a cesarean section may need to be performed.

**J.** Presenting part: The specific fetal structure lying nearest to the cervix

**K.** Position: Relationship of assigned area of the presenting part or landmark to the maternal pelvis (Fig. 26-2, Box 26-2)

#### L. Station

1. The measurement of the progress of descent in centimeters above or below the midplane from the presenting part to the ischial spine
2. Station 0: At ischial spine
3. Minus station: Above ischial spine
4. Plus station: Below ischial spine
5. Engagement: When the widest diameter of the presenting part has passed the inlet; usually corresponds to a 0 station

### Box 26-2 Fetal Positions

|     |                          |
|-----|--------------------------|
| ROA | Right occipitoanterior   |
| LOA | Left occipitoanterior    |
| ROP | Right occipitoposterior  |
| LOP | Left occipitoposterior   |
| ROT | Right occipitotransverse |
| LOT | Left occipitotransverse  |
| RMA | Right mentum anterior    |
| LMA | Left mentoanterior       |
| RMP | Right mentoposterior     |
| LSA | Left sacroanterior       |
| LSP | Left sacroposterior      |

## II. MECHANISMS OF LABOR (Box 26-3)

### A. Assessment

1. Lightening or dropping: Is also known as engagement and occurs when the fetus descends into the pelvis about 2 weeks before **delivery**; lightening or dropping is most noticeable in first pregnancies
2. Braxton Hicks contractions increase.

**Box 26-3 Mechanisms of Labor****Engagement**

Engagement is the mechanism whereby the fetus nestles into the pelvis.

Engagement also is termed *lightening* or *dropping*.

**Descent**

Descent is the process that the fetal head undergoes as it begins its journey through the pelvis.

Descent is a continuous process from the time of engagement until birth and is assessed by the measurement called station.

**Flexion**

Flexion is a process of nodding of the fetal head forward toward the fetal chest.

**Internal Rotation**

Internal rotation of the fetus occurs most commonly from the occipitotransverse position, assumed at engagement into the pelvis, to the occipitoanterior position while continuously descending.

**Extension**

Extension enables the head to emerge when the fetus is in a cephalic position.

Extension begins after the head crowns.

Extension is complete when the head passes under the symphysis pubis and occiput, and the anterior fontanel, brow, face, and chin pass over the sacrum and coccyx and are over the perineum.

**Restitution**

Restitution is realignment of the fetal head with the body after the head emerges.

**External Rotation**

The shoulders externally rotate after the head emerges and restitution occurs, so that the shoulders are in the anteroposterior diameter of the pelvis.

**Expulsion**

Expulsion is the birth of the entire body.

3. The vaginal mucosa is congested, and vaginal discharge increases.
4. Brownish or blood-tinged cervical mucus is passed.
5. Cervix ripens, becomes soft and partly effaced, and may begin to dilate.
6. The mother has a sudden burst of energy, also known as “nesting,” often 24 to 48 hours before onset of **labor**.
7. Weight loss of 1 to 3 lb results from fluid shifts produced by the changes in progesterone and estrogen levels 24 to 48 hours before the onset of **labor**.
8. Spontaneous rupture of membranes occurs.

- B. True labor:** Contractions may manifest as back pain in some women; contractions often resemble menstrual cramps during early **labor** (Box 26-4).
- C. False labor:** Also known as prodromal **labor**, contractions are felt in the abdomen and groin and may be more annoying than painful (see Box 26-4).

 In true labor, contractions increase in duration and intensity. In false labor, contractions are irregular and do not produce dilation, effacement, or descent.

**Box 26-4 True Labor and False Labor****True Labor**

Contractions occur regularly, become stronger, last longer, and occur closer together.

Cervical dilation and effacement are progressive.

The fetus usually becomes engaged in the pelvis and begins to descend.

**False Labor**

False labor does not produce dilation, effacement, or descent. Contractions are irregular, without progression.

Activity, such as walking, often relieves false labor.

**Example:** If a woman has been sleeping and wakes up with contractions, gets up, and moves around, and her contractions become stronger and closer together, this is true labor. If the contractions go away, this is false labor.

- D. Irregular knobs and lumps,** which may be the hands, feet, elbows, and knees, are felt on the opposite side of the abdomen.

**IV. BREATHING TECHNIQUES** (Box 26-5)

- A.** Provide a focus during contractions, interfering with pain sensory transmission
- B.** Promote relaxation and oxygenation
- C.** Begin with simple breathing patterns and progress to more complex ones as needed.

**V. FETAL MONITORING**

- A. Description**
  1. The fetal monitor displays the fetal heart rate (FHR).

**III. LEOPOLD'S MANEUVERS**

- A.** Description: Methods of palpation to determine presentation and position of the fetus and aid in location of fetal heart sounds
- B.** If the head is in the fundus, a hard, round, movable object is felt. The buttocks feel soft and have an irregular shape and are more difficult to move.
- C.** The fetus' back, which is a smooth, hard surface, should be felt on one side of the abdomen.

**Box 26-5 Breathing Techniques****First-Stage Breathing****Cleansing Breath**

Each contraction begins and ends with a deep inspiration and expiration.

**Slow-Paced Breathing**

Slow-paced breathing promotes relaxation.

Slow-paced breathing is used as long as possible during labor.

**Modified-Paced Breathing**

Modified-paced breathing is used when slow-paced breathing is no longer effective.

Breathing is shallow and fast.

**Pattern-Paced Breathing**

Pattern-paced breathing sometimes is referred to as pant-blow.

After a certain number of breaths (modified-paced breathing), the woman exhales with a slight blow, and then begins modified-paced breathing again.

**Breathing to Prevent Pushing**

The woman blows repeatedly using short puffs when the urge to push is strong.

**Second-Stage Breathing**

Several variations of breathing can be used in the pushing stage of labor, and the woman may grunt, groan, sigh, or moan as she pushes. Prolonged breath holding while pushing with a closed glottis may result in a decrease in cardiac output. If breath holding while pushing is used, the open glottis method or limiting breath holding to less than 6 to 8 seconds should be done.

2. The device monitors uterine activity.
  3. The monitor assesses frequency, duration, and intensity of contractions.
  4. The monitor assesses FHR in relation to maternal contractions.
  5. Baseline FHR is measured between contractions; the normal FHR at term is 120 to 160 beats/min.
- B.** External fetal monitoring
1. External fetal monitoring is noninvasive and is performed using a tocotransducer or Doppler ultrasonic transducer.
  2. Leopold's maneuvers are performed to determine on which side the fetal back is located, and the ultrasound transducer is placed over this area (fasten with a belt).
  3. The tocotransducer is placed over the fundus of the uterus where contractions feel the strongest (fasten with a belt).
  4. The client is allowed to assume a comfortable position, avoiding vena cava compression (maternal supine hypotensive syndrome).
  5. The preferred position is to have the client lie on her side to increase perfusion.

**Box 26-6 Variability in Fetal Heart Rate**

Absent variability: Undetected variability

Minimal variability: Greater than undetected but not more than 5 beats/min

Moderate variability: Fetal heart rate fluctuations are 6 to 25 beats/min

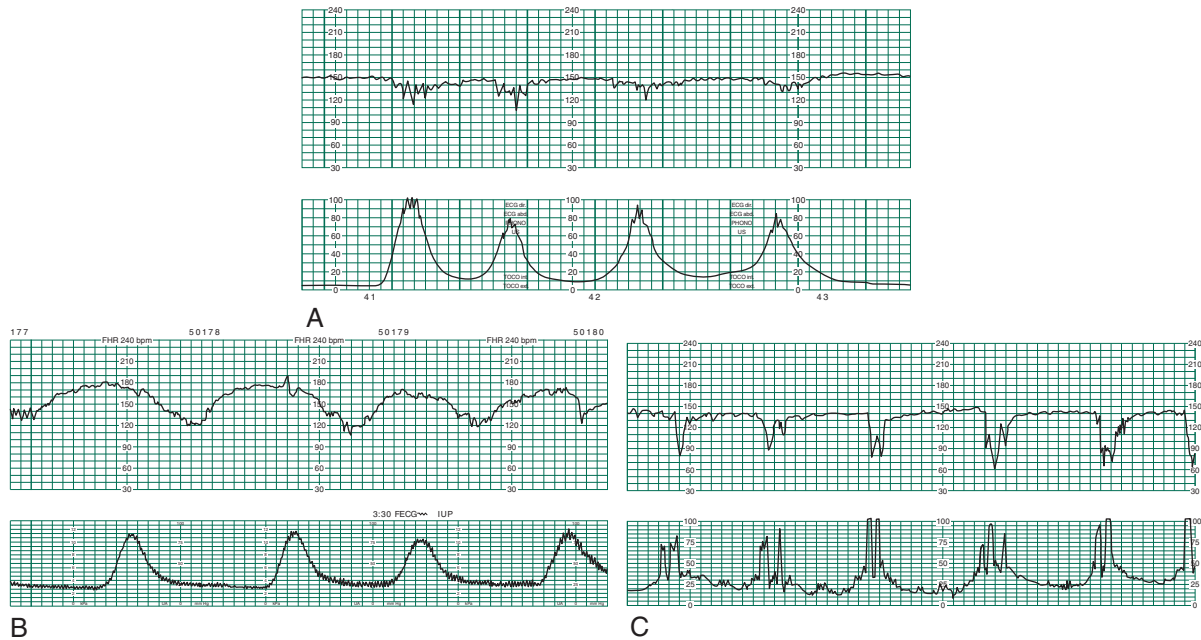

Marked variability: Fetal heart rate fluctuations are greater than 25 beats/min

- C.** Internal fetal monitoring
1. Internal fetal monitoring is invasive and requires rupturing of the membranes and attaching an electrode to the presenting part of the fetus.
  2. The client must be dilated 2 to 3 cm to perform internal monitoring.
- D.** Periodic patterns in FHR
1. Fetal bradycardia and tachycardia
    - a. Bradycardia: FHR is less than 120 beats/min for 10 minutes or longer.
    - b. Tachycardia: FHR is more than 160 beats/min for 10 minutes or longer.

**!** If fetal bradycardia or tachycardia occurs, change the position of the mother, administer oxygen, and assess the mother's vital signs. Notify the health care provider as soon as possible.

2. Variability (Box 26-6)
  - a. Fluctuations in baseline FHR
  - b. Absent or undetected variability is considered nonreassuring.
  - c. Decreased variability can result from fetal hypoxemia, acidosis, or certain medications.
  - d. A temporary decrease in variability can occur when the fetus is in a sleep state (sleep states do not usually last longer than 30 minutes).
3. Accelerations
  - a. Brief, temporary increases in FHR of at least 15 beats more than baseline and lasting at least 15 seconds
  - b. Usually are a reassuring sign, reflecting a responsive, nonacidotic fetus
  - c. Usually occur with fetal movement
  - d. May be nonperiodic (having no relation to contractions) or periodic
  - e. May occur with uterine contractions, vaginal examinations, or mild cord compression, or when the fetus is in a breech presentation.
4. Early decelerations (Fig. 26-3)
  - a. Early decelerations are decreases in FHR below baseline; the rate at the lowest point of the deceleration usually remains greater than 100 beats/min.
  - b. Early decelerations occur during contractions as the fetal head is pressed against the

**▲ FIGURE 26-3** Deceleration patterns. **A**, Early decelerations caused by head compression. **B**, Late decelerations caused by uteroplacental insufficiency. **C**, Variable decelerations caused by cord compression. (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed.]. St. Louis: Mosby.)

mother's pelvis or soft tissues, such as the cervix, and return to baseline FHR by the end of the contraction.

- c. Tracing shows a uniform shape and mirror image of uterine contractions.
  - d. Early decelerations are not associated with fetal compromise and require no intervention.
  5. Late decelerations (see Fig. 26-3)
    - a. Late decelerations are nonreassuring patterns that reflect impaired placental exchange or uteroplacental insufficiency.
    - b. The patterns look similar to early decelerations, but begin well after the contraction begins and return to baseline after the contraction ends.
    - c. The degree of decline in FHR from baseline is not related to the amount of uteroplacental insufficiency.
- ! Interventions for late decelerations include improving placental blood flow and fetal oxygenation.**
6. Variable decelerations (see Fig. 26-3)
    - a. Variable decelerations are caused by conditions that restrict flow through the umbilical cord.
    - b. Variable decelerations do not have the uniform appearance of early and late decelerations.
    - c. The shape, duration, and degree of decline below baseline FHR are variable; these fall and rise abruptly with the onset and relief of cord compression.
    - d. Variable decelerations also may be nonperiodic, occurring at times unrelated to contractions.
    - e. Baseline rate and variability are considered when evaluating variable decelerations.

### Box 26-7 Nonreassuring FHR Patterns

Bradycardia  
 Tachycardia  
 Late decelerations  
 Prolonged decelerations  
 Hypertonic uterine activity  
 Decreased or absent variability  
 Variable decelerations falling to less than 70 beats/min for longer than 60 seconds

- f. Variable decelerations are significant when FHR repeatedly declines to less than 70 beats/min and persists at that level for at least 60 seconds before returning to baseline.
7. Hypertonic uterine activity
  - a. Assessment of uterine activity includes frequency, duration, intensity of contractions, and uterine resting tone.
  - b. The **uterus** should relax between contractions for 60 seconds or longer.
  - c. Uterine contraction intensity is about 50 to 75 mm Hg (with intrauterine catheter) during **labor** and may reach 110 mm Hg with pushing during the second stage.
  - d. The average resting tone is 5 to 15 mm Hg.
  - e. In hypertonic uterine activity, the uterine resting tone between contractions is high, reducing uterine blood flow and decreasing fetal oxygen supply.
8. Nonreassuring FHR patterns (Box 26-7)
9. Interventions for nonreassuring patterns (see Priority Nursing Actions)

### PRIORITY NURSING ACTIONS!

#### Actions to Take for a Nonreassuring Fetal Heart Rate Pattern

1. Identify the cause.
2. Discontinue oxytocin (Pitocin) infusion.
3. Change the mother's position.
4. Administer oxygen by face mask at 8 to 10 L/min and infuse intravenous fluids as prescribed.
5. Prepare to initiate continuous electronic fetal monitoring with internal devices if not contraindicated.
6. Prepare for cesarean delivery if necessary.
7. Document the event, actions taken, and the mother's response.

Nonreassuring fetal heart rate patterns include bradycardia, tachycardia, late decelerations, prolonged decelerations, hypertonic uterine activity, decreased or absent variability, or variable decelerations falling to less than 70 beats/min for longer than 60 seconds. If a nonreassuring fetal heart rate pattern is noted, the physician or nurse-midwife is notified as soon as possible (the nurse stays with the client and asks another nurse to contact the health care provider). The nurse needs to identify the cause of the pattern immediately. This includes checking for a prolapsed umbilical cord and checking maternal vital signs to identify hypotension, hypertension, or fever that can contribute to the fetal response associated with the nonreassuring pattern. If the mother is receiving an oxytocin (Pitocin) infusion, it is stopped because oxytocin causes uterine stimulation, which can worsen the nonreassuring pattern. A tocolytic may be prescribed. The mother is repositioned because this may improve placental perfusion (avoid the supine position). Oxygen is administered by face mask at 8 to 10 L/min to increase maternal blood oxygen saturation making more oxygen available to the fetus, and intravenous fluids are infused to expand the mother's blood volume and improve placental perfusion. If not contraindicated, the nurse prepares to initiate continuous electronic fetal monitoring with internal devices. Cesarean delivery may be necessary, and the nurse should prepare for this procedure. Birth preparation should also include neonatal resuscitation. The nurse documents the event, actions taken, the mother's response, and any other pertinent data.

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 397). St. Louis: Saunders.

## VI. FOUR STAGES OF LABOR (Table 26-1)

### A. Stage 1: Latent phase

1. Description: Stage 1 is the longest. A **labor** curve, often called a Friedman curve, may be used to identify whether a woman's cervical dilation is progressing at the expected rate (Fig. 26-4).
2. Assessment
  - a. Cervical dilation is 1 to 4 cm.
  - b. Uterine contractions occur every 15 to 30 minutes, are 15 to 30 seconds in duration, and are of mild intensity.

**TABLE 26-1** Four Stages of Labor

| First Stage  | Second Stage  | Third Stage  | Fourth Stage  |
|--|---|--|---|
| Effacement and dilation of cervix  | Expulsion of fetus  | Separation of placenta   | Physical recovery   |
| Three stages—latent, active, and transition  | Pushing stage   | Expulsion of placenta  | 1–4 hr after expulsion of placenta                                  |
| Mother is talkative and eager in latent phase, becoming tired, restless, and anxious as labor intensifies and contractions become stronger | Mother has intense concentration on pushing with contractions; may fall asleep between contractions | Mother is relieved after birth of infant; mother is usually very tired | Mother is tired, but is eager to become acquainted with her newborn |

### 3. Interventions

- a. Encourage mother and partner to participate in care.
- b. Assist with comfort measures, changes of position, and ambulation.
- c. Keep mother and partner informed of progress.
- d. Offer fluids and ice chips.
- e. Encourage voiding every 1 to 2 hours.

### B. Stage 1: Active phase

#### 1. Assessment

- a. Cervical dilation is 4 to 7 cm.
- b. Uterine contractions occur every 3 to 5 minutes, are 30 to 60 seconds in duration, and are of moderate intensity.

#### 2. Interventions

- a. Encourage maintenance of effective breathing patterns.
- b. Provide a quiet environment.
- c. Keep mother and partner informed of progress.
- d. Promote comfort with back rubs, sacral pressure, pillow support, and position changes.
- e. Instruct partner in effleurage (light stroking of abdomen).
- f. Offer fluids and ice chips and ointment for dry lips.
- g. Encourage voiding every 1 to 2 hours.

### C. Stage 1: Transition phase

#### 1. Assessment

- a. Cervical dilation is 8 to 10 cm.
- b. Uterine contractions occur every 2 to 3 minutes, are 45 to 90 seconds in duration, and are of strong intensity.

#### 2. Interventions

- a. Encourage rest between contractions.
- b. Wake mother at beginning of contraction so she can begin breathing pattern.

**▲ FIGURE 26-4** A labor curve, often called a Friedman curve, may be used to identify whether a woman's cervical dilation is progressing at the expected rate. The symbol for station (X) may be added to the labor curve. Typical labor curves for a multiparous woman and a nulliparous woman are illustrated for comparison of patterns. (From McKinney, E., James, S., Murray, S., & Ashwill, J. [2009]. *Maternal-child nursing* [3rd ed.]. St. Louis: Saunders.)

- c. Keep mother and partner informed of progress.
  - d. Provide privacy.
  - e. Offer fluids and ice chips and ointment for dry lips.
  - f. Encourage voiding every 1 to 2 hours.
- D. Interventions throughout stage 1**
1. Monitor maternal vital signs.
  2. Monitor FHR via ultrasound Doppler, fetoscope, or electronic fetal monitor.
  3. Assess FHR before, during, and after a contraction, noting that the normal FHR is 120 to 160 beats/min.
  4. Monitor uterine contractions by palpation or tocodynamometer, determining frequency, duration, and intensity.
  5. Assess status of cervical dilation and effacement.
  6. Assess fetal station presentation and position by Leopold's maneuvers.
  7. Assist with pelvic examination and prepare for a fern test.
- ⚠ Assess the color of the amniotic fluid if the membranes have ruptured because meconium-stained fluid can indicate fetal distress.**
- E. Stage 2**
1. Assessment
    - a. Cervical dilation is complete.
    - b. Progress of labor is measured by descent of fetal head through the birth canal (change in fetal station).
    - c. Uterine contractions occur every 2 to 3 minutes, lasting 60 to 75 seconds, and are of strong intensity.
    - d. Increase in bloody show occurs.
    - e. Mother feels urge to bear down; assist mother in pushing efforts.
  2. Interventions
    - a. Perform assessments every 5 minutes.
    - b. Monitor maternal vital signs.
    - c. Monitor FHR via ultrasound Doppler, fetoscope, or electronic fetal monitor.
    - d. Assess FHR before, during, and after a contraction, noting that normal FHR is 120 to 160 beats/min.
    - e. Monitor uterine contractions by palpation or tocodynamometer, determining frequency, duration, and intensity.
    - f. Provide mother with encouragement and praise and provide for rest between contractions.
    - g. Keep mother and partner informed of progress.
    - h. Maintain privacy.
    - i. Provide ice chips and ointment for dry lips.
    - j. Assist mother into a position that promotes comfort and facilitates pushing efforts, such as lithotomy, semisitting, kneeling, side-lying, or squatting.
    - k. Monitor for signs of approaching birth, such as perineal bulging or visualization of the fetal head.
    - l. Prepare for birth (expulsion of the fetus).

**F. Stage 3****1. Assessment**

- a. Contractions occur until the **placenta** is expelled.
- b. Placental separation and expulsion occur.
- c. Expulsion of the **placenta** occurs 5 to 30 minutes after the birth of the infant.
- d. Schultze mechanism: Center portion of the **placenta** separates first, and its shiny fetal surface emerges from the **vagina**.
- e. Duncan mechanism: Margin of the **placenta** separates, and the dull, red, rough maternal surface emerges from the **vagina** first.

**2. Interventions**

- a. Assess maternal vital signs.
- b. Assess uterine status.
- c. Provide parents with an explanation regarding expulsion of the **placenta**.
- d. After expulsion of the **placenta**, uterine fundus remains firm and is located 2 fingerbreadths below the umbilicus.
- e. Examine **placenta** for cotyledons and membranes to verify that it is intact.
- f. Assess mother for shivering and provide warmth.
- g. Promote parental-neonatal attachment.

**G. Stage 4****1. Description: Period 1 to 4 hours after delivery****2. Assessment**

- a. Blood pressure returns to prelabor level.
- b. Pulse is slightly lower than during **labor**.
- c. Fundus remains contracted, in the midline, 1 or 2 fingerbreadths below the umbilicus.

 **Monitor lochia discharge.** Lochia may be moderate in amount and red in color in stage 4.

**3. Interventions**

- a. Perform maternal assessments every 15 minutes for 1 hour, every 30 minutes for 1 hour, and hourly for 2 hours (or as per agency policy).
- b. Provide warm blankets.
- c. Apply ice packs to the perineum.
- d. Massage the **uterus** if needed, and teach the mother to massage the **uterus**.
- e. Provide breast-feeding support as needed.
- f. See Chapter 30 for information on caring for the **newborn**.

**VII. ANESTHESIA****A. Local anesthesia**

1. Local anesthesia is used for blocking pain during episiotomy.
2. Local anesthesia is administered just before the birth of the infant.
3. The anesthetic has no effect on the fetus.

**B. Pudendal block**

1. A pudendal block is administered just before the birth of the infant.
2. Injection site is at the pudendal nerve through a transvaginal route.
3. Anesthetic blocks the perineal area for episiotomy.
4. Its effect lasts about 30 minutes.
5. Anesthetic has no effect on contractions or the fetus.

**C. Lumbar epidural block**

1. Injection site is in epidural space at L3 to L4.
2. The block is administered after **labor** is established or just before a scheduled cesarean birth.
3. The anesthetic relieves pain from contractions and numbs the **vagina** and perineum.
4. The block may cause hypotension, bladder distention, and a prolonged second stage.
5. The anesthetic does not cause a headache because the dura mater is not penetrated.
6. Assess maternal blood pressure and assess bladder frequently.
7. Maintain the mother in a side-lying position or place a rolled blanket beneath the right hip to displace the **uterus** from the vena cava.
8. Administer intravenous fluids as prescribed.
9. Increase fluids as prescribed if hypotension occurs.
10. Observe for any adverse effects from opioid epidurals, such as nausea and vomiting, pruritus, or respiratory depression.

**D. Intrathecal opioid analgesics**

1. The medication is injected into the subarachnoid space and has a rapid onset of action.
2. It may be used in combination with a lumbar epidural block.

**E. Subarachnoid (spinal) block**

1. Injection site is in the spinal subarachnoid space at L3 to L5.
2. The block is administered just before birth.
3. The anesthetic relieves uterine and perineal pain and numbs the **vagina**, perineum, and lower extremities.
4. The anesthetic may cause maternal hypotension.
5. The anesthetic may cause postpartum headache.
6. The mother must lie flat for 8 to 12 hours after spinal injection.
7. Administer intravenous fluids as prescribed.

**F. General anesthesia**

1. General anesthesia may be used for some surgical interventions.
2. The mother is not awake.

 **General anesthesia presents a danger of respiratory depression, vomiting, and aspiration.**

**TABLE 26-2** Factors of the Bishop Score

|                            | Score     |             |          |        |
|----------------------------|-----------|-------------|----------|--------|
|                            | 0         | 1           | 2        | 3      |
| Dilation of cervix (cm)    | 0         | 1-2         | 3-4      | >5     |
| Effacement of cervix (%)   | 0-30      | 40-50       | 60-70    | >80    |
| Consistency of cervix      | Firm      | Medium      | Soft     | —      |
| Position of cervix         | Posterior | Midposition | Anterior | —      |
| Station of presenting part | -3        | -2          | -1       | +1, +2 |

### VIII. OBSTETRICAL PROCEDURES

#### A. Bishop score (Table 26-2)

1. The Bishop score is used to determine maternal readiness for **labor** and evaluates cervical status and fetal position.
2. The Bishop score is indicated before the induction of **labor**.
3. The five factors are assigned a score of 0 to 3, and the total score is calculated.
4. A score of 6 or more indicates a readiness for **labor** induction.

#### B. Induction

1. Induction is a deliberate initiation of uterine contractions that stimulates **labor**.
2. Elective induction may be accomplished by oxytocin (Pitocin) infusion.
3. Obtain baseline tracing of uterine contractions and FHR.
4. Increase the intravenous dosage of oxytocin as prescribed only after assessing contractions, FHR, and maternal blood pressure and pulse.
5. Do not increase the rate of oxytocin when the desired contraction pattern is obtained (contraction frequency of 2 to 3 minutes and lasting 60 seconds).

 An oxytocin (Pitocin) infusion is discontinued if uterine contraction frequency is less than 2 minutes or duration is longer than 90 seconds, or if fetal distress is noted.

#### C. Amniotomy

1. Artificial rupture of the membranes is performed by the physician or nurse-midwife to stimulate **labor**.
2. Amniotomy is performed if the fetus is at 0 or a plus station.
3. Amniotomy increases the risk of prolapsed cord and infection.

4. Monitor FHR before and after amniotomy.
5. Record time of amniotomy, FHR, and characteristics of the fluid.
6. Meconium-stained **amniotic fluid** may be associated with fetal distress.
7. Bloody **amniotic fluid** may indicate abruptio placentae or fetal trauma.
8. An unpleasant odor to **amniotic fluid** is associated with infection.
9. Polyhydramnios is associated with maternal diabetes and certain congenital disorders.
10. Oligohydramnios is associated with intrauterine growth restriction and congenital disorders.
11. Expect more variable decelerations after rupture of the membranes as a result of possible cord compression during contractions.
12. Limit client activity if prescribed.

#### D. External version

1. External version is the manipulation of the fetus from an abnormal position into a normal presentation.
2. External version is indicated for an abnormal presentation that exists after the thirty-fourth week.
3. Monitor vital signs.
4. If the mother is Rh-negative, ensure that Rh<sub>o</sub>(D) immune globulin (RhoGAM) was given at 28 weeks' gestation.
5. Prepare for a nonstress test to evaluate fetal well-being.
6. Intravenous fluids and tocolytic therapy may be administered to relax the **uterus** and permit easier manipulation of the fetus.
7. Ultrasound is used during the procedure to evaluate fetal position and placental placement and guide direction of the fetus.
8. The abdominal wall is manipulated to direct the fetus into a cephalic presentation if possible.
9. Monitor blood pressure to identify vena cava compression.
10. Monitor for unusual pain.
11. After the procedure, do the following:
  - a. Perform a nonstress test to evaluate fetal well-being.
  - b. Monitor for uterine activity, bleeding, ruptured membranes, and decreased fetal activity.
  - c. With Rh-negative clients, perform Kleihauer-Betke test as prescribed to detect the presence and amount of fetal blood in the maternal circulation and to identify clients who need additional Rh<sub>o</sub>(D) immune globulin.

#### E. Episiotomy

1. An episiotomy is an incision made into the perineum to enlarge the vaginal outlet and facilitate **delivery**.
2. Check the episiotomy site.

3. Institute measures to relieve pain.
4. Provide ice packs during the first 24 hours.
5. Instruct the client in the use of sitz baths.
6. Apply analgesic spray or ointment as prescribed.
7. Provide perineal care, using clean technique.
8. Instruct the client in the proper care of the incision.
9. Instruct the client to dry the perineal area from front to back and to blot the area rather than wipe it.
10. Instruct the client to shower rather than bathe in a tub.
11. Apply a perineal pad without touching the inside surface of the pad.
12. Report any bleeding or discharge from the episiotomy site to the physician.

#### F. Forceps **delivery**

1. Two double-crossed, spoon-like articulated blades are used to assist in the **delivery** of the fetal head.
2. Reassure the mother and explain the need for forceps.
3. Monitor the mother and fetus during **delivery**.
4. Check neonate and mother after **delivery** for any possible injury.
5. Assist with repair of any lacerations.

#### G. Vacuum extraction

1. A cap-like suction device is applied to the fetal head to facilitate extraction.
2. Suction is used to assist in **delivery** of the fetal head.
3. Traction is applied during uterine contractions until descent of the fetal head is achieved.
4. The suction device should not be kept in place any longer than 25 minutes.
5. Monitor FHR every 5 minutes if external fetal monitoring is not used.
6. Assess **infant** at birth and throughout the postpartum period for signs of cerebral trauma.
7. Monitor for developing cephalhematoma.
8. Caput succedaneum is normal and resolves in 24 hours.

#### H. Cesarean **delivery**

1. Cesarean section is **delivery** of the fetus usually through a transabdominal, low-segment incision of the **uterus**.
2. Preoperative
  - a. If planned, prepare the mother and partner.
  - b. If an emergency, quickly explain the need and procedure to the mother and partner.
  - c. Obtain informed consent.
  - d. Ensure that the preoperative diagnostic tests are done, including Rh factor determination.
  - e. Prepare to insert an intravenous line and a Foley catheter.
  - f. Prepare the abdomen as prescribed.
  - g. Monitor the mother and fetus continuously.
  - h. Provide emotional support.

- i. Administer preoperative medications as prescribed.
3. Postoperative
  - a. Monitor vital signs.
  - b. Provide pain relief.
  - c. Encourage turning, coughing, and deep breathing.
  - d. Encourage ambulation.
  - e. Monitor for signs of infection and bleeding.
  - f. Burning and pain on urination may indicate a bladder infection.
  - g. A tender **uterus** and foul-smelling **lochia** may indicate endometritis.
  - h. A productive cough or chills may indicate pneumonia.
  - i. Pain, redness, or edema of an extremity may indicate thrombophlebitis.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 250.** A nurse is caring for a client in labor. The nurse determines that the client is beginning the second stage of labor when which of the following assessments is noted?
1. The contractions are regular.
  2. The membranes have ruptured.
  3. The cervix is dilated completely.
  4. The client begins to expel clear vaginal fluid.
- 251.** A nurse in the labor room is caring for a client in the active stage of labor. The nurse is assessing the fetal patterns and notes a late deceleration on the monitor strip. The appropriate nursing action is to:
1. Administer oxygen via face mask.
  2. Place the mother in a supine position.
  3. Increase the rate of the oxytocin (Pitocin) intravenous infusion.
  4. Document the findings and continue to monitor the fetal patterns.
- 252.** A nurse is performing an assessment of a client who is scheduled for a cesarean delivery. Which assessment finding would indicate a need to contact the physician?
1. Hemoglobin of 11 g/dL
  2. Fetal heart rate of 180 beats/min
  3. Maternal pulse rate of 85 beats/min
  4. White blood cell count of 12,000/mm<sup>3</sup>
- 253.** A nurse is reviewing the record of a client in the labor room and notes that the nurse-midwife has documented that the fetus is at -1 station. The nurse determines that the fetal presenting part is:

1. 1 inch below the coccyx
  2. 1 inch below the iliac crest
  3. 1 cm above the ischial spine
  4. 1 fingerbreadth below the symphysis pubis
- 254.** A client arrives at a birthing center in active labor. Her membranes are still intact, and the nurse-midwife prepares to perform an amniotomy. A nurse who is assisting the nurse-midwife explains to the client that after this procedure, she will most likely have:
1. Less pressure on her cervix
  2. Decreased number of contractions
  3. Increased efficiency of contractions
  4. The need for increased maternal blood pressure monitoring
- 255.** A nurse is monitoring a client in labor. The nurse suspects umbilical cord compression if which of the following is noted on the external monitor tracing during a contraction?
1. Variability
  2. Accelerations
  3. Early decelerations
  4. Variable decelerations
- 256.** A client in labor is transported to the delivery room and prepared for a cesarean delivery. After the client is transferred to the delivery room table, a nurse places her in:
1. Supine position with a wedge under the right hip
  2. Trendelenburg's position with the legs in stirrups
  3. Prone position with the legs separated and elevated
  4. Semi-Fowler's position with a pillow under the knees
- 257.** A nurse has provided discharge instructions to a client who delivered a healthy infant by cesarean delivery. Which statement made by the client indicates a need for further instructions?
1. "I will begin abdominal exercises immediately."
  2. "I will notify the physician if I develop a fever."
  3. "I will turn on my side and push up with my arms to get out of bed."
  4. "I will lift nothing heavier than the newborn infant for at least 2 weeks."
- 258.** A nurse is monitoring a client in active labor and notes that the client is having contractions every 3 minutes that last 45 seconds. The nurse notes that the fetal heart rate between contractions is 100 beats/min. Which of the following nursing actions is appropriate?
1. Notify the physician or nurse-midwife.
  2. Continue monitoring the fetal heart rate.
  3. Encourage the client to continue pushing with each contraction.
  4. Instruct the client's coach to continue to encourage breathing techniques.
- 259.** A nurse is caring for a client in labor and is monitoring the fetal heart rate patterns. The nurse notes the presence of episodic accelerations on the electronic fetal monitor tracing. Which of the following actions is appropriate?
1. Notify the physician or nurse-midwife of the findings.
  2. Reposition the mother and check the monitor for changes in the fetal tracing.
  3. Take the mother's vital signs and tell the mother that bedrest is required to conserve oxygen.
  4. Document the findings and tell the mother that the pattern on the monitor indicates fetal well-being.
- 260.** A nurse is admitting a pregnant client to the labor room and attaches an external electronic fetal monitor to the client's abdomen. After attachment of the electronic fetal monitor, the initial nursing assessment is which of the following?
1. Identify the types of accelerations.
  2. Assess the baseline fetal heart rate.
  3. Determine the intensity of the contractions.
  4. Determine the frequency of the contractions.
- 261.** A nurse is reviewing true and false labor signs with a multiparous client. The nurse determines that the client understands the signs of true labor if she makes which statement?
1. "I won't be in labor until my baby drops."
  2. "My contractions will be felt in my abdominal area."
  3. "My contractions will not be as painful if I walk around."
  4. "My contractions will increase in duration and intensity."
- 262.** After an amniotomy has been performed, a nurse should first assess:
1. For cervical dilation
  2. For bladder distention
  3. The maternal blood pressure
  4. The fetal heart rate pattern
- 263.** A client in labor has been pushing effectively for 1 hour. A nurse determines that the client's primary physiological need at this time is to:
1. Ambulate
  2. Rest between contractions
  3. Change positions frequently
  4. Consume oral food and fluids

### Alternate Item Format: Prioritizing (Ordered Response)

**264.** A nurse is monitoring a client in labor who is receiving oxytocin (Pitocin) and notes that the client is experiencing hypertonic uterine contractions. List in order of priority the actions that the nurse takes. (Number 1 is the first action, and number 6 is the last action.)

- \_\_\_ Reposition the client.
- \_\_\_ Stop the oxytocin infusion.
- \_\_\_ Perform a vaginal examination.
- \_\_\_ Check the client's blood pressure.
- \_\_\_ Administer oxygen by face mask at 8 to 10 L/min.
- \_\_\_ Administer medication as prescribed to reduce uterine activity

## ANSWERS

### 250. 3

**Rationale:** The second stage of labor begins when the cervix is dilated completely and ends with birth of the neonate. Options 1, 2, and 4 are not specific assessment findings of the second stage of labor and occur in stage 1.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 2 and 4 first because they are comparable or alike. From the remaining options, recalling that regular contractions occur before the second stage of labor will direct you to option 3. Review the stages of labor if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Intrapartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 466). St. Louis: Mosby.

### 251. 1

**Rationale:** Late decelerations are due to uteroplacental insufficiency and occur because of decreased blood flow and oxygen to the fetus during the uterine contractions. Hypoxemia results; oxygen at 8 to 10 L/min via face mask is necessary. The supine position is avoided because it decreases uterine blood flow to the fetus. The client should be turned onto her side to displace pressure of the gravid uterus on the inferior vena cava. An intravenous oxytocin infusion is discontinued when a late deceleration is noted. The oxytocin would cause further hypoxemia because of increased uteroplacental insufficiency resulting from stimulation of contractions by this medication. Although the nurse would document the occurrence, option 4 would delay necessary treatment.

**Test-Taking Strategy:** Use the ABCs—airway, breathing, and circulation—and knowledge related to the significance of a late deceleration to answer this question. Review the nursing actions to take if late decelerations occur if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Intrapartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 467). St. Louis: Mosby.

### 252. 2

**Rationale:** Normal fetal heart rate is 120 to 160 beats/min. Fetal heart rate of 180 beats/min could indicate fetal distress

and would warrant immediate notification of the physician. White blood cell counts in a normal pregnancy begin to increase in the second trimester and peak in the third trimester, with a normal range of 11,000 to 15,000/mm<sup>3</sup> (up to 18,000/mm<sup>3</sup>). During the immediate postpartum period, white blood cell count may be 25,000 to 30,000/mm<sup>3</sup> because of increased leukocytosis that occurs during delivery. By full term, a normal maternal hemoglobin range is 11 to 13 g/dL because of the hemodilution caused by an increase in plasma volume during pregnancy. The maternal pulse rate during pregnancy increases 10 to 15 beats/min over prepregnancy readings to facilitate increased cardiac output, oxygen transport, and kidney filtration.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *indicate a need to contact the physician*. Knowledge regarding the normal and abnormal findings in a pregnant client and fetus will direct you to option 2. If you are unfamiliar with these normal and abnormal findings and the normal fetal heart rate, review this content.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Maternity—Intrapartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 261, 388). St. Louis: Saunders.

### 253. 3

**Rationale:** Station is the relationship of the presenting part to an imaginary line drawn between the ischial spines, measured in centimeters, and noted as a negative number above the line and a positive number below the line. At negative 1 (–1) station, the fetal presenting part is 1 cm above the ischial spines.

**Test-Taking Strategy:** Recalling that station is measured in centimeters and uses the ischial spines as a reference point will assist in answering this question. Options 1, 2, and 4 are comparable or alike in the use of the word *below*, which would be represented by a positive measurement in determining station. Review stations of the presenting part if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Intrapartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 337, 350). St. Louis: Saunders.

### 254. 3

**Rationale:** Amniotomy (artificial rupture of the membranes) can be used to induce labor when the condition of the cervix

is favorable (ripe) or to augment labor if the progress begins to slow. Rupturing of the membranes allows the fetal head to contact the cervix more directly and may increase the efficiency of contractions. Increased monitoring of maternal blood pressure is unnecessary following this procedure. The fetal heart rate needs to be monitored frequently, however.

**Test-Taking Strategy:** Focus on the subject, an amniotomy. Recalling that amniotomy is performed to augment labor if the progress begins to slow will direct you to option 3. Review the purpose of amniotomy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Intrapartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 505–506). St. Louis: Mosby.

#### 255. 4

**Rationale:** Variable decelerations occur if the umbilical cord becomes compressed, reducing blood flow between the placenta and the fetus. Variability refers to fluctuations in the baseline fetal heart rate. Accelerations are a reassuring sign and usually occur with fetal movement. Early decelerations result from pressure on the fetal head during a contraction.

**Test-Taking Strategy:** Use the process of elimination, focusing on the subject, umbilical cord compression. Recalling that variable decelerations occur if the umbilical cord becomes compressed will direct you to option 4. Review the findings that occur in umbilical cord compression if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Intrapartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 403). St. Louis: Saunders.

#### 256. 1

**Rationale:** Vena cava and descending aorta compression by the pregnant uterus impedes blood return from the lower trunk and extremities. This leads to decreasing cardiac return, cardiac output, and blood flow to the uterus and subsequently the fetus. The best position to prevent this would be side-lying, with the uterus displaced off the abdominal vessels. Positioning for abdominal surgery necessitates a supine position; however, a wedge placed under the right hip provides displacement of the uterus. Trendelenburg's position places pressure from the pregnant uterus on the diaphragm and lungs, decreasing respiratory capacity and oxygenation. A semi-Fowler's position or prone position is not practical for this type of abdominal surgery.

**Test-Taking Strategy:** Focus on the subject, positioning the pregnant woman. Use the process of elimination, visualizing each of the positions identified in the options and considering the effect that the position may have on the mother and the fetus. If you had difficulty with this question, review care for the mother requiring cesarean delivery.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Intrapartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 452). St. Louis: Saunders.

#### 257. 1

**Rationale:** A cesarean delivery requires an incision made through the abdominal wall and into the uterus. Abdominal exercises should not start immediately after abdominal surgery; the client should wait at least 3 to 4 weeks postoperatively to allow for healing of the incision. Options 2, 3, and 4 are appropriate instructions for the client after a cesarean delivery.

**Test-Taking Strategy:** Note the strategic words *indicates a need for further instructions*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Keeping in mind that the client had a cesarean delivery and noting the word *immediately* in option 1 will assist in directing you to this option. Review home care instructions for a client after cesarean delivery if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 475). St. Louis: Saunders.

#### 258. 1

**Rationale:** A normal fetal heart rate is 120 to 160 beats/min, and the fetal heart rate should be within this range between contractions. Fetal bradycardia between contractions may indicate the need for immediate medical management, and the physician or nurse-midwife needs to be notified. Options 2, 3, and 4 are inappropriate nursing actions in this situation and delay necessary intervention.

**Test-Taking Strategy:** Focus on the data in the question. Knowledge that the normal fetal heart rate is 120 to 160 beats/min will assist you to recognize that fetal bradycardia is present. If you had difficulty with this question, review the expected and unexpected findings during the labor process.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Intrapartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 363, 366). St. Louis: Saunders.

#### 259. 4

**Rationale:** Accelerations are transient increases in the fetal heart rate that often accompany contractions or are caused by fetal movement. Episodic accelerations are thought to be a sign of fetal well-being and adequate oxygen reserve. Options 1, 2, and 3 are inaccurate nursing actions and are unnecessary.

**Test-Taking Strategy:** Use the process of elimination. Options 1, 2, and 3 are comparable or alike in that they indicate the need for further intervention. Also, knowing that accelerations indicate fetal well-being will direct you to option 4. Review the significance of episodic accelerations if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Intrapartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 429–430). St. Louis: Mosby.

## 260. 2

**Rationale:** Assessing the baseline fetal heart rate is important so that abnormal variations of the baseline rate can be identified if they occur. The intensity of contractions is assessed by an internal fetal monitor, not an external fetal monitor. Options 1 and 4 are important to assess, but not as the first priority. Fetal heart rate is evaluated by assessing baseline and periodic changes. Periodic changes occur in response to the intermittent stress of uterine contractions and the baseline beat-to-beat variability of the fetal heart rate.

**Test-Taking Strategy:** Note the strategic word *initial* in the question. Use the ABCs—airway, breathing, and circulation. Fetal heart rate reflects the ABCs. Review the concepts related to external fetal monitoring if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Intrapartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 392–393). St. Louis: Saunders.

## 261. 4

**Rationale:** True labor is present when contractions increase in duration and intensity. Lightening or dropping is also known as engagement and occurs when the fetus descends into the pelvis about 2 weeks before delivery. Contractions felt in the abdominal area and contractions that ease with walking are signs of false labor.

**Test-Taking Strategy:** Focus on the subject, the signs of true labor. Noting the word *true* in the question and its relationship to the words *increase in duration and intensity* in option 4 will direct you to this option. Review the signs of true and false labor if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Maternity—Intrapartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 348, 352). St. Louis: Saunders.

## 262. 4

**Rationale:** Fetal heart rate is assessed immediately after amniotomy to detect any changes that may indicate cord compression or prolapse. Bladder distention or maternal blood pressure would not be the first things to check after an amniotomy. When the membranes are ruptured, minimal vaginal examinations would be done because of the risk of infection.

**Test-Taking Strategy:** Note the strategic word *first*. Because of the risk of a prolapsed cord after an amniotomy, the first action is to check the fetal heart rate for signs of

nonreassuring fetal heart rate patterns. Review care after an amniotomy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Intrapartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal-child nursing care* (4th ed., pp. 506–507). St. Louis: Mosby.

## 263. 2

**Rationale:** The birth process expends a great deal of energy, particularly during the transition stage. Encouraging rest between contractions conserves maternal energy, facilitating voluntary pushing efforts with contractions. Uteroplacental perfusion also is enhanced, which promotes fetal tolerance of the stress of labor. Changing positions frequently is not the primary physiological need. Ambulation is encouraged during early labor. Ice chips should be provided. Food and fluids likely are to be withheld at this time.

**Test-Taking Strategy:** Use the process of elimination. Focusing on the strategic words *pushing effectively* will assist in directing you to option 2. Review care for the client in the transition stage of labor if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Maternity—Intrapartum

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 369). St. Louis: Saunders.

Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 458). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: PRIORITIZING (ORDERED RESPONSE)

### 264. 2, 1, 4, 5, 3, 6

**Rationale:** If uterine hypertonicity occurs, the nurse would immediately intervene to reduce uterine activity and increase fetal oxygenation. The nurse would stop the oxytocin infusion and increase the rate of the nonadditive solution, position the client in a side-lying position, and administer oxygen by face mask at 8 to 10 L/min. The nurse then would attempt to determine the cause of the uterine hypertonicity and perform a vaginal examination to check for a prolapsed cord. The nurse would check maternal blood pressure for the presence of hypertension or hypotension. The nurse stays with the client and contacts the physician as soon as possible (or asks another nurse to contact the physician) and then implements prescribed physician prescriptions, including the administration of medications to reduce uterine activity.

**Test-Taking Strategy:** Noting that the client is experiencing uterine hypertonicity will assist in determining that the first action would be to stop the oxytocin infusion. The mother's position would then be changed because this would immediately provide oxygen to the fetus. Because fetal oxygenation is a concern, oxygen would be administered next. The nurse then would determine the cause of the uterine

hypertonicity by performing a vaginal examination to check for a prolapsed cord and checking the client's blood pressure. Medications cannot be administered without a physician's prescription; medication administration would be the last action in this situation. Review care for the client experiencing hypertonic uterine contractions if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Intrapartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 508–510). St. Louis: Mosby.

# Problems With Labor and Delivery

-  **I. SUPINE HYPOTENSION (VENA CAVA SYNDROME)**
- A. Description**
1. Supine hypotension (also known as vena cava syndrome) occurs when the venous return to the heart is impaired by the weight of the **uterus** on the vena cava.
  2. The syndrome results in partial occlusion of the vena cava and aorta and in reduced cardiac return, cardiac output, and blood pressure.
- B. Assessment**
1. Pallor
  2. Faintness, dizziness, breathlessness
  3. Tachycardia, hypotension
  4. Sweating, cool and damp skin
  5. Fetal distress
- C. Interventions**
1. Position the client on her side to shift the weight of the fetus off the vena cava until her signs and symptoms subside and vital signs stabilize.
  2. Monitor vital signs and fetal heart rate.
-  Place a pillow or wedge under the client's hip to displace the gravid uterus off the vena cava. Avoid the supine position.
- II. PREMATURE RUPTURE OF THE MEMBRANES**
- A. Description**
1. Premature rupture of the membranes refers to spontaneous rupture of the amniotic membrane before the onset of **labor**.
  2. Gestational age usually determines the plan and intervention.
  3. When the rupture of membranes is before term and **delivery** will be delayed, infection becomes a risk.
-  **B. Assessment**
1. There is evidence of fluid pooling in vaginal vault; nitrazine test is positive.
  2. Amount, color, consistency, and odor of fluid needs to be assessed.
  3. Vital signs are monitored; an elevated temperature may indicate the presence of infection.
4. Fetal monitoring is necessary; tachycardia may indicate infection.
- C. Interventions**
1. Assist with tests to assess gestational age.
  2. Avoid vaginal examinations because of the risk of infection.
  3. Monitor maternal and fetal status for signs of compromise or infection.
  4. Administer antibiotics as prescribed.
- III. PROLAPSED UMBILICAL CORD**
- A. Description:** The umbilical cord is displaced between the presenting part and the amnion or protruding through the cervix, causing compression of the cord and compromising fetal circulation (Fig. 27-1). 
- B. Assessment** 
1. The client has a feeling that something is coming through the **vagina**.
  2. Umbilical cord is visible or palpable.
  3. Fetal heart rate is irregular and slow.
  4. Fetal heart monitor shows variable decelerations or bradycardia after rupture of the membranes.
  5. If fetal hypoxia is severe, violent fetal activity may occur and then cease.
- C. Interventions** (see Priority Nursing Actions) 
- IV. PLACENTA PREVIA** 
- A. Description**
1. **Placenta** previa is an improperly implanted **placenta** in the lower uterine segment near or over the internal cervical os (Fig. 27-2).
  2. Total: The internal cervical os is covered entirely by the **placenta** when the cervix is dilated fully.
  3. Partial: The lower border of the **placenta** is within 3 cm of the internal cervical os, but does not fully cover it.
  4. Marginal: The **placenta** is implanted in the lower **uterus**, but its lower border is greater than 3 cm from the internal cervical os.
  5. Management depends on the classification of the previa and gestational age of the fetus.

**▲ FIGURE 27-1** Prolapse of umbilical cord. Note the pressure of the presenting part on the umbilical cord, which endangers fetal circulation. **A**, Occult (hidden) prolapse of cord. **B**, Complete prolapse of cord. Membranes are intact. **C**, Cord presenting in front of the fetal head may be seen in the vagina. **D**, Frank breech presentation with prolapsed cord. (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed., p. 521]. St. Louis: Mosby.)

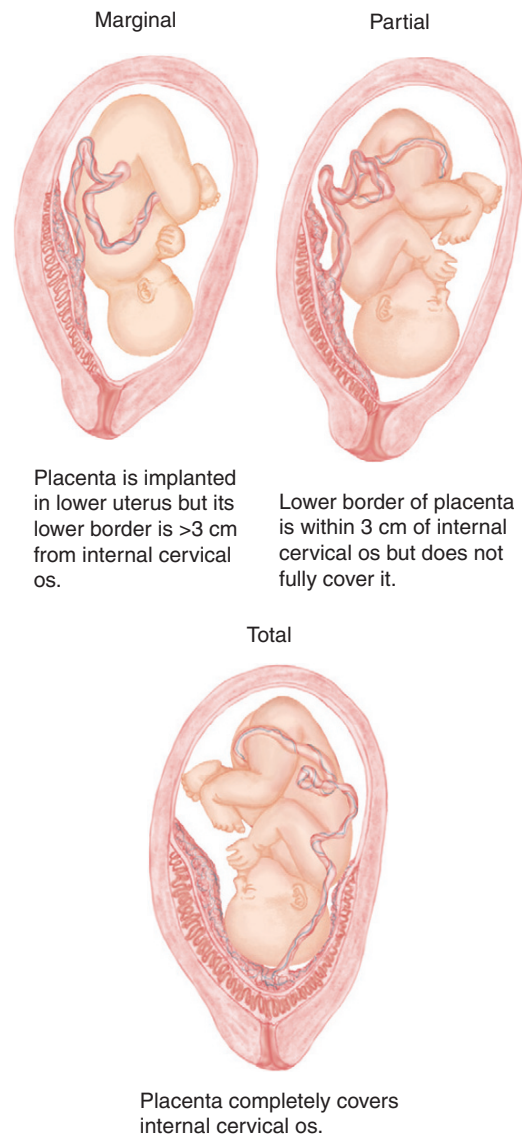

### PRIORITY NURSING ACTIONS!

#### Steps to Take if Umbilical Cord Prolapse Is Suspected

1. Elevate the fetal presenting part that is lying on the cord by applying finger pressure with a gloved hand.
2. Place the client into extreme Trendelenburg's or modified Sims' position or a knee-chest position.
3. Administer oxygen, 8 to 10 L/min, by face mask to the client.
4. Monitor fetal heart rate and assess the fetus for hypoxia.
5. Prepare to start intravenous fluids or increase the rate of an existing solution.
6. Prepare for immediate birth.
7. Document the event, actions taken, and the client's response.

If umbilical cord prolapse occurs, the cord is lying alongside or below the presenting part of the fetus and can be seen or felt in or protruding from the vagina. The nurse stays with the client and asks another nurse to call the health care provider immediately. The nurse must relieve cord pressure immediately so that the fetus receives adequate oxygenation. The nurse can relieve cord pressure by elevating the fetal presenting part that is lying on the cord; the nurse does this by quickly gloving the hand and inserting two fingers into the vagina to the cervix and exerting upward pressure on the presenting part. The nurse also relieves cord pressure by placing the client into extreme Trendelenburg's or modified Sims' position or a knee-chest position (a rolled towel is placed under the client's hip). The nurse administers oxygen, 8 to 10 L/min, by face mask to the client, monitors fetal heart rate and fetal heart rate patterns, and assesses the fetus for hypoxia. The client is prepared for immediate birth (vaginal or cesarean). The nurse documents the event, actions taken, the client's response, and any additional pertinent information. The nurse never attempts to push the cord into the uterus. If the umbilical cord is protruding from the vagina, the cord is wrapped loosely in a sterile towel saturated with warm sterile normal saline.

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 467). St. Louis: Mosby.

**▲ FIGURE 27-2** Three classifications of placenta previa. (From McKinney, E., James, S., Murray, S., & Ashwill, J. [2009]. *Maternal-child nursing* [3rd ed., p. 614]. St. Louis: Saunders.)

**B. Assessment**

1. Sudden onset of painless, bright red vaginal bleeding occurs in the last half of pregnancy.
2. **Uterus** is soft, relaxed, and nontender.
3. Fundal height may be more than expected for gestational age.

**C. Interventions**

1. Monitor maternal vital signs, fetal heart rate, and fetal activity.
2. Prepare for ultrasound to confirm the diagnosis.
3. Vaginal examinations or any other actions that would stimulate uterine activity are avoided.
4. Maintain bedrest in a side-lying position as prescribed.
5. Monitor amount of bleeding (treat signs of shock).
6. Administer intravenous fluids, blood products, or tocolytic medications as prescribed.
7. If bleeding is heavy, a cesarean **delivery** may be performed.

**▲ FIGURE 27-3** Types of abruption placentae. (From McKinney, E., James, S., Murray, S., & Ashwill, J. [2009]. *Maternal-child nursing* [3rd ed., p. 616]. St. Louis: Saunders.)

**V. ABRUPTIO PLACENTAE**

**A. Description:** Premature separation of the **placenta** from the uterine wall after the twentieth week of gestation and before the fetus is delivered (Fig. 27-3)

**B. Assessment**

1. Dark red vaginal bleeding. If the bleeding is high in the **uterus** or is minimal, there can be an absence of visible blood.
2. Uterine pain or tenderness or both
3. Uterine rigidity
4. Severe abdominal pain
5. Signs of fetal distress
6. Signs of maternal shock if bleeding is excessive

**C. Interventions**

1. Monitor maternal vital signs and fetal heart rate.
2. Assess for excessive vaginal bleeding, abdominal pain, and an increase in fundal height.
3. Maintain bedrest; administer oxygen, intravenous fluids, and blood products as prescribed.
4. Place the client in Trendelenburg's position if indicated to decrease the pressure of the fetus on the **placenta**, or place in the lateral position with the head of the bed flat if hypovolemic shock occurs.
5. Monitor and report any uterine activity.
6. Prepare for **delivery** of the fetus as quickly as possible, with vaginal **delivery** preferable if the fetus is healthy and stable and the presenting part is in the pelvis; emergency cesarean **delivery** is performed if the fetus is alive but shows signs of distress.
7. Monitor for signs of disseminated intravascular coagulation in the postpartum period.

**▲** Know the differences between placenta previa and abruption placentae. In placenta previa, there is painless, bright red vaginal bleeding, and the uterus is soft, relaxed, and nontender. In abruption placentae, there is dark red vaginal bleeding, uterine pain or tenderness or both, and uterine rigidity.

**VI. PLACENTAL ABNORMALITIES**

**A. Description:** **Placenta accreta** is an abnormally adherent **placenta**; **placenta increta** occurs when the **placenta** penetrates the uterine muscle itself; **placenta percreta** occurs when the **placenta** goes all the way through the **uterus**.

**B. Assessment:** May cause hemorrhage immediately after birth because the **placenta** does not separate cleanly

**C. Intervention**

1. Monitor for hemorrhage and shock.
2. Prepare the client for a hysterectomy if a large portion of the **placenta** is abnormally adherent.

**VII. PRETERM LABOR****A. Description**

1. Preterm **labor** occurs after the twentieth week but before the thirty-seventh week of gestation.

- Risk factors include a history of medical conditions; present and past obstetric problems; infection; and social and environmental factors, including substance abuse.
- Additional risk factors include a multifetal pregnancy, which contributes to overdistention of the **uterus**; anemia, which decreases oxygen supply to the **uterus**; and age younger than 18 years or first pregnancy and age older than 40 years.

#### B. Assessment

- Uterine contractions (painful or painless)
- Abdominal cramping (may be accompanied by diarrhea)
- Low back pain
- Pelvic pressure or heaviness
- Change in character and amount of usual discharge—may be thicker or thinner, bloody, brown or colorless, odorous
- Rupture of amniotic membranes

#### C. Interventions

- Focus on stopping the **labor**: identify and treat infection, restrict activity, and ensure hydration.
- Maintain bedrest and a lateral position.
- Monitor fetal status.
- Administer fluids.
- Administer medications as prescribed and monitor for side effects of tocolytics (see Table 31-1 for a description of medications used to treat preterm **labor**).

### VIII. PRECIPITOUS LABOR AND DELIVERY

#### A. Description: **Labor** lasting less than 3 hours

#### B. Interventions

- Have a precipitous **delivery** tray available (hemostats, scissors, and cord clamp).
- Stay with the client at all times.
- Provide emotional support and keep the client calm.
- Encourage the client to pant between contractions.
- Prepare for rupturing membranes when the head crowns, if they are not already ruptured.
- Do not try to keep the fetus from being delivered.
- If **delivery** is necessary before the arrival of the health care provider, do the following:
  - Apply gentle pressure to the fetal head upward toward the **vagina** to prevent damage to the fetal head and vaginal lacerations.
  - Support the **infant's** body during **delivery**.
  - Deliver the **infant** between contractions, checking for the cord around the neck.
  - Use restitution to deliver the posterior shoulder.
  - Use gentle downward pressure to move the anterior shoulder under the pubic symphysis.
  - Clear the **infant's** mouth.
  - Dry and cover the **infant** to keep the body warm.
  - Allow the **placenta** to separate naturally.
  - Place the **infant** on the mother's abdomen or breast to induce uterine contractions.

### IX. DYSTOCIA

#### A. Description

- Dystocia is difficult **labor** that is prolonged or more painful.
- Dystocia occurs because of problems caused by uterine contractions, the fetus, or the bones and tissues of the maternal pelvis.
- The fetus may be excessively large, malpositioned, or in an abnormal presentation.
- Contractions may be hypotonic or hypertonic.
- Hypotonic contractions are short, irregular, and weak; amniotomy and oxytocin (Pitocin) infusion may be treatment measures.
- Hypertonic contractions are painful, occur frequently, and are uncoordinated; treatment depends on the cause and includes pain relief measures and rest.
- Dystocia can result in maternal dehydration, infection, fetal injury, or death.

#### B. Assessment

- Excessive abdominal pain
- Abnormal contraction pattern
- Fetal distress
- Maternal or fetal tachycardia
- Lack of progress in **labor**

#### C. Interventions

- Assess fetal heart rate; monitor for fetal distress.
- Monitor uterine contractions.
- Monitor maternal temperature and heart rate.
- Assist with pelvic examination, measurements, ultrasound, and other procedures.
- Administer prophylactic antibiotics as prescribed to prevent infection.
- Administer intravenous fluids as prescribed.
- Monitor intake and output.
- Maintain hydration.
- Instruct the client in breathing techniques and relaxation exercises.
- Perform fetal monitoring if oxytocin is prescribed for hypotonic uterine contractions (oxytocin is not prescribed for hypertonic uterine contractions).
- Monitor color of **amniotic fluid**.
- Provide rest and comfort as with a normal **delivery**, such as back rubs and position changes.
- Assess client's fatigue and pain, and administer sedatives and pain medications as prescribed.
- Assess for prolapse of the cord after membranes rupture.

### X. AMNIOTIC FLUID EMBOLISM

#### A. Description

- Amniotic fluid** embolism is the escape of **amniotic fluid** into the maternal circulation.
- The debris-containing **amniotic fluid** deposits in the pulmonary arterioles and is usually fatal to the mother.

- B. Assessment**
1. Abrupt onset of respiratory distress and chest pain
  2. Cyanosis
  3. Seizures
  4. Heart failure and pulmonary edema
  5. Fetal bradycardia and distress if **delivery** has not occurred at the time of the embolism

- C. Intervention**
1. Institute emergency measures to maintain life.
  2. Administer oxygen, 8 to 10 L/min, by face mask or resuscitation bag delivering 100% oxygen.
  3. Prepare for intubation and mechanical ventilation.
  4. Position the client on her side.
  5. Administer intravenous fluids, blood products, and medications to correct coagulation failure.
  6. Monitor fetal status.
  7. Prepare for emergency **delivery** when the client is stabilized.
  8. Provide emotional support to the client, partner, and family.

### XI. FETAL DISTRESS

- A. Assessment**
1. Fetal heart rate less than 120 beats/min or greater than 160 beats/min
  2. Meconium-stained **amniotic fluid**
  3. Fetal hyperactivity
  4. Progressive decrease in baseline variability
  5. Severe variable decelerations
  6. Late decelerations
- B. Interventions**
1. Place the client in a lateral position.
  2. Administer oxygen, 8 to 10 L/min, via face mask.
  3. Discontinue oxytocin if infusing.
  4. Monitor maternal and fetal status.

 In the event of fetal distress, prepare the client for emergency cesarean delivery.

### XII. INTRAUTERINE FETAL DEMISE

- A. Assessment**
1. Loss of fetal movement
  2. Absence of fetal heart tones
  3. Disseminated intravascular coagulation (DIC) screen (monitor for coagulation abnormalities because DIC is a complication related to intrauterine fetal demise)
  4. Low hemoglobin and hematocrit; low platelet count; prolonged bleeding and clotting time
  5. Bleeding from puncture sites (could indicate DIC)
- B. Interventions**
1. Encourage the client and her family to verbalize feelings; provide emotional support.
  2. Incorporate religious and cultural health care beliefs and practices in the plan of care.
  3. Allow the client choices relating to **labor** and **delivery**.

4. Administer intravenous fluids, medications, and blood and blood products as prescribed if DIC occurs.

### XIII. RUPTURE OF THE UTERUS

- A. Description**
1. Complete or incomplete separation of the uterine tissue as a result of a tear in the wall of the **uterus** from the stress of **labor**
  2. Complete: Direct communication between the uterine and peritoneal cavities
  3. Incomplete: Rupture into the peritoneum covering the **uterus**, but not into the peritoneal cavity
  4. Manifestations vary with the degree of rupture.
- B. Assessment**
1. Abdominal pain or tenderness
  2. Chest pain
  3. Contractions may stop or fail to progress
  4. Rigid abdomen
  5. Absent fetal heart rate
  6. Signs of maternal shock
  7. Fetus palpated outside the **uterus** (complete rupture)
- C. Interventions**
1. Monitor for and treat signs of shock (administer oxygen, intravenous fluids, and blood products).
  2. Prepare client for cesarean **delivery** (possible hysterectomy may be necessary).
  3. Provide emotional support for the client and partner.

### XIV. UTERINE INVERSION

- A. Description**
1. **Uterus** completely or partly turns inside out.
  2. This can occur during **delivery** or after **delivery** of the **placenta**.
- B. Assessment**
1. A depression in the fundal area of the **uterus** is noted.
  2. The interior of the **uterus** may be seen through the cervix or protruding through the **vagina**.
  3. The client has severe pain.
  4. Hemorrhage is evident.
  5. The client shows signs of shock.
- C. Intervention**
1. Monitor for hemorrhage and signs of shock and treat shock.
  2. Prepare the client for a return of the **uterus** to the correct position via the **vagina**; if unsuccessful, laparotomy with replacement to the correct position is done.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 265.** A nurse is assessing a pregnant client in the second trimester of pregnancy who was admitted

to the maternity unit with a suspected diagnosis of abruption placentae. Which of the following assessment findings would the nurse expect to note if this condition is present?

1. Soft abdomen
2. Uterine tenderness
3. Absence of abdominal pain
4. Painless, bright red vaginal bleeding

**266.** A maternity nurse is preparing for the admission of a client in the third trimester of pregnancy who is experiencing vaginal bleeding and has a suspected diagnosis of placenta previa. The nurse reviews the physician's prescriptions and would question which prescription?

1. Prepare the client for an ultrasound.
2. Obtain equipment for a manual pelvic examination.
3. Prepare to draw a hemoglobin and hematocrit blood sample.
4. Obtain equipment for external electronic fetal heart rate monitoring.

**267.** An ultrasound is performed on a client at term gestation who is experiencing moderate vaginal bleeding. The results of the ultrasound indicate that abruption placentae is present. Based on these findings, the nurse would prepare the client for:

1. Delivery of the fetus
2. Strict monitoring of intake and output
3. Complete bedrest for the remainder of the pregnancy
4. The need for weekly monitoring of coagulation studies until the time of delivery

**268.** A nurse is performing an initial assessment on a client who has just been told that a pregnancy test is positive. Which assessment finding would indicate that the client is at risk for preterm labor?

1. The client is a 35-year-old primigravida.
2. The client has a history of cardiac disease.
3. The client's hemoglobin level is 13.5 g/dL.
4. The client is a 20-year-old primigravida of average weight and height.

**269.** A nurse is monitoring a client who is in the active stage of labor. The client has been experiencing contractions that are short, irregular, and weak. The nurse documents that the client is experiencing which type of labor dystocia?

1. Hypotonic
2. Precipitous
3. Hypertonic
4. Preterm labor

**270.** After a precipitous delivery, a nurse notes that the new mother is passive and only touches her newborn infant briefly with her fingertips. The nurse

should do which of the following to help the woman process what has happened?

1. Encourage the mother to breast-feed soon after birth.
2. Support the mother in her reaction to the newborn infant.
3. Tell the mother that it is important to hold the newborn infant.
4. Document a complete account of the mother's reaction on the birth record.

**271.** A nurse in a labor room is monitoring a client with dysfunctional labor for signs of fetal or maternal compromise. Which of the following assessment findings would alert the nurse to a compromise?

1. Maternal fatigue
2. Coordinated uterine contractions
3. Progressive changes in the cervix
4. Persistent nonreassuring fetal heart rate

**272.** A nurse in a labor room is preparing to care for a client with hypertonic uterine contractions. The nurse is told that the client is experiencing uncoordinated contractions that are erratic in their frequency, duration, and intensity. The priority nursing intervention in caring for the client is to:

1. Provide pain relief measures.
2. Prepare the client for an amniotomy.
3. Promote ambulation every 30 minutes.
4. Monitor the oxytocin (Pitocin) infusion closely.

**273.** A nurse is reviewing the physician's prescriptions for a client admitted for premature rupture of the membranes. Gestational age of the fetus is determined to be 37 weeks. Which physician's prescription should the nurse question?

1. Perform a vaginal examination every shift.
2. Monitor maternal vital signs frequently.
3. Monitor fetal heart rate continuously.
4. Administer ampicillin 1 g as an intravenous piggyback every 6 hours.

**274.** A nurse has developed a plan of care for a client experiencing dystocia and includes several nursing interventions in the plan of care. The nurse prioritizes the plan of care and selects which intervention as the highest priority?

1. Providing comfort measures
2. Monitoring the fetal heart rate
3. Changing the client's position frequently
4. Keeping the significant other informed of the progress of the labor

**275.** Fetal distress is occurring with a laboring client. As the nurse prepares the client for a cesarean birth, what other intervention should be performed?

1. Slow the intravenous flow rate.
2. Place the client in a high Fowler's position.
3. Continue the oxytocin (Pitocin) drip if infusing.
4. Administer oxygen, 8 to 10 L/min, via face mask.

**276.** A nurse in the postpartum unit is caring for a client who has just delivered a newborn infant following a pregnancy with a placenta previa. The nurse reviews the plan of care and prepares to monitor the client for which risk associated with placenta previa?

1. Infection
2. Hemorrhage
3. Chronic hypertension
4. Disseminated intravascular coagulation

**277.** A nurse in a labor room is performing a vaginal assessment on a pregnant client in labor. The nurse notes the presence of the umbilical cord protruding from the vagina. Which of the following is an initial nursing action?

1. Gently push the cord into the vagina.
2. Place the client in Trendelenburg's position.
3. Find the closest telephone and page the physician stat.
4. Call the delivery room to notify the staff that the client will be transported immediately.

### Alternate Item Format: Multiple Response

**278.** A nurse is performing an assessment on a client diagnosed with placenta previa. Which of these assessment findings would the nurse expect to note? **Select all that apply.**

- 1. Uterine rigidity
- 2. Uterine tenderness
- 3. Severe abdominal pain
- 4. Bright red vaginal bleeding
- 5. Soft, relaxed, nontender uterus
- 6. Fundal height may be greater than expected for gestational age

## ANSWERS

### 265. 2

**Rationale:** Abruptio placentae is the premature separation of the placenta from the uterine wall after the twentieth week of gestation and before the fetus is delivered. Painless, bright red vaginal bleeding in the second or third trimester of pregnancy is a sign of placenta previa. In abruptio placentae, acute abdominal pain is present. Uterine tenderness accompanies placental abruption, especially with a central abruption and trapped blood behind the placenta. The abdomen feels hard and board-like on palpation as the blood penetrates the myometrium and causes uterine irritability.

**Test-Taking Strategy:** Focus on the subject, abruption placentae. Remember that the difference between placenta previa and abruptio placentae involves the presence of uterine pain and tenderness with abruptio placentae, as opposed to painless bleeding with placenta previa. Review the signs of abruptio placentae if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Intrapartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 616). St. Louis: Saunders.

### 266. 2

**Rationale:** Placenta previa is an improperly implanted placenta in the lower uterine segment near or over the internal cervical os. Manual pelvic examinations are contraindicated when vaginal bleeding is apparent until a diagnosis is made and placenta previa is ruled out. Digital examination of the cervix can lead to hemorrhage. A diagnosis of placenta previa is made by ultrasound. The hemoglobin and hematocrit

levels are monitored, and external electronic fetal heart rate monitoring is initiated. Electronic fetal monitoring (external) is crucial in evaluating the status of the fetus, who is at risk for severe hypoxia.

**Test-Taking Strategy:** Use knowledge of the pathophysiology associated with placenta previa. Note the strategic words *would question which prescription* in the event query. Also, note that option 2 is the only procedure that is invasive to the pregnancy and endangers the physiological safety of the client and the fetus. Review care for the client with placenta previa if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Intrapartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 615). St. Louis: Saunders.

### 267. 1

**Rationale:** Abruptio placentae is the premature separation of the placenta from the uterine wall after the twentieth week of gestation and before the fetus is delivered. The goal of management in abruptio placentae is to control the hemorrhage and deliver the fetus as soon as possible. Delivery is the treatment of choice if the fetus is at term gestation or if the bleeding is moderate to severe and the client or fetus is in jeopardy. Because delivery of the fetus is necessary, options 2, 3, and 4 are incorrect regarding management of a client with abruptio placentae.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the management of abruptio placentae to answer the question. Note the strategic words *term gestation* and *moderate vaginal bleeding*. Knowing that the goal is to deliver the fetus will direct you easily to option 1. If you had difficulty with this question or are unfamiliar with the management of abruptio placentae, review this content.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Maternity—Intrapartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 616). St. Louis: Saunders.

### 268. 2

**Rationale:** Preterm labor occurs after the twentieth week but before the thirty-seventh week of gestation. Several factors are associated with preterm labor, including a history of medical conditions, present and past obstetric problems, social and environmental factors, and substance abuse. Other risk factors include a multifetal pregnancy, which contributes to overdistention of the uterus; anemia, which decreases oxygen supply to the uterus; and age younger than 18 years or first pregnancy at age older than 40 years.

**Test-Taking Strategy:** Use the process of elimination and note that option 2 is the only option that identifies an abnormal condition. Options 1, 3, and 4 are average and normal findings. Review the risk factors for preterm labor if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Antepartum

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 674–675). St. Louis: Saunders.

Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 192, 487). St. Louis: Mosby.

### 269. 1

**Rationale:** Hypotonic labor contractions are short, irregular, and weak and usually occur during the active phase of labor. Hypertonic dystocia usually occurs during the latent phase of labor, and contractions are painful, frequent, and usually uncoordinated. Precipitous labor is labor that lasts in its entirety for 3 hours or less. Preterm labor is the onset of labor after 20 weeks of gestation and before the thirty-seventh week of gestation.

**Test-Taking Strategy:** Use the process of elimination. Note the relationship between the words *short*, *irregular*, and *weak* in the question and *hypotonic* in the correct option. If you are unfamiliar with dysfunctional labor (dystocia), review this content.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Maternity—Intrapartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 498). St. Louis: Mosby.

### 270. 2

**Rationale:** Precipitous labor is labor that lasts less than 3 hours. Women who have experienced precipitous labor often describe feelings of disbelief that their labor progressed so rapidly. To assist the client to process what has happened, the best option is to support the client in her reaction to the newborn infant. Options 1, 3, and 4 do not acknowledge the client's feelings.

**Test-Taking Strategy:** Use therapeutic communication techniques. Option 2 is the only option that acknowledges the client's feelings. If you had difficulty with this question, review these techniques and care to the mother after a precipitous labor.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Caring

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 664, 667). St. Louis: Saunders.

### 271. 4

**Rationale:** Signs of fetal or maternal compromise include a persistent, nonreassuring fetal heart rate, fetal acidosis, and the passage of meconium. Maternal fatigue and infection can occur if the labor is prolonged, but do not indicate fetal or maternal compromise. Progressive changes in the cervix and coordinated uterine contractions are a reassuring pattern in labor.

**Test-Taking Strategy:** Focus on the subject of the question, signs of fetal or maternal compromise. Use the process of elimination, noting that options 1, 2, and 3 are normal expectations during labor. Review the assessment findings that indicate fetal or maternal compromise if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Intrapartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 366). St. Louis: Saunders.

### 272. 1

**Rationale:** Hypertonic uterine contractions are painful, occur frequently, and are uncoordinated. Management of hypertonic labor depends on the cause. Relief of pain is the primary intervention to promote a normal labor pattern. An amniotomy and oxytocin infusion are not treatment measures for hypertonic contractions; however, these treatments may be used in clients with hypotonic dysfunction. A client with hypertonic uterine contractions would not be encouraged to ambulate every 30 minutes, but would be encouraged to rest.

**Test-Taking Strategy:** Focus on the strategic word *hypertonic*. This strategic word and knowledge of the therapeutic management for this condition will assist in directing you to option 1. Options 2, 3, and 4 are therapeutic measures for hypotonic dysfunction. If you had difficulty with this question, review the therapeutic management for hypertonic uterine contractions.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Intrapartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 498). St. Louis: Mosby.

**273. 1**

**Rationale:** Vaginal examinations should not be done routinely on a client with premature rupture of the membranes because of the risk of infection. The nurse would expect to administer an antibiotic, monitor maternal vital signs, and monitor fetal heart rate.

**Test-Taking Strategy:** Note the strategic word *question*. This word indicates the activity that the nurse should not implement without clarification. Options 2, 3, and 4 are expected activities for the nurse to perform for a client with premature rupture of the membranes. Performing a vaginal examination every shift should not be done on a client with premature rupture of the membranes because of the risk of infection, so the nurse would question this prescription. Review care for the client with premature rupture of the membranes if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Intrapartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 673–674). St. Louis: Saunders.

**274. 2**

**Rationale:** Dystocia is difficult labor that is prolonged or more painful than expected. The priority is to monitor the fetal heart rate. Although providing comfort measures, changing the client's position frequently, and keeping the significant other informed of the progress of the labor are components of the plan of care, the fetal status would be the priority.

**Test-Taking Strategy:** Note the strategic words *highest priority*. Use Maslow's Hierarchy of Needs theory and the ABCs—airway, breathing, and circulation—to assist in answering the question. Review priority nursing interventions for the client with dystocia if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Maternity—Intrapartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 504). St. Louis: Mosby.

**275. 4**

**Rationale:** Oxygen is administered, 8 to 10 L/min, via face mask to optimize oxygenation of the circulating blood. Option 1 is incorrect because the intravenous infusion should be increased to increase the maternal blood volume. Option 2 is incorrect because the client is placed in the lateral position with her legs raised to increase maternal blood volume and improve fetal perfusion. Option 3 is incorrect because oxytocin stimulation of the uterus is discontinued if fetal heart rate patterns change for any reason.

**Test-Taking Strategy:** Use the ABCs—airway, breathing, and circulation. Oxygen is the only option that would improve cardiac output and improve perfusion to the fetus. The other options would not improve perfusion to the fetus. Review

care for the laboring client experiencing fetal distress if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Intrapartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 400). St. Louis: Saunders.

**276. 2**

**Rationale:** In placenta previa, the placenta is implanted in the lower uterine segment. The lower uterine segment does not contain the same intertwining musculature as the fundus of the uterus, and this site is more prone to bleeding. Options 1, 3, and 4 are not risks that are related specifically to placenta previa.

**Test-Taking Strategy:** Use the process of elimination, focusing on the subject of the question, placenta previa. Recalling that bleeding is a primary concern in this client will direct you easily to option 2. Review the complications associated with placenta previa if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Postpartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 364). St. Louis: Mosby.

**277. 2**

**Rationale:** When cord prolapse occurs, prompt actions are taken to relieve cord compression and increase fetal oxygenation. The client should be positioned with the hips higher than the head to shift the fetal presenting part toward the diaphragm. The nurse should push the call light to summon help, and other staff members should call the physician and notify the delivery room. If the cord is protruding from the vagina, no attempt should be made to replace it because to do so could traumatize it and reduce blood flow further. The examiner may place a gloved hand into the vagina, however, and hold the presenting part off the umbilical cord. Oxygen, 8 to 10 L/min, by face mask is administered to the client to increase fetal oxygenation.

**Test-Taking Strategy:** Note the strategic words *umbilical cord protruding from the vagina*. Options 3 and 4 can be eliminated first because these actions delay necessary and immediate treatment. Recalling that the goal is to relieve cord compression and to increase fetal oxygenation will direct you to option 2. Also remember that the cord should not be pushed back into the vagina. Review priority nursing measures for prolapsed cord if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Intrapartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 688–689). St. Louis: Saunders.

**ALTERNATE ITEM FORMAT:  
MULTIPLE RESPONSE****278. 4, 5, 6**

**Rationale:** Placenta previa is an improperly implanted placenta in the lower uterine segment near or over the internal cervical os. Painless, bright red vaginal bleeding in the second or third trimester of pregnancy is a sign of placenta previa. The client has a soft, relaxed, nontender uterus, and fundal height may be more than expected for gestational age. In abruptio placentae, severe abdominal pain is present. Uterine tenderness accompanies placental abruption. Additionally, in abruptio placentae, the abdomen feels hard and board-like on palpation as the blood penetrates the myometrium and causes uterine irritability.

**Test-Taking Strategy:** First eliminate options 1 and 2 because they are comparable or alike. Next, remember that the difference between placenta previa and abruptio placentae involves the presence of uterine pain and tenderness with abruptio placentae, as opposed to painless bleeding with placenta previa. Review the signs of placenta previa and abruptio placentae if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Intrapartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 361–362). St. Louis: Mosby.

# Postpartum Period

## I. POSTPARTUM

- A. Description: Period when the reproductive tract returns to the normal, nonpregnant state
- B. The postpartum period starts immediately after **delivery** and is usually completed by week 6 following **delivery**.

## II. PHYSIOLOGICAL MATERNAL CHANGES

### A. Involution

#### 1. Description

- a. Involution is the rapid decrease in the size of the **uterus** as it returns to the nonpregnant state.
- b. Clients who breast-feed may experience a more rapid involution because of the release of oxytocin during breast-feeding.

#### 2. Assessment

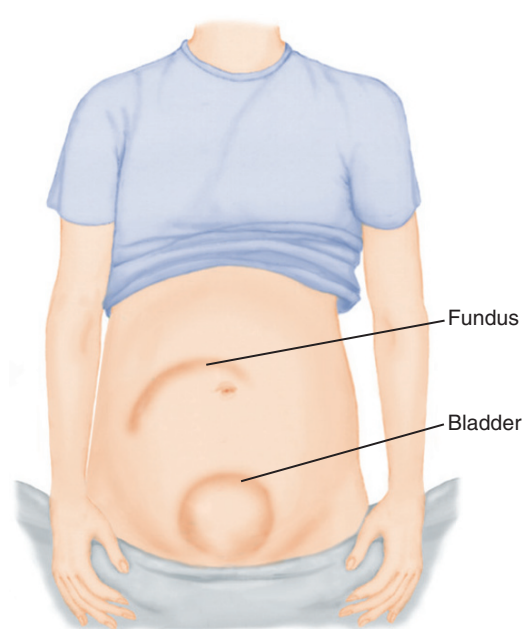

- a. The weight of the **uterus** decreases from approximately 2 lb to 2 oz in 6 weeks.
- b. The endometrium regenerates.
- c. The fundus steadily descends into the pelvis.
- d. Fundal height decreases about 1 fingerbreadth (1 cm) per day (Fig. 28-1).
- e. By 10 days postpartum, the **uterus** cannot be palpated abdominally.
- f. A flaccid fundus indicates uterine atony and should be massaged until firm; a tender fundus indicates an infection (Fig. 28-2).
- g. Afterpains decrease in frequency after the first few days.

### B. Lochia

- 1. Description: Discharge from the **uterus** that consists of blood from the vessels of the placental site and debris from the decidua

▲ **FIGURE 28-1** Involution of the uterus. The height of the uterine fundus decreases by approximately 1 cm/day. (From McKinney, E., James, S., Murray, S., & Ashwill, J. [2009]. *Maternal-child nursing* [3rd ed., p. 457]. St. Louis: Saunders.)

▲ **FIGURE 28-2** A full bladder displaces and prevents contraction of the uterus. (From McKinney, E., James, S., Murray, S., & Ashwill, J. [2009]. *Maternal-child nursing* [3rd ed., p. 460]. St. Louis: Saunders.)

**Box 28-1 Amount of Lochia**

**Scant:** Less than 2.5 cm (<1 inch) on menstrual pad in 1 hour

**Light:** Less than 10 cm (<4 inches) on menstrual pad in 1 hour

**Moderate:** Less than 15 cm (<6 inches) on menstrual pad in 1 hour

**Heavy:** Saturated menstrual pad in 1 hour

**Excessive:** Menstrual pad saturated in 15 minutes

From McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 457). St. Louis: Saunders.

2. Assessment (Box 28-1)
  - a. Rubra is bright red discharge that occurs from **delivery** day to day 3.
  - b. Serosa is brownish pink discharge that occurs from days 4 to 10.
  - c. Alba is white discharge that occurs from days 11 to 14.
  - d. The discharge should smell like normal menstrual flow.
  - e. Discharge decreases daily in amount.
  - f. Discharge may increase with ambulation.

 **To determine most accurately the amount of lochial flow, weigh the perineal pad before and after use and identify the amount of time between pad changes.**

- C. Cervix: Cervical involution occurs, and the muscle begins to regenerate after 1 week.
- D. **Vagina:** Vaginal distention decreases, although muscle tone is never restored completely to the pregravid state.
- E. Ovarian function and menstruation
  1. Ovarian function depends on the rapidity with which pituitary function is restored.
  2. Menstrual flow resumes within 1 to 2 months in non-breast-feeding mothers.
  3. Menstrual flow usually resumes within 3 to 6 months in breast-feeding mothers.
  4. Breast-feeding mothers may experience amenorrhea during the entire period of lactation.

 **Women may ovulate without menstruating, so breast-feeding should not be considered a form of birth control.**

- F. Breasts
  1. Breasts continue to secrete colostrum for the first 48 to 72 hours after **delivery**.
  2. A decrease in estrogen and progesterone levels after **delivery** stimulates increased prolactin levels, which promote breast milk production.
  3. Breasts become distended with milk on the third day.

**Box 28-2 Breast Care for Non-Breast-Feeding Mothers**

Avoid nipple stimulation.

Apply a breast binder, wear a snug-fitting bra, apply ice packs, or take a mild analgesic.

Engorgement usually resolves within 24 to 36 hours after it begins.

**TABLE 28-1** Normal Postpartum Vital Signs

| Vital Sign     | Description  |
|----------------|--|
| Temperature    | May increase to 100.4° F because of dehydrating effects of labor. Any higher elevation may be caused by infection and must be reported |
| Pulse          | May decrease to 50 beats/min (normal puerperal bradycardia). Pulse >100 beats/min may indicate excessive blood loss or infection       |
| Blood pressure | Should be normal; suspect hypovolemia if it decreases  |
| Respirations   | Rarely change; if respirations increase significantly, suspect pulmonary embolism, uterine atony, or hemorrhage                        |

4. Engorgement occurs on approximately day 4 in non-breast-feeding mothers. Box 28-2 summarizes care of breasts for non-breast-feeding mothers.
5. Breast-feeding relieves engorgement.
- G. Urinary tract
  1. The client may have urinary retention as a result of loss of elasticity and tone and loss of sensation in the bladder from trauma, medications, anesthesia, and lack of privacy.
  2. Diuresis usually begins within the first 12 hours after **delivery**.
- H. Gastrointestinal tract
  1. Clients are usually hungry after **delivery**.
  2. Constipation can occur, with bowel movement (soft, formed stool) by the second or third postpartum day.
  3. Hemorrhoids are common.
- I. Vital signs (Table 28-1)
  1. Temperature may be elevated during the first 24 hours because of dehydration.
  2. Bradycardia is common during the first week (range of 50 to 70 beats/min).
  3. Blood pressure remains unchanged.

### III. POSTPARTUM INTERVENTIONS

#### A. Assessment

1. Monitor vital signs.
2. Assess pain level.
3. Assess height, consistency, and location of the fundus (have client empty the bladder before fundal assessment) (see Fig. 28-2).
4. Monitor color, amount, and odor of **lochia**.
5. Assess breasts for engorgement.
6. Monitor perineum for swelling or discoloration.
7. Monitor episiotomy for healing.
8. Assess incisions or dressings of client who had a cesarean birth.
9. Monitor bowel status.
10. Monitor intake and output.
11. Encourage frequent voiding.
12. Encourage ambulation.
13. Assess extremities for thrombophlebitis (redness, tenderness, or warmth of the leg).
14. Administer Rh<sub>o</sub>(D) immune globulin (RhoGAM) as prescribed within 72 hours postpartum to Rh-negative client who has given birth to Rh-positive **infant**.
15. Assess bonding with the **newborn infant**.
16. Assess emotional status.

#### B. Client teaching

1. Demonstrate **newborn** care skills as necessary.
2. Provide the opportunity for the client to bathe the **newborn infant**.
3. Instruct in feeding technique.
4. Instruct the client to avoid heavy lifting for at least 3 weeks.
5. Instruct the client to plan at least one rest period per day.
6. Instruct the client that contraception should begin after **delivery** or with the initiation of intercourse (intercourse should be postponed at least until **lochia** ceases).
7. Instruct the client in the importance of follow-up, which should be scheduled at 4 to 6 weeks.
8. Instruct the client to report any signs of chills, fever, increased **lochia**, or depressed feelings to the physician immediately.

### IV. POSTPARTUM DISCOMFORTS

#### A. Afterbirth pains

1. Afterbirth pains occur as a result of contractions of the **uterus**.
2. Afterbirth pains are more common in multiparas, breast-feeding mothers, clients treated with oxytocin (Pitocin), and clients who had an overdistended **uterus** during pregnancy, such as with carrying twins.

#### B. Perineal discomfort

1. Apply ice packs to the perineum during the first 24 hours to reduce swelling.

### Box 28-3 Signs and Symptoms of Postpartum Depression

|  |                                       |
|--|---------------------------------------|
| Anxiety                                      | Irritability and agitation            |
| Appetite changes                             | Lack of energy                        |
| Crying, sadness                              | Less responsive to the infant         |
| Difficulty concentrating or making decisions | Loss of pleasure in normal activities |
| Fatigue, unable to sleep                     | Suicide thoughts                      |
| Feelings of guilt                            |                                       |

Modified from McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 712). St. Louis: Saunders.

2. After the first 24 hours, apply warmth by sitz baths.

#### C. Episiotomy

1. Instruct the client to administer perineal care after each voiding.
2. Encourage the use of an analgesic spray as prescribed.
3. Administer analgesics as prescribed if comfort measures are unsuccessful.

#### D. Perineal lacerations

1. Care as for an episiotomy; administer perineal care and use analgesic spray and analgesics for comfort.
2. Rectal suppositories and enemas may be contraindicated (to avoid injury to sutures).

#### E. Breast discomfort from engorgement

1. Encourage the client to wear a support bra at all times, even while she is sleeping.
2. Encourage the use of ice packs between feedings if the client is breast-feeding.
3. Encourage the use of warm soaks or a warm shower before feeding for the breast-feeding mother.
4. Administer analgesics as prescribed if comfort measures are unsuccessful.

#### F. Constipation

1. Encourage adequate intake of fluids (2000 mL/day).
2. Encourage diet high in fiber.
3. Encourage ambulation.
4. Administer stool softener, laxative, enema, or suppository if needed and prescribed.

#### G. Postpartum depression (Box 28-3).

1. Acknowledge the client's feelings and demonstrate a caring attitude.
2. Determine availability of family support and other support systems and resources as needed.
3. Encourage and assist the client to verbalize her feelings.
4. Monitor **newborn** for appropriate growth and development expectations.
5. Assist the significant other and other appropriate family members to discuss feelings and identify ways to assist the client.

 All clients should be assessed for depression during pregnancy and in the postpartum period.

## V. NUTRITIONAL COUNSELING

- A. Discuss caloric intake with breast-feeding and non-breast-feeding mothers.
- B. Nutritional needs depend on prepregnancy weight, ideal weight for height, and whether the client is breast-feeding.
-  C. If the client is breast-feeding, calorie needs increase by 200 to 500 cal/day, and the client may require increased fluids and the continuance of prenatal vitamins and minerals.

## VI. BREAST-FEEDING

- A. Interventions
  1. Put the **infant** to the mother's breast as soon as the mother's and **infant's** conditions are stable (on **delivery** table, if possible).
  2. Stay with the client each time she nurses until she feels secure and confident with the **infant** and her feelings.
  3. Assess *LATCH* (latch achieved by **infant**; audible swallowing; type of nipple; comfort of mother; help given to mother with nursing).
  4. Uterine cramping may occur the first day after **delivery** while the client is nursing, when oxytocin stimulation causes the **uterus** to contract.
  5. Instruct the client to use general hygiene and wash the breasts once daily.
  6. If engorgement occurs, breast-feed frequently, apply warm packs before feeding, apply ice packs between feedings, and massage the breasts.
  7. The client should not use soap on the breasts because it tends to remove natural oils, which increases the chance of cracked nipples.
  8. If cracked nipples develop, the client should expose the nipples to air for 10 to 20 minutes after feeding, rotate the position of the **infant** for each feeding, and ensure that the **infant** is latched on to the areola, not just the nipple.
  9. The bra should be well-fitted and supporting.
  10. Breasts may leak between feedings or during coitus; place breast pad in bra.
  11. Calories should be increased by 200 to 500 cal/day, and the diet should include additional fluids; prenatal vitamins should be taken as prescribed.
  12. **Infant's** stools are usually light yellow, seedy, watery, and frequent.
  13. Medications, including over-the-counter medications, need to be avoided unless prescribed because they may be unsafe when breast-feeding.
  14. Gas-producing foods and caffeine should be avoided.
  15. Hormonal contraceptives may cause a decrease in the milk supply and are best avoided during the first 6 weeks after birth.

### Box 28-4 Breast-Feeding Procedure for the Mother

Wash hands and assume a comfortable position. Start with the breast with which the last feeding ended. Brush the newborn infant's lower lip with nipple. Tickle the lips to have the infant open the mouth wide. Guide the nipple and surrounding areola into the infant's mouth. Encourage the infant to nurse on each breast for 15 to 20 minutes. After the infant has nursed, release suction by depressing the infant's chin or inserting a clean finger into the infant's mouth. Burp the infant after the first breast. Repeat the procedure on the second breast until the infant stops nursing. Burp the infant again. Listen for audible sucking and swallowing.

- 16. Oral contraceptives containing estrogen are not recommended for breast-feeding mothers; progestin-only birth control pills are less likely to interfere with the milk supply.
- 17. The **infant** will develop his or her own feeding schedule.
- B. Breast-feeding procedure for client (Box 28-4)

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 279. A postpartum nurse is taking the vital signs of a client who delivered a healthy infant 4 hours ago. The nurse notes that the client's temperature is 100.2° F. Which of the following actions would be appropriate?
  1. Notify the physician.
  2. Document the findings.
  3. Retake the temperature in 15 minutes.
  4. Increase hydration by encouraging oral fluids.
- 280. A nurse is assessing a client who is 6 hours postpartum after delivering a full-term healthy infant. The client complains to the nurse of feelings of faintness and dizziness. Which nursing action would be most appropriate?
  1. Elevate the client's legs.
  2. Determine hemoglobin and hematocrit levels.
  3. Instruct the client to request help when getting out of bed.
  4. Inform the nursery room nurse to avoid bringing the newborn infant to the client until the feelings of faintness and dizziness have subsided.

- 281.** A postpartum nurse is providing instructions to a client after delivery of a healthy infant. The nurse instructs the client that she should expect normal bowel elimination to return:
1. 3 days postpartum
  2. 7 days postpartum
  3. On the day of delivery
  4. Within 2 weeks postpartum
- 282.** A nurse is planning care for a postpartum client who had a vaginal delivery 2 hours ago. The client had a midline episiotomy and has several hemorrhoids. What is the priority nursing diagnosis for this client?
1. *Acute pain*
  2. *Disturbed body image*
  3. *Impaired urinary elimination*
  4. *Risk for imbalanced fluid volume*
- 283.** A nurse is monitoring the amount of lochia drainage in a client who is 2 hours postpartum and notes that the client has saturated a perineal pad in 1 hour. The nurse reports the amount of lochial flow as:
1. Scant
  2. Light
  3. Heavy
  4. Excessive
- 284.** A nurse is teaching a postpartum client about breast-feeding. Which of the following instructions should the nurse include?
1. The diet should include additional fluids.
  2. Prenatal vitamins should be discontinued.
  3. Soap should be used to cleanse the breasts.
  4. Birth control measures are unnecessary while breast-feeding.
- 285.** A nurse is preparing to perform a fundal assessment on a postpartum client. The initial nursing action in performing this assessment is which of the following?
1. Ask the client to turn on her side.
  2. Ask the client to urinate and empty her bladder.
  3. Massage the fundus gently before determining the level of the fundus.
  4. Ask the client to lie flat on her back with the knees and legs flat and straight.
- 286.** A nurse is caring for four 1-day postpartum clients. Which client has an abnormal finding that would require further intervention?
1. The client with mild afterpains
  2. The client with a pulse rate of 60 beats/min
  3. The client with colostrum discharge from both breasts
  4. The client with lochia that is red and has a foul-smelling odor
- 287.** When performing a postpartum assessment on a client, a nurse notes the presence of clots in the lochia. The nurse examines the clots and notes that they are larger than 1 cm. Which nursing action is appropriate?
1. Notify the physician.
  2. Document the findings.
  3. Reassess the client in 2 hours.
  4. Encourage increased oral intake of fluids.

### Alternate Item Format: Multiple Response

- 288.** A nurse is providing postpartum instructions to a client who will be breast-feeding her newborn. The nurse determines that the client has understood the instructions if she makes which of the following statements? **Select all that apply.**
1. "I should wear a bra that provides support."
  2. "Drinking alcohol can affect my milk supply."
  3. "The use of caffeine can decrease my milk supply."
  4. "I will start my estrogen birth control pills again as soon as I get home."
  5. "I know if my breasts get engorged I will limit my breast-feeding and supplement the baby."
  6. "I plan on having bottled water available in the refrigerator so I can get additional fluids easily."

## ANSWERS

### 279. 4

**Rationale:** The client's temperature should be taken every 4 hours while she is awake. Temperatures up to 100.4° F (38° C) in the first 24 hours after birth often are related to the dehydrating effects of labor. The appropriate action is to increase hydration by encouraging oral fluids, which should bring the temperature to a normal reading. Although the nurse also would document the findings, the appropriate action would be to increase hydration. Contacting the physician is not necessary. Taking the temperature in another 15 minutes is an unnecessary action.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the physiological findings in the immediate postpartum period to assist in answering this question. Recalling that a temperature elevation often is related to the dehydrating effects of labor will direct you to the correct option. Also, increasing hydration relates to a physiological client need. Review normal postpartum assessment findings if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Postpartum

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 466). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 705). St. Louis: Mosby.

### 280. 3

**Rationale:** Orthostatic hypotension may be evident during the first 8 hours after birth. Feelings of faintness or dizziness are signs that caution the nurse to focus interventions on the client's safety. The nurse should advise the client to get help the first few times she gets out of bed. Option 1 is not the most appropriate or helpful action in this situation. Option 2 requires a physician's prescription. Option 4 is unnecessary.

**Test-Taking Strategy:** Focus on the subject of the question, client safety. Option 4 is inappropriate and should be eliminated first. Elevating the client's legs is not an appropriate or helpful nursing intervention. From the remaining options, recall that safety is a primary issue. This should assist in directing you to the correct option. If you had difficulty with this question, review postpartum nursing interventions.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 466). St. Louis: Saunders.

### 281. 1

**Rationale:** After birth, the nurse should auscultate the client's abdomen in all four quadrants to determine the return of bowel sounds. Normal bowel elimination usually returns 2 to 3 days postpartum. Surgery, anesthesia, and the use of opioids and pain control agents also contribute to the longer period of altered bowel functions. Options 2, 3, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination and general principles related to postpartum care to assist in answering this question. Eliminate options 2 and 4 first because of the length of time stated in these options. From the remaining options, eliminate option 3 because it would seem unreasonable that bowel function would return that quickly in the postpartum woman. Review normal gastrointestinal functions in the postpartum client if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 459). St. Louis: Saunders.

### 282. 1

**Rationale:** The priority nursing diagnosis for a client who delivered 2 hours ago and who has a midline episiotomy and hemorrhoids is *Acute pain*. Most clients have some degree of discomfort during the immediate postpartum period. There are no data in the question that indicate the presence

of *Disturbed body image*, *Impaired urinary elimination*, or *Risk for imbalanced fluid volume*.

**Test-Taking Strategy:** Note the strategic word *priority*. Use Maslow's Hierarchy of Needs theory to eliminate option 2 because this is a psychosocial, not a physiological, need. From the remaining options, focus on the data in the question to direct you to option 1. Review the discomforts that can occur in the postpartum client if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Maternity—Postpartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 539). St. Louis: Mosby.

### 283. 3

**Rationale:** Lochia is the discharge from the uterus in the postpartum period that consists of blood from the vessels of the placental site and debris from the decidua. The following can be used as a guide to determine the amount of flow: scant = less than 2.5 cm (<1 inch) on menstrual pad in 1 hour; light = less than 10 cm (<4 inches) on menstrual pad in 1 hour; moderate = less than 15 cm (<6 inches) on menstrual pad in 1 hour; heavy = saturated menstrual pad in 1 hour; and excessive = menstrual pad saturated in 15 minutes.

**Test-Taking Strategy:** Focus on the data in the question. The data and the use of guidelines to determine the amount of lochial flow will direct you to the correct option. If you had difficulty with this question, review postpartum assessment of the amount of lochial flow.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Postpartum

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 457, 700). St. Louis: Saunders.

Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 526–527). St. Louis: Mosby.

### 284. 1

**Rationale:** The diet for a breast-feeding client should include additional fluids. Prenatal vitamins should be taken as prescribed, and soap should not be used on the breast because it tends to remove natural oils, which increases the chance of cracked nipples. Breast-feeding is not a method of contraception, so birth control measures should be resumed.

**Test-Taking Strategy:** Use the process of elimination, noting the subject of the question, teaching for the breast-feeding client. Remember that fluids and calories should be increased when the client is breast-feeding. If you had difficulty with this question, review breast-feeding interventions.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Postpartum

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 727). St. Louis: Mosby.

### 285. 2

**Rationale:** Before starting the fundal assessment, the nurse should ask the client to empty her bladder so that an accurate assessment can be done. When the nurse is performing fundal assessment, the nurse asks the client to lie flat on her back with the knees flexed. Massaging the fundus is inappropriate unless the fundus is boggy or soft, and then it should be massaged gently until firm.

**Test-Taking Strategy:** Note the strategic words *initial nursing action* in the query. Visualize the procedure when answering the question. This should direct you to option 2. Remember that a full bladder displaces the uterus. If you had difficulty with this question, review the procedure for performing fundal assessment in the postpartum period.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Postpartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 483). St. Louis: Mosby.

### 286. 4

**Rationale:** Lochia, the discharge present after birth, is red for the first 1 to 3 days and gradually decreases in amount. Normal lochia has a fleshy odor or an odor similar to menstrual flow. Foul-smelling or purulent lochia usually indicates infection, and these findings are not normal. The other options are normal findings for a 1-day postpartum client.

**Test-Taking Strategy:** Note the strategic words *abnormal finding*. Noting the word *foul* in option 4 will direct you to this option. If you had difficulty with this question, review normal assessment findings in the postpartum client.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 469). St. Louis: Saunders.

### 287. 1

**Rationale:** Normally, a few small clots may be noted in the lochia in the first 1 to 2 days after birth from pooling of the blood in the vagina. Clots larger than 1 cm are considered abnormal. The cause of these clots, such as uterine atony or retained placental fragments, needs to be determined and treated to prevent further blood loss. Although the findings would be documented, the appropriate action is to notify the physician. Reassessing the client in 2 hours would delay

necessary treatment. Increasing oral intake of fluids would not be a helpful action in this situation.

**Test-Taking Strategy:** Focus on the strategic words *larger than 1 cm*. Knowledge regarding the presence of clots in the postpartum period and their significance will direct you to option 1. If you had difficulty with this question, review normal findings in the postpartum client.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Postpartum

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 700). St. Louis: Saunders.

Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 539–540). St. Louis: Mosby.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 708). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 288. 1, 2, 3, 6

**Rationale:** The postpartum client should wear a bra that is well-fitted and supportive. Breasts may leak between feedings or during coitus, and the client is taught to place a breast pad in the bra. Breast-feeding clients should increase their daily fluid intake; having bottled water available indicates that the postpartum client understands the importance of increasing fluids. If engorgement occurs, the client should not limit breast-feeding, but should breast-feed frequently. Oral contraceptives containing estrogen are not recommended for breast-feeding mothers. Common causes of decreased milk supply include formula use; inadequate rest or diet; smoking by the mother or others in the home; and use of caffeine, alcohol, or other medications.

**Test-Taking Strategy:** Note the strategic words *understood the instructions*. Think about the physiology associated with milk production and the complications of breast-feeding. This will direct you to the correct options. Review postpartum instructions for a breast-feeding client if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Evaluation

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 568). St. Louis: Saunders.

Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 694–695). St. Louis: Mosby.

# Postpartum Complications

## I. CYSTITIS

- A. Description: Infection of the bladder
- B. Assessment
  1. Burning and pain on urination
  2. Lower abdominal pain
  3. Increased frequency of urination
  4. Costovertebral angle tenderness
  5. Fever
  6. Proteinuria, hematuria, bacteriuria, white blood cells in the urine
- C. Interventions
  1. Palpate bladder for distention.
  2. Palpate fundus.
  3. Obtain urine specimen for culture and sensitivity if prescribed.
  4. Institute measures to assist the client to void.
  5. Encourage frequent and complete emptying of the bladder.
  6. Encourage fluids to 3000 mL/day.
  7. Administer antibiotics as prescribed.
  8. Instruct the client in the methods of prevention and treatment of cystitis.

 Obtain urine specimen for culture and sensitivity before initiating antibiotic therapy.

## II. HEMATOMA

- A. Description
  1. Hematoma is a localized collection of blood into the tissues of the reproductive sac after **delivery**; vulvar hematomas are the most common (Fig. 29-1).
  2. Predisposing conditions include operative **delivery** with forceps and injury to a blood vessel.
  3. Hematoma can be a life-threatening condition.
- B. Assessment
  1. Abnormal severe pain
  2. Pressure in the perineal area
  3. Sensitive, bulging mass in the perineal area with discolored skin
  4. Inability to void
  5. Decreased hemoglobin and hematocrit levels

6. Signs of shock, such as pallor, tachycardia, and hypotension, if significant blood loss has occurred
- C. Interventions
    1. Monitor vital signs.
    2. Monitor client for abnormal pain or perineal pressure, especially when forceps **delivery** has occurred.
    3. Place ice at the hematoma site.
    4. Administer analgesics as prescribed.
    5. Monitor intake and output.
    6. Encourage fluids and voiding.
    7. Prepare for urinary catheterization if the client is unable to void.
    8. Administer blood products as prescribed.
    9. Monitor for signs of infection, such as increased temperature, pulse rate, and white blood cell count.
    10. Administer antibiotics as prescribed because infection is common after hematoma formation.
    11. Prepare for incision and evacuation of hematoma if necessary.

**▲ FIGURE 29-1** A vulvar hematoma is caused by rapid bleeding into soft tissue. It causes severe pain and feelings of pressure. (From Murray, S., & McKinney, E. [2010]. *Foundations of maternal-newborn and women's health nursing* [5th ed.]. St. Louis: Saunders.)

### III. HEMORRHAGE

#### A. Description

1. Bleeding of 500 mL or more after **delivery**
2. Primary cause of maternal mortality that demands prompt recognition and intervention

#### B. Assessment (Box 29-1)

1. Early: Hemorrhage occurs during the first 24 hours after **delivery**.
2. Late: Hemorrhage occurs after the first 24 hours following **delivery**.

#### Box 29-1 Postpartum Hemorrhage

##### Causes

Uterine atony  
Laceration of the vagina  
Hematoma development in the cervix, perineum, or labia  
Retained placental fragments

##### Predisposing Factors

Previous history of postpartum hemorrhage  
Placenta previa  
Abruptio placentae  
Overdistention of the uterus—polyhydramnios, multiple gestation, large neonate  
Infection  
Multiparity  
Dystocia or labor that is prolonged  
Operative delivery—cesarean or forceps delivery, intrauterine manipulation

#### C. Interventions for signs of bleeding or shock

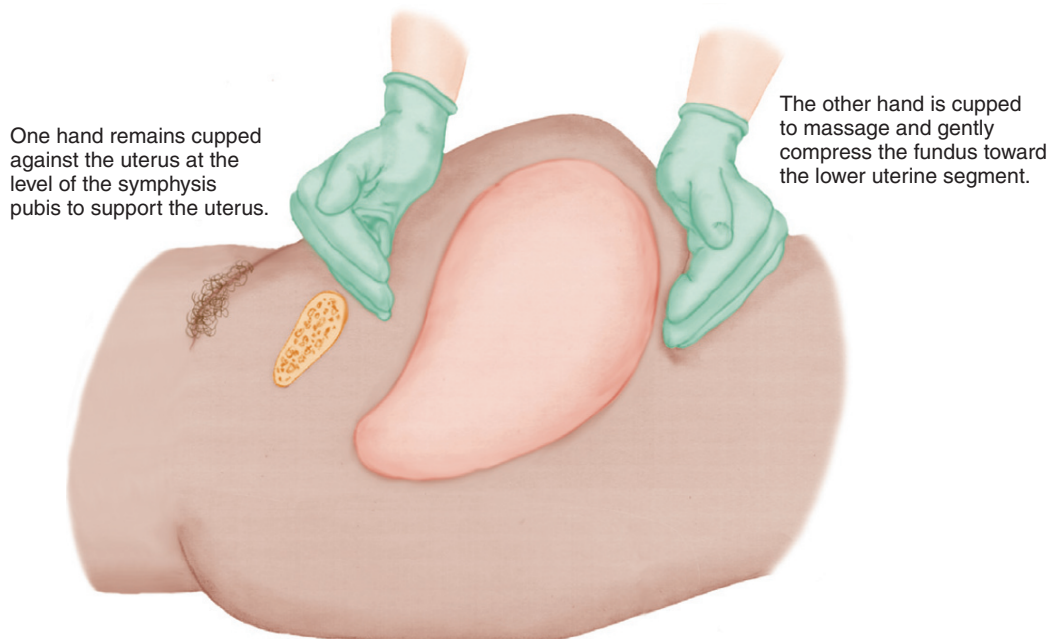

1. Massage fundus for uterine atony, with care not to overmassage (Fig. 29-2).
2. Remain with the client.
3. Ask another nurse to notify the physician or midwife.
4. Monitor vital signs and fundus every 5 to 15 minutes; monitor for early signs of hemorrhaging, including restlessness and increased pulse rate (a decrease in blood pressure is a later sign of hemorrhage).
5. Assess and estimate blood loss by pad count.
6. Turn the client to assess for pooled blood underneath her.
7. Assess level of consciousness.
8. Administer fluids and monitor intake and output.
9. Monitor hemoglobin and hematocrit levels.
10. Maintain asepsis because hemorrhage predisposes to infection.
11. Prepare for the administration of oxytocin (Pitocin) if prescribed.
12. Prepare for the administration of intravenous fluids and blood transfusions if prescribed.

### IV. INFECTION

#### A. Description: Any infection of the reproductive organs that occurs within 28 days of **delivery** or abortion

#### B. Assessment

1. Fever

▲ **FIGURE 29-2** Technique for fundal massage. One hand remains cupped against the uterus at the level of the symphysis pubis to support the uterus. The other hand is cupped to massage and compress the fundus gently toward the lower uterine segment. (From McKinney, E., James, S., Murray, S., & Ashwill, J. [2009]. *Maternal-child nursing* [3rd ed., p. 697]. St. Louis: Saunders.)

2. Chills
3. Anorexia
4. Pelvic discomfort or pain
5. Vaginal discharge that is malodorous; normal vaginal discharge has a fleshy odor or an odor similar to a menstrual period.
6. Elevated white blood cell count

**!** A temperature of 100.4° F is normal during the first 24 hours postpartum because of dehydration; a temperature of 100.4° F or greater after 24 hours postpartum indicates infection.

### C. Interventions

1. Monitor vital signs and temperature every 2 to 4 hours.
2. Make the client as comfortable as possible; position the client to promote drainage.
3. Keep the client warm if chilled.
4. Isolate the infant from the client only if the client can infect the infant.
5. Provide nutritious, high-calorie, high-protein diet.
6. Encourage fluids to 3000 to 4000 mL/day, if not contraindicated.
7. Encourage frequent voiding and monitor intake and output.
8. Monitor culture results if cultures were prescribed.
9. Administer antibiotics according to identified organism, as prescribed.

## V. MASTITIS

### A. Description

1. Mastitis is inflammation of the breast as a result of infection.
2. Mastitis primarily occurs in breast-feeding mothers 2 to 3 weeks after **delivery**, but may occur at any time during lactation.

### B. Assessment (Fig. 29-3)

1. Localized heat and swelling
2. Pain; tender axillary lymph nodes
3. Elevated temperature
4. Complaints of flu-like symptoms

### C. Interventions

1. Instruct the client in good handwashing and breast hygiene techniques.
2. Promote comfort.
3. Apply heat or cold to the site as prescribed.
4. Maintain lactation in breast-feeding mothers.
5. Encourage manual expression of breast milk or use of a breast pump every 4 hours.
6. Encourage the client to support the breasts by wearing a supportive bra.
7. Administer analgesics as prescribed.
8. Administer antibiotics as prescribed.

**▲ FIGURE 29-3** Mastitis. (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed., p. 586]. St. Louis: Mosby.)

## VI. PULMONARY EMBOLISM

**A. Description:** Passage of a thrombus, often originating in a uterine or other pelvic vein, into the lungs, where it disrupts the circulation of the blood

### B. Assessment

1. Sudden dyspnea and chest pain
2. Tachypnea and tachycardia
3. Cough and lung crackles
4. Hemoptysis
5. Feeling of impending doom

### C. Interventions

1. Administer oxygen.
2. Position client with the head of the bed elevated.
3. Monitor vital signs frequently, especially respiratory and heart rate and breath sounds.
4. Monitor for signs of respiratory distress and for signs of increasing hypoxemia.
5. Administer intravenous fluids as prescribed.
6. Administer anticoagulants as prescribed.
7. Prepare to assist the physician to administer medications to dissolve the clot if prescribed.

## VII. SUBINVOLUTION

**A. Description:** Incomplete involution or failure of the **uterus** to return to its normal size and condition

### B. Assessment

1. Uterine pain on palpation
2. **Uterus** larger than expected
3. More than normal vaginal bleeding

### C. Interventions

1. Assess vital signs.
2. Assess **uterus** and fundus.
3. Monitor for uterine pain and vaginal bleeding.
4. Elevate legs to promote venous return.

### Box 29-2 Assessment of Types of Thrombophlebitis

#### Superficial

Palpable thrombus that feels bumpy and hard  
Tenderness and pain in affected lower extremity  
Warm and pinkish red color over the thrombus area

#### Femoral

Malaise  
Chills and fever  
Possible positive Homans' sign (not always present)  
Diminished peripheral pulses  
Shiny white skin over affected area  
Pain, stiffness, and swelling of affected leg

#### Pelvic

Severe chills  
Dramatic body temperature changes  
Pulmonary embolism may be the first sign

5. Encourage frequent voiding.
6. Monitor hemoglobin and hematocrit.
7. Prepare to administer methylergonovine maleate (Methergine), which provides sustained contraction of the uterus, as prescribed.

## VIII. THROMBOPHLEBITIS

### A. Description

1. A clot forms in a vessel wall as a result of the inflammation of the vessel wall.
2. A partial obstruction of the vessel can occur.
3. Increased blood-clotting factors in the postpartum period place the client at risk.
4. Early ambulation in the postoperative period after cesarean section is a preventive measure.

### B. Types

1. Superficial thrombophlebitis
2. Femoral thrombophlebitis
3. Pelvic thrombophlebitis

### C. Assessment (Box 29-2)

### D. Interventions

1. Specific therapies may depend on the location of thrombophlebitis.
2. Assess the lower extremities for edema, tenderness, varices, and increased skin temperature.
3. Maintain bedrest.
4. Elevate affected leg.
5. Apply a bed cradle and keep bedclothes off affected leg.
6. Never massage the leg.
7. Monitor for manifestations of pulmonary embolism.
8. Apply hot packs or moist heat to the affected site as prescribed to alleviate discomfort.
9. Apply elastic stockings (support hose) if prescribed.
10. Administer analgesics as prescribed.

### Box 29-3 Client Education for Thrombophlebitis

Never massage the leg.  
Avoid crossing the legs.  
Avoid prolonged sitting.  
Avoid constrictive clothing.  
Avoid pressure behind the knees.  
Know how to apply elastic stockings (support hose) if prescribed.  
Understand the importance of anticoagulant therapy if prescribed.  
Understand the importance of follow-up with the health care provider.

11. Administer antibiotics if prescribed.
12. Heparin sodium intravenously may be prescribed for femoral or pelvic thrombophlebitis to prevent further thrombus formation.

### E. Client education (Box 29-3)

## IX. PERINATAL LOSS

### A. Description

1. Perinatal loss is associated with miscarriage, neonatal death, stillbirth, and therapeutic abortion.
2. Loss and grief may also occur with the birth of a preterm **infant**, an **infant** with complications of birth, or an **infant** with congenital anomalies; it may also occur in a client who is giving up a child for adoption.

### B. Interventions

 Not all interventions are appropriate for every woman and her significant family. It is crucial to consider religious and cultural health care practices and beliefs when planning care for a woman and family who have experienced perinatal loss.

1. Communicate therapeutically and actively listen, providing parents time to grieve.
2. Notify the hospital chaplain or other religious person.
3. Discuss with the parents options such as seeing, holding, bathing, or dressing the deceased **infant**; visitation by other family members or friends; religious or cultural rituals; and funeral arrangements.
4. Prepare a special memories box with keepsakes such as footprints, handprints, locks of hair, and pictures, if appropriate.
5. Admit the mother to a private room; if possible, mark the door to the room with a special card (per agency procedure and maintaining confidentiality) that denotes to hospital staff that this family has experienced a loss.
6. See Chapter 27 for additional information on intrauterine fetal demise.

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 289.** A nurse is monitoring a client in the immediate postpartum period for signs of hemorrhage. Which of the following signs, if noted, would be an early sign of excessive blood loss?
1. A temperature of 100.4° F
  2. A blood pressure change from 130/88 to 124/80 mm Hg
  3. An increase in the pulse rate from 88 to 102 beats/min
  4. An increase in the respiratory rate from 18 to 22 breaths/min
- 290.** A nurse is preparing to assess the uterine fundus of a client in the immediate postpartum period. When the nurse locates the fundus, she notes that the uterus feels soft and boggy. Which nursing intervention would be appropriate initially?
1. Elevate the client's legs.
  2. Encourage the client to void.
  3. Massage the fundus until it is firm.
  4. Push on the uterus to assist in expressing clots.
- 291.** A nurse is providing instructions about measures to prevent postpartum mastitis to a client who is breast-feeding her newborn. Which of the following, if stated by the client, would indicate a need for further instructions?
1. "I should breast-feed every 2 to 3 hours."
  2. "I should change the breast pads frequently."
  3. "I should wash my hands well before breast-feeding."
  4. "I should wash my nipples daily with soap and water."
- 292.** A postpartum nurse is assessing a client who delivered a healthy infant by cesarean section for signs and symptoms of superficial venous thrombosis. Which of the following signs or symptoms would the nurse note if superficial venous thrombosis were present?
1. Paleness of the calf area
  2. Coolness of the calf area
  3. Enlarged, hardened veins
  4. Palpable dorsalis pedis pulses
- 293.** A client in a postpartum unit complains of sudden sharp chest pain and dyspnea. The nurse notes that the client is tachycardic and the respiratory rate is elevated. The nurse suspects a pulmonary embolism. Which of the following would be the initial nursing action?
1. Initiate an intravenous line.
  2. Assess the client's blood pressure.
  3. Prepare to administer morphine sulfate.
  4. Administer oxygen, 8 to 10 L/min, by face mask.
- 294.** A nurse is assessing a client in the fourth stage of labor and notes that the fundus is firm, but that bleeding is excessive. Which of the following would be the initial nursing action?
1. Record the findings.
  2. Notify the physician.
  3. Massage the fundus.
  4. Place the client in Trendelenburg's position.
- 295.** A nurse is preparing to care for four assigned clients. Which client is at highest risk for hemorrhage?
1. A primiparous client who delivered 4 hours ago
  2. A multiparous client who delivered 6 hours ago
  3. A primiparous client who delivered 6 hours ago and had epidural anesthesia
  4. A multiparous client who delivered a large fetus after oxytocin (Pitocin) induction
- 296.** A postpartum client is diagnosed with cystitis. The nurse plans for which priority nursing intervention in the care of the client?
1. Providing sitz baths
  2. Encouraging fluid intake
  3. Placing ice on the perineum
  4. Monitoring hemoglobin and hematocrit levels
- 297.** A nurse is monitoring a postpartum client who received epidural anesthesia for delivery for the presence of a vulvar hematoma. Which of the following assessment findings would best indicate the presence of a hematoma?
1. Changes in vital signs
  2. Signs of heavy bruising
  3. Complaints of intense pain
  4. Complaints of a tearing sensation
- 298.** A nurse is developing a plan of care for a postpartum client with a small vulvar hematoma. The nurse includes which specific intervention in the plan during the first 12 hours after delivery?
1. Assess vital signs every 4 hours.
  2. Measure fundal height every 4 hours.
  3. Prepare an ice pack for application to the area.
  4. Inform the health care provider of assessment findings.

### Alternate Item Format: Multiple Response

- 299.** A nurse is preparing a list of self-care instructions for a postpartum client who was diagnosed with mastitis. Which of the following instructions would be included on the list? **Select all that apply.**
- 1. Wear a supportive bra.
  - 2. Rest during the acute phase.

- 3. Maintain a fluid intake of at least 3000 mL.
- 4. Continue to breast-feed if the breasts are not too sore.
- 5. Take the prescribed antibiotics until the soreness subsides.
- 6. Avoid decompression of the breasts by breast-feeding or breast pump.

## ANSWERS

### 289. 3

**Rationale:** During the fourth stage of labor, the maternal blood pressure, pulse, and respiration should be checked every 15 minutes during the first hour. An increasing pulse is an early sign of excessive blood loss because the heart pumps faster to compensate for reduced blood volume. The blood pressure decreases as the blood volume diminishes, but a decreased blood pressure would not be the earliest sign of hemorrhage. A slight increase in temperature is normal. The respiratory rate is slightly increased from normal.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic word *early* in the question. Think about the physiological occurrences of shock and the expected findings in the postpartum period. This should assist in directing you to option 3. Review signs of early hemorrhage if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 364, 381). St. Louis: Saunders.

### 290. 3

**Rationale:** If the uterus is not contracted firmly, the initial intervention is to massage the fundus until it is firm and to express clots that may have accumulated in the uterus. Pushing on an uncontracted uterus can invert the uterus and cause massive hemorrhage. Elevating the client's legs and encouraging the client to void would not assist in managing uterine atony. If the uterus does not remain contracted as a result of the uterine massage, the problem may be a distended bladder, and the nurse should assist the mother to urinate, but this would not be the initial action if the uterus is soft and boggy.

**Test-Taking Strategy:** Note the strategic word *initially* in the question. Focus on the subject of the question, that the uterus is soft and boggy. Recalling the therapeutic management for uterine atony will assist in directing you to the correct option. If you had difficulty with this question, review therapeutic management for the client with uterine atony.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 381). St. Louis: Saunders.

### 291. 4

**Rationale:** Mastitis is inflammation of the breast as a result of infection. It generally is caused by an organism that enters through an injured area of the nipples, such as a crack or blister. Measures to prevent the development of mastitis include changing nursing pads when they are wet and avoiding continuous pressure on the breasts. Soap is drying and could lead to cracking of the nipples, and the client should be instructed to avoid using soap on the nipples. The mother is taught about the importance of handwashing and that she should breast-feed every 2 to 3 hours.

**Test-Taking Strategy:** Note the strategic words *a need for further instructions*. These words indicate a negative event query and the need to select the option that identifies the incorrect client statement. Recalling that the use of soap is drying to the skin and could cause cracking and provide an entry point for organisms will direct you easily to option 4. Review these measures if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 571). St. Louis: Saunders.

### 292. 3

**Rationale:** Thrombosis of superficial veins usually is accompanied by signs and symptoms of inflammation, including swelling, redness, tenderness, and warmth of the involved extremity. It also may be possible to palpate the enlarged, hard vein. Clients sometimes experience pain when they walk. Palpable dorsalis pedis pulses is a normal finding.

**Test-Taking Strategy:** Use the process of elimination, eliminating option 4 first because this is a normal and expected finding. Next eliminate options 1 and 2 because they are comparable or alike. If you had difficulty with this question, review the clinical manifestations associated with superficial venous thrombosis.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 702–703). St. Louis: Saunders.

### 293. 4

**Rationale:** If pulmonary embolism is suspected, oxygen should be administered, 8 to 10 L/min, by face mask. Oxygen

is used to decrease hypoxia. The client also is kept on bedrest with the head of the bed slightly elevated to reduce dyspnea. Morphine sulfate may be prescribed for the client, but this would not be the initial nursing action. An intravenous line also will be required, and vital signs need to be monitored, but these actions would follow the administration of oxygen.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic word *initial* in the query. Use the ABCs—airway, breathing, and circulation—to assist in directing you to option 4. If you had difficulty with this question, review the initial nursing interventions and therapeutic management of a client with pulmonary embolism.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 704–705). St. Louis: Saunders.

### 294. 2

**Rationale:** If bleeding is excessive, the cause may be laceration of the cervix or birth canal. Massaging the fundus if it is firm would not assist in controlling the bleeding. Trendelenburg's position should be avoided because it may interfere with cardiac and respiratory function. Although the nurse would record the findings, the initial nursing action would be to notify the physician.

**Test-Taking Strategy:** Read the question carefully, noting the subject of the question and the clinical manifestations identified in the question. Eliminate option 3 first because, if the uterus is firm, it would not be necessary to perform fundal massage. Knowing that Trendelenburg's position is not advised will assist in eliminating this option. From the remaining options, noting the strategic words *bleeding is excessive* will assist in directing you to option 2. Review the interventions related to a client who is hemorrhaging if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 700). St. Louis: Saunders.

### 295. 4

**Rationale:** The causes of postpartum hemorrhage include uterine atony; laceration of the vagina; hematoma development in the cervix, perineum, or labia; and retained placental fragments. Predisposing factors for hemorrhage include a previous history of postpartum hemorrhage, placenta previa, abruptio placentae, overdistention of the uterus from polyhydramnios, multiple gestation, a large neonate, infection, multiparity, dystocia or labor that is prolonged, operative delivery such as a cesarean or forceps delivery, and intrauterine manipulation. The multiparous client who delivered a large fetus after oxytocin induction has more risk factors associated with postpartum hemorrhage than the other clients. Additionally, there are no specific data in the client descriptions in options 1, 2, or 3 that present the risk for hemorrhage.

**Test-Taking Strategy:** Focus on the subject, the client at highest risk for hemorrhage. Read the client description in each option. Noting the words *large* and *oxytocin* in option 4 will direct you to this option. Review delegating and assignment-making guidelines if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership and Management—Delegating/Prioritizing

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 479, 579). St. Louis: Mosby.

### 296. 2

**Rationale:** Cystitis is an infection of the bladder. The client should consume 3000 mL of fluids per day if not contraindicated. Sitz baths and ice would be appropriate interventions for perineal discomfort. Hemoglobin and hematocrit levels would be monitored with hemorrhage.

**Test-Taking Strategy:** Focus on the subject, priority intervention for the client with cystitis. Remember that increased fluids are a priority intervention. Review these interventions for a client with cystitis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 782). St. Louis: Saunders.

### 297. 1

**Rationale:** Because the client has had epidural anesthesia and is anesthetized, she cannot feel pain, pressure, or a tearing sensation. Changes in vital signs indicate hypovolemia in an anesthetized postpartum client with vulvar hematoma. Option 2 (heavy bruising) may be seen, but vital sign changes indicate hematoma caused by blood collection in the perineal tissues.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *epidural anesthesia*. With this in mind, eliminate options 3 and 4. From the remaining options, use the ABCs—airway, breathing, and circulation—to direct you to option 1. Review the signs of a vulvar hematoma in a client who had epidural anesthesia if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 698). St. Louis: Saunders.

### 298. 3

**Rationale:** A hematoma is a localized collection of blood into the tissues of the reproductive sac after delivery. Vulvar hematoma is the most common. Application of ice reduces swelling caused by hematoma formation in the vulvar area. Options 1, 2, and 4 are not interventions that are specific to the plan of care for a client with a small vulvar hematoma.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *small* and *specific intervention* in the question. This focus will assist in directing you to option 3. Review nursing care of the client with a hematoma if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 382, 446). St. Louis: Saunders.

### ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

#### 299. 1, 2, 3, 4

**Rationale:** Mastitis is an infection of the lactating breast. Client instructions include resting during the acute phase, maintaining a fluid intake of at least 3000 mL/day (if not contraindicated), and taking analgesics to relieve discomfort.

Antibiotics may be prescribed and are taken until the complete prescribed course is finished. They are not stopped when the soreness subsides. Additional supportive measures include the use of moist heat or ice packs and wearing a supportive bra. Continued decompression of the breast by breastfeeding or breast pump is important to empty the breast and prevent the formation of an abscess.

**Test-Taking Strategy:** Think about the pathophysiology associated with mastitis. Recalling that supportive measures include rest, moist heat or ice packs, antibiotics, analgesics, increased fluid intake, breast support, and decompression of the breasts will assist in answering the question. Review the measures to treat mastitis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Postpartum

# Care of the Newborn

## I. INITIAL CARE OF THE NEWBORN

### A. Assessment

1. Observe or assist with initiation of respirations.
2. Assess Apgar score.
3. Note characteristics of cry.
4. Monitor for nasal flaring, grunting, retractions, and abnormal respirations, such as a seesaw respiratory pattern (rise and fall of the chest and abdomen do not occur together).
5. Assess for cyanosis.
6. Obtain vital signs.
7. Observe the **newborn** for signs of hypothermia or hyperthermia.
8. Assess for gross anomalies.

### B. Interventions

1. Suction the mouth first and then the nares with a bulb syringe.
2. Dry the **newborn** and stimulate crying by rubbing.
3. Maintain temperature stability; wrap the **newborn** in warm blankets and place a stockinette cap on the **newborn's** head.
4. Keep the **newborn** with the mother to facilitate bonding.
5. Place the **newborn** at mother's breast if breastfeeding is planned, or place the **newborn** on the mother's abdomen.
6. Place the **newborn** in radiant warmer (incubator).
7. Position the **newborn** on the side with a rolled blanket at the back to facilitate drainage of mucus.
8. Ensure the **newborn's** proper identification.
9. Footprint the **newborn** and fingerprint the mother on the identification sheet per agency policies and procedures.
10. Place matching identification bracelets on the mother and the **newborn**.

### C. Apgar scoring system

1. Assess each of five items to be scored and add the points to determine the **newborn's** total score.
2. Five vital indicators (Table 30-1)
3. Interventions: Apgar score (Table 30-2)

**!** The newborn's Apgar score is assessed and recorded at 1 minute and at 5 minutes after birth.

**TABLE 30-1** Five Vital Indicators of Apgar Scoring

| Indicator           | 0 Points           | 1 Point  | 2 Points  |
|---------------------|--------------------|--|---|
| Heart rate          | Absent             | <100 beats/min   | >100 beats/min                                  |
| Respiratory rate    | Absent             | Slow, irregular, weak cry  | Good, vigorous cry                              |
| Muscle tone         | Flaccid, limp      | Minimal flexion of extremities                                   | Good flexion, active motion                     |
| Reflex irritability | No response        | Minimal response (grimace) to suction or to gentle slap on soles | Responds promptly with a cry or active movement |
| Skin color          | Pallor or cyanosis | Body skin normal, extremities blue                               | Body and extremity skin color normal            |

## II. INITIAL PHYSICAL EXAMINATION

### A. General guidelines

1. Keep the **newborn** warm during the examination.
2. Begin with general observations, and then perform assessments that are least disturbing to the **newborn** first.
3. Initiate nursing interventions for abnormal findings and document findings.

### B. Vital signs

1. Heart rate (resting): 100 to 160 beats/min (apical); auscultate at the fourth intercostal space for 1 full minute to detect abnormalities
2. Respirations: 30 to 60 breaths/min; assess for 1 full minute
3. Assess heart rate and respiratory rate first while the **newborn** is resting or sleeping.
4. Axillary temperature: 96.8° F to 99° F
5. Blood pressure: 73/55 mm Hg

### C. Body measurements (approximate)

1. Length: 45 to 55 cm (18 to 22 inches)
2. Weight: 2500 to 4300 g (5.5 to 9.5 lb)
3. Head circumference: 33 to 35 cm (13.2 to 14 inches)

**TABLE 30-2** Apgar Score Interventions

| Score | Intervention   |
|-------|--|
| 8-10  | No intervention required except to support newborn's spontaneous efforts |
| 4-7   | Gently stimulate; rub newborn's back; administer oxygen to newborn       |
| 0-3   | Newborn requires resuscitation   |

**TABLE 30-3** Fontanels

| Fontanel  | Characteristics   | Closure                         |
|-----------|---|---------------------------------|
| Anterior  | Soft, flat, diamond-shaped; 3-4 cm wide × 2-3 cm long                         | Between 12 and 18 mo of age     |
| Posterior | Triangular; 0.5-1 cm wide<br><br>Located between occipital and parietal bones | Between birth and 2-3 mo of age |

**D. Head**

1. Head should be one-fourth of the body length (cephalocaudal development).
2. Bones of the skull are not fused.
3. Sutures (connective tissue between the skull bones) are palpable and may be overlapping because of head molding, but should not be widened.
4. Fontanels are unossified membranous tissue at the junction of the sutures (Table 30-3).
5. Molding is asymmetry of the head resulting from pressure in the birth canal; molding disappears in about 72 hours (Fig. 30-1).
6. Masses from birth trauma
  - a. Caput succedaneum is edema of the soft tissue over bone (crosses over suture line); it subsides within a few days.
  - b. Cephalhematoma is swelling caused by bleeding into an area between the bone and its periosteum (does not cross over suture line); it usually is absorbed within 6 weeks with no treatment.
7. Head lag
  - a. Common when pulling the **newborn** to a sitting position
  - b. When prone, the **newborn** should be able to lift the head slightly and turn the head from side to side.

**E. Eyes**

1. Slate gray (light skin), dark blue, or brown-gray (dark skin)
2. Symmetrical and clear
3. Pupils equal, round, react to light and by accommodation
4. Blink reflex present

**A****B**

**▲ FIGURE 30-1** Molding. **A**, Significant molding after vaginal birth. **B**, Schematic of bones of skull when molding is present. (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed.]. St. Louis: Mosby. Courtesy of Kim Molloy, Knoxville, IA.)

5. Eyes cross because of weak extraocular muscles
6. Ability to track and fixate momentarily
7. Red reflex present
8. Eyelids often edematous as a result of pressure during the birth process and the effects of eye medication

**F. Ears**

1. Symmetrical
2. Firm cartilage with recoil
3. Top of pinna on or above line drawn from outer canthus of eye
4. Low-set ears associated with Down syndrome

**G. Nose**

1. Flat, broad, in center of face
2. Obligatory nose breathing
3. Occasional sneezing to remove obstructions
4. Nares are patent and should not flare (flaring is an indication of respiratory distress).

**H. Mouth**

1. Pink, moist gums
2. Soft and hard palates intact
3. Epstein's pearls (small, white cysts) may be present on hard palate.
4. Uvula in midline

5. Freely moving tongue, symmetrical, has short frenulum
6. Sucking and crying movements symmetrical
7. Able to swallow
8. Root and gag reflexes present

**!** When assessing the newborn's mouth, look for the presence of thrush (*Candida albicans*), which are white patchy areas on the tongue or gums that cannot be removed with a washcloth; these may be painful.

#### I. Neck

1. Short and thick
2. Head held in midline
3. Trachea on midline
4. Good range of motion and ability to flex and extend
5. Assess for torticollis (head inclined to one side as a result of contraction of muscles on that side of the neck)

#### J. Chest

1. Circular appearance because anteroposterior and lateral diameters are about equal (approximately 30 to 33 cm [12 to 13.2 inches] at birth)
2. Diaphragmatic respirations—chest and abdomen should rise and fall in synchrony, not in seesaw pattern
3. Bronchial sounds heard on auscultation
4. Nipples prominent and often edematous; milky secretion (witch's milk) common
5. Breast tissue present
6. Clavicles need to be palpated to assess for fractures.

#### K. Skin

1. Pinkish red (light-skinned **newborn**) to pinkish brown or pinkish yellow (dark-skinned **newborn**)
2. Vernix caseosa, a cheesy white substance, can be found on entire body, but is more prominent between folds.
3. Lanugo, fine hair, might be seen, especially on the back.
4. Milia, small white sebaceous glands, appear on the forehead, nose, and chin.
5. Dry, peeling skin
6. Dark red color common in premature **newborns**
7. Cyanosis may be noted with hypothermia, infection, and hypoglycemia and with cardiac, respiratory, or neurological abnormalities.
8. Acrocyanosis (peripheral cyanosis) is normal in the first few hours after birth and may be noted intermittently for the next 7 to 10 days (Fig. 30-2).
9. Assessment for ecchymosis and petechiae resulting from trauma of birth
10. Assessment of skin turgor over the abdomen to determine hydration status

**▲ FIGURE 30-2** Acrocyanosis. (From McKinney, E., James, S., Murray, S., & Ashwill, J. [2009]. *Maternal-child nursing* [3rd ed.]. St. Louis: Saunders. Courtesy of Todd Shiros, Santa Fe Springs, CA.)

#### 11. Observation for forceps marks

#### 12. Harlequin sign

- a. Deep pink or red color develops over one side of **newborn's** body while the other side remains pale or of normal color.
- b. Harlequin sign may indicate shunting of blood that occurs with a cardiac problem or may indicate sepsis.

#### 13. Birthmarks (Table 30-4)

#### L. Abdomen

##### 1. Umbilical cord

- a. Umbilical cord should have three vessels—two arteries and one vein; if fewer than three vessels are noted, notify the physician.
- b. Small, thin cord may be associated with poor fetal growth.
- c. Assess for intact cord, and ensure that the cord clamp is secured.
- d. Cord should be clamped for at least the first 24 hours after birth; clamp can be removed when the cord is dried and occluded and is no longer bleeding.
- e. Note any bleeding or drainage from the cord.
- f. Hospital protocol and physician's preference determine the technique and skin preparation used for cord care; protocols include the use of antibiotic ointment, triple dye, alcohol, soap and water, sterile water, povidone-iodine, or another treatment.
- g. If symptoms of infection, such as moistness, oozing, discharge, and a reddened base, occur, antibiotic treatment is prescribed.

##### 2. Gastrointestinal

- a. Monitor cord for meconium staining.
- b. Assess for umbilical hernia.
- c. Assess for abdominal depression associated with diaphragmatic hernia.
- d. Assess for abdominal distention associated with obstruction, mass, or sepsis.
- e. Monitor bowel sounds, which should occur within 1 to 2 hours after birth.

**TABLE 30-4** Birthmarks

| Birthmark                          | Characteristics  |
|------------------------------------|--|
| Telangiectatic nevi (stork bites)  | Pale pink or red, flat, dilated capillaries<br>On eyelids, nose, lower occipital bone, and nape of neck<br>Blanch easily<br>More noticeable during crying periods<br>Disappear by age 2 yr               |
| Nevus flammeus (port-wine stain)   | Capillary angioma directly below epidermis<br>Nonelevated, sharply demarcated, red to purple, dense areas of capillaries<br>Commonly appear on face<br>No fading with time<br>May require future surgery |
| Nevus vasculosus (strawberry mark) | Capillary hemangioma<br>Raised, clearly delineated, dark red, with rough surface<br>Common in head region<br>Disappears by age 7-9 yr  |
| Mongolian spots                    | Bluish black pigmentation<br>On lumbar dorsal area and buttocks<br>Gradually fade during first and second years of life<br>Common in Asian and dark-skinned individuals                                  |

## 3. Anus

- Ensure that the anal opening is patent.
- First stool meconium should pass within first 24 hours.

**M.** Genitals

## 1. Female

- Labia are edematous; clitoris is enlarged.
- Smegma may be present (thick, white mucous discharge).
- Pseudomenstruation, caused from the withdrawal of the maternal hormone estrogen, is possible (blood-tinged mucus).
- Hymen tag may be visible.
- First voiding should occur within 24 hours.

## 2. Male

- Prepuce (foreskin) covers glans penis.
- Scrotum is edematous.
- Verify meatus at tip of penis.
- Testes are descended, but may retract with cold.
- Assess for hernia or hydrocele.
- First voiding should occur within 24 hours.

**N.** Spine

- Straight
- Posture flexed
- Supportive of head momentarily when prone
- Arms and legs flexed
- Chin flexed on upper chest
- Well-coordinated, sporadic movements
- A degree of hypotonicity or hypertonicity may indicate central nervous system damage.

- Assess for hair tufts and dimples along the spinal column (may be indicative of a possible opening).

**O.** Extremities

- Flexed
- Full range of motion; symmetrical movements
- Fists clenched
- Ten fingers and 10 toes, all separate
- Legs bowed
- Major gluteal folds even
- Creases on soles of feet
- Assessment for fractures (especially clavicle) or dislocations (hip)
- Assessment for developmental dysplasia of the hip; when thighs are rotated outward, no clicks should be heard (Ortolani's sign and Barlow's sign are the two assessment tools for developmental dysplasia of the hip)
- Pulses palpable (radial, brachial, femoral)

 Slight tremors noted in the newborn may be a common finding, but could also be a sign of hypoglycemia or drug withdrawal.

**III. BODY SYSTEMS ASSESSMENT AND INTERVENTIONS****A.** Cardiovascular system 

- Keep the **newborn** warm.
- Measure the apical heart rate for 1 full minute.
- Listen for murmurs; assess oxygen saturation via pulse oximetry if a murmur is heard.
- Palpate pulses.
- Assess for cyanosis; blanch the skin on the trunk and extremities to assess circulation.
- Observe for cardiac distress when the **newborn** is feeding.

**B.** Respiratory system 

- Suction the airway as necessary: use a bulb syringe for upper airway suctioning (compress bulb before insertion) and a French catheter for deeper suctioning.
- Observe for respiratory distress and hypoxemia.
  - Nasal flaring
  - Increasingly severe retractions
  - Grunting
  - Cyanosis
  - Bradycardia and periods of apnea lasting longer than 15 seconds
- Administer oxygen via hood if necessary and as prescribed.

**C.** Hepatic system 

- Normal or physiological jaundice appears after the first 24 hours in full-term **newborns** and after the first 48 hours in premature **newborns**; jaundice occurring before this time (pathological jaundice) may indicate early hemolysis of

red blood cells and must be reported to the physician.

2. Physiological jaundice peaks about the fifth day of life (indirect bilirubin levels 6 to 7 mg/dL).
3. Monitor serum bilirubin levels.
4. Feed early to stimulate intestinal activity and to keep the bilirubin level low.
5. Prevent chilling because hypothermia can cause acidosis that interferes with bilirubin conjugation and excretion.
6. Liver stores the iron passed from the mother for 5 to 6 months.
7. Glycogen storage occurs in the liver.
8. The **newborn** is at risk for hemorrhagic disorders; coagulation factors synthesized in the liver depend on vitamin K, which is not synthesized until intestinal bacteria are present.
9. Handle the **newborn** carefully and monitor for any bruising or bleeding episodes.
10. Watch for meconium stool and subsequent stools.
11. Administer intramuscular dose of vitamin K to the **newborn** as prescribed to prevent hemorrhagic disorders (usually 0.5 to 1 mg is prescribed); administer in lateral aspect of the middle third of the vastus lateralis muscle.
12. Assess the **newborn's** hemoglobin and blood glucose levels.

#### D. Renal system

1. The immature kidneys are unable to concentrate urine.
2. A weight loss of 5% to 15% during the first week of life occurs as a result of voiding and limited intake; birth weight should be regained by 10 to 14 days after birth.
3. Weigh the **newborn** daily.
4. Monitor intake and output; weigh diapers if necessary (1 g of diaper weight equals 1 mL of urine).
5. If the diaper requires weighing, record the weight before putting it on the **newborn**; after the **newborn** voids, reweigh the diaper and subtract the prevoided weight.
6. Measure specific gravity of urine if necessary.
7. Assess for signs of dehydration (dry mucous membranes, sunken eyeballs, poor skin turgor, sunken fontanels).

#### E. Immune system

1. **Newborn** receives passive immunity via the **placenta** (immunoglobulin G).
2. **Newborn** receives passive immunity from colostrum (immunoglobulin A).
3. Elevations in immunoglobulin M indicate infection in utero.
4. Use aseptic technique when caring for the **newborn**.
5. Observe standard precautions when handling the **newborn**.

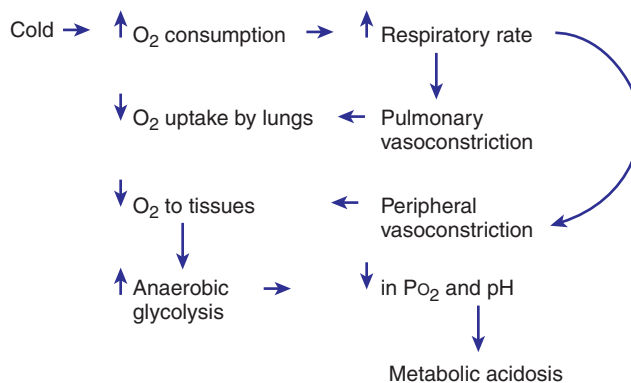

6. Ensure meticulous handwashing.
7. Ensure that an infection-free staff cares for the **newborn**.
8. Monitor the **newborn's** temperature.
9. Observe for any cracks or openings in the skin.
10. Administer eye medication within 1 hour after birth to prevent ophthalmia neonatorum.
  - a. Agent used varies depending on agency protocols, but usually ophthalmic forms of erythromycin (0.5%) or tetracycline (1%) are prescribed because they are bacteriostatic and bactericidal and provide prophylaxis against *Neisseria gonorrhoeae* and *Chlamydia trachomatis*.
  - b. Silver nitrate (1%) solution may be prescribed, but its use is minimal because it does not protect against chlamydial infection and it can cause chemical conjunctivitis.
11. Provide cord care.
  - a. Umbilical clamp can be removed after 24 hours if cord is dried and occluded and is not bleeding.
  - b. Teach the client how to perform cord care.
  - c. Keep the cord clean and dry; soap and water may be prescribed for cleaning the cord.
  - d. Keep the diaper from covering the cord; fold the diaper below the cord.
  - e. Assess cord for odor, swelling, or discharge.
  - f. The **newborn** is washed via a sponge bath until the cord falls off (within 2 weeks).
12. Provide circumcision care.
  - a. Apply petroleum jelly gauze to the penis except when a PlastiBell is used.
  - b. Remove petroleum jelly gauze, if applied, after the first voiding following circumcision.
  - c. Observe for swelling, infection, or bleeding from the circumcision site.
  - d. Teach the client how to care for circumcision site.
  - e. Clean the penis after each voiding by squeezing warm water over the penis.
  - f. A milky covering over the glans penis is normal and should not be disrupted.
  - g. Monitor for urinary retention.
- F. Metabolic system and gastrointestinal system
  1. **Newborns** are able to digest simple carbohydrates, but are unable to digest fats because of the lack of lipase.
  2. Proteins may be broken down only partially, so they may serve as antigens and provoke an allergic reaction.
  3. The **newborn** has a small stomach capacity (about 90 mL), with rapid intestinal peristalsis (bowel emptying time is 2.5 to 3 hours).
  4. Breast-feeding usually can begin immediately after birth; based on physician preference and agency protocols, bottle-fed **newborns** may be

offered a few milliliters of sterile water or 5% dextrose 1 to 4 hours after birth before a feeding with formula.

5. Observe feeding reflexes, such as rooting, sucking, and swallowing.
6. Assist the client with breast-feeding or formula feeding; breast-feeding should be done every 2 to 3 hours, and formula feeding (minimum of 30 mL, or 1 oz) should be done every 3 to 4 hours (or per physician preference or agency protocols).
7. Burp the **newborn** during and after feeding.
8. Assess for regurgitation or vomiting.
9. Position the **newborn** on the right side after feeding; however, the side-lying position is not recommended for sleep because this position makes it easy for the **newborn** to roll to the prone position (prone position is contraindicated because the prone position increases the risk of sudden **infant** death syndrome).
10. Observe for normal stool and the passage of meconium.
  - a. Meconium stool, which is greenish black with a thick, sticky, tar-like consistency, usually is passed within the first 24 hours of life.
  - b. Transitional stool, the second type of stool excreted by the **newborn**, is greenish brown and of looser consistency than meconium.
  - c. Seedy, yellow stools are usually noted in breast-fed **newborns**; pale yellow to light brown stools are usually seen in formula-fed **newborns**.
11. Perform a **newborn** screening test (including the test for phenylketonuria) as prescribed before discharge after sufficient protein intake occurs; the **newborn** should be on formula or breast milk for 24 hours before screening.

#### G. Neurological system

1. **Newborn** head size is proportionally larger than that of an adult because of cephalocaudal development.
2. Myelination of nerve fibers is incomplete, so primitive reflexes are present.
3. Fontanels are open to allow for brain growth.
4. Assess for an abnormal head size and a bulging or depressed anterior fontanel.
5. Measure and graph the head circumference in relation to chest circumference and length.
6. Assess the **newborn's** movements, noting symmetry, posture, and abnormal movements.
7. Observe for jitteriness, marked tremors, and seizures.
8. Test the **newborn's** reflexes.
9. Assess for lethargy.
10. Assess pitch of cry.

▲ **FIGURE 30-3** Effects of cold stress. When a newborn is stressed by cold, oxygen consumption increases, and pulmonary and peripheral vasoconstriction occur, decreasing oxygen uptake by the lungs and oxygen to the tissues; anaerobic glycolysis increases; and there is a decrease in  $P_{O_2}$  and pH, leading to metabolic acidosis. (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed.]. St. Louis: Mosby).

#### H. Thermal regulatory system

1. Prevent cold stress (Fig. 30-3).
2. **Newborns** do not shiver to produce heat.
3. **Newborns** have brown fat deposits, which produce heat.
4. Prevent heat loss resulting from evaporation by keeping the **newborn** dry and well wrapped with a blanket.
5. Prevent heat loss resulting from radiation by keeping the **newborn** away from cold objects and outside walls.
6. Prevent heat loss resulting from convection by shielding the **newborn** from drafts.
7. Prevent heat loss resulting from conduction by performing all treatments on a warm, padded surface.
8. Keep the temperature in room warm.
9. Take the **newborn's** axillary temperature every hour for the first 4 hours of life, every 4 hours for the remainder of the first 24 hours, and then every shift (as per agency protocol).

▲ **Cold stress causes oxygen consumption and energy to be diverted from maintaining normal brain cell function and cardiac function resulting in serious metabolic and physiological conditions.**

### I. Reflexes

1. Sucking and rooting
  - a. Touch the **newborn's** lip, cheek, or corner of the mouth with a nipple.
  - b. The **newborn** turns the head toward the nipple, opens the mouth, takes hold of the nipple, and sucks.
  - c. Rooting reflex usually disappears after 3 to 4 months, but may persist for 1 year.
2. Swallowing reflex
  - a. Swallowing reflex occurs spontaneously after sucking and obtaining fluids.
  - b. **Newborn** swallows in coordination with sucking without gagging, coughing, or vomiting.
3. Tonic neck or fencing
  - a. While the **newborn** is falling asleep or sleeping, gently and quickly turn the head to one side.
  - b. As the **newborn** faces the left side, the left arm and leg extend outward while the right arm and leg flex.
  - c. When the head is turned to the right side, the right arm and leg extend outward while the left arm and leg flex.
  - d. Response usually disappears within 3 to 4 months.
4. Palmar-plantar grasp
  - a. Place a finger in the palm of the **newborn's** hand and then place a finger at the base of the toes.
  - b. The **newborn's** fingers curl around the examiner's fingers, and the **newborn's** toes curl downward.
  - c. Palmar response lessens within 3 to 4 months.
  - d. Plantar response lessens within 8 months.
5. Moro reflex
  - a. Hold the **newborn** in a semi-sitting position and then allow the head and trunk to fall backward to at least a 30-degree angle.
  - b. The **newborn** assumes sharp extension and abduction of the arms with the thumbs and forefingers in a "C" position; this is followed by flexion and adduction to an "embrace" position (legs follow a similar pattern).
  - c. The Moro reflex is present at birth and is absent by 6 months of age if neurological maturation is not delayed.
  - d. A body jerk motion may be the response between 8 and 18 weeks.
  - e. A persistent response lasting more than 6 months may indicate a neurological abnormality.
6. Startle reflex
  - a. The response is best elicited if the **newborn** is a least 24 hours old.
  - b. The examiner makes a loud noise or claps hands to elicit the response.
  - c. The **newborn's** arms adduct while the elbows flex.
  - d. The hands stay clenched.
  - e. The reflex should disappear within 4 months.
7. Pull-to-sit response
  - a. Pull the **newborn** up by the wrist while the **newborn** is in the supine position.
  - b. The head lags until the **newborn** is in an upright position, and then the head is level with the chest and shoulders momentarily before falling forward.
  - c. The head then lifts for a few minutes.
  - d. The response depends on the **newborn's** general muscle tone and condition and on maturity level.
8. Babinski sign: Plantar reflex
  - a. Beginning at the heel of the foot, use a finger to stroke gently upward along the lateral aspect of the sole, and then move the finger along the ball of the foot.
  - b. The **newborn's** toes hyperextend while the big toe dorsiflexes.
  - c. The reflex disappears after the **newborn** is 1 year old.
  - d. Absence of this reflex indicates the need for a neurological examination.
9. Stepping or walking
  - a. Hold the **newborn** in a vertical position, allowing one foot to touch a table surface.
  - b. The **newborn** simulates walking, alternately flexing and extending the feet.
  - c. The reflex is usually present for 3 to 4 months.
10. Crawling
  - a. Place the **newborn** on the abdomen
  - b. The **newborn** begins making crawling movements with the arms and legs.
  - c. The reflex usually disappears after about 6 weeks.

### IV. NEWBORN SAFETY

#### A. Newborn identification

1. Information bracelets are applied to the mother and **newborn** immediately after birth and before the mother and **newborn** are separated; additionally, identification pictures of the **newborn** and footprints from the **newborn** may be obtained before the **newborn** leaves the mother's side in the delivery room.
2. The bracelets include name, sex, date, time of birth, and identification numbers.
3. Some agencies use identification bracelets that have radiofrequency transmitters that set off alarms if the **newborn** is removed from a certain area.

### Box 30-1 Precautions to Prevent Infant Abduction

All personnel must wear identification that is easily visible at all times.

Teach parents to allow only hospital staff with proper identification to take their infants from them.

Question anyone with a newborn near an exit or in an unusual part of the facility.

Never leave a newborn unattended.

Teach the parents that the newborn must be observed at all times.

When the newborn is in the mother's room, position the crib away from the doorway.

Teach the parents home safety precautions; suggest that the parents not place announcements in the paper or signs in their yard that might alert an abductor that a new infant is in the home.

4. Agencies also conduct unit and hospital-wide drills to prevent **newborn** abductions.

#### B. **Newborn** abduction

1. The client is taught to check the identification of any person who comes to remove the **infant** from her room and is taught other precautions to prevent **newborn** abduction (nurses must be wearing photo identification or some other security badge) (Box 30-1).
2. Closed-circuit televisions, code-alert bands, computer monitoring systems, or other monitoring systems may be used in some agencies.
3. The **newborn** is wheeled in a bassinet, not carried in a staff member's arms.

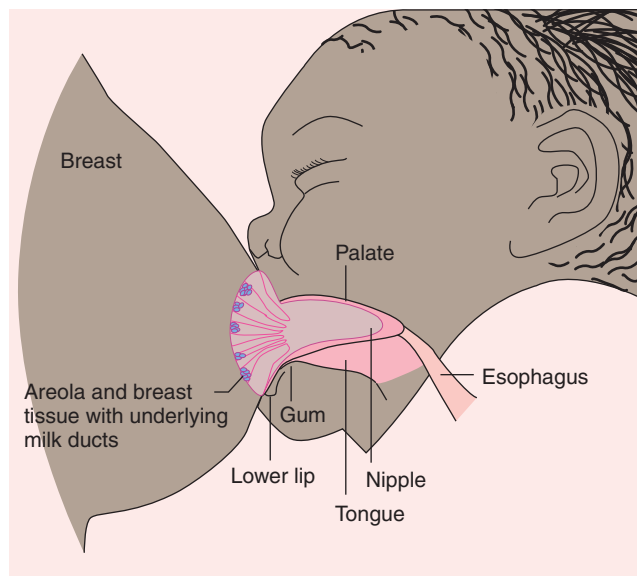

## V. PARENT TEACHING

#### A. Formula feeding

1. Teach sterilization techniques if the water supply is located in areas where the purification process of the water is questionable.
2. Remind the client not to heat the bottle of formula in a microwave oven.
3. Inform the client that formula is a sufficient diet for the first 4 to 6 months.
4. Assess the client's ability to burp the **newborn**.

#### B. Breast-feeding

1. Assess the **newborn's** ability to attach to the mother's breast and suck (Fig. 30-4).
2. Teach the client about engorgement.
3. Teach the client how to pump her breasts and how to store breast milk properly.
4. Inform the client that breast milk is a sufficient diet for the first 4 to 6 months.
5. Give the client the phone numbers of local organizations that offer support to breast-feeding mothers.

▲ **FIGURE 30-4** Correct attachment (latch-on) of a newborn at breast. (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed.]. St. Louis: Mosby.)

#### C. Bathing

1. Bathe the **newborn** in a warm room before feeding.
2. Have all equipment for bathing available.
3. Use a mild soap (not on the face).
4. Proceed from the cleanest area to the dirtiest.
5. Clean eyes from the inner canthus outward.
6. Special care should be taken to clean under the folds of the neck, underarms, groin, and genitals.
7. Make bath time enjoyable for the **newborn** and the mother.

#### D. Clothing

1. Assess diaper and clothing needs for the **newborn** with the client.
2. Instruct the client that the **newborn's** head should be covered in cold weather to prevent heat loss.
3. Instruct the client to layer the **newborn's** clothing in cooler weather.
4. To be comfortable, the **newborn** should be dressed in one more layer of clothing than what the parents are wearing.

**E. Cord care:** See earlier for cord care, "Body Systems Assessment and Interventions."

**F. Circumcision:** See earlier for circumcision care, "Body Systems Assessment and Interventions."

#### G. Uncircumcised **newborn**

1. Inform the client that the foreskin and glans are two similar layers of cells that separate from each other and that the separation process normally is complete by 3 years of age, although the layers can remain adhered until puberty.
2. Instruct the client not to pull back the foreskin, but to allow for the natural separation to occur.

3. Inform the client that as the process of separation occurs, sloughed cells build up between the layers of the foreskin and the glans, and that when retraction occurs, daily gentle washing of the glans with soap and water is sufficient to maintain adequate cleanliness.

## VI. PRETERM NEWBORN

### A. Description

1. An **infant** born before 37 weeks of gestation
2. Primary concern relates to immaturity of all body systems

### B. Assessment

1. Respirations are irregular with periods of apnea.
2. Body temperature is below normal.
3. The **newborn** has poor suck and swallow reflexes.
4. Bowel sounds are diminished.
5. Urinary output is increased or decreased.
6. Extremities are thin, with minimal creasing on soles and palms.
7. The **newborn** extends extremities and does not maintain flexion.
8. Lanugo, on skin and in the hair on the **newborn's** head, is present in woolly patches.
9. Skin is thin, with visible blood vessels and minimal subcutaneous fat pads.
10. Skin may appear jaundiced.
11. Testes are undescended in boys.
12. Labia are narrow in girls.

### C. Interventions

1. Monitor vital signs every 2 to 4 hours.
2. Maintain airway and cardiopulmonary functions.
3. Administer oxygen and humidification as prescribed.
4. Monitor intake and output and electrolyte balance.
5. Monitor daily weight.
6. Maintain the **newborn** in a warming device.
7. Reposition the **newborn** every 1 to 2 hours, and handle the **newborn** carefully.
8. Avoid exposure to infections.
9. Provide the **newborn** with appropriate stimulation, such as touch and cuddling.

## VII. POST-TERM NEWBORN

### A. Description: **Infant** born after 42 weeks of gestation

### B. Assessment

1. Hypoglycemia
2. Parchment-like skin (dry and cracked) without lanugo
3. Long fingernails, extended over ends of fingers
4. Profuse scalp hair
5. Long and thin body
6. Wasting of fat and muscle in extremities
7. Meconium staining possibly present on nails and umbilical cord

### C. Interventions

1. Provide normal **newborn** care.
2. Monitor for hypoglycemia.
3. Maintain **newborn's** temperature.
4. Monitor for meconium aspiration.

## VIII. SMALL FOR GESTATIONAL AGE

### A. Description: **Newborn** who is plotted at or below the 10th percentile on the intrauterine growth curve

### B. Assessment

1. Fetal distress
2. Gestational age and physical maturity
3. Decreased or elevated body temperature
4. Physical abnormalities
5. Hypoglycemia
6. Signs of polycythemia
  - a. Ruddy appearance
  - b. Cyanosis
  - c. Jaundice
7. Signs of infection
8. Signs of aspiration of meconium

### C. Interventions

1. Maintain airway and cardiopulmonary function.
2. Maintain body temperature.
3. Observe for signs of respiratory distress.
4. Monitor for infection and initiate measures to prevent sepsis.
5. Monitor blood glucose levels and for signs of hypoglycemia.
6. Initiate early feedings and monitor for signs of aspiration.
7. Provide stimulation (e.g., touch and cuddling).

## IX. LARGE FOR GESTATIONAL AGE

### A. Description: **Newborn** who is plotted at or above the 90th percentile on the intrauterine growth curve

### B. Assessment

1. Gestational age
2. Birth trauma or injury
3. Respiratory distress
4. Hypoglycemia

### C. Interventions

1. Monitor vital signs.
2. Monitor blood glucose levels and for signs of hypoglycemia.
3. Initiate early feedings.
4. Monitor for infection and initiate measures to prevent sepsis.
5. Provide stimulation, such as touch and cuddling.

## X. RESPIRATORY DISTRESS SYNDROME

### A. Description: Serious lung disorder caused by immaturity and inability to produce **surfactant**, resulting in hypoxia and acidosis

**B. Assessment**

1. Tachypnea
2. Flaring nares
3. Expiratory grunting
4. Retractions
5. Seesaw respirations
6. Decreased breath sounds
7. Apnea
8. Pallor and cyanosis
9. Hypothermia
10. Poor muscle tone

**C. Interventions**

1. Monitor color, respiratory rate, and degree of effort in breathing.
2. Maintain airway and cardiopulmonary function and support respirations as prescribed.
3. Monitor arterial blood gases and oxygen saturation levels as prescribed (arterial blood gases from umbilical artery).
4. Monitor arterial blood gases so that oxygen administered to the **newborn** is at the lowest possible concentration necessary to maintain adequate arterial oxygenation.
5. Any premature **newborn** who required oxygen support should be scheduled for an eye examination before discharge to assess for retinal damage.
6. Suction every 2 hours or more often as necessary.
7. Position the **newborn** on the side or back, with the neck slightly extended.
8. Administer respiratory therapy (percussion and vibration) as prescribed; use padded small plastic cup or small oxygen mask for percussion; use padded electric toothbrush for vibration.
9. Provide nutrition.
10. Support bonding.
11. Prepare parents for short-term to long-term period of oxygen dependency if necessary.
12. Encourage the mother to pump the breasts for future breast-feeding if she so desires.
13. Encourage as much parental participation in the **newborn's** care as the condition allows.

 Prepare to administer surfactant replacement therapy (instilled into the endotracheal tube) to a newborn with respiratory distress syndrome.

**XI. MECONIUM ASPIRATION SYNDROME****A. Description**

1. Occurs in term or post-term **newborns**
2. Fetal distress increases intestinal peristalsis, relaxing the anal sphincter and releasing meconium into the **amniotic fluid**.
3. Aspiration can occur in utero or with the first breath.

**B. Assessment**

1. Respiratory distress is present at birth; tachypnea, cyanosis, retractions, nasal flaring, grunting, crackles, and rhonchi may be present.

2. The **newborn's** nails, skin, and umbilical cord may be stained a yellow-green color.

**C. Interventions**

1. Suctioning must be done immediately after the head is delivered and before the first breath is taken; vocal cords should be viewed to see if the airway is clear before stimulation and crying. 
2. **Newborns** with severe meconium aspiration syndrome may benefit from extracorporeal membrane oxygenation; this therapy uses a modified heart-lung machine and provides oxygen to the circulation allowing the lungs to rest and decreasing pulmonary hypertension and hypoxemia in some conditions, such as meconium aspiration.

**XII. BRONCHOPULMONARY DYSPLASIA****A. Description**

1. This chronic pulmonary condition affects **newborns** who have experienced respiratory failure or have been oxygen-dependent for more than 28 days. 
2. X-ray findings are abnormal, indicating areas of overinflation and atelectasis.

**B. Assessment**

1. Tachypnea
2. Tachycardia
3. Retractions
4. Nasal flaring
5. Labored breathing
6. Crackles and decreased air movement
7. Occasional expiratory wheezing

**C. Interventions**

1. Monitor airway and cardiopulmonary function; provide oxygen therapy.
2. Fluid restriction may be prescribed.
3. Medications include **surfactant**, diuretics, corticosteroids, and bronchodilators.

**XIII. TRANSIENT TACHYPNEA OF THE NEWBORN****A. Description**

1. Respiratory condition that results from incomplete evacuation of fetal lung fluid in full-term **newborns** 
2. Usually disappears within 24 to 48 hours

**B. Assessment**

1. Tachypnea
2. Expiratory grunting
3. Retractions
4. Nasal flaring
5. Wet lung sounds per auscultation
6. Cyanosis

**C. Interventions**

1. Supportive care
2. Oxygen administration

**XIV. INTRAVENTRICULAR HEMORRHAGE**

- A. Description**
1. Bleeding within the ventricles of the brain
  2. Risk factors include prematurity, respiratory distress syndrome, trauma, and asphyxia.
- B. Assessment:** Diminished or absent Moro reflex, lethargy, apnea, poor feeding, high-pitched shrill cry, seizure activity
- C. Interventions:** Supportive treatment

**XV. RETINOPATHY OF PREMATURITY**

- A. Description**
1. Vascular disorder involving gradual replacement of retina by fibrous tissue and blood vessels
  2. Primarily caused by prematurity and use of supplemental oxygen (>30 days)
- B. Assessment:** Leukorrhea (white tissue on the retrolental space), vitreous hemorrhage, myopia, strabismus, cataracts (check for red reflex)
- C. Interventions:** Laser photocoagulation surgery

**XVI. NECROTIZING ENTEROCOLITIS**

- A. Description**
1. Acute inflammatory disease of the gastrointestinal tract
  2. Usually occurs 4 to 10 days after birth in a term **newborn**
- B. Assessment:** Increased abdominal girth, decreased or absent bowel sounds, bowel loop distention, vomiting, bile-stained emesis, abdominal tenderness, occult blood in stool
- C. Interventions**
1. Hold oral feedings.
  2. Insert oral gastric tube to decompress the abdomen.
  3. Intravenous antibiotics
  4. Intravenous fluids to correct fluid, electrolyte, and acid-base imbalances
  5. Surgery if indicated

**XVII. HYPERBILIRUBINEMIA**

- A. Description**
1. Elevated serum bilirubin level
  2. Evaluation is indicated when serum levels are greater than 12 mg/dL in a term **newborn**.
  3. Therapy is aimed at preventing kernicterus, which results in permanent neurological damage resulting from the deposition of bilirubin in the brain cells.
- B. Assessment**
1. Jaundice
  2. Elevated serum bilirubin levels
  3. Enlarged liver
  4. Poor muscle tone
  5. Lethargy
  6. Poor sucking reflex

**C. Interventions**

1. Monitor for the presence of jaundice; assess skin and sclera for jaundice.
  - a. Examine the **newborn's** skin color in natural light.
  - b. Press a finger over a bony prominence or tip of the **newborn's** nose to press out capillary blood from the tissues.
  - c. Note that jaundice starts at the head first and spreads to the chest, abdomen, arms and legs, and hands and feet, which are the last to be jaundiced.
2. Keep the **newborn** well hydrated to maintain blood volume.
3. Facilitate early, frequent feeding to hasten passage of meconium and encourage excretion of bilirubin.
4. Report to the physician any signs of jaundice in the first 24 hours of life and any abnormal signs and symptoms.
5. Prepare for phototherapy, and monitor the **newborn** closely during the treatment.

 At any serum bilirubin level, the appearance of jaundice during the first day of life indicates a pathological process.

**D. Phototherapy**

- 1. Description**
- a. Phototherapy is use of intense fluorescent lights to reduce serum bilirubin levels in the **newborn**.
  - b. Adverse effects from treatment, such as eye damage, dehydration, or sensory deprivation, can occur.
- 2. Interventions**
- a. Expose as much of the **newborn's** skin as possible.
  - b. Cover the genital area, and monitor the genital area for skin irritation or breakdown.
  - c. Cover the **newborn's** eyes with eye shields or patches; ensure that the eyelids are closed when shields or patches are applied.
  - d. Remove the shields or patches at least once per shift (during a feeding time) to inspect the eyes for infection or irritation and to allow for eye contact and bonding with the parents.
  - e. Measure the lamp energy output to ensure efficacy of the treatment (done with a special device known as a photometer).
  - f. Monitor skin temperature closely.
  - g. Increase fluids to compensate for water loss.
  - h. Expect loose green stools and green urine.
  - i. Monitor the **newborn's** skin color with the fluorescent light turned off, every 4 to 8 hours.
  - j. Monitor the skin for bronze baby syndrome, a grayish brown discoloration of the skin.
  - k. Reposition the **newborn** every 2 hours.

- l. Provide stimulation.
- m. After treatment, continue monitoring for signs of hyperbilirubinemia because rebound elevations are normal after therapy is discontinued.
- n. Turn off the phototherapy lights before drawing a blood specimen for serum bilirubin levels, and do not leave the blood specimen uncovered under fluorescent lights (to prevent the breakdown of bilirubin in the blood specimen).

### XVIII. ERYTHROBLASTOSIS FETALIS

#### A. Description

1. Erythroblastosis fetalis is the destruction of red blood cells that results from an antigen-antibody reaction.
2. The disorder is characterized by hemolytic anemia or hyperbilirubinemia.
3. Exchange of fetal and maternal blood occurs primarily when the **placenta** separates at birth (Fig. 30-5).
4. Antibodies are harmless to the mother, but attach to the erythrocytes in the fetus and cause hemolysis.
5. Sensitization is rare with the first pregnancy.
6. ABO incompatibility is usually less severe.

#### B. Assessment

1. Anemia
2. Jaundice that develops rapidly after birth and before 24 hours
3. Edema

#### C. Interventions

1. Administer Rh<sub>o</sub>(D) immune globulin (RhoGAM) to the mother during the first 72 hours after **delivery** if the Rh-negative mother delivers an Rh-positive fetus but remains unsensitized.

2. Assist with exchange transfusion after birth or intrauterine transfusion as prescribed.
3. The **newborn's** blood is replaced with Rh-negative blood to stop the destruction of the **newborn's** red blood cells; the Rh-negative blood is replaced with the **newborn's** own blood gradually.
4. Reassure the mother that the **newborn** will experience no untoward effects from the condition.

### XIX. SEPSIS

**A.** Description: Generalized infection resulting from the presence of bacteria in the blood

#### B. Assessment

1. Pallor
2. Tachypnea, tachycardia
3. Poor feeding
4. Abdominal distention
5. Temperature instability

#### C. Interventions

1. Assess for periods of apnea or irregular respirations.
2. If apnea is present, stimulate by gently rubbing the chest or foot.
3. Administer oxygen as prescribed.
4. Monitor vital signs; assess for fever.
5. Maintain warmth in a radiant warmer.
6. Provide isolation as necessary.
7. Monitor intake and output, and obtain daily weight.
8. Monitor for diarrhea.
9. Assess feeding and sucking reflex, which may be poor.
10. Assess for jaundice.
11. Assess for irritability and lethargy.
12. Administer antibiotics as prescribed, and observe carefully for toxicity because a **newborn's** liver and kidneys are immature.

**▲ FIGURE 30-5** Development of maternal sensitization to Rh antigens. **A**, Fetal Rh-positive erythrocytes enter maternal system. Maternal anti-Rh antibodies are formed. **B**, Anti-Rh antibodies cross placenta and attack fetal erythrocytes. (From Hockenberry, M., & Wilson, D. [2009]. *Wong's essentials of pediatric nursing* [8th ed.]. St. Louis: Mosby.)

**TABLE 30-5** Infections Included in TORCH Syndrome

| Infection            | Characteristics and Description  |
|----------------------|--|
| Toxoplasmosis        | Caused by protozoan infection<br>Produces no serious effects in mother<br>Organism can be transmitted to fetus<br>Infection can result in severe physical, developmental abnormalities<br>Common carriers include cat feces, raw beef  |
| Other infections     | Can include syphilis, gonorrhea, varicella, hepatitis B, HIV, human parvovirus B19   |
| Rubella              | Systemic viral infection<br>Rubella causes congenital rubella syndrome—includes congenital heart disease, cataracts, growth retardation, and pneumonia if mother becomes infected within first trimester<br>Deafness and some learning disabilities can occur if mother becomes infected during first trimester              |
| Cytomegalovirus      | Viral infection that persists in the body indefinitely; has periods of reactivation without symptoms<br>Can infect fetus or newborn during delivery or after birth through breast milk, blood transfusions, or contact with infected secretions<br>May cause microcephaly, blindness, deafness, mental and motor retardation |
| Herpes simplex virus | Sexually transmitted infection<br>Has periods of reactivation<br>Newborn commonly infected during delivery by direct contact with lesions in genital tract<br>Can cause neurological impairment or death   |

HIV, human immunodeficiency virus.

## XX. TORCH INFECTIONS

### A. Description

- TORCH infections are infections that occur in the fetus or **newborn**.
- Infection is caused by one of the following:
  - Toxoplasmosis
  - Other infections such as gonorrhea, syphilis, varicella, hepatitis B, human immunodeficiency virus (HIV), or human parvovirus B19
  - Rubella
  - Cytomegalovirus
  - Herpes simplex virus

### B. Infections (Table 30-5)

**▲ FIGURE 30-6** Neonatal syphilitic lesions on hands and feet. (From Lowdermilk, D., & Perry, S. [2007]. *Maternity & women's health care* [9th ed.]. St. Louis: Mosby. Courtesy of Mahesh Kotwal, MD, Phoenix, AZ.)

throughout pregnancy and infect the fetus, usually after 18 weeks' gestation.

- Risks include preterm birth, stillbirth, and low birth weight.
- Congenital effects are irreversible and may include central nervous system damage and hearing loss.

### B. Assessment

- Hepatosplenomegaly
- Joint swelling
- Palmar rash and lesions (Fig. 30-6)
- Anemia
- Jaundice
- Snuffles
- Ascites
- Pneumonitis
- Cerebrospinal fluid changes

### C. Interventions

- Monitor the **newborn** for signs of syphilis.
- Monitor for palmar rash and snuffles.
- Prepare the **newborn** for serological testing if prescribed.
- Administer antibiotic therapy as prescribed.
- Use standard precautions and drainage and secretion (contact) precautions with suspected congenital syphilis.
- Wear gloves when handling the **newborn** until antibiotic therapy has been administered for 24 hours.
- Provide psychological support to the mother, and provide instructions regarding follow-up care to the **newborn**.

## XXII. ADDICTED NEWBORN

### A. Description

- A **newborn** can become passively addicted to drugs that have passed through the **placenta**.

## XXI. SYPHILIS

### A. Description

- Syphilis is a sexually transmitted infection.
- Congenital syphilis can result in premature **delivery**, skin lesions, and abnormal skeletal development.
- The causative organism, *Treponema pallidum*, a spirochete, is able to cross the **placenta**

2. Assessment findings and withdrawal times may vary depending on the specific addicting drug.
3. See also fetal alcohol syndrome.

#### B. Assessment

1. Irritability
2. Tremors
3. Hyperactivity and hypertonicity
4. Respiratory distress
5. Vomiting
6. High-pitched cry
7. Sneezing
8. Fever
9. Diarrhea
10. Excessive sweating
11. Poor feeding
12. Extreme sucking of fists
13. Seizures

#### C. Interventions

1. Monitor respiratory and cardiac status frequently.
2. Monitor temperature and vital signs.
3. Hold **newborn** firmly and close to the body during feeding and when giving care.
4. Initiate seizure precautions (pad sides of the crib).
5. Provide small frequent feedings and allow a longer period for feeding.
6. Monitor intake and output.
7. Administer intravenous hydration if prescribed.
8. Protect the **newborn's** skin from injury that can be caused by the constant rubbing from hyperactive jitters.
9. Swaddle the **newborn**.
10. Place the **newborn** in a quiet room and reduce stimulation.
11. Allow the mother to express feelings such as anxiety and guilt.
12. Refer the mother for treatment of the substance abuse problem.

▲ **FIGURE 30-7** Infant with fetal alcohol syndrome. (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed.]. St. Louis: Mosby.)

2. Abnormal palmar creases
3. Respiratory distress (apnea, cyanosis)
4. Congenital heart disorders
5. Irritability and hypersensitivity to stimuli
6. Tremors
7. Poor feeding
8. Seizures

#### C. Interventions

1. Monitor for respiratory distress.
2. Position the **newborn** on the side to facilitate drainage of secretions.
3. Keep resuscitation equipment at the bedside.
4. Monitor for hypoglycemia.
5. Assess suck and swallow reflex.
6. Administer small feedings and burp well.
7. Suction as necessary.
8. Monitor intake and output.
9. Monitor weight and head circumference.
10. Decrease environmental stimuli.

### XXIV. NEWBORN OF A MOTHER WITH HUMAN IMMUNODEFICIENCY VIRUS (HIV)

#### A. Description

1. The fetus of a client who is positive for HIV antibody should be monitored closely throughout the pregnancy.
2. Serial ultrasound screenings should be done during pregnancy to identify intrauterine growth restriction.
3. Weekly nonstress testing after 32 weeks of gestation and biophysical profiles may be necessary during pregnancy.

### XXIII. FETAL ALCOHOL SYNDROME

#### A. Description

1. Fetal alcohol syndrome is caused by maternal alcohol use during pregnancy.
2. The syndrome is a result of teratogenesis.
3. The syndrome causes mental and physical retardation.

#### B. Assessment

1. Facial changes (Fig. 30-7)
  - a. Short palpebral fissures
  - b. Hypoplastic philtrum
  - c. Short, upturned nose
  - d. Flat midface
  - e. Thin upper lip
  - f. Low nasal bridge

4. **Newborns** born to HIV-positive clients may test positive because the mother's antibodies may persist in the **newborn** for 18 months after birth.
5. The use of antiviral medication, the reduction of **newborn** exposure to maternal blood and body fluids, and the early identification of HIV in pregnancy reduce the risk of transmission to the **newborn**.
6. All **newborns** born to HIV-positive mothers acquire maternal antibody to HIV infection, but not all acquire the infection.
7. The **newborn** may be asymptomatic for the first several months to years of life.

**B. Transmission**

1. Across placental barrier
2. During **labor** and **delivery**
3. Breast milk

**C. Assessment**

1. Possibly no outward signs at birth
2. Signs of immunodeficiency
3. Hepatomegaly
4. Splenomegaly
5. Lymphadenopathy
6. Impairment in growth and development

**D. Interventions**

1. Clean the **newborn's** skin carefully before any invasive procedure, such as the administration of vitamin K, heel sticks, or venipunctures.
2. Circumcisions are not done on **newborns** with HIV-positive mothers until the **newborn's** status is determined.
3. **Newborn** can room with mother.
4. All HIV-exposed **newborns** should be treated with medication to prevent infection by *Pneumocystis jiroveci*.
5. Antiretroviral medications may be administered as prescribed for the first 6 weeks of life.
6. Monitor for early signs of immunodeficiency, such as enlarged spleen or liver, lymphadenopathy, and impairment in growth and development.
7. **Newborns** at risk for HIV infection should be seen by the physician at birth and at 1 week, 2 weeks, 1 month, and 2 months of age.
8. Inform the client that HIV culture is recommended at 1 month and after 4 months of age.

**E. Immunizations**

1. Immunizations with live vaccines, such as measles-mumps-rubella and varicella, should not be done until the **newborn's**, **infant's**, or child's status is confirmed.
2. If infected, live vaccine will not be given.

 **Newborns at risk for HIV infection need to receive all recommended immunizations at the regular schedule.**

## XXV. NEWBORN OF A DIABETIC MOTHER

**A. Description**

1. **Infant** born to mother with insulin-dependent diabetes or gestational diabetes
2. Hypoglycemia, hyperbilirubinemia, respiratory distress syndrome, hypocalcemia, birth trauma, and congenital anomalies may be present.

**B. Assessment**

1. Excessive size and weight as a result of excess fat and glycogen in the tissues
2. Edema or puffiness in the face and cheeks
3. Signs of hypoglycemia, such as twitching, apnea, difficulty in feeding, lethargy, seizures, and cyanosis
4. Hyperbilirubinemia
5. Signs of respiratory distress, such as tachypnea, cyanosis, retractions, grunting, and nasal flaring

**C. Interventions**

1. Monitor for signs of respiratory distress, birth trauma, and congenital anomalies.
2. Monitor bilirubin and blood glucose levels.
3. Monitor weight.
4. Feed the **newborn** soon after birth with glucose in water, breast milk, or formula as prescribed.
5. Administer glucose intravenously to treat hypoglycemia if necessary and as prescribed.
6. Monitor for edema.
7. Monitor for respiratory distress, tremors, or seizures.

## XXVI. HYPOGLYCEMIA

**A. Description**

1. Hypoglycemia is an abnormally low level of glucose in the blood (<40 mg/dL in the first 72 hours of life or <45 mg/dL after the first 3 days of life).
2. Normal blood glucose level is 40 to 60 mg/dL in a 1-day-old **newborn** and 50 to 90 mg/dL in a **newborn** older than 1 day.

**B. Assessment**

1. Increased respiratory rate
2. Twitching, nervousness, or tremors
3. Unstable temperature
4. Lethargy, apnea, seizures, cyanosis

**C. Interventions**

1. Prevent low blood glucose level through early feedings.
2. Administer glucose orally or intravenously as prescribed.
3. Monitor blood glucose levels as prescribed.
4. Monitor for feeding problems.
5. Monitor for apneic periods.
6. Assess for shrill or intermittent cries.
7. Evaluate lethargy and poor muscle tone.

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 300.** A nurse in a delivery room is assisting with the delivery of a newborn. After delivery, the nurse prepares to prevent heat loss in the newborn resulting from evaporation by:
1. Warming the crib pad
  2. Closing the doors to the room
  3. Drying the infant with a warm blanket
  4. Turning on the overhead radiant warmer
- 301.** The mother of a newborn calls a clinic and reports to a nurse that when cleaning the umbilical cord, the mother noticed that the cord was moist and that discharge was present. The appropriate nursing instruction to the mother is which of the following?
1. Bring the infant to the clinic.
  2. This is a normal occurrence.
  3. Increase the number of times that the cord is cleaned per day.
  4. Monitor the cord for another 24 to 48 hours and call the clinic if the discharge continues.
- 302.** A nurse in a newborn nursery receives a telephone call to prepare for the admission of a 43-week gestation newborn with Apgar scores of 1 and 4. In planning for admission of this newborn, the nurse's highest priority should be to:
1. Turn on the apnea and cardiorespiratory monitors.
  2. Connect the resuscitation bag to the oxygen outlet.
  3. Set up the intravenous line with 5% dextrose in water.
  4. Set the radiant warmer control temperature at 36.5° C (97.6° F).
- 303.** A nurse is assessing a newborn infant after circumcision and notes that the circumcised area is red with a small amount of bloody drainage. Which of the following nursing actions is appropriate?
1. Contact the physician.
  2. Apply gentle pressure.
  3. Reinforce the dressing.
  4. Document the findings.
- 304.** A nurse in a newborn nursery is monitoring a preterm newborn for respiratory distress syndrome. Which assessment signs noted in the newborn would alert the nurse to the possibility of this syndrome?
1. Tachypnea and retractions
  2. Acrocyanosis and grunting
  3. Hypotension and bradycardia
  4. Presence of a barrel chest with acrocyanosis
- 305.** A postpartum nurse is providing instructions to the mother of a newborn with hyperbilirubinemia who is being breast-fed. The nurse provides which appropriate instruction to the mother?
1. Feed the newborn less frequently.
  2. Continue to breast-feed every 2 to 4 hours.
  3. Switch to bottle-feeding the infant for 2 weeks.
  4. Stop breast-feeding and switch to bottle-feeding permanently.
- 306.** A nurse is assessing a newborn who was born to a mother who is addicted to drugs. Which assessment finding would the nurse expect to note during the assessment of this newborn?
1. Lethargy
  2. Sleepiness
  3. Incessant crying
  4. Cuddles when being held
- 307.** A nurse notes hypotonia, irritability, and a poor sucking reflex in a full-term newborn on admission to the nursery. The nurse suspects fetal alcohol syndrome and is aware that which additional sign would be consistent with fetal alcohol syndrome?
1. Length of 19 inches
  2. Abnormal palmar creases
  3. Birth weight of 6 lb, 14 oz
  4. Head circumference appropriate for gestational age
- 308.** A nurse is preparing a plan of care for a newborn with fetal alcohol syndrome. The nurse should include which priority intervention in the plan of care?
1. Allow the newborn to establish own sleep-rest pattern.
  2. Maintain the newborn in a brightly lighted area of the nursery.
  3. Encourage frequent handling of the newborn by staff and parents.
  4. Monitor the newborn's response to feedings and weight gain pattern.
- 309.** A nurse administers erythromycin ointment (0.5%) to the eyes of a newborn and the mother asks the nurse why this is performed. The nurse explains to the mother that this is routinely done to:
1. Protect the newborns eyes from possible infections acquired while hospitalized.
  2. Prevent cataracts in the newborn born to a woman who is susceptible to rubella.
  3. Minimize the spread of microorganisms to the newborn from invasive procedures during labor.
  4. Prevent ophthalmia neonatorum from occurring after delivery in a newborn born to a woman with an untreated gonococcal infection.

- 310.** A nurse prepares to administer a vitamin K injection to a newborn, and the mother asks the nurse why her infant needs the injection. The best response by the nurse would be:
1. "Your newborn needs vitamin K to develop immunity."
  2. "The vitamin K will protect your newborn from being jaundiced."
  3. "Newborns have sterile bowels, and vitamin K promotes the growth of bacteria in the bowel."
  4. "Newborns are deficient in vitamin K, and this injection prevents your newborn from bleeding."
- 311.** A nurse develops a plan of care for a woman with human immunodeficiency virus infection and her newborn. The nurse includes which intervention in the plan of care?
1. Monitoring the newborn's vital signs routinely
  2. Maintaining standard precautions at all times while caring for the newborn
  3. Initiating referral to evaluate for blindness, deafness, learning problems, or behavioral problems
  4. Instructing the breast-feeding mother regarding the treatment of the nipples with nystatin ointment
- 312.** A nurse is planning care for a newborn of a diabetic mother. A priority nursing diagnosis for this infant is:
1. *Hyperthermia* related to excess fat and glycogen
  2. *Risk for injury* related to low blood glucose levels
  3. *Risk for delayed development* related to excessive size
  4. *Risk for aspiration* related to impaired suck and swallow reflexes
- 313.** The nurse determines that a new mother understands the teaching about prevention of newborn abduction if she states:
1. "I will place my baby's crib close to the door."
  2. "Some health care personnel won't have name badges."
  3. "It's OK to allow the nurse assistant to carry my newborn to the nursery."
  4. "I will ask the nurse to attend to my infant if I am napping and my husband is not here."

### Alternate Item Format: Multiple Response

- 314.** The nurse is preparing to care for a newborn receiving phototherapy. Which interventions are appropriate? **Select all that apply.**
- 1. Avoid stimulation.
  - 2. Decrease fluid intake.
  - 3. Expose all of the newborn's skin.
  - 4. Monitor skin temperature closely.
  - 5. Reposition the newborn every 2 hours.
  - 6. Cover the newborn's eyes with eye shields or patches.

## ANSWERS

### 300. 3

**Rationale:** Evaporation of moisture from a wet body dissipates heat along with the moisture. Keeping the newborn dry by drying the wet newborn at birth prevents hypothermia via evaporation. Hypothermia caused by conduction occurs when the newborn is on a cold surface, such as a cold pad or mattress, and heat from the newborn's body is transferred to the colder object (direct contact). Warming the crib pad assists in preventing hypothermia by conduction. Convection occurs as air moves across the newborn's skin from an open door and heat is transferred to the air. Radiation occurs when heat from the newborn radiates to a colder surface (indirect contact).

**Test-Taking Strategy:** Note the strategic word *evaporation* in the question to assist in selecting the correct option. Recalling that evaporation of moisture from a wet body dissipates heat along with the moisture will assist in directing you to option 3. Review the methods of heat loss in a newborn if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 495–496). St. Louis: Saunders.

### 301. 1

**Rationale:** Symptoms of umbilical cord infection are moistness, oozing, discharge, and a reddened base around the cord. If symptoms of infection occur, the client should be instructed to notify a health care provider. If these symptoms occur, antibiotics may be necessary. Options 2, 3, and 4 are inappropriate nursing interventions for the description given in the question.

**Test-Taking Strategy:** Focus on the clinical manifestations provided in the question to assist in directing you to the correct option. Noting the strategic word *discharge* in the question will assist in directing you to the option that indicates that the newborn needs to be seen by the health care provider. Review interventions related to cord care and the signs of infection if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 555). St. Louis: Saunders.

### 302. 2

**Rationale:** The highest priority on admission to the nursery for a newborn with a low Apgar score is the airway, which would involve preparing respiratory resuscitation equipment and oxygen. The remaining options are also important, although they are of lower priority. The newborn would be placed on an apnea and cardiorespiratory monitor. Setting up an intravenous line with 5% dextrose in water would provide circulatory support. The radiant warmer would provide an external heat source, which is necessary to prevent further respiratory distress.

**Test-Taking Strategy:** Note the strategic words *highest priority*. This question asks you to prioritize care on the basis of information about a newborn's condition. Use the ABCs—airway, breathing, and circulation. A method of planning for airway support is to have the resuscitation bag connected to an oxygen source. Review care for a newborn with low Apgar scores if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Critical Care

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 374–375, 377). St. Louis: Saunders.

### 303. 4

**Rationale:** The penis is normally red during the healing process after circumcision. A yellow exudate may be noted in 24 hours, and this is part of normal healing. The nurse would expect that the area would be red with a small amount of bloody drainage. Only if the bleeding were excessive would the nurse apply gentle pressure with a sterile gauze. If bleeding cannot be controlled, the blood vessel may need to be ligated, and the nurse would notify the physician. Because the findings identified in the question are normal, the nurse would document the assessment findings.

**Test-Taking Strategy:** Use the process of elimination. Note the strategic words *small amount of bloody drainage*. This should assist in directing you to option 4 because this is a normal occurrence after circumcision. If you had difficulty with this question, review the expected findings after circumcision.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Postpartum

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 669). St. Louis: Mosby.

### 304. 1

**Rationale:** A newborn infant with respiratory distress syndrome may present with clinical signs of cyanosis, tachypnea

or apnea, nasal flaring, chest wall retractions, or audible grunts. Acrocyanosis is bluish discoloration of the hands and feet, is associated with immature peripheral circulation, and is common in the first few hours of life. Options 2, 3, and 4 do not indicate clinical signs of respiratory distress syndrome.

**Test-Taking Strategy:** Use the process of elimination. Recalling that acrocyanosis may be a normal sign in a newborn infant will assist in eliminating options 2 and 4. From the remaining options, you must be familiar with the signs of respiratory distress syndrome. Also, note the relationship between the diagnosis and the signs noted in option 1. If you had difficulty with this question, review the signs of respiratory distress syndrome.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Postpartum

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 286). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 505). St. Louis: Saunders.

### 305. 2

**Rationale:** Hyperbilirubinemia is an elevated serum bilirubin level. At any serum bilirubin level, the appearance of jaundice during the first day of life indicates a pathological process. Early and frequent feeding hastens the excretion of bilirubin. Breast-feeding should be initiated within 2 hours after birth and every 2 to 4 hours thereafter. The infant should not be fed less frequently. Switching to bottle-feeding for 2 weeks or stopping breast-feeding permanently is unnecessary.

**Test-Taking Strategy:** Options 3 and 4 are comparable or alike. These options discourage the continuation of breast-feeding and should be eliminated. From the remaining options, recalling the pathophysiology associated with hyperbilirubinemia will assist you in eliminating option 1. Review client instructions related to hyperbilirubinemia in the newborn if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 573). St. Louis: Saunders.

### 306. 3

**Rationale:** A newborn of a woman using drugs is irritable. The infant is overloaded easily by sensory stimulation. The infant may cry incessantly and be difficult to console. The infant would hyperextend and posture rather than cuddle when being held.

**Test-Taking Strategy:** Options 1 and 2 are comparable or alike in that they indicate hypoactivity of the newborn and can be eliminated. From the remaining options, recalling the pathophysiology associated with an infant born to a drug-addicted mother and that the newborn is irritable will assist you in eliminating option 4. Review assessment findings for the newborn of a drug-addicted mother if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 757). St. Louis: Saunders.

### 307. 2

**Rationale:** Fetal alcohol syndrome is caused by maternal alcohol use during pregnancy. Features of newborns diagnosed with fetal alcohol syndrome include craniofacial abnormalities, intrauterine growth restriction, cardiac abnormalities, abnormal palmar creases, and respiratory distress. Options 1, 3, and 4 are normal assessment findings in the full-term newborn infant.

**Test-Taking Strategy:** Use knowledge regarding normal assessment findings in the full-term newborn infant to answer this question. Options 1, 3, and 4 are comparable or alike and represent normal assessment findings in a full-term newborn. If you had difficulty with this question, review the content related to normal newborn assessment findings and fetal alcohol syndrome.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Postpartum

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 311). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1547). St. Louis: Saunders.

### 308. 4

**Rationale:** Fetal alcohol syndrome is caused by maternal alcohol use during pregnancy. A primary nursing goal for the newborn diagnosed with fetal alcohol syndrome is to establish nutritional balance after delivery. These newborns may exhibit hyperirritability, vomiting, diarrhea, or an uncoordinated sucking and swallowing ability. A quiet environment with minimal stimuli and handling would help establish appropriate sleep-rest cycles in the newborn as well. Options 1, 2, and 3 are inappropriate interventions.

**Test-Taking Strategy:** Use the process of elimination and think about the pathophysiology that occurs in a newborn with this condition. Recalling that these newborns may exhibit hyperirritability, vomiting, diarrhea, or an uncoordinated sucking and swallowing ability will direct you easily to option 4. Review care of a newborn with fetal alcohol syndrome if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1548). St. Louis: Saunders.

### 309. 4

**Rationale:** Erythromycin ophthalmic ointment 0.5% is used as a prophylactic treatment for ophthalmia neonatorum,

which is caused by the bacterium *Neisseria gonorrhoeae*. Preventive treatment of gonorrhea is required by law. Options 1, 2, and 3 are not the purposes for administering this medication to a newborn infant.

**Test-Taking Strategy:** Use knowledge of the purpose of administering erythromycin ophthalmic ointment to a newborn infant. Remember that this is done to prevent ophthalmia neonatorum. If you had difficulty with this question, review initial eye care for the newborn infant.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 539). St. Louis: Saunders.

### 310. 4

**Rationale:** Vitamin K is necessary for the body to synthesize coagulation factors. Vitamin K is administered to the newborn to prevent bleeding disorders. Vitamin K promotes liver formation of the clotting factors II, VII, IX, and X. Newborns are vitamin K-deficient because the bowel does not have the bacteria necessary for synthesizing fat-soluble vitamin K. The normal flora in the intestinal tract produces vitamin K. The newborn's bowel does not support the normal production of vitamin K until bacteria adequately colonize it. The bowel becomes colonized by bacteria as food is ingested. Vitamin K does not promote the development of immunity or prevent the infant from becoming jaundiced.

**Test-Taking Strategy:** Note the strategic word *best*. Because immunity and jaundice are not related to the action of vitamin K, eliminate options 1 and 2. From the remaining options, recall the action of vitamin K to direct you to option 4. Remember that vitamin K does not promote the growth of bacteria, but is administered to prevent bleeding. If you had difficulty with this question, review the purpose of administering a vitamin K injection to a newborn.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Postpartum

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 222). St. Louis: Mosby.

### 311. 2

**Rationale:** An infant born to a mother infected with human immunodeficiency virus (HIV) must be cared for with strict attention to standard precautions. This prevents the transmission of HIV from the newborn, if infected, to others and prevents transmission of other infectious agents to the possibly immunocompromised newborn. Mothers infected with HIV should not breast-feed. Options 1 and 3 are not associated specifically with the care of a potentially HIV-infected newborn.

**Test-Taking Strategy:** Use knowledge regarding care of an infant born to an HIV-infected mother. Eliminate options 1 and 3 first because they are not associated specifically with the care of a potentially HIV-infected newborn.

Recalling that HIV-infected mothers should not breast-feed will direct you to option 2. Review care of an infant born to an HIV-infected mother if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1054). St. Louis: Saunders.

### 312. 2

**Rationale:** The newborn of a diabetic mother is at risk for hypoglycemia, so *Risk for injury* related to low blood glucose levels would be a priority nursing diagnosis. The newborn would also be at risk for hyperbilirubinemia, respiratory distress, hypocalcemia, and congenital anomalies. Hyperthermia, risk for delayed development, and risk for aspiration are not expected problems. **Test-Taking Strategy:** Note the strategic word *priority*. Read each option thoroughly and eliminate options 1, 3, and 4 because newborns of diabetic mothers are not at risk for these problems. Also, note the relationship of the word *diabetic* in the question and the word *glucose* in option 2. Review nursing interventions for newborns of diabetic mothers if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Maternity-Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 755). St. Louis: Saunders.

### 313. 4

**Rationale:** Precautions to prevent infant abduction include placing a newborn's crib away from the door, transporting a newborn only in the crib and never carrying the newborn, expecting health care personnel to wear identification that is easily visible at all times, and asking a nurse to attend to the newborn if the mother is napping and no family member is available to watch the newborn (the newborn is never left unattended). If the mother states that she will ask the nurse to watch the newborn while she is sleeping, she has understood the teaching. Options 1, 2, and 3 are incorrect and would indicate that the mother needs further teaching.

**Test-Taking Strategy:** Focus on the subject, that the client understands precautions to prevent infant abduction. Read each option carefully and select the option that provides protection to the infant. This will direct you to option 4. Review

precautions to prevent newborn abduction if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 547). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 314. 4, 5, 6

**Rationale:** Phototherapy is the use of intense fluorescent lights to reduce serum bilirubin levels in the newborn. Adverse effects from treatment, such as eye damage, dehydration, or sensory deprivation, can occur. Interventions include exposing as much of the newborn's skin as possible; however, the genital area is covered. The newborn's eyes are also covered with eye shields or patches, ensuring that the eyelids are closed when shields or patches are applied. The shields or patches are removed at least once per shift to inspect the eyes for infection or irritation and to allow eye contact. The nurse measures the lamp energy output to ensure efficacy of the treatment (done with a special device known as a photometer), monitors skin temperature closely, and increases fluids to compensate for water loss. The newborn will have loose green stools and green-colored urine. The newborn's skin color is monitored with the fluorescent light turned off every 4 to 8 hours and is monitored for bronze baby syndrome, a grayish brown discoloration of the skin. The newborn is repositioned every 2 hours, and stimulation is provided. After treatment, the newborn is monitored for signs of hyperbilirubinemia because rebound elevations can occur after therapy is discontinued.

**Test-Taking Strategy:** Focus on the subject, phototherapy. Recalling that adverse effects from treatment, such as eye damage, dehydration, or sensory deprivation, can occur will assist in determining the correct interventions. Review the interventions for a newborn receiving phototherapy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Postpartum

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., pp. 279–280). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 750). St. Louis: Saunders.

# Maternity and Newborn Medications

## I. Rh<sub>o</sub>(D) IMMUNE GLOBULIN (RhoGAM)

### A. Description

1. Prevention of anti-Rh<sub>o</sub>(D) antibody formation is most successful if the medication is administered twice, at 28 weeks of gestation and again within 72 hours after **delivery**.
2. Rh<sub>o</sub>(D) immune globulin also should be administered within 72 hours after potential or actual exposure to Rh-positive blood and must be given with each subsequent exposure or potential exposure to Rh-positive blood.

**B. Use:** To prevent isoimmunization in Rh-negative clients who are exposed or potentially exposed to Rh-positive red blood cells by transfusion, termination of pregnancy, amniocentesis, chorionic villus sampling, abdominal trauma, or bleeding during pregnancy or the birth process

### C. Adverse reactions and contraindications

1. Elevated temperature
2. Tenderness at the injection site
3. Contraindicated for Rh-positive clients
4. Contraindicated in clients with a history of systemic allergic reactions to preparations containing human immunoglobulins
5. Not administered to a **newborn**

### D. Interventions

1. Administer to the client by the intramuscular injection at 28 weeks' gestation and within 72 hours after **delivery**.
2. Never administer by intravenous route.
3. Monitor for temperature elevation.
4. Monitor injection site for tenderness.

**!** Rh<sub>o</sub>(D) immune globulin (RhoGAM) is of no benefit when the client has developed a positive antibody titer to the Rh antigen.

## II. TOCOLYTICS

**A. Description:** Tocolytics are medications that produce uterine relaxation and suppress uterine activity in an attempt to halt uterine contractions and prevent preterm birth (Box 31-1 and Table 31-1).

**B. Uses:** To halt uterine contractions and prevent preterm birth

### C. Adverse reactions and contraindications

1. See Table 31-1 for a description of adverse reactions.
2. Maternal contraindications include severe pre-eclampsia and eclampsia, active vaginal bleeding, intrauterine infection, cardiac disease, and medical or obstetric condition that contraindicates continuation of pregnancy.
3. Fetal contraindications include estimated gestational age greater than 37 weeks, cervical dilation greater than 4 cm, fetal demise, lethal fetal anomaly, chorioamnionitis, acute fetal distress, and chronic intrauterine growth restriction.

### D. Interventions for the client receiving tocolytic therapy

1. Position the client on her side to enhance **placental** perfusion and reduce pressure on the cervix.
2. Monitor maternal vital signs, fetal status, and **labor** status frequently according to agency protocol.
3. Monitor for signs of adverse reactions to the medication.
4. Monitor daily weight and input and output status, and provide fluid intake as prescribed.
5. Offer comfort measures and provide psychosocial support to the client and family.
6. See Table 31-1 for interventions specific to each tocolytic medication.

## III. MAGNESIUM SULFATE

### A. Description (see Table 31-1)

1. Magnesium sulfate is a central nervous system depressant and anticonvulsant.
2. The medication causes smooth muscle relaxation.
3. The antidote is calcium gluconate.

### Box 31-1 Tocolytics

Prostaglandin inhibitor: Indomethacin (Indocin)

Magnesium sulfate

Calcium channel blocker: Nifedipine (Procardia, Adalat, Nifedical)

β<sub>2</sub>-selective adrenergic agonist: Terbutaline (Brethine)

- B. Uses**
1. Stopping preterm **labor** to prevent preterm birth
  2. Preventing and controlling seizures in preeclamptic and eclamptic clients
- C. Adverse reactions and contraindications**
1. Magnesium sulfate can cause respiratory depression, depressed reflexes, flushing, hypotension, extreme muscle weakness, decreased urine output, pulmonary edema, and elevated serum magnesium levels.
  2. Continuous intravenous infusion increases the risk of magnesium toxicity in the **newborn**.
  3. Intravenous administration should not be used for 2 hours preceding **delivery**.

**TABLE 31-1** Tocolytics

| Medication, Classification, and Actions  | Adverse Reactions   | Nursing Interventions   |
|--|---|---|
| Indomethacin (Indocin)—prostaglandin inhibitor; relaxes uterine smooth muscle  | <i>Maternal</i> —nausea and vomiting, dyspepsia, dizziness  | Used when other methods fail only if gestational age is <32 wk  |
|  | <i>Fetal</i> —premature closure of ductus arteriosus  | Not used in clients with bleeding potential, peptic ulcer disease, or oligohydramnios   |
|  | <i>Newborn</i> —bronchopulmonary dysplasia, respiratory distress syndrome, intracranial pressure, necrotizing enterocolitis, hyperbilirubinemia                                   | Follow agency protocol for administration   |
|  |   | Prepare to determine amniotic fluid volume and function of ductus arteriosus before therapy and within 48 hr of discontinuing therapy |
| Magnesium sulfate—central nervous system depressant; relaxes smooth muscle, including the uterus; used to halt preterm labor contractions; used for preeclamptic clients to prevent seizures | <i>Maternal</i> —depressed respirations, depressed DTRs, hypotension, extreme muscle weakness, flushing, decreased urine output, pulmonary edema, serum magnesium levels >9 mg/dL | Use intravenous controller pump for administration  |
|  | <i>Newborn</i> —hypotonia and sleepiness  | Follow agency protocol for administration   |
|  |   | Discontinue infusion and notify physician if adverse reactions occur  |
|  |   | Monitor for respirations <12/min, urine output <100 mL/4 hr (25-30 mL/hr)   |
|  |   | Monitor DTRs  |
|  |   | Monitor magnesium levels and report values outside therapeutic range (4-7.5 mEq/L [5-8 mg/dL])  |
| Nifedipine (Procardia, Adalat, Nifedical)—calcium channel blocker; relaxes smooth muscles, including the uterus, by blocking calcium entry   | <i>Maternal</i> —tachycardia, hypotension, dizziness, headache, nervousness, facial flushing, fatigue, nausea   | Follow agency protocol for administration   |
|  | <i>Newborn</i> —hypotension   | Avoid use or use cautiously with magnesium sulfate because severe hypotension can occur   |
|  |   | Monitor for adverse reactions   |
| Terbutaline (Brethine)— $\beta$ -adrenergic agonist; relaxes smooth muscles, inhibiting uterine activity and causing bronchodilation   | <i>Maternal</i> —tachycardia, palpitations, pulmonary edema, chest pain, myocardial ischemia, hypotension, tremors, hypokalemia, hyperglycemia                                    | Monitor for adverse reactions and notify physician if they occur  |
|  | <i>Newborn</i> —tachycardia, hypotension, ileus, hypocalcemia, hyperbilirubinemia, hyperinsulinemia with hypoglycemia   | Teach client and family to monitor for adverse reactions and when to notify physician   |

DTRs, deep tendon reflexes.

4. Magnesium sulfate may be prescribed for the first 12 to 24 hours postpartum if it is used for preeclampsia.
5. High doses can cause loss of deep tendon reflexes, heart block, respiratory paralysis, and cardiac arrest.
6. The medication is contraindicated in clients with heart block, myocardial damage, or renal failure.
7. The medication is used with caution in clients with severe renal impairment.

#### D. Interventions

1. Monitor maternal vital signs, especially respirations, every 30 to 60 minutes.
2. Assess renal function and electrocardiogram for cardiac function.
3. Monitor magnesium levels—the target range is 4 to 7.5 mEq/L (5 to 8 mg/dL); if the magnesium level increases, notify the health care provider.
4. Always administer by intravenous infusion via an infusion monitoring device such as a controller pump; carefully monitor the dose being administered, and follow agency protocol for administration.
5. Keep calcium gluconate on hand in case of a magnesium sulfate overdose because calcium gluconate antagonizes the effect of magnesium sulfate.
6. Monitor deep tendon reflexes hourly for signs of developing toxicity.
7. Test the patellar reflex or knee jerk reflex before administering a repeat parenteral dose (used as an indicator of central nervous system depression; suppressed reflex may be a sign of impending respiratory arrest) (Fig. 31-1 and Table 31-2).
8. Patellar reflex must be present and respiratory rate must be greater than 16 breaths/min (or as designated by agency protocol) before each parenteral dose.
9. Monitor intake and output hourly; output should be maintained at 25 to 30 mL/hr because the medication is eliminated through the kidneys.

 **Monitor a client receiving magnesium sulfate intravenously closely for signs of toxicity. Call the health care provider if respirations are less than 12 breaths/min, which indicate respiratory depression, or if any other adverse reactions occur.**

#### IV. BETAMETHASONE AND DEXAMETHASONE

- A. Description:** Corticosteroids that increase the production of **surfactant** to accelerate fetal lung maturity and reduce the incidence or severity of respiratory distress syndrome
- B. Use:** For a client in preterm **labor** between 28 and 32 weeks' gestation whose **labor** can be inhibited for 48 hours without jeopardizing the mother or fetus
- C. Adverse reactions and contraindications**
  1. May decrease the mother's resistance to infection
  2. Pulmonary edema secondary to sodium and fluid retention can occur.

3. Elevated blood glucose levels can occur in a client with diabetes mellitus.

#### **D. Interventions**

1. Monitor maternal vital signs, lung sounds, and for edema.
2. Monitor mother for signs of infection.
3. Monitor white blood cell count.
4. Monitor blood glucose levels.

### V. OPIOID ANALGESICS

#### **A. Description**

1. Used to relieve moderate to severe pain associated with **labor**
2. Administered by intramuscular or intravenous route
3. Regular use of opioids during pregnancy may produce withdrawal symptoms in the **newborn** (irritability, excessive crying, tremors, hyperactive reflexes, fever, vomiting, diarrhea, yawning, sneezing, and seizures).
4. Antidotes for opioids
  - a. Naloxone (Narcan) is usually the treatment of choice because it rapidly reverses opioid toxicity; the dose may need to be repeated every few hours until opioid concentrations have decreased to nontoxic levels.

**▲ FIGURE 31-1** Patellar reflex, with client's legs hanging freely over end of examining table. (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed.]. St. Louis: Mosby. Courtesy Shannon Perry, Phoenix, AZ.)

**TABLE 31-2** Assessing Deep Tendon Reflexes

| Grade | Deep Tendon Reflex Response                               |
|-------|---|
| 0     | No response   |
| 1     | Sluggish or diminished                                    |
| 2     | Active or expected response                               |
| 3     | More brisk than expected, slightly hyperactive            |
| 4     | Brisk, hyperactive, with intermittent or transient clonus |

From Seidel, H., Ball, J., Dains, J., & Benedict, G. (2006). *Mosby's guide to physical examination* (5th ed.). St. Louis: Mosby.

- b. Nalmefene (Revox) is a long-acting opioid antagonist that does not require repeat doses.
  - c. These medications can cause withdrawal in opioid-dependent clients.
- B.** Meperidine hydrochloride (Demerol) and hydro-morphone hydrochloride (Dilaudid)
1. Can cause dizziness, nausea, vomiting, sedation, decreased blood pressure, decreased respirations, diaphoresis, flushed face, urinary retention
  2. May be prescribed to be administered with an antiemetic such as promethazine (Phenergan) to prevent nausea
  3. High dosages may result in respiratory depression, skeletal muscle flaccidity, cold clammy skin, cyanosis, and extreme somnolence progressing to seizures, stupor, and coma.
  4. Used cautiously in clients delivering preterm infants
  5. Not administered in early **labor** because it may slow the **labor** process
  6. Not administered in advanced **labor** (within 1 hour of expected **delivery**); if the medication is not adequately removed from the fetal circulation, respiratory depression can occur.
- C.** Fentanyl (Sublimaze) and sufentanil (Sufenta): Can cause respiratory depression, dizziness, drowsiness, hypotension, urinary retention, fetal narcosis and distress
- D.** Butorphanol tartrate (Stadol) and nalbuphine (Nubain)
1. Can cause confusion, sedation, sweating, nausea, vomiting, hypotension, sinusoidal-like fetal heart rhythm
  2. Use with caution in a client with preexisting opioid dependency because these medications can precipitate withdrawal symptoms in the client and the **newborn**.
- E.** Interventions
1. Monitor vital signs, particularly respiratory status; if respirations are 12 breaths/min or less, withhold the medication and contact the health care provider.
  2. Monitor the fetal heart rate and characteristics of uterine contractions.
  3. Monitor for blood pressure changes (hypotension); maintain the client in a recumbent position (elevate the hip with a wedge pillow or other device).
  4. Record the client's response and level of pain relief.
  5. Monitor the bladder for distention and retention.
  6. Have the antidote naloxone (Narcan) available, especially if **delivery** is expected to occur during peak drug absorption time.

 Obtain a drug history before the administration of an opioid analgesic. Some medications may be contraindicated if the client has a history of opioid dependency because these medications can precipitate withdrawal symptoms in the client and newborn.

## VI. PROSTAGLANDINS (Box 31-2)

- A.** Description
1. Ripen the cervix, making it softer and causing it to begin to dilate and efface
  2. Stimulate uterine contractions
  3. Administered vaginally
- B.** Uses
1. Preinduction cervical ripening (ripening of the cervix before the induction of **labor** when the Bishop score is  $\leq 4$ )
  2. Induction of **labor**
  3. Induction of abortion (abortifacient agent)
- C.** Adverse reactions and contraindications
1. Gastrointestinal effects, including diarrhea, nausea, vomiting, and stomach cramps
  2. Fever, chills, flushing, headache, hypotension
  3. Tachysystole ( $\geq 12$  uterine contractions in 20 minutes without an alteration in the fetal heart rate pattern)
  4. Hyperstimulation of the **uterus**
  5. Fetal passage of meconium
  6. Contraindications (Box 31-3)
- D.** Interventions
1. Monitor maternal vital signs, fetal heart rate pattern, and status of pregnancy including indications for cervical ripening or the induction of **labor**, signs of **labor** or impending **labor**, and the Bishop score (see Table 26-2 for information about the Bishop score).
  2. Monitor for adverse reactions to the medication.
  3. Have the client void before administration of medication and then have her maintain a supine with lateral tilt or side-lying position for 30 to 60 minutes (gel) up to 2 hours (insert) after administration, depending on the medication administered.

### Box 31-2 Prostaglandins

Prostaglandin E<sub>2</sub>: Dinoprostone (Cervidil vaginal insert, Prepidil gel)

### Box 31-3 Contraindications to the Use of Prostaglandins

Active cardiac, hepatic, pulmonary, or renal disease  
 Acute pelvic inflammatory disease  
 Clients in whom vaginal delivery is not indicated  
 Fetal malpresentation  
 History of cesarean section or major uterine surgery  
 History of difficult labor or traumatic labor  
 Hypersensitivity to prostaglandins  
 Maternal fever or infection  
 Nonreassuring fetal heart rate pattern  
 Placenta previa or unexplained vaginal bleeding  
 Regular progressive uterine contractions  
 Significant cephalopelvic disproportion

4. Treatment is discontinued when the Bishop score is 8 or more (cervix ripens) or an effective contraction pattern is established (three or more contractions in a 10-minute period); additionally, signs of adverse reactions indicate that the treatment needs to be discontinued.
5. Follow agency protocol for the induction of **labor** if cervical ripening has occurred and **labor** has not begun; oxytocin (Pitocin) can be initiated if needed 6 to 12 hours after discontinuation of prostaglandin therapy.

4. Administered by intravenous infusion via an infusion monitoring device; prescribed additive solution is piggybacked at the port nearest the point of venous insertion (prescribed additive solution may be normal saline, lactated Ringer's, or 5% dextrose in water)
5. Carefully monitor the dose being administered; do not leave the client unattended while the oxytocin is infusing.
6. Administer oxygen if prescribed.
7. Monitor for hypertonic contractions or a nonreassuring fetal heart rate and notify the health care provider if these occur (See Priority Nursing Actions).

## VII. UTERINE STIMULANTS (OXYTOCICS): OXYTOCIN (PITOCIN)

### A. Description

1. Oxytocin stimulates the smooth muscle of the **uterus** and increases the force, frequency, and duration of uterine contractions.
2. Oxytocin also promotes milk letdown.
3. For induction of **labor**, oxytocin is administered by the intravenous route (other routes of administration include intranasal and intramuscular).
4. Minimal cervical change usually is noted until the active phase of **labor** is achieved.

### B. Uses

1. Induces or augments **labor**
2. Controls postpartum bleeding
3. Promotes milk letdown and facilitates breastfeeding (intranasal route)
4. Manages an incomplete abortion

### C. Adverse reactions and contraindications

1. Adverse reactions include allergies, dysrhythmias, changes in blood pressure, uterine rupture, and water intoxication; intranasal administration may cause nasal vasoconstriction.
2. Oxytocin may produce uterine hypertonicity, resulting in fetal or maternal adverse effects.
3. High doses may cause hypotension, with rebound hypertension.
4. Postpartum hemorrhage can occur and should be monitored for because the **uterus** may become atonic when the medication wears off.
5. Oxytocin should not be used in a client who cannot deliver vaginally or in a client with hypertonic uterine contractions; it is also contraindicated in a client with active genital herpes.

### D. Interventions

1. Monitor maternal vital signs (every 15 minutes), especially the blood pressure and heart rate; weight; intake and output; level of consciousness; and lung sounds.
2. Monitor frequency, duration, and force of contractions and resting uterine tone every 15 minutes.
3. Monitor fetal heart rate every 15 minutes, and notify the health care provider if significant changes occur; use of an internal fetal scalp electrode may be prescribed.

## PRIORITY NURSING ACTIONS!

### Steps to Take if Hypertonic Contractions or a Nonreassuring Fetal Heart Rate Occurs During Oxytocin (Pitocin) Infusion

1. Stop the oxytocin (Pitocin) infusion.
2. Turn the client on her side, stay with the client, and ask another nurse to contact the health care provider.
3. Increase the flow rate of the intravenous additive solution.
4. Administer oxygen, 8 to 10 L/min, by snug face mask.
5. Assess maternal vital signs; fetal heart rate and patterns; and frequency, duration, and force of contractions.
6. Document the event, actions taken, and the response.

Oxytocin (Pitocin) is a uterine stimulant and stimulates the smooth muscle of the uterus and increases the force, frequency, and duration of uterine contractions. It is administered to induce or augment labor. The presence of hypertonic contractions or a nonreassuring fetal heart rate indicates the need to institute emergency measures to reduce uterine stimulation and increase fetal oxygenation. The nurse would always follow the agency's protocol regarding the procedure to follow in this event. Keeping the emergency goals of care in mind (to reduce uterine stimulation and increase fetal oxygenation) guides the nurse's actions. The oxytocin infusion needs to be stopped to reduce uterine contractions. The nurse turns the client on her side to increase placental oxygenation. The nurse never leaves a client if an emergency situation is present; the nurse asks another nurse to contact the health care provider. The flow rate of the intravenous additive solution is increased, and oxygen is administered. These actions also facilitate the goals of care. When these emergency actions are taken, the nurse assesses and continuously monitors maternal vital signs; fetal heart rate and patterns; and frequency, duration, and force of contractions. The nurse also implements any additional prescriptions and documents the event, actions taken, and the response.

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 440). St. Louis: Saunders.

Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 508-509). St. Louis: Mosby.

8. Stop the medication if uterine hyperstimulation or a nonreassuring fetal heart rate occurs; turn the client on her side, increase the intravenous rate of the normal saline, and administer oxygen via face mask.
9. Monitor for signs of water intoxication.
10. Have emergency equipment available.
11. Document the dose of the medication and the time the medication was started, increased, maintained, and discontinued; document the client's response.
12. Keep the client and family informed of the client's progress.

### VIII. MEDICATIONS USED TO MANAGE POSTPARTUM HEMORRHAGE (Box 31-4)

#### A. Ergot alkaloids

##### 1. Description

- a. Ergonovine maleate or ergometrine (Ergotrate Maleate) and methylergonovine maleate (Methergine) are ergot alkaloids.
- b. Directly stimulate uterine muscle, increase the force and frequency of contractions, and produce a firm tetanic contraction of the **uterus**.
- c. Can produce arterial vasoconstriction and vasospasm of the coronary arteries.
- d. Ergot alkaloids are not administered before the **delivery** of the **placenta**.

##### 2. Uses

- a. Postpartum hemorrhage
- b. Postabortal hemorrhage resulting from atony or involution

##### 3. Adverse reactions and contraindications

- a. Can cause nausea, uterine cramping, bradycardia, dysrhythmias, myocardial infarction, and severe hypertension
- b. High doses are associated with peripheral vasospasm or vasoconstriction, angina, miosis, confusion, respiratory depression, seizures, or unconsciousness; uterine tetany can occur.
- c. Contraindicated during pregnancy and in clients with significant cardiovascular disease, peripheral vascular disease, or hypertension

##### 4. Interventions

- a. Monitor maternal vital signs, weight, intake and output, level of consciousness, and lung sounds.
- b. Monitor the blood pressure closely; the medication produces vasoconstriction, and if an increase in blood pressure is noted, withhold

the medication and notify the health care provider.

- c. Monitor uterine contractions (frequency, strength, and duration).
- d. Assess for chest pain, headache, shortness of breath, itching, pale or cold hands or feet, nausea, diarrhea, or dizziness.
- e. Assess the extremities for color, warmth, movement, and pain.
- f. Assess vaginal bleeding.
- g. Notify the health care provider if chest pain or other adverse reactions occur.
- h. Administer analgesics as prescribed; they may be required because the medication produces painful uterine contractions.

**!** Check the client's blood pressure before administering an ergot alkaloid. These medications can cause severe hypertension and are contraindicated in a client with hypertension.

#### B. Prostaglandin $F_{2\alpha}$ (carboprost tromethamine [Hemabate])

1. Description: Contracts the **uterus**
2. Uses: Postpartum hemorrhage
3. Adverse reactions and contraindications
  - a. Can cause headache, nausea, vomiting, diarrhea, fever, tachycardia, hypertension
  - b. Contraindicated if client has asthma
4. Interventions
  - a. Monitor vital signs.
  - b. Monitor vaginal bleeding and uterine tone.

#### C. Oxytocin (Pitocin): see section on uterine stimulants

### IX. RUBELLA VACCINE

- A. Given subcutaneously before hospital discharge to a nonimmune postpartum client
- B. Administered if the rubella titer is less than 1:8
- C. Adverse reactions: Transient rash, hypersensitivity
- D. Contraindicated in a client with an allergy to duck eggs
- E. Interventions
  1. Assess for allergy to duck eggs and notify the health care provider before administration if an allergy exists
  2. Do not administer if the client or other family members are immunocompromised.

**!** The client should avoid pregnancy for 1 to 3 months (or as prescribed) after immunization with rubella vaccine. Inform the client about the need for using a contraception method during this time.

### X. LUNG SURFACTANTS (Box 31-5)

#### A. Description

1. Lung **surfactants** replenish **surfactant** and restore surface activity to the lungs to prevent and treat respiratory distress syndrome.

#### Box 31-4 Medications Used to Manage Postpartum Bleeding

Ergonovine maleate, ergometrine (Ergotrate Maleate)  
 Methylergonovine (Methergine)  
 Oxytocin (Pitocin)  
 Prostaglandin  $F_{2\alpha}$ : Carboprost tromethamine (Hemabate)

2. Lung **surfactants** are administered by the intratracheal route.

**B.** Use: To prevent or treat respiratory distress syndrome in premature infants

**C.** Adverse reactions and contraindications

1. Adverse effects include transient bradycardia and oxygen desaturation; pulmonary hemorrhage, mucus plugging, and endotracheal tube reflux can also occur.

2. **Surfactants** are administered with caution in infants at risk for circulatory overload.

 **D.** Interventions

1. Instill **surfactant** through the catheter inserted into the **newborn's** endotracheal tube; avoid suctioning for at least 2 hours after administration.

2. Monitor for bradycardia and decreased oxygen saturation during administration.

3. Monitor respiratory status and lung sounds and for signs of adverse reactions.

## XI. EYE PROPHYLAXIS FOR THE NEWBORN

**A.** Description

1. Preventive eye treatment against ophthalmia neonatorum in the **newborn** is required by law in the United States.

2. Agent used varies depending on agency protocols, but usually ophthalmic forms of erythromycin (0.5%) or tetracycline (1%) are prescribed because they are bacteriostatic and bactericidal and provide prophylaxis against *Neisseria gonorrhoeae* and *Chlamydia trachomatis*.

3. Silver nitrate (1%) solution may be prescribed, but its use is minimal because it does not protect against chlamydial infection and can cause chemical conjunctivitis.

**B.** Use: As a prophylactic measure to protect against *N. gonorrhoeae* and *C. trachomatis*

**C.** Adverse reaction: Silver nitrate (1%) solution can cause chemical conjunctivitis.

 **D.** Interventions

1. Clean the **newborn's** eyes before instilling the medication.

2. Do not flush the eyes after instillation.

 **Instillation of eye medication can be delayed for 1 hour after birth to facilitate eye contact and parent-newborn attachment and bonding.**

### Box 31-5 Lung Surfactant Replacement Therapy

Beractant (Survanta)  
Calfactant (Infasurf)  
Poractant alfa (Curosurf)

## XII. VITAMIN K

**A.** Description

1. The **newborn** is at risk for hemorrhagic disorders; coagulation factors synthesized in the liver depend on vitamin K, which is not synthesized until intestinal bacteria are present. 

2. **Newborns** are deficient in vitamin K for the first 5 to 8 days of life because of the lack of intestinal bacteria.

**B.** Use: Prophylaxis and treatment of hemorrhagic disease of the **newborn** 

**C.** Adverse reaction: Vitamin K can cause hyperbilirubinemia in the **newborn**. 

**D.** Interventions 

1. Protect the medication from light.

2. Administer during the early **newborn** period.

3. Administer in the lateral aspect of the middle third of the vastus lateralis muscle of the thigh. 

4. Monitor for bruising at the injection site and for bleeding from the cord.

5. Monitor for jaundice and monitor the bilirubin level because the medication can cause hyperbilirubinemia in the **newborn**.

## XIII. HEPATITIS B VIRUS (HBV) VACCINE

**A.** Description: Given intramuscularly to the **newborn** before discharge home

**B.** Use: Recommended for all **newborns** to prevent hepatitis B 

**C.** Adverse reaction: Rash, fever, erythema, and pain at injection site

**D.** Interventions 

1. Parental consent must be obtained.

2. Administer intramuscularly in the lateral aspect of the middle third of the vastus lateralis muscle.

3. If the **infant** was born to a mother positive for hepatitis B surface antigen, hepatitis B immune globulin should be given within 12 hours of birth in addition to HBV vaccine. Then follow the regularly scheduled HBV vaccination schedule.

4. Document immunization administration on a vaccination card for the parents to have a record that it was administered.

## MORE QUESTIONS ON THE CD!

### Practice Questions

**315.** A nurse is caring for a client who is receiving oxytocin (Pitocin) to induce labor. The nurse discontinues the oxytocin infusion if which of the following is noted on assessment of the client?

1. Fatigue

2. Drowsiness

3. Uterine hyperstimulation

4. Early decelerations of the fetal heart rate

- 316.** A pregnant client is receiving magnesium sulfate for the management of preeclampsia. A nurse determines that the client is experiencing toxicity from the medication if which of the following is noted on assessment?
1. Proteinuria of 3+
  2. Respirations of 10 breaths/min
  3. Presence of deep tendon reflexes
  4. Serum magnesium level of 6 mEq/L
- 317.** Methylergonovine (Methergine) is prescribed for a client with postpartum hemorrhage. Before administering the medication, a nurse contacts the health care provider who prescribed the medication if which condition is documented in the client's medical history?
1. Hypotension
  2. Hypothyroidism
  3. Diabetes mellitus
  4. Peripheral vascular disease
- 318.** A nursing instructor asks a nursing student to describe the procedure for administering erythromycin ointment to the eyes of a newborn. The instructor determines that the student needs to research this procedure further if the student states that:
1. "I will flush the eyes after instilling the ointment."
  2. "I will clean the newborn's eyes before instilling ointment."
  3. "I need to administer the eye ointment within 1 hour after delivery."
  4. "I will instill the eye ointment into each of the newborn's conjunctival sacs."
- 319.** A client in preterm labor (31 weeks) who is dilated to 4 cm has been started on magnesium sulfate and contractions have stopped. If the client's labor can be inhibited for the next 48 hours, what medication does the nurse anticipate will be prescribed?
1. Betamethasone
  2. Nalbuphine (Nubain)
  3. Rh<sub>o</sub>(D) immune globulin (RhoGAM)
  4. Dinoprostone (Cervidil vaginal insert)
- 320.** Methylergonovine (Methergine) is prescribed for a woman to treat postpartum hemorrhage. Before administration of methylergonovine, the priority nursing assessment is to check the:
1. Uterine tone
  2. Blood pressure
  3. Amount of lochia
  4. Deep tendon reflexes
- 321.** A nurse is preparing to administer beractant (Survanta) to a premature infant who has respiratory distress syndrome. The nurse plans to administer the medication by which of the following routes?
1. Intradermal
  2. Intratracheal
  3. Subcutaneous
  4. Intramuscular
- 322.** An opioid analgesic is administered to a client in labor. The nurse assigned to care for the client ensures that which medication is readily available if respiratory depression occurs?
1. Betamethasone
  2. Morphine sulfate
  3. Naloxone (Narcan)
  4. Meperidine hydrochloride (Demerol)
- 323.** Rh<sub>o</sub>(D) immune globulin (RhoGAM) is prescribed for a client after delivery and the nurse provides information to the client about the purpose of the medication. The nurse determines that the woman understands the purpose of the medication if the woman states that it will protect her next baby from which of the following?
1. Having Rh-positive blood
  2. Developing a rubella infection
  3. Developing physiological jaundice
  4. Being affected by Rh incompatibility

### Alternate Item Format: Multiple Response

- 324.** A nurse is monitoring a client in preterm labor who is receiving intravenous magnesium sulfate. The nurse monitors for which adverse reactions of this medication? **Select all that apply.**
- 1. Flushing
  - 2. Hypertension
  - 3. Increased urine output
  - 4. Depressed respirations
  - 5. Extreme muscle weakness
  - 6. Hyperactive deep tendon reflexes

## ANSWERS

### 315. 3

**Rationale:** Oxytocin stimulates uterine contractions and is a common pharmacological method to induce labor. Adverse reactions associated with administration of the medication are hyperstimulation of uterine contractions

and nonreassuring fetal heart rate patterns. Oxytocin infusion must be stopped when any signs of uterine hyperstimulation are present. Drowsiness and fatigue may be caused by the labor experience. Early decelerations of the fetal heart rate are a reassuring sign and do not indicate fetal distress.

**Test-Taking Strategy:** Use the process of elimination, focusing on the subject, an adverse reaction to oxytocin. Options 1 and 2 are comparable or alike and can be eliminated first. From the remaining options, recalling that early decelerations of the fetal heart rate are a reassuring sign will direct you to option 3. Review the nursing responsibilities associated with the administration of oxytocin if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Intrapartum

**References:** Hodgson, B., & Kizior, R. (2009). *Saunders nursing drug handbook 2009* (pp. 883–884). St. Louis: Saunders.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 331). St. Louis: Saunders.

### 316. 2

**Rationale:** Magnesium toxicity can occur from magnesium sulfate therapy. Signs of magnesium sulfate toxicity relate to the central nervous system depressant effects of the medication and include respiratory depression, loss of deep tendon reflexes, and a sudden decline in fetal heart rate and maternal heart rate and blood pressure. Therapeutic serum levels of magnesium are 4 to 7.5 mEq/L. Proteinuria of 3+ is an expected finding in a client with preeclampsia.

**Test-Taking Strategy:** Use the process of elimination and eliminate option 3 first because it is a normal finding. Next, eliminate option 4, knowing that the therapeutic serum level of magnesium is 4 to 7.5 mEq/L. From the remaining options, recalling that proteinuria of 3+ would be noted in a client with preeclampsia will direct you to the correct option. Review the adverse effects of magnesium sulfate if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Intrapartum

**References:** Hodgson, B., & Kizior, R. (2009). *Saunders nursing drug handbook 2009* (p. 711). St. Louis: Saunders.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 625). St. Louis: Saunders.

### 317. 4

**Rationale:** Methylergonovine is an ergot alkaloid used to treat postpartum hemorrhage. Ergot alkaloids are contraindicated in clients with significant cardiovascular disease, peripheral vascular disease, hypertension, preeclampsia, or eclampsia. These conditions are worsened by the vasoconstrictive effects of the ergot alkaloids. Options 1, 2, and 3 are not contraindications related to the use of ergot alkaloids.

**Test-Taking Strategy:** Focus on the purpose and action of methylergonovine. Recalling that ergot alkaloids produce vasoconstriction will direct you to option 4. Review the effects of this medication and the associated contraindications if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity—Postpartum

**References:** Hodgson, B., & Kizior, R. (2009). *Saunders nursing drug handbook 2009* (p. 744). St. Louis: Saunders.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 697–698). St. Louis: Saunders.

### 318. 1

**Rationale:** Eye prophylaxis protects the newborn against *Neisseria gonorrhoeae* and *Chlamydia trachomatis*. The eyes are not flushed after instillation of the medication because the flush would wash away the administered medication. Options 2, 3, and 4 are correct statements regarding the procedure for administering eye medication to the newborn.

**Test-Taking Strategy:** Note the strategic words *needs to research*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Eliminate options 3 and 4 first because they are comparable or alike and relate to instilling the eye medication. From the remaining options, visualize the effect of each. This will direct you to option 1. Review the procedure for administering eye medication to the newborn if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 539). St. Louis: Saunders.

### 319. 1

**Rationale:** Betamethasone, a glucocorticoid, is given to increase the production of surfactant to stimulate fetal lung maturation. It is administered to clients in preterm labor at 28 to 32 weeks of gestation if the labor can be inhibited for 48 hours. Nalbuphine (Nubain) is an opioid analgesic. Rh<sub>0</sub>(D) immune globulin (RhoGAM) is given to Rh-negative clients to prevent sensitization. Dinoprostone (Cervidil vaginal insert) is a prostaglandin given to ripen and soften the cervix and to stimulate uterine contractions.

**Test-Taking Strategy:** Note the strategic words *client in preterm labor (31 weeks)* and recall that the preterm infant is at risk for respiratory distress syndrome because of immaturity and the inability to produce surfactant. Next, recalling the actions of the medications in the options and that betamethasone is used to increase the production of surfactant will direct you to option 1. Review the purpose and actions of the medications listed in the options if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Maternity—Intrapartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 683). St. Louis: Saunders.

### 320. 2

**Rationale:** Methylergonovine, an ergot alkaloid, is used to prevent or control postpartum hemorrhage by contracting the uterus. Methylergonovine causes continuous uterine contractions and may elevate the blood pressure. A priority assessment before the administration of the medication is to

check the blood pressure. The physician should be notified if hypertension is present. Although options 1, 3, and 4 may be components of the postpartum assessment, option 2, blood pressure, is related specifically to the administration of this medication.

**Test-Taking Strategy:** Eliminate options 1 and 3 first because they are comparable or alike and related to one another. To choose from the remaining options, use the ABCs—airway, breathing, and circulation. Blood pressure is a method of assessing circulation. Review the adverse effects of methylergonovine if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity—Postpartum

**References:** Hodgson, B., & Kizior, R. (2009). *Saunders nursing drug handbook 2009* (p. 744). St. Louis: Saunders.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 697–698). St. Louis: Saunders.

### 321. 2

**Rationale:** Respiratory distress syndrome is a serious lung disorder caused by immaturity and the inability to produce surfactant, resulting in hypoxia and acidosis. It is common in premature infants and may be due to lung immaturity as a result of surfactant deficiency. The mainstay of treatment is the administration of exogenous surfactant, which is administered by the intratracheal route. Options 1, 3, and 4 are not routes of administration for this medication.

**Test-Taking Strategy:** Use the process of elimination. Note the relationship between the diagnosis *respiratory distress syndrome* and the correct option, *intratracheal*. Review the route of administration of beractant (Survanta) if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Maternity—Postpartum

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 287). St. Louis: Mosby.

Hodgson, B., & Kizior, R. (2009). *Saunders nursing drug handbook 2009* (pp. 126–127). St. Louis: Saunders.

### 322. 3

**Rationale:** Opioid analgesics may be prescribed to relieve moderate to severe pain associated with labor. Opioid toxicity can occur and cause respiratory depression. Naloxone (Narcan) is a opioid antagonist, which reverses the effects of opioids and is given for respiratory depression. Morphine sulfate and meperidine hydrochloride are opioid analgesics. Betamethasone is a corticosteroid administered to enhance fetal lung maturity.

**Test-Taking Strategy:** Use the process of elimination, focusing on the subject of the question, the antidote for respiratory depression. Eliminate options 2 and 4 first because they are comparable or alike and are opioid analgesics. Next, eliminate option 1, knowing that this medication is a corticosteroid. Review the purpose and actions of the medications identified in the options and the antidote for opioid toxicity if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Maternity—Postpartum

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 421). St. Louis: Saunders.

### 323. 4

**Rationale:** Rh incompatibility can occur when an Rh-negative mother becomes sensitized to the Rh antigen. Sensitization may develop when an Rh-negative woman becomes pregnant with a fetus who is Rh positive. During pregnancy and at delivery, some of the fetus' Rh-positive blood can enter the maternal circulation, causing the mother's immune system to form antibodies against Rh-positive blood. Administration of Rh<sub>0</sub>(D) immune globulin (RhoGAM) prevents the mother from developing antibodies against Rh-positive blood by providing passive antibody protection against the Rh antigen.

**Test-Taking Strategy:** Use the process of elimination and note the subject of the question, the purpose of Rh<sub>0</sub>(D) immune globulin. Noting the relationship between the name of the medication, Rh<sub>0</sub>(D) immune globulin, and the word *incompatibility* in option 4 will direct you to this option. Review the purpose of Rh<sub>0</sub>(D) immune globulin if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Maternity—Postpartum

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 324. 1, 4, 5

**Rationale:** Magnesium sulfate is a central nervous system depressant and relaxes smooth muscle, including the uterus. It is used to halt preterm labor contractions and is used for preeclamptic clients to prevent seizures. Adverse effects include flushing, depressed respirations, depressed deep tendon reflexes, hypotension, extreme muscle weakness, decreased urine output, pulmonary edema, and elevated serum magnesium levels.

**Test-Taking Strategy:** Focus on the subject, adverse effects of magnesium sulfate. Recalling that this medication is a central nervous system depressant and relaxes smooth muscle will assist you in choosing the correct answer. Review the adverse effects of this medication if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

## UNIT VI

# Growth and Development Across the Life Span

### PYRAMID TERMS

**abuse** The willful infliction of pain, injury, mental anguish, or unreasonable confinement. Abuse can include verbal assaults, the demand to perform demeaning tasks, theft, or mismanagement of personal belongings (exploitation). Abuse inflicted can be physical, emotional, or sexual.

**auscultation** The physical assessment technique that involves listening to sounds within the body. Special equipment such as a stethoscope may be needed to perform this technique.

**dementia** An organic syndrome identified by gradual and progressive deterioration in intellectual functioning. Long- and short-term memory losses occur with impairment in judgment, abstract thinking, problem-solving ability, and behavior, resulting in a self-care deficit. A common type of dementia is Alzheimer's disease.

**depression** A mood disorder that can be identified by feelings of sadness, hopelessness, and worthlessness, and a decreased interest in activities.

**ego** One's "sense of self"; provides functions such as problem solving, mobilization of defense mechanisms, reality testing, and the capability of functioning independently; the mediator between the id and the superego.

**id** Source of all primitive drives and instincts; considered to be the reservoir of all psychic energy.

**inspection** The first physical assessment technique that begins the moment that the examiner meets the client. It involves a visual assessment of the client during the health history and making observations during the physical examination of specific body systems.

**neglect** The lack of providing services necessary for physical or mental health; includes failure to prevent injury.

**objective data** Information about the client that is obtained by the examiner through the physical examination and

reviewing the results of laboratory, radiological, or other diagnostic studies.

**palpation** A physical assessment technique that involves using the hands to feel certain parts of the client's body, including some organs. The examiner uses this technique to assess texture, size, and consistency of the body part being examined.

**percussion** A physical assessment technique that involves tapping the body to assess the size, borders, and consistency of some organs and to assess for the presence of fluid within body cavities. Direct percussion is performed by striking the fingers directly on the body surface. Indirect percussion is performed by striking a finger of one hand on a finger of the other hand as it is placed on the body surface, such as over an organ.

**polypharmacy** Taking multiple prescription and/or over-the-counter medications together.

**play** An activity that is spontaneous or organized and provides entertainment or diversion. It is a part of childhood that is necessary for the development of a normal personality and social, physical and intellectual skills.

**safety** Instituting measures that ensure protection and the prevention of an accident or injury.

**self-neglect** The choice to avoid medical care or other services that could improve optimal function. Unless declared legally incompetent, an individual has the right to refuse care.

**subjective data** Information obtained from the client during history-taking. It is what the client says about himself or herself.

**superego** The moral component of personality, including internalization of the values, ideals, and moral standards of society.

## THE PYRAMID TO SUCCESS

Normal growth and development proceed in an orderly, systematic, and predictable pattern, which provides a basis for identifying and assessing an individual's abilities. Understanding the normal path of growth and development across the life span assists the nurse in identifying appropriate and expected human behavior. The Pyramid to Success focuses on Sigmund Freud's theory of psychosexual development, Jean Piaget's theory of cognitive development, Erik Erikson's psychosocial theory, and Lawrence Kohlberg's theory of moral development. Growth and development concepts also focus on the health and physical assessment of the adult client; on the aging process; and on physical characteristics, nutritional behaviors, skills, play, and specific safety measures relevant to a particular age group that will ensure a safe and hazard-free environment. When a question is presented on the NCLEX-RN examination, if an age is identified in the question, note the age and think about the associated growth and developmental concepts to answer the question correctly.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Acting as a client advocate
- Consulting with members of the health care team
- Ensuring home safety and security plans
- Establishing priorities
- Maintaining confidentiality
- Preventing accidents
- Providing care following ethical and legal standards
- Respecting client and family needs based on their preferences
- Upholding client's rights

### Health Promotion and Maintenance

- Discussing high-risk behaviors and lifestyle choices

- Identifying changes that occur as a result of the aging process
- Identifying developmental stages and transitions
- Maintaining health and wellness and self-care measures
- Monitoring growth and development
- Performing the techniques associated with the health and physical assessment of the client
- Providing client and family education
- Respecting health care beliefs and preferences

### Psychosocial Integrity

- Assessing for abuse and neglect
- Considering grief and loss issues and end-of life care
- Identifying coping mechanisms
- Identifying loss of quantity and quality of relationships with the older client
- Identifying cultural practices and beliefs of the client and appropriate support systems
- Monitoring for adjustment to potential deterioration in physical and mental health and well-being in the older client
- Monitoring for changes and adjustment in role function in the older client (threat to independent functioning)
- Monitoring for sensory and perceptual alterations
- Providing resources for the client and family

### Physiological Integrity

- Administering medication safely and teaching the client about prescribed medications
- Identifying practices or restrictions related to procedures and treatments
- Monitoring for alterations in body systems and the related risks associated with the client's age
- Providing basic care and comfort needs
- Providing care using a nonjudgmental approach
- Providing interventions compatible with the client's age, cultural, religious, and health care beliefs, education level, and language.

# Theories of Growth and Development

## I. PSYCHOSOCIAL DEVELOPMENT AND ERIK ERIKSON

### A. The theory

1. Erikson's theory of psychosocial development describes the human life cycle as a series of eight **ego** developmental stages from birth to death.
2. Each stage presents a psychosocial crisis, the goal of which is to integrate physical, maturation, and societal demands.
3. The result of one stage may not be permanent, but can be changed by experience(s) later in life.
4. The theory focuses on psychosocial tasks that are accomplished throughout the life cycle.

### B. Psychosocial development: Occurs through a lifelong series of crises affected by social and cultural factors

 According to Erikson's theory of psychosocial development, each psychosocial crisis must be resolved for the child or adult to progress emotionally. Unsuccessful resolution leaves the person emotionally disabled.

### C. Stages of psychosocial development (Table 32-1)

## II. COGNITIVE DEVELOPMENT AND JEAN PIAGET

### A. The theory

1. Piaget's theory of cognitive development defines cognitive acts as ways in which the mind organizes and adapts to its environment (i.e., "mental mapping").
2. Schema refers to an individual's cognitive structure or framework of thought.
3. Schemata
  - a. Schemata are categories that an individual forms in his or her mind to organize and understand the world.
  - b. A young child has only a few schemata with which to understand the world, and gradually these are increased.
  - c. Adults use a wide variety of schemata to understand the world.
4. Assimilation

- a. Assimilation is the ability to incorporate new ideas, objects, and experiences into the framework of one's thoughts.

- b. The growing child will perceive and give meaning to new information according to what is already known and understood.

### 5. Accommodation

- a. Accommodation is the ability to change a schema to introduce new ideas, objects, or experiences.

- b. Accommodation changes the mental structure so that new experiences can be added.

### B. Stages of cognitive development

#### 1. Sensorimotor stage

- a. Birth to 2 years

- b. Development proceeds from reflex activity to imagining and solving problems through the senses and movement.

- c. The infant or toddler learns about reality and how it works.

- d. The infant or toddler does not recognize that objects continue to be in existence, even if out of the visual field.

#### 2. Preoperational stage

- a. 2 to 7 years

- b. The child learns to think in terms of past, present, and future.

- c. The child moves from knowing the world through sensation and movement to prelogical thinking and finding solutions to problems.

- d. The child is egocentric.

- e. The child is unable to conceptualize and requires concrete examples.

#### 3. Concrete operational

- a. 7 to 11 years

- b. The child is able to classify, order, and sort facts.

- c. The child moves from prelogical thought to solving concrete problems through logic.

- d. The child begins to develop abstract thinking.

#### 4. Formal operations

- a. 11 years to adulthood

- b. The person is able to think abstractly and logically.

**TABLE 32-1** Erik Erikson's Stages of Psychosocial Development

| Age                                    | Psychosocial Crisis             | Task   | Resolution of Crisis  |  |
|--|---------------------------------|--|---|--|
|  |                                 |  | Successful  | Unsuccessful   |
| Infancy (birth to 18 months)           | Trust versus mistrust           | Attachment to the mother                                       | Trust in persons; faith and hope about the environment and future | General difficulties relating to persons effectively; suspicion; trust-fear conflict, fear of the future |
| Early childhood (18 months to 3 years) | Autonomy versus shame and doubt | Gaining some basic control over self and environment           | Sense of self-control and adequacy; will power                    | Independence-fear conflict; severe feelings of self-doubt  |
| Late childhood (3-6 years)             | Initiative versus guilt         | Becoming purposeful and directive                              | Ability to initiate one's own activities; sense of purpose        | Aggression-fear conflict; sense of inadequacy or guilt   |
| School age (6-12 years)                | Industry versus inferiority     | Developing social, physical, and learning skills               | Competence; ability to learn and work                             | Sense of inferiority; difficulty learning and working  |
| Adolescence (12-20 years)              | Identity versus role confusion  | Developing sense of id-entify                                  | Sense of personal identity  | Confusion about who one is; identity submerged in relationships or group memberships                     |
| Early adulthood (20-35 years)          | Intimacy versus isolation       | Establishing intimate bonds of love and friendship             | Ability to love deeply and commit oneself                         | Emotional isolation, egocentricity   |
| Middle adulthood (35-65 years)         | Generativity versus stagnation  | Fulfilling life goals that involve family, career, and society | Ability to give and care for others                               | Self-absorption; inability to grow as a person   |
| Later adulthood (65 years to death)    | Integrity versus despair        | Looking back over one's life and accepting its meaning         | Sense of integrity and fulfillment                                | Dissatisfaction with life  |

Modified from Varcarolis, E. (2010). *Foundations of psychiatric mental health nursing* (6th ed.). St. Louis: Saunders.

- c. Logical thinking is expanded to include solving abstract and concrete problems.

### III. MORAL DEVELOPMENT AND LAWRENCE KOHLBERG

#### A. Moral development

1. Moral development is a complicated process involving the acceptance of the values and rules of society in a way that shapes behavior.
2. Moral development is classified in a series of levels and behaviors.
3. Moral development is sequential but people do not automatically go from one stage or level to the next as they mature.
4. Stages or levels of moral development cannot be skipped.

#### B. Levels of moral development (Box 32-1)

### IV. PSYCHOSEXUAL DEVELOPMENT AND SIGMUND FREUD

#### A. Components of the theory (Box 32-2)

#### B. Levels of awareness

1. Conscious level of awareness
  - a. The conscious mind is logical and is regulated by the Reality Principle.
  - b. Consciousness includes all experiences that are within an individual's awareness and that the individual is able to control and includes all information that is remembered easily and is immediately available to an individual.
2. Preconscious level of awareness
  - a. The preconscious is called the *subconscious*.
  - b. The preconscious includes experiences, thoughts, feelings, or desires that might not be in immediate awareness but can be recalled to consciousness.
  - c. The subconscious can help repress unpleasant thoughts or feelings and can examine and censor certain wishes and thinking.
3. Unconscious level of awareness
  - a. The unconscious is not logical and is governed by the Pleasure Principle, which refers to seeking immediate tension reduction.
  - b. Memories, feelings, thoughts, or wishes are repressed and are not available to the conscious mind.

**Box 32-1 Moral Development and Lawrence Kohlberg****Level One: Preconventional Morality****Stage 0 (Birth to 2 years): Egocentric Judgment**

The infant has no awareness of right or wrong.

**Stage 1 (2 to 3 years): Punishment-Obedience Orientation**

At this stage, children cannot reason as mature members of society.

Children view the world in a selfish way, with no real understanding of right or wrong.

The child obeys rules and demonstrates acceptable behavior to avoid punishment and to avoid displeasing those who are in power, and because the child fears punishment from a superior force, such as a parent.

A toddler typically is at the first substage of the preconventional stage, involving punishment and obedience orientation, in which the toddler makes judgments based on avoiding punishment or obtaining a reward.

Physical punishment and withholding privileges tend to give the toddler a negative view of morals.

Withdrawing love and affection as punishment leads to feelings of guilt in the toddler.

Appropriate discipline includes providing simple explanations why certain behaviors are unacceptable, praising appropriate behavior, and using distractions when the toddler is headed for an unsafe action.

**Stage 2 (4 to 7 years): Instrumental Relativist Orientation**

The child conforms to rules to obtain rewards or have favors returned.

The child's moral standards are those of others, and the child observes them either to avoid punishment or obtain rewards.

A preschooler is in the preconventional stage of moral development.

In this stage, conscience emerges and the emphasis is on external control.

**Level Two: Conventional Morality**

The child conforms to rules to please others.

The child has increased awareness of others' feelings.

A concern for social order begins to emerge.

A child views good behavior as that which those in authority will approve.

If the behavior is not acceptable, the child feels guilty.

**Stage 3 (7 to 10 years): Good Boy—Nice Girl Orientation**

Conformity occurs to avoid disapproval or dislike by others.

This stage involves living up to what is expected by individuals close to the child or what individuals generally expect of others in their roles such as daughter, son, brother, sister, and friend.

Being good is important and is interpreted as having good motives and showing concern about others.

Being good also means maintaining mutual relationships, such as trust, loyalty, respect, and gratitude.

**Stage 4 (10 to 12 years): Law and Order Orientation**

The child has more concern with society as a whole.

Emphasis is on obeying laws to maintain social order.

Moral reasoning develops as the child shifts the focus of living to society.

The school-age child is at the conventional level of the conformity stage and has an increased desire to please others.

The child observes and to some extent internalizes the standards of others.

The child wants to be considered “good” by those individuals whose opinions matter to her or him.

**Level Three: Postconventional Morality**

The individual focuses on individual rights and principles of conscience.

The focus is on concerns regarding what is best for all.

**Stage 5: Social Contract and Legalistic Orientation**

The person is aware that others hold a variety of values and opinions and that most values and rules are relative to the group.

The adolescent in this stage gives and takes and does not expect to get something without paying for it.

**Stage 6: Universal Ethical Principles Orientation**

Conformity is based on universal principles of justice and occurs to avoid self-condemnation.

This stage involves following self-chosen ethical principles.

The development of the postconventional level of morality occurs in the adolescent at about age 13 years, marked by the development of an individual conscience and a defined set of moral values.

The adolescent can now acknowledge a conflict between two socially accepted standards and try to decide between them.

Control of conduct is now internal in standards observed and in reasoning about right and wrong.

**Box 32-2 Psychosexual Development and Sigmund Freud: Components of the Theory**

Levels of awareness

Agencies of the mind (id, ego, superego)

Concept of anxiety and defense mechanisms

Psychosexual stages of development

c. These repressed memories, thoughts, or feelings, if made prematurely conscious, can cause anxiety.

C. Agencies of the mind: **Id**, **ego**, and **superego**

The id, ego, and superego are the three systems of personality. These psychological processes follow different operating principles. In a mature and well-adjusted personality, they work together as a team under the leadership of the ego.

- 
1. The **id**
    - a. Source of all drives
    - b. Present at birth
    - c. Includes genetic inheritance, reflexes, capacities to respond, instincts, basic drives, needs, and wishes that motivate an individual
    - d. Operates according to the Pleasure Principle
    - e. Does not tolerate uncomfortable states and seeks to discharge the tension and return to a more comfortable, constant level of energy
    - f. Acts immediately in an impulsive, irrational way and pays no attention to the consequences of its actions; therefore often behaves in ways harmful to self and others
    - g. The primary process is a psychological activity in which the **id** attempts to reduce tension.
    - h. The primary process can include hallucinating or forming an image of the object that will satisfy its needs and remove the tension.
    - i. The primary process by itself is not capable of reducing tension; therefore a secondary psychological process must develop if the individual is to survive. When this occurs, the structure of the second system of the personality, the **ego**, begins to take form.
  2. The **ego**
    - a. Functions include reality testing and problem solving
    - b. Begins its development during the fourth or fifth month of life
    - c. Emerges out of the **id** and acts as an intermediary between the **id** and the external world
    - d. Emerges because the needs, wishes, and demands of the **id** require appropriate exchanges with the outside world of reality
    - e. The **ego** distinguishes between things in the mind and things in the external world.
    - f. Reality testing is a function of the **ego**, and the **ego** uses realistic thinking.
    - g. The **ego** follows the Reality Principle and operates by means of the secondary process—that is, realistic thinking.
    - h. The aim of the Reality Principle is to satisfy the **id's** impulses in the external world with an object that is suitable; the Reality Principle determines whether an experience is true or false and whether it has external existence.
    - i. The **ego** devises a plan and tests the plan by some type of action to see whether it will work.
  3. The **superego**
    - a. Necessary part of socialization that develops during the phallic stage at 3 to 6 years of age
    - b. Develops from interactions with the child's parents during the extended period of childhood dependency
    - c. Includes internalization of the values, ideals, and moral standards of society
    - d. Child internalizes moral standards of the parents and society
    - e. **Superego** consists of the conscience and the **ego** ideal
    - f. Conscience refers to capacity for self-evaluation and criticism; when moral codes are violated, the conscience punishes the individual by instilling guilt.
    - g. What parents approve of and what they reward the child for doing become incorporated as the **ego** ideal by the mechanism of introjection.
    - h. The **superego** strives for perfection rather than pleasure and represents the ideal rather than the real.
    - i. Living up to one's **ego** ideal results in the individual feeling proud and increases self-esteem.
- D. Anxiety and defense mechanisms**
1. The **ego** develops defenses or defense mechanisms to fight off anxiety.
  2. Defense mechanisms operate on an unconscious level, except for suppression, so the individual is not aware of their operation.
  3. Defense mechanisms deny, falsify, or distort reality to make it less threatening.
  4. An individual cannot survive without defense mechanisms; however, if the individual becomes too extreme in distorting reality, then interference with healthy adjustment and personal growth may occur.
- E. Psychosexual stages of development (Box 32-3 on next page)**
1. Human development proceeds through a series of stages from infancy to adulthood.
  2. Each stage is characterized by the inborn tendency of all individuals to reduce tension and seek pleasure.
  3. Each stage is associated with a particular conflict that must be resolved before the child can move successfully to the next stage.
  4. Experiences during the early stages determine an individual's adjustment patterns and the personality traits that the individual has as an adult.
- 

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 325.** A clinic nurse is preparing to discuss the concepts of moral development with a mother. The nurse understands that according to Kohlberg's theory of moral development, in the pre-conventional level, moral development is thought to be motivated by which of the following?
1. Peer pressure
  2. Social pressures

**Box 32-3 Freud's Psychosexual Stages of Development****Oral Stage (Birth to 1 Year)**

During this stage, the infant is concerned with self-gratification.

The infant is all id, operating on the Pleasure Principle and striving for immediate gratification of needs.

When the infant experiences gratification of basic needs, a sense of trust and security begins.

The ego begins to emerge as the infant begins to see self as separate from the mother; this marks the beginning of the development of a sense of self.

**Anal Stage (1 to 3 Years)**

Toilet training occurs during this period, and the child gains pleasure from the elimination of the feces and from their retention.

The conflict of this stage is between those demands from society and the parents and the sensations of pleasure associated with the anus.

The child begins to gain a sense of control over instinctive drives and learns to delay immediate gratification to gain a future goal.

**Phallic Stage (3 to 6 Years)**

The child experiences pleasurable and conflicting feelings associated with the genital organs.

The pleasures of masturbation and the fantasy life of children set the stage for the Oedipus complex.

The child's unconscious sexual attraction to and wish to possess the parent of the opposite gender, the hostility and desire to remove the parent of the same gender, and the subsequent guilt about these wishes is the conflict the child faces.

The conflict is resolved when the child identifies with the parent of the same gender.

The emergence of the superego is the solution to and the result of these intense impulses.

**Latency Stage (6 to 12 Years)**

The latency stage is a tapering off of conscious biological and sexual urges.

The sexual impulses are channeled and elevated into a more culturally accepted level of activity.

Growth of ego functions and the ability to care about and relate to others outside the home is the task of this stage of development.

**Genital Stage (12 Years and Beyond)**

The genital stage emerges at adolescence with the onset of puberty, when the genital organs mature.

The individual gains gratification from his or her own body.

During this stage, the individual develops satisfying sexual and emotional relationships with members of the opposite gender.

The individual plans life goals and gains a strong sense of personal identity.

3. Parents' behavior
4. Punishment and reward

**326.** A maternity nurse is providing instructions to a new mother regarding the psychosocial development of the newborn infant. Using Erikson's psychosocial development theory, the nurse instructs the mother to:

1. Allow the newborn infant to signal a need.
2. Anticipate all the needs of the newborn infant.
3. Attend to the newborn infant immediately when crying.
4. Avoid the newborn infant during the first 10 minutes of crying.

**327.** A mother of a 3-year-old tells a clinic nurse that the child is rebelling constantly and having temper tantrums. Using Erikson's psychosocial development theory, the nurse tells the mother to:

1. Set limits on the child's behavior.
2. Ignore the child when this behavior occurs.
3. Allow the behavior, because this is normal at this age period.
4. Punish the child every time the child says "no" to change the behavior.

**328.** The mother of an 8-year-old child tells the clinic nurse that she is concerned about the child

because the child seems to be more attentive to friends than anything else. Using Erikson's psychosocial development theory, the appropriate nursing response is which of the following?

1. "You need to be concerned."
2. "You need to monitor the child's behavior closely."
3. "At this age, the child is developing his own personality."
4. "You need to provide more praise to the child to stop this behavior."

**329.** The mother of a 4-year-old child calls the clinic nurse and expresses concern because the child has been masturbating. Using Freud's psychosexual stages of development, the appropriate response by the nurse is which of the following?

1. "This is a normal behavior at this age."
2. "Children usually begin this behavior at age 8 years."
3. "This is not normal behavior, and the child should be seen by the physician."
4. "The child is very young to begin this behavior and should be brought to the clinic."

**330.** A nursing instructor asks a nursing student to present a clinical conference to peers regarding Freud's psychosexual stages of development,

specifically the anal stage. The student plans the conference, knowing that which of the following most appropriately relates to this stage of development?

1. This stage is associated with toilet training.
2. This stage is characterized by the gratification of self.
3. This stage is characterized by a tapering off of conscious biological and sexual urges.
4. This stage is associated with pleasurable and conflicting feelings about the genital organs.

**331.** A nursing instructor asks a nursing student to describe the formal operations stage of Piaget's cognitive developmental theory. The appropriate response by the nursing student is:

1. "The child has the ability to think abstractly."
2. "The child begins to understand the environment."
3. "The child is able to classify, order, and sort facts."
4. "The child learns to think in terms of past, present, and future."

## ANSWERS

### 325. 4

**Rationale:** In the preconventional stage, morals are thought to be motivated by punishment and reward. If the child is obedient and is not punished, then the child is being moral. The child sees actions as good or bad. If the child's actions are good, the child is praised. If the child's actions are bad, the child is punished. Options 1, 2, and 3 are incorrect for this stage of moral development.

**Test-Taking Strategy:** Eliminate options 1 and 2 because they are comparable or alike because peer pressure is the same as social pressures. To select from the remaining options, recalling that the preconventional stage occurs between birth and 7 years will assist in directing you to option 4 from the remaining options. If you had difficulty with this question, review the preconventional stage of Kohlberg's theory of moral development.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 439). St. Louis: Mosby.

### 326. 1

**Rationale:** According to Erikson, the caregiver should not try to anticipate the newborn infant's needs at all times but must allow the newborn infant to signal needs. If a newborn infant is not allowed to signal a need, the newborn will not learn how to control the environment. Erikson believed that a delayed or prolonged response to a newborn infant's signal would inhibit the development of trust and lead to mistrust of others.

## Alternate Item Format: Multiple Response

**332.** A nurse educator is preparing to conduct a session to the nursing staff regarding the theories of growth and development and plans to discuss Kohlberg's theory of moral development. Which of the following should the nurse include in the session? **Select all that apply.**

- 1. Individuals move through all six stages in a sequential fashion.
- 2. Moral development progresses in relationship to cognitive development.
- 3. A person's ability to make moral judgments develops over a period of time.
- 4. The theory provides a framework for understanding how individuals determine a moral code to guide their behavior.
- 5. In stage 1 (punishment-obedience orientation), children are expected to reason as mature members of society.
- 6. In stage 2 (instrumental relativist orientation), the child conforms to rules to obtain rewards or have favors returned.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 2, 3, and 4 because of the close-ended words *all*, *immediately*, and *avoid* in these options. Review Erikson's stage of psychosocial development for infancy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 327). St. Louis: Mosby.

### 327. 1

**Rationale:** According to Erikson, the child focuses on gaining some basic control over self and the environment and independence between ages 1 and 3 years. Gaining independence often means that the child has to rebel against the parents' wishes. Saying things like "no" or "mine" and having temper tantrums are common during this period of development. Being consistent and setting limits on the child's behavior are necessary elements. Options 2 and 3 do not address the child's behavior. Option 4 is likely to produce a negative response during this normal developmental pattern.

**Test-Taking Strategy:** Use the process of elimination.

Options 2 and 3 can be eliminated first because they are comparable or alike indicating that the mother should not address the child's behavior. Next, eliminate option 4 because this action is likely to produce a negative response during this normal developmental pattern. Review psychosocial development of the toddler according to Erikson if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 56). St. Louis: Saunders.

### 328. 3

**Rationale:** According to Erikson, during school-age years (6 to 12 years of age), the child begins to move toward peers and friends and away from the parents for support. The child also begins to develop special interests that reflect his or her own developing personality instead of the parents. Therefore options 1, 2, and 4 are incorrect responses.

**Test-Taking Strategy:** Use knowledge of Erikson's psychosocial development theory related to middle childhood. Options 1 and 2 can be eliminated first because they are comparable or alike and indicate that the mother should be concerned about the child. Eliminate option 4 next because, although praising the child for accomplishments is important at this age, the behavior that the child is exhibiting is normal. Review psychosocial development of the school-age child according to Erikson if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 80). St. Louis: Mosby.

### 329. 1

**Rationale:** According to Freud's psychosexual stages of development, between the ages of 3 and 6 the child is in the phallic stage. At this time, the child devotes much energy to examining his or her genitalia, masturbating, and expressing interest in sexual concerns. Therefore options 2, 3, and 4 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 3 and 4 first because they are comparable or alike indicating that the child's behavior is abnormal. Next, focus on the subject of the question and note the words *age 8 years* in option 2 to assist in eliminating this option. If you had difficulty with this question, review Freud's psychosexual stages of development.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 56). St. Louis: Saunders.

### 330. 1

**Rationale:** Generally, toilet training occurs during the anal stage. According to Freud, the child gains pleasure from the elimination of feces and from their retention. Option 2 relates to the oral stage. Option 3 relates to the latency period. Option 4 relates to the phallic stage.

**Test-Taking Strategy:** Use the process of elimination. Note the relationship between the words *anal* in the question and *toilet*

*training* in the correct option. If you had difficulty with this question, review Freud's psychosexual stages of development.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 56). St. Louis: Saunders.

### 331. 1

**Rationale:** In the formal operations stage, the child has the ability to think abstractly and logically. Option 2 identifies the sensorimotor stage. Option 3 identifies the concrete operational stage. Option 4 identifies the preoperational stage.

**Test-Taking Strategy:** Focus on the subject, the formal operations stage of Piaget's cognitive developmental theory, and note the relationship between the subject and the description in option 1. Remember that in the formal operations stage, the child has the ability to think abstractly and logically. If you had difficulty with this question, review these concepts.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 80). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 332. 2, 3, 4, 6

**Rationale:** Kohlberg's theory states that individuals move through the six stages of development in a sequential fashion but that not everyone reaches stages 5 and 6 in his or her development of personal morality. The theory provides a framework for understanding how individuals determine a moral code to guide their behavior. It states that moral development progresses in relationship to cognitive development and that a person's ability to make moral judgments develops over a period of time. In stage 1, ages 2 to 3 years (punishment-obedience orientation), children cannot reason as mature members of society. In stage 2, ages 4 to 7 years, (instrumental relativist orientation), the child conforms to rules to obtain rewards or have favors returned.

**Test-Taking Strategy:** Read each option carefully. Recalling that the theory provides a framework for understanding how individuals determine a moral code to guide their behavior and recalling the ages associated with each stage will assist in answering the question. Also noting the word *all* in option 1 and the word *mature* in option 5 will assist in eliminating these options. If you had difficulty with this question, review Kohlberg's theory of moral development.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 56–57). St. Louis: Saunders.

# Developmental Stages

## I. THE HOSPITALIZED INFANT AND TODDLER

### A. Separation anxiety

1. Protest
  - a. Crying, screaming, searching for a parent; avoidance and rejection of contact with strangers
  - b. Verbal attacks on others
  - c. Physical fighting: kicking, biting, hitting, pinching
2. Despair
  - a. Withdrawn, depressed, uninterested in the environment
  - b. Loss of newly learned skills
3. Detachment
  - a. Detachment is uncommon and occurs only after lengthy separations from the parent.
  - b. Superficially, the toddler appears to have adjusted to the loss.
  - c. During the detachment phase, the toddler again becomes more interested in the environment, plays with others, and seems to form new relationships; this behavior is a form of resignation and is not a sign of contentment.
  - d. The toddler detaches from the parents in an effort to escape the emotional pain of desiring the parent's presence.
  - e. During the detachment phase, the toddler copes by forming shallow relationships with others, becoming increasingly self-centered, and attaching primary importance to material objects.
  - f. Detachment is the most serious phase because reversal of the potential adverse effects is less likely to occur once detachment is established. In most situations, the temporary separation imposed by hospitalization does not cause such prolonged parental absence that the toddler enters into detachment.

 **B.** Fear of injury and pain: Affected by previous experiences, separation from parents, and preparation for the experience

### C. Loss of control

1. Hospitalization, with its own set of rituals and routines, can severely disrupt the life of a toddler.

2. The lack of control often is exhibited in behaviors related to feeding, toileting, playing, and bedtime.
3. The toddler may demonstrate regression.

### D. Interventions

1. Provide cuddling and touch and talk softly to the infant. 
2. Provide opportunities for sucking and oral stimulation for the infant using a pacifier if the infant is NPO (not to receive anything by mouth).
3. Provide stimulation, if appropriate, for the infant, using objects of contrasting colors and textures.
4. Provide choices as much as possible to the toddler to enable him or her to have some control.
5. Approach the toddler with a positive attitude.
6. Allow the toddler to express feelings of protest.
7. Encourage the toddler to talk about parents or others in their lives.
8. Accept regressive behavior without ridiculing the toddler.
9. Provide the toddler with favorite and comforting objects.
10. Allow the toddler as much mobility as possible.
11. Anticipate temper tantrums from the toddler, and maintain a safe environment for physical acting out.
12. Employ pain reduction techniques, as appropriate. 

 For the hospitalized toddler, provide routines and rituals as close as possible to what he or she is used to at home.

## II. THE HOSPITALIZED PRESCHOOLER

### A. Separation anxiety

1. Separation anxiety is generally less obvious and less serious than in the toddler.
2. As stress increases, the preschooler's ability to separate from the parents decreases.
3. Protest

- a. Protest is less direct and aggressive than in the toddler.
- b. The preschooler may displace feelings onto others.
4. Despair
  - a. The preschooler reacts in a manner similar to that of the toddler.
  - b. The preschooler is quietly withdrawn, depressed, and uninterested in the environment.
  - c. The child exhibits loss of newly learned skills.
  - d. The preschooler becomes generally uncooperative, refusing to eat or take medication.
  - e. The preschooler repeatedly asks when the parents will be visiting.
5. Detachment: Similar to the toddler

#### B. Fear of injury and pain

1. The preschooler has a general lack of understanding of body integrity.
2. The child fears invasive procedures and mutilation.
3. The child imagines things to be much worse than they are.
4. Preschoolers believe that they are ill because of something they did or thought.

#### C. Loss of control

1. The preschooler likes familiar routines and rituals and may show regression if not allowed to maintain some control.
2. The child has attained a good deal of independence and self-care at home and may expect that to continue in the hospital.

#### D. Interventions

1. Provide a safe and secure environment.
2. Take time for communication.
3. Allow the preschooler to express anger.
4. Acknowledge fears and anxieties.
5. Accept regressive behavior; assist the preschooler in moving from regressive to appropriate behaviors according to age.
6. Encourage rooming-in or leaving a favorite toy.
7. Allow mobility and provide **play** and diversional activities.
8. Place the preschooler with other children of the same age if possible.
9. Encourage the preschooler to be independent.
10. Explain procedures simply, on the preschooler's level.
11. Avoid intrusive procedures when possible.
12. Allow wearing of underpants.

### III. THE HOSPITALIZED SCHOOL-AGE CHILD

#### A. Separation anxiety

1. The school-age child is accustomed to periods of separation from the parents, but as stressors are added, the separation becomes more difficult.

2. The child is more concerned with missing school and the fear that friends will forget her or him.
3. Usually, the stages of behavior of protest, despair, and detachment do not occur with school-age children.

#### B. Fear of injury and pain

1. The school-age child fears bodily injury and pain.
2. The child fears illness itself, disability, death, and intrusive procedures in genital areas.
3. The child is uncomfortable with any type of sexual examination.
4. The child groans or whines, holds rigidly still, and communicates about pain.

#### C. Loss of control

1. The child is usually highly social, independent, and involved with activities.
2. The child seeks information and asks relevant questions about tests and procedures and the illness.
3. The child associates his or her actions with the cause of the illness.
4. The child may feel helpless and dependent if physical limitations occur.

#### D. Interventions

1. Encourage rooming-in.
2. Focus on the school-age child's abilities and needs.
3. Encourage the school-age child to become involved with his or her own care.
4. Accept regression but encourage independence.
5. Provide choices to the school-age child.
6. Allow expression of feelings verbally and nonverbally.
7. Acknowledge fears and concerns and allow for discussion.
8. Explain all procedures, using body diagrams or outlines.
9. Provide privacy.
10. Avoid intrusive procedures if possible.
11. Allow the school-age child to wear underpants.
12. Involve the school-age child in activities appropriate to developmental level and illness.
13. Encourage the school-age child to contact friends.
14. Provide for educational needs.
15. Use appropriate interventions to relieve pain.

### IV. THE HOSPITALIZED ADOLESCENT

#### A. Separation anxiety

1. Adolescents are not sure whether they want their parents with them when they are hospitalized.
2. Adolescents become upset if friends go on with their lives, excluding them.

For the hospitalized adolescent, separation from friends is a source of anxiety.

-  **B.** Fear of injury and pain
  1. Adolescents fear being different from others and their peers.
  2. Adolescents may give the impression that they are not afraid, even though they are terrified.
  3. Adolescents become guarded when any areas related to sexual development are examined.
- C.** Loss of control
  1. Behaviors exhibited include anger, withdrawal, and uncooperativeness.
  2. Adolescents seek help and then reject it.
-  **D.** Interventions
  1. Encourage questions about appearance and effects of the illness on the future.
  2. Explore feelings about the hospital and the significance that the illness might have for relationships.
  3. Encourage adolescents to wear their own clothes and carry out normal grooming activities.
  4. Allow favorite foods to be brought in to the hospital if possible.
  5. Provide privacy.
  6. Use body diagrams to prepare for procedures.
  7. Introduce them to other adolescents in the nursing unit.
  8. Encourage maintaining contact with peer groups.
  9. Provide for educational needs.
  10. Identify formation of future plans.
  11. Help develop positive coping mechanisms.

## V. COMMUNICATION APPROACHES

-  **A.** General guidelines (Box 33-1)
-  **B.** Infant
  1. Infants respond to nonverbal communication behaviors of adults, such as holding, rocking, patting, cuddling, and touching.
  2. Use a slow approach and allow the infant to get to know the nurse.
  3. Use a calm, soft, soothing voice.
  4. Be responsive to cries.
  5. Talk and read to infants.
  6. Allow security objects such as blankets and pacifiers if the infant has them.
-  **C.** Toddler
  1. Approach the toddler cautiously.
  2. Remember that toddlers accept verbal communications of others literally.
  3. Learn the toddler's words for common items and use them in conversations.
  4. Use short, concrete terms.
  5. Prepare the toddler for procedures immediately before the event.
  6. Repeat explanations and descriptions.
  7. Use **play** for demonstrations.
  8. Use visual aids such as picture books, puppets, and dolls.

### Box 33-1 General Guidelines for Communication

Allow the child to feel comfortable with the nurse. Communicate through the use of objects. Allow the child to express fears and concerns. Speak clearly and in a quiet, unhurried voice. Offer choices when possible. Be honest with the child. Set limits with the child as appropriate.

9. Allow the toddler to handle the equipment or instruments; explain what the equipment or instrument does and how it feels.
  10. Encourage the use of comfort objects.
-  **D.** Preschooler
    1. Seek opportunities to offer choices.
    2. Speak in simple sentences.
    3. Be concise and limit the length of explanations.
    4. Allow asking questions.
    5. Describe procedures as they are about to be performed.
    6. Use **play** to explain procedures and activities.
    7. Allow handling the equipment or instruments, which will ease fear and help answer questions.
  -  **E.** School-age child
    1. Establish limits.
    2. Provide reassurance to help in alleviating fears and anxieties.
    3. Engage in conversations that encourage thinking.
    4. Use medical **play** techniques.
    5. Use photographs, books, dolls, and videos to explain procedures.
    6. Explain in clear terms.
    7. Allow time for composure and privacy.
  -  **F.** Adolescent
    1. Remember that the adolescent may be preoccupied with body image.
    2. Encourage and support independence.
    3. Provide privacy.
    4. Use photographs, books, and videos to explain procedures.
    5. Engage in conversations about adolescent's interests.
    6. Avoid becoming too abstract, too detailed, and too technical.
    7. Avoid responding by prying, confrontation, or judgmental attitudes.

## VI. DEVELOPMENTAL CHARACTERISTICS

- A.** Infant
  1. Physical
    - a. Height increases by  $\frac{3}{4}$  inch per month.
    - b. Weight is doubled at 5 to 6 months and tripled at 12 months.

### Box 33-2 Vital Signs: Newborn and 1-Year-Old Infant

#### Newborn

Temperature: Axillary, 97.9° to 98° F  
 Apical heart rate: 120 to 140 beats/min  
 Respirations: 30 to 60 (average 40) breaths/min  
 Blood pressure: 73/55 mm Hg

#### 1-Year-Old Infant

Temperature: Axillary, 97° to 99° F  
 Apical heart rate: 90 to 130 beats/min  
 Respirations: 20 to 40 breaths/min  
 Blood pressure: 90/56 mm Hg

▲ **FIGURE 33-1** Nursing caries. (From Hockenberry, M., & Wilson, D. [2009]. *Wong's essentials of pediatric nursing* [8th ed., p. 426]. St. Louis: Mosby. Courtesy Bruce Carter, DDS, Texas Children's Hospital, Houston.)

- c. At birth, head circumference is 33 to 35 cm (13.2 to 14 inches), approximately 2 to 3 cm more than chest circumference.
  - d. By 1 to 2 years of age, head circumference and chest circumference are equal.
  - e. Anterior fontanel (soft and flat in a normal infant) closes by 12 to 18 months of age.
  - f. Posterior fontanel (soft and flat in a normal infant) closes by the end of the second month.
  - g. Infant has 10 upper and 10 lower deciduous teeth by 2½ years of age.
  - h. Lower central incisors are present by 6 to 8 months.
  - i. Sleep patterns vary among infants; generally, by 3 to 4 months of age, most infants have developed a nocturnal pattern of sleep that lasts 9 to 11 hours.
2. Vital signs (Box 33-2)
  3. Nutrition
    - a. The infant may breast-feed or bottle-feed (with iron-fortified formula), depending on the mother's choice; however, human milk is the preferred form of nutrition for all infants, especially during the first 6 months.
    - b. All infants should receive daily vitamin D supplementation (200 IU) starting in the first 2 months of life to prevent rickets and vitamin D deficiency.
    - c. Iron stores from birth are depleted by 4 months of age; if the infant is being only breast-fed, iron supplementation usually with iron-fortified cereal is needed.
    - d. Whole milk, low-fat milk, skim milk, other animal milk, or imitation milk should not be given to infants as a primary source of nutrition because these food sources lack the necessary components needed for growth and have limited digestibility.
    - e. Fluoride supplementation may be needed at about 6 months of age, depending on the infant's intake of fluoridated tap water.
    - f. Solid foods (strained, pureed, or finely mashed) are introduced at about 5 to 6 months of age; introduce solid foods one at a time, usually at intervals of 4 to 5 days, to identify food allergies.
    - g. Sequence of the introduction of solid foods varies depending on physician's preference and usually is as follows: iron-fortified rice cereal, fruits, vegetables, then meats.
    - h. At 12 months of age, eggs can be given (introduce egg whites in small quantities to detect an allergy); cheese may be used as a substitute for meat.
    - i. Avoid solid foods that place the infant at risk for choking, such as nuts, foods with seeds, raisins, popcorn, grapes, and hot dog pieces.
    - j. Avoid microwaving baby bottles and baby food.
    - k. Never mix food or medications with formula.
    - l. Avoid adding honey to formula, water, or other fluid to prevent botulism.
    - m. Offer fruit juice from a cup (12 to 13 months or at a prescribed age) rather than a bottle to prevent nursing (bottle-mouth) caries; fruit juice is limited because of its high sugar content (Fig. 33-1).
  4. Skills (Box 33-3)
  5. **Play**
    - a. Solitary
    - b. Birth to 3 months: Verbal, visual, and tactile stimuli
    - c. 4 to 6 months: Initiation of actions and recognition of new experiences
    - d. 6 to 12 months: Awareness of self, imitation, repetition of pleasurable actions
    - e. Enjoyment of soft stuffed animals, crib mobiles with contrasting colors, squeeze

**Box 33-3 Infant Skills****2 to 3 Months**

Smiles  
Turns head side to side  
Cries  
Follows objects  
Holds head in midline

**4 to 5 Months**

Grasps objects  
Switches objects from hands  
Rolls over for the first time  
Enjoys social interaction  
Begins to show memory  
Aware of unfamiliar surroundings

**6 to 7 Months**

Creeps  
Sits with support  
Imitates  
Exhibits fear of strangers  
Holds arms out  
Frequent mood swings  
Waves “bye-bye”

**8 to 9 Months**

Sits steadily unsupported  
Crawls  
May stand while holding on  
Begins to stand without help

**10 to 11 Months**

Can change from prone to sitting position  
Walks while holding on to furniture  
Stands securely  
Entertains self for periods of time

**12 to 13 Months**

Walks with one hand held  
Can take a few steps without falling  
Can drink from a cup

**14 to 15 Months**

Walks alone  
Can crawl up stairs  
Shows emotions such as anger and affection  
Will explore away from mother in familiar surroundings

toys, rattles, musical toys, water toys during the bath, large picture books, and push toys after he or she begins to walk

**6. Safety**

- a. Parents must baby-proof the home.
- b. Guard the infant when on a bed or changing table.
- c. Use gates to protect the infant from stairs.
- d. Be sure that bath water is not hot; do not leave the infant unattended in the bath.
- e. Do not hold the infant while drinking or working near hot liquids or items such as a stove.
- f. Cool vaporizers should be used if needed, instead of steam, to prevent burn injuries.

- g. Avoid offering food that is round and similar to the size of the airway to prevent choking.
- h. Be sure toys have no small pieces.
- i. Toys or mobiles hanging over the crib should be well out of reach to prevent strangulation.
- j. Avoid placing large toys in the crib because an older infant may use them as steps to climb.
- k. Cribs should be positioned away from curtains and blind cords.
  - l. Cover electrical outlets.
- m. Remove hazardous objects from low, reachable places.
- n. Remove chemicals such as cleaning or other household products, medications, poisons, and plants from the infant's reach.
- o. Keep the Poison Control Center number available.

 Never shake an infant because of the risk of causing a closed head injury known as shaken baby syndrome.

**B. Toddler****1. Physical**

- a. Height and weight increase in phases, reflecting growth spurts and lags.
  - b. Head circumference increases about 1 inch between ages 1 and 2; thereafter head circumference increases about ½ inch per year until age 5.
  - c. Anterior fontanel closes between ages 12 and 18 months.
  - d. Weight gain is slower than in infancy; by age 2, the average weight is 22 to 27 pounds.
  - e. Normal height changes include a growth of about 3 inches per year; the average height of the toddler is 34 inches at age 2 years.
  - f. Lordosis (pot belly) is noted.
  - g. The toddler should see a dentist soon after the first teeth erupt, usually around 1 year of age and oral hygiene measures should be instituted; regular dental care is essential, and the toddler will require assistance with brushing and flossing of teeth (fluoride supplements may be necessary if the water is not fluoridated).
  - h. A toddler should never be allowed to fall asleep with a bottle containing milk, juice, soda pop, sweetened water, or any other sweet liquid because of the risk of nursing (bottle-mouth) caries (see Fig. 33-1).
  - i. Typically, the toddler sleeps through the night and has one daytime nap; the daytime nap is normally discontinued at about age 3.
  - j. A consistent bedtime ritual helps prepare the toddler for sleep.
  - k. Security objects at bedtime may assist in sleep.
- 2. Vital signs (Box 33-4)**

**Box 33-4 The Toddler's Vital Signs**

Temperature: Axillary, 97.5° to 98.6° F  
 Apical heart rate: 80 to 120 beats/min  
 Respirations: 20 to 30 breaths/min  
 Blood pressure: Average, 92/55 mm Hg

**3. Nutrition**

- a. The MyPyramid for Kids food guide provides dietary guidelines and applies to children as young as 2 years of age (see [www.mypyramid.gov](http://www.mypyramid.gov)).
- b. The toddler should average an intake of two to three servings of milk daily (24 to 30 oz) to ensure an adequate amount of calcium and phosphorus (low-fat milk may be given after 2 years of age).
- c. Trans-fatty acids and saturated fats need to be restricted; otherwise fat restriction is not appropriate for a toddler (mothers should be taught about the types of food that contain fat that should be selected).
- d. Iron-fortified cereal and a high-iron diet, adequate amounts of calcium and vitamin D, and vitamin C (4 to 6 oz of juice daily) are essential components for the toddler's diet.
- e. Most toddlers prefer to feed themselves.
- f. The toddler generally does best by eating several small nutritious meals each day rather than three large meals.
- g. Offer a limited number of foods at any one time.
- h. Offer finger foods and avoid concentrated sweets and empty calories.
- i. The toddler is at risk for aspiration of small foods that are not chewed easily, such as nuts, foods with seeds, raisins, popcorn, grapes, and hot dog pieces.
- j. Physiological anorexia may occur and is normal because of the alternating stages of fast and slow growth.
- k. Sit the toddler in a high chair at the family table for meals.
- l. Allow sufficient time to eat, but remove food when the toddler begins to **play** with it.
- m. The toddler drinks well from a cup held with both hands.
- n. Avoid using food as a reward or punishment.

**4. Skills**

- a. The toddler begins to walk with one hand held by age 12 to 13 months.
- b. The toddler runs by age 2 years and walks backward and hops on one foot by age 3 years.
- c. The toddler usually cannot alternate feet when climbing stairs.

**Box 33-5 Signs of Readiness for Toilet Training**

Child is able to stay dry for 2 hours.  
 Child is waking up dry from a nap.  
 Child is able to sit, squat, and walk.  
 Child is able to remove clothing.  
 Child recognizes the urge to defecate or urinate.  
 Child expresses willingness to please a parent.  
 Child is able to sit on the toilet for 5 to 10 minutes without fussing or getting off.

Modified from Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 417). St. Louis: Mosby.

- d. The toddler begins to master fine motor skills for building, undressing, and drawing lines.
  - e. The young toddler often uses "no" even when he or she means "yes" to assert independence.
  - f. The toddler begins to use short sentences and has a vocabulary of about 300 words by age 2.
- 5. Bowel and bladder control**
- a. Certain signs indicate that a toddler is ready for toilet training (Box 33-5).
  - b. Bowel control develops before bladder control.
  - c. By age 3, the toddler achieves fairly good bowel and bladder control.
  - d. The toddler may stay dry during the day but may need a diaper at night until about age 4.
- 6. Play**
- a. The major socializing mechanism is parallel **play**, and therapeutic **play** can begin at this age.
  - b. The toddler has a short attention span, causing the toddler to change toys often.
  - c. The toddler explores body parts of self and others.
  - d. Typical toys include push-pull toys, blocks, sand, finger paints and bubbles, large balls, crayons, trucks and dolls, containers, Play-Doh, toy telephones, cloth books, and wooden puzzles.
- 7. Safety**

 **Toddlers are eager to explore the world around them they need to be supervised at play to ensure safety.**

- a. Use back burners on the stove to prepare a meal; turn pot handles inward and toward the middle of the stove.
- b. Keep dangling cords from small appliances away from the toddler.
- c. Place inaccessible locks on windows and doors, and keep furniture away from windows.
- d. Secure screens on all windows.

**Box 33-6 The Preschooler's Vital Signs**

Temperature: Axillary, 97.5° to 98.6° F  
 Apical heart rate: 70 to 110 beats/min  
 Respirations: 16 to 22 breaths/min  
 Blood pressure: Average, 95/57 mm Hg

- e. Place safety gates at stairways.
- f. Do not allow the toddler to sleep or **play** in an upper bunk bed.
- g. Never leave the toddler alone near a bathtub, pail of water, swimming pool, or any other body of water.
- h. Keep toilet lids closed.
- i. Keep all medicines, poisons, household plants, and toxic products in high areas and locked out of reach.
- j. Keep the Poison Control Center number available.

**C. Preschooler****1. Physical**

- a. The preschooler grows 2½ to 3 inches per year.
- b. Average height is 37 inches at age 3, 40½ inches at age 4, and 43 inches at age 5.
- c. The preschooler gains approximately 5 pounds per year; average weight is 35 to 40 pounds at age 5.
- d. The preschooler requires about 12 hours of sleep each day.
- e. A security object and a nightlight help with sleeping.
- f. At the beginning of the preschool period, the eruption of the deciduous (primary) teeth is complete.
- g. Regular dental care is essential, and the preschooler may require assistance with brushing and flossing of teeth; fluoride supplements may be necessary if the water is not fluoridated.

**2. Vital signs (Box 33-6)****3. Nutrition**

- a. Nutritional needs are similar to those required for the toddler although the daily amounts of minerals, vitamins, and protein may increase with age.
- b. The MyPyramid for Kids food guide is appropriate for preschoolers (see [www.mypyramid.gov](http://www.mypyramid.gov)).
- c. The preschooler exhibits food fads and certain taste preferences and may exhibit finicky eating.
- d. By 5 years old, the child tends to focus on social aspects of eating, table conversations, manners, and willingness to try new foods.

**4. Skills**

- a. The preschooler has good posture.
- b. The child develops fine motor coordination.

- c. The child can hop, skip, and run more smoothly.
- d. Athletic abilities begin to develop.
- e. The preschooler demonstrates increased skills in balancing.
- f. The child alternates feet when climbing stairs.
- g. The child can tie shoelaces by age 6.
- h. The child may talk continuously and ask many “why” questions.
- i. Vocabulary increases to about 900 words by age 3 and to 2100 words by age 5.
- j. By age 3, the preschooler usually talks in three- or four-word sentences and speaks in short phrases.
- k. By age 4, the preschooler speaks five- or six-word sentences and, by age 5, speaks in longer sentences that contain all parts of speech.
- l. The child can be understood readily by others and can understand clearly what others are saying.

**5. Bowel and bladder control**

- a. By age 4, the preschooler has daytime control of bowel and bladder but may experience bed-wetting accidents at night.
- b. By age 5, the preschooler achieves bowel and bladder control, although accidents may occur in stressful situations.

**6. Play**

- a. The preschooler is cooperative.
- b. The preschooler has imaginary playmates.
- c. The child likes to build and create things, and **play** is simple and imaginative.
- d. The child understands sharing and is able to interact with peers.
- e. The child requires regular socialization with mates of similar age.
- f. **Play** activities include a large space for running and jumping.
- g. The preschooler likes dress-up clothes, paints, paper, and crayons for creative expression.
- h. Swimming and sports aid in growth development.
- i. Puzzles and toys aid with fine motor development.

**7. Safety**

- a. Preschoolers are active and inquisitive.
- b. Because of their magical thinking, they may believe that daring feats seen in cartoons are possible and may attempt them.
- c. The preschooler can learn simple safety practices because they can follow simple verbal directions and their attention span is longer.
- d. Teach the preschooler basic safety rules to ensure safety when playing in a playground such as near swings and ladders.

- e. Teach the preschooler never to **play** with matches or lighters.
- f. The preschooler should be taught what to do in the event of a fire or if clothes catch fire; fire drills should be practiced with the preschooler.
- g. Guns should be stored unloaded and secured under lock and key (ammunition should be locked in a separate place).
- h. Teach the preschooler his or her full name, address, parents' names, and telephone number.
- i. Teach the preschooler how to dial 911 in an emergency situation.
- j. Keep the Poison Control Center number available.

 Teach a preschooler and school-age child to leave an area immediately if a gun is visible and to tell an adult. The preschooler should also be taught never to point a toy gun at another person.

#### D. School-age child

##### 1. Physical

- a. Girls usually grow faster than boys.
- b. Growth is about 2 inches per year between ages 6 and 12.
- c. Height ranges from 45 inches at age 6 to 59 inches at age 12.
- d. School-age children gain weight at a rate of about 4½ to 6½ pounds per year.
- e. Average weight is 46 pounds at age 6 and 88 pounds at age 12.
- f. The first permanent (secondary) teeth erupt around age 6, and deciduous teeth are lost gradually.
- g. Regular dentist visits are necessary, and the school-age child needs to be supervised with brushing and flossing teeth; fluoride supplements may be necessary if the water is not fluoridated.
- h. For school-age children with primary and permanent dentition, the best toothbrush is one with soft nylon bristles and an overall length of about 6 inches.
- i. Sleep requirements range from 10 to 12 hours a night.

##### 2. Vital signs (Box 33-7)

##### 3. Nutrition

- a. School-age children will have increased growth needs as they approach adolescence.
- b. Children require a balanced diet from foods in the MyPyramid Food Guide; healthy snacks should continue to be emphasized to prevent childhood obesity.
- c. Children still may be picky eaters but are usually willing to try new foods.

#### Box 33-7 The School-Age Child's Vital Signs

Temperature: Oral, 97.5° to 98.6° F  
 Apical heart rate: 60 to 100 beats/min  
 Respirations: 18 to 20 breaths/min  
 Blood pressure: Average, 107/64 mm Hg

##### 4. Skills

- a. School-age children exhibit refinement of fine motor skills.
- b. Development of gross motor skills continues.
- c. Strength and endurance increase.

##### 5. Play

- a. **Play** is more competitive.
- b. Rules and rituals are important aspects of **play** and games.
- c. The school-age child enjoys drawing, collecting items, dolls, pets, guessing games, board games, listening to the radio, TV, reading, watching videos or DVDs, and computer games.
- d. The child participates in team sports.
- e. The child may participate in secret clubs, group peer activities, and scout organizations.

##### 6. Safety

- a. The school-age child experiences less fear in **play** activities and frequently imitates real life by using tools and household items.
- b. Major causes of injuries include bicycles, skateboards, and team sports as the child increases in motor abilities and independence.
- c. Children should always wear a helmet when riding a bike or using in-line skates or skateboards.
- d. Teach the child water safety rules.
- e. Instruct the child to avoid teasing or playing roughly with animals.
- f. Teach the child never to **play** with matches or lighters.
- g. The child should be taught what to do in the event of a fire or if clothes catch fire; fire drills should be practiced with the child.
- h. Guns should be stored unloaded and secured under lock and key (ammunition should be locked in a separate place).
- i. Teach the child traffic safety rules.
- j. Teach the child how to dial 911 in an emergency situation.
- k. Keep the Poison Control Center number available.

 Teach the preschooler and school-age child that if another person touches his or her body in an inappropriate way, an adult should be told. Also teach the child to avoid speaking to strangers and never to accept a ride, toys, or gifts from a stranger.

**E. Adolescent****1. Physical**

- a. Puberty is the maturational, hormonal, and growth process that occurs when the reproductive organs begin to function and the secondary sex characteristics develop.
- b. Body mass increases to adult size.
- c. Sebaceous and sweat glands become active and fully functional.
- d. Body hair distribution occurs.
- e. Increases in height, weight, breast development, and pelvic girth occur in girls.
- f. Menstrual periods occur about 2½ years after the onset of puberty.
- g. In boys, increases in height, weight, muscle mass, and penis and testicle size occur.
- h. The voice deepens in boys.
  - i. Normal weight gain during puberty: Girls gain 15 to 55 pounds; boys gain 15 to 65 pounds.
- j. Careful brushing and care of the teeth are important, and many adolescents need to wear braces.
- k. Sleep patterns include a tendency to stay up late; therefore, in an attempt to catch up on missed sleep, adolescents sleep late whenever possible; an overall average of 8 hours per night is recommended.

**2. Vital signs (Box 33-8)****3. Nutrition**

- a. Teaching about the MyPyramid Food Guide is important.
- b. Adolescents typically eat whenever they have a break in activities.
- c. Calcium, zinc, iron, folic acid, and protein are especially important nutritional needs.
- d. Adolescents tend to snack on empty calories and the importance of adequate and healthy nutrition needs to be stressed.
- e. Body image is important.

**4. Skills**

- a. Gross and fine motor skills are well developed.
- b. Strength and endurance increase.

**5. Play**

- a. Games and athletic activities are the most common forms of **play**.
- b. Competition and strict rules are important.
- c. Adolescents enjoy activities such as sports, videos, movies, reading, parties, dancing, hobbies, computer games, music, communicating via the Internet, and experimenting, such as with makeup and hairstyles.
- d. Friends are important, and adolescents like to gather in small groups.

**6. Safety**

- a. Adolescents are risk takers.
- b. Adolescents have a natural urge to experiment and to be independent.

**Box 33-8 The Adolescent's Vital Signs**

Temperature: Oral, 97.5° to 98.6° F  
 Apical heart rate: 55 to 90 beats/min  
 Respirations: 12 to 20 breaths/min  
 Blood pressure: Average, 121/70 mm Hg

- c. Reinforce instructions about the dangers related to cigarette smoking, caffeine ingestion, alcohol, and drugs.
- d. Help adolescents recognize that they have choices when difficult or potentially dangerous situations arise.
- e. Ensure that the adolescent uses a seat belt.
- f. Instruct adolescents in the consequences of injuries that motor vehicle accidents can cause.
- g. Instruct adolescents in water safety and emphasize that they should enter the water feet first as opposed to diving, especially when the depth of the water is unknown.
- h. Instruct adolescents about the dangers associated with guns, violence, and gangs.
- i. Instruct adolescents about the complications associated with body piercing, tattooing, and sun tanning.

**!** Discuss issues such as date rape, sexual relationships, and transmission of sexually transmitted infections with the adolescent. Also discuss the dangers of the Internet related to communicating and setting up meetings (dates) with unknown persons.

**F. Early adulthood**

1. Description: Period between the late teens and mid to late 30s
2. Physical changes
  - a. Person has completed physical growth by the age of 20.
  - b. Person is active.
  - c. Severe illnesses are less common than in older age groups.
  - d. Person tends to ignore physical symptoms and postpone seeking health care.
  - e. Lifestyle habits such as smoking, stress, lack of exercise, poor personal hygiene, and family history of disease increase the risk of future illness.
3. Cognitive changes
  - a. Person has rational thinking habits.
  - b. Conceptual, problem-solving, and motor skills increase.
  - c. Person identifies preferred occupational areas.
4. Psychosocial changes
  - a. Person separates from family of origin.

- b. Person gives much attention to occupational and social pursuits to improve socioeconomic status.
- c. Person makes decisions regarding career, marriage, and parenthood.
- d. Person needs to adapt to new situations.

- 5. Sexuality
  - a. Person has the emotional maturity to develop mature sexual relationships.
  - b. Person is at risk for sexually transmitted infections.

#### G. Middle adulthood

1. Description: Period between the mid to late 30s and mid 60s
2. Physical changes
  - a. Physical changes occur between 40 and 65 years of age.
  - b. Individual becomes aware that changes in reproductive and physical abilities signify the beginning of another stage in life.
  - c. Menopause occurs in women and climacteric occurs in men.
  - d. Physiological changes often have an impact on self-concept and body image.
  - e. Physiological concerns include stress, level of wellness, and the formation of positive health habits.

3. Cognitive changes
  - a. Person may be interested in learning new skills.
  - b. Person may become involved in educational or vocational programs for entering the job market or for changing careers.

4. Psychosocial changes
  - a. Changes may include expected events, such as children moving away from home (post-parental family stage), or unexpected events, such as the death of a close friend.
  - b. Time and financial demands decrease as children move away from home, and couples face redefining their relationship.
  - c. Adults may become grandparents.
  - d. Adults are achieving generativity.

5. Sexuality
  - a. Many couples renew their relationships and find increased marital and sexual satisfaction.
  - b. The onset of menopause and climacteric may affect sexual health.
  - c. Stress, health, and medications can affect sexuality.

- H. Later adulthood (period between 65 years to death): refer to Chapter 35.

### VII. CAR SAFETY SEATS AND GUIDELINES

- A. The safest place for all children to ride, regardless of age, is in the back seat of the car.

- B. There are different types of car safety seats and the manufacturer's guidelines need to be followed.

- C. LATCH (Lower Anchors and Tethers for Children): An attachment or anchor system that is in the vehicle and on the car safety seat that improves safety because it eliminates the need to use seat belts to secure the car safety seat; if the vehicle or car safety seat does not have this anchor system, the seat belts need to be used to install the car safety system.

- D. A rear-facing car safety seat is never placed in the front seat of a vehicle because if the air bag inflates it will hit the back of the car safety seat (where the child's head is) and cause serious injury.

- E. Make sure that the safety seat is installed tightly and that the seat is at the correct angle so that the infant's head does not fall forward.

- F. Lock the car doors; four-door cars should be equipped with child safety locks on the back doors.

- G. The harness placed around the infant or child should be snug.

- H. Infants should ride in a car in a semireclined, rear-facing position in an infant-only seat or a convertible seat until they weigh at least 20 pounds and have reached at least 1 year of age. (Convertible seats can be used rear-facing for infants and then converted to a forward-facing position once the child is old enough and big enough to do so safely.)

- I. The toddler can be placed in an upright forward-facing position in a car safety seat (convertible restraint with a full harness); the transition point for switching to a forward-facing position is defined by the manufacturer of the car seat but is generally at a body weight of at least 20 pounds (9 kg) and 1 year of age (Fig. 33-2).

- J. Booster seats are used for children shorter than 4 feet, 9 inches tall and weigh more than 40 pounds (typically between 4 and 8 years of age); a booster seat is used until the child can sit against the back of the seat with feet hanging down and legs bent at the knees and adult belts fit correctly (usually when the child is between 8 and 12 years of age and reaches 4 feet, 9 inches tall) (Fig. 33-3).

- K. Once the child has outgrown the booster seat, the child should ride in a lap and shoulder belt in the back seat until 13 years of age (shoulder strap should be away from neck and face).

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 333.** A 4-year old child diagnosed with leukemia is hospitalized for chemotherapy. The child is fearful of the hospitalization. Which nursing intervention would be most appropriate to alleviate the child's fears?

▲ **FIGURE 33-2** When the child reaches 1 year of age and 20 pounds, the car safety seat can be adjusted to a forward-facing, upright position. The seat is appropriate for the toddler until the child weighs about 40 pounds. The safety straps should be adjusted to provide a snug fit, and the seat should be placed in the back seat of the car, ideally in the middle. (From McKinney, E., James, S., Murray, S., & Ashwill, J. [2009]. *Maternal-child nursing* [3rd ed.]. St. Louis: Saunders.)

▲ **FIGURE 33-3** A high-backed booster seat designed to hold car lap and shoulder belts properly is strongly recommended for children who have outgrown a child safety seat. Booster seats raise the young child high enough to allow the car seat belt to be positioned correctly over the child's chest and pelvis. (From McKinney, E., James, S., Murray, S., & Ashwill, J. [2009]. *Maternal-child nursing* [3rd ed.]. St. Louis: Saunders. Photo courtesy of Michele M. Hayden.)

1. Encourage the child's parents to stay with the child.
  2. Encourage play with other children of the same age.
  3. Advise the family to visit only during the scheduled visiting hours.
  4. Provide a private room, allowing the child to bring the favorite toys from home.
- 334.** A 16-year-old is admitted to the hospital for acute appendicitis and an appendectomy is performed. Which nursing intervention is appropriate to facilitate normal growth and development postoperatively?
1. Encourage the child to rest and read.
  2. Encourage the parents to room in with the child.
  3. Allow the child to interact with others in his or her same age group.
  4. Allow the family to bring in the child's favorite computer games.
- 335.** A nurse prepares to administer digoxin (Lanoxin) to a 3-year-old child with a diagnosis of congestive heart failure and notes that the apical heart rate is 110 beats/min. Based on this finding which nursing action is appropriate?
1. Hold the medication.
  2. Notify the physician.
  3. Administer the digoxin.
  4. Recheck the apical rate in 15 minutes.
- 336.** Which of the following car safety devices should be used for a child who is 8 years old and is 4 feet tall?
1. Seat belt
  2. Booster seat
  3. Rear-facing convertible seat
  4. Front-facing convertible seat
- 337.** A nurse assesses the vital signs of a 12-month-old infant with a respiratory infection and notes that the respiratory rate is 35 breaths/min. Based on this finding, which action is appropriate?
1. Administer oxygen.
  2. Notify the physician.
  3. Document the findings.
  4. Reassess the respiratory rate in 15 minutes.
- 338.** A nurse is monitoring a 3-month-old infant for signs of increased intracranial pressure. On palpation of the fontanel, the nurse notes that the anterior fontanel is soft and flat. Based on this finding, which nursing action is appropriate?
1. Increase oral fluids.
  2. Notify the physician.
  3. Document the finding.
  4. Elevate the head of the bed to 90 degrees.

- 339.** A nurse is evaluating the developmental level of a 2-year-old. Which of the following does the nurse expect to observe in this child?
1. Uses a fork to eat
  2. Uses a cup to drink
  3. Pours own milk into a cup
  4. Uses a knife for cutting food
- 340.** A 2-year-old child is treated in the emergency room for a burn to the chest and abdomen. The child sustained the burn by grabbing a cup of hot coffee that was left on the kitchen counter. The nurse reviews safety principles with the parents before discharge. Which statement by the parents indicates an understanding of measures to provide safety in the home?
1. "We will be sure not to leave hot liquids unattended."
  2. "I guess my children need to understand what the word *hot* means."
  3. "We will be sure that the children stay in their rooms when we work in the kitchen."
  4. "We will install a safety gate as soon as we get home so the children cannot get into the kitchen."
- 341.** A mother arrives at a clinic with her toddler and tells a nurse that she has a difficult time getting the child to go to bed at night. Which of the following is appropriate for the nurse to suggest to the mother?
1. Avoid a nap during the day.
  2. Allow the child to set bedtime limits.
  3. Allow the child to have temper tantrums.
  4. Inform the child of bedtime a few minutes before it is time for bed.
- 342.** A mother of a 3-year-old asks a clinic nurse about appropriate and safe toys for the child. The nurse tells the mother that the most appropriate toy for a 3-year-old is which of the following?
1. A wagon
  2. A golf set
  3. A farm set
  4. A jack set with marbles
- 343.** The mother of a 3-year-old is concerned because her child still is insisting on a bottle at nap time and at bedtime. Which of the following is the appropriate suggestion to the mother?
1. Allow the bottle if it contains juice.
  2. Allow the bottle if it contains water.
  3. Do not allow the child to have the bottle.
  4. Allow the bottle during naps but not at bedtime.
- 344.** A nurse is preparing to care for a 5-year-old who has been placed in traction following a fracture of the femur. The nurse plans care, knowing that which of the following is the most appropriate activity for this child?
1. A radio
  2. A sports video
  3. Large picture books
  4. Crayons and a coloring book

### Alternate Item Format: Multiple Response

- 345.** Which interventions are appropriate for the care of an infant? **Select all that apply.**
- 1. Provide swaddling.
  - 2. Talk in a loud voice.
  - 3. Provide the infant with a bottle of juice at nap time.
  - 4. Hang mobiles with black and white contrast designs.
  - 5. Caress the infant while bathing or during diaper changes.
  - 6. Allow the infant to cry for at least 10 minutes before responding.

## ANSWERS

### 333. 1

**Rationale:** Although the preschooler already may be spending some time away from parents at a day care center or preschool, illness adds a stressor that makes separation more difficult. The child may ask repeatedly when parents will be coming for a visit or may constantly want to call the parents. Options 3 and 4 increase stress related to separation anxiety. Option 2 is unrelated to the subject of the question and, in addition, may not be appropriate for a child who may be immunocompromised and at risk for infection.

**Test-Taking Strategy:** Note that the subject relates to the child's fear and use the process of elimination. Options 3 and 4 will increase anxiety and fear further and should be eliminated. Bearing the subject of the question in mind and

considering the child's diagnosis will assist you in eliminating option 2. Review interventions to prevent or minimize separation anxiety in the preschooler if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Caring

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 886). St. Louis: Saunders.

### 334. 3

**Rationale:** Adolescents often are not sure whether they want their parents with them when they are hospitalized. Because of the importance of their peer group, separation from friends

is a source of anxiety. Ideally, the members of the peer group will support their ill friend. Options 1, 2, and 4 isolate the child from the peer group.

**Test-Taking Strategy:** Consider the psychosocial needs of the adolescent when answering the question and remember that the peer group is very important. Options 1, 2, and 4 are comparable or alike in that they isolate the child from his or her own peer group. If you had difficulty with this question, review the psychosocial needs of the adolescent.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Caring

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 891). St. Louis: Saunders.

### 335. 3

**Rationale:** The normal apical heart rate for a 3-year-old is 80 to 120 beats/min. Because the apical rate is within the normal range, options 1, 2, and 4 are inappropriate and unnecessary.

**Test-Taking Strategy:** Use the process of elimination and knowledge of the normal apical heart rate for a 3-year-old to answer the question. Recalling that a heart rate of 110 beats/min is within the normal range will direct you to option 3. Review the normal vital signs for a 3-year-old if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., pp. 817, 1272). St. Louis: Saunders.

### 336. 2

**Rationale:** Children should remain in a booster seat until they are 8 to 12 years old and at least 4 feet, 9 inches tall. Infants should ride in a car in a semireclined, rear-facing position in an infant-only seat or a convertible seat until they weigh at least 20 pounds and are at least 1 year of age. The transition point for switching to the forward-facing position is defined by the manufacturer of the convertible car safety seat but is generally at a body weight of 9 kg (20 pounds) and 1 year of age.

**Test-Taking Strategy:** Note the age and height of the child to identify the appropriate safety device. Remember that children should remain in a booster seat until they are 8 to 12 years old and at least 4 feet, 9 inches tall. If you had difficulty with this question, review the physical development requirements for car safety devices.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 119). St. Louis: Saunders.

### 337. 3

**Rationale:** The normal respiratory rate in a 12-month-old infant is 20 to 40 breaths/min. The normal apical heart

rate is 90 to 130 beats/min, and the average blood pressure is 90/56 mm Hg. The nurse would document the findings.

**Test-Taking Strategy:** Focus on the data in the question. Recalling the normal vital signs of an infant and noting that the respiratory rate identified in the question is within the normal range will direct you to the correct option. If you had difficulty with this question, review the normal vital signs for an infant.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 129). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 817). St. Louis: Saunders.

### 338. 3

**Rationale:** The anterior fontanel is diamond-shaped and located on the top of the head. The fontanel should be soft and flat in a normal infant, and it normally closes by 12 to 18 months of age. The nurse would document the finding because it is normal. There is no useful reason to increase oral fluids, notify the physician, or elevate the head of the bed to 90 degrees.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *soft* and *flat*. This should provide you with the clue that this is a normal finding. A bulging or tense fontanel may result from crying or increased intracranial pressure. If you had difficulty with this question, review normal assessment findings in an infant related to the fontanels.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1468). St. Louis: Saunders.

### 339. 2

**Rationale:** By age 2 years, the child can use a cup and spoon correctly but with some spilling. By age 3 to 4, the child begins to use a fork. By the end of the preschool period, the child should be able to pour milk into a cup and begin to use a knife for cutting.

**Test-Taking Strategy:** Note the age of the child and use the process of elimination. Option 4 can be eliminated first because of the word *knife*. Next, think about the fine motor skills that need to be developed in selecting the correct option. With this in mind, eliminate options 1 and 3. If you had difficulty with this question, review the developmental skills of a 2-year-old.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 110). St. Louis: Saunders.

**340. 1**

**Rationale:** Toddlers, with their increased mobility and development of motor skills, can reach hot water or hot objects placed on counters and stoves and can reach open fires or stove burners above their eye level. The nurse should encourage parents to remain in the kitchen when preparing a meal, use the back burners on the stove, and turn pot handles inward and toward the middle of the stove. Hot liquids should never be left unattended or within the child's reach, and the toddler should always be supervised. The statements in options 2, 3, and 4 do not indicate an understanding of the principles of safety.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *indicates an understanding*. Option 2 can be eliminated because it is mandating that the toddler understand what is and what is not safe. The toddler is not developmentally able to understand danger. Options 3 and 4 are comparable or alike in that they isolate the child from the environment. Option 1 is the only option that reflects an understanding of safety principles by the parents. Review the home safety principles for the toddler if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 120). St. Louis: Saunders.

**341. 4**

**Rationale:** Toddlers often resist going to bed. Bedtime protests may be reduced by establishing a consistent before-bedtime routine and enforcing consistent limits regarding the child's bedtime behavior. Informing the child of bedtime a few minutes before it is time for bed is the most appropriate option. Most toddlers take an afternoon nap and, until their second birthday, also may require a morning nap. Firm, consistent limits are needed for temper tantrums or when toddlers try stalling tactics.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1, 2, and 3 by using concepts related to growth and development. Remember that preparing the toddler for an event will minimize resistive behavior. Review concepts related to sleep patterns and the toddler if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 424). St. Louis: Mosby.

**342. 1**

**Rationale:** Toys for the toddler must be strong, safe, and too large to swallow or place in the ear or nose. Toddlers need supervision at all times. Push-pull toys, large balls, large crayons, large trucks, and dolls are some of the appropriate toys. A farm set, a golf set, and jacks with marbles may contain items that the child could swallow.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject, the appropriate toy for a 3-year-old. Options 2, 3, and 4 can be eliminated because they are comparable or alike and could contain items that the child could swallow. Remember that large and strong toys are safest for the toddler. Review the safety principles related to play activities and the toddler if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 416). St. Louis: Mosby.

**343. 2**

**Rationale:** A toddler should never be allowed to fall asleep with a bottle containing milk, juice, soda pop, sweetened water, or any other sweet liquid because of the risk of nursing (bottle-mouth) caries. If a bottle is allowed at nap time or bedtime, it should contain only water.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 3 and 4 first because they are comparable or alike statements. From the remaining options, recalling that nursing (bottle-mouth) caries is a concern in a child will assist in directing you to option 2. Review dental health principles related to children if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 426). St. Louis: Mosby.

**344. 4**

**Rationale:** In the preschooler, play is simple and imaginative, and includes activities such as crayons and coloring books, puppets, felt and magnetic boards, and Play-Doh. A radio or sports video are most appropriate for the adolescent. Large picture books are most appropriate for the infant.

**Test-Taking Strategy:** Note the age of the child, and think about the age-related activity that would be most appropriate. Eliminate options 1 and 2, knowing that they are most appropriate for the adolescent. From the remaining options, the word *large* in option 3 should provide you with the clue that this activity would be more appropriate for a child younger than age 5. If you had difficulty with this question, review the appropriate play activities for a preschooler.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Planning

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., pp. 673–674). St. Louis: Mosby.

**ALTERNATE ITEM FORMAT:  
MULTIPLE RESPONSE****345. 1, 4, 5**

**Rationale:** Holding, caressing, and swaddling provide warmth and tactile stimulation for the infant. To provide auditory stimulation, the nurse should talk to the infant in a soft voice and should instruct the mother to do so also. Additional interventions include playing a music box, radio, or television, or having a ticking clock or metronome nearby. Hanging a bright shiny object in midline within 20 to 25 cm of the infant's face and hanging mobiles with contrasting colors, such as black and white, provide visual stimulation. Crying is an infant's way of communicating; therefore the nurse would respond to the infant's crying. The mother is taught to do so also. An infant or child should never be allowed to fall asleep with a bottle containing milk, juice, soda pop, sweetened water, or another sweet liquid because of the risk of nursing (bottle-mouth) caries.

**Test-Taking Strategy:** Focus on the subject, care of the infant. Noting the word *loud* and the words *at least 10 minutes before responding* will assist in eliminating these interventions. Also, recalling the concerns related to dental caries will assist in eliminating option 3. Review the guidelines related to the care of an infant if you had difficulty with this question.

# Health and Physical Assessment of the Adult Client

## I. ENVIRONMENT/SETTING

- A. Establish a relationship and explain the procedure to the client.
- B. Ensure privacy and make the client feel comfortable (comfortable room temperature, sufficient lighting, remove distractions such as noise or objects, avoid interruptions).
- C. Sit down for the interview (avoid barriers such as a desk), maintain an appropriate social distance, and maintain eye level.
- D. Use therapeutic communication techniques and open-ended questions to obtain information about the client's symptoms and concerns; allow time for the client to ask questions.
- E. Consider religious and cultural characteristics such as language (the need for an interpreter), values and beliefs, health practices, eye contact, and touch.
- F. Keep note-taking to a minimum so the client is the focus of attention.
- G. Types of health and physical assessments (Box 34-1)

## II. HEALTH HISTORY

- A. General state of health: Body features and physical characteristics, body movements, body posture, level of consciousness, nutritional status, speech
- B. Chief complaint and history of present illness (direct client quotes) that directs the client to seek care
- C. Family history: The health status of direct blood relatives as well as the client's spouse
- D. Social history
  - 1. Data about the client's lifestyle with a focus on factors that may impact health.
  - 2. Information about alcohol, drug, and tobacco use; sexual practices; tattoos; body piercing; travel history; and work setting to identify occupational hazards
- E. Domestic violence screening
  - 1. Done to determine if the client is experiencing any form of domestic violence.
  - 2. Conducted during a one-to-one interview with client while obtaining the health history.

## III. MENTAL STATUS EXAM

- A. The mental status can be assessed while obtaining **subjective data** from the client during the health history interview.
- B. Appearance
  - 1. Note appearance, including posture, body movements, dress, and hygiene and grooming.
  - 2. An inappropriate appearance and poor hygiene may be indicative of **depression**, manic disorder, **dementia**, organic brain disease, or another disorder.
- C. Behavior
  - 1. Level of consciousness: Assess alertness and awareness and the client's ability to interact appropriately with the environment.
  - 2. Facial expression and body language: Check for appropriate eye contact and determine whether facial expression and body language are appropriate to the situation; this assessment also provides information regarding the client's mood and affect.
  - 3. Speech: Assess speech pattern for articulation and appropriateness of conversation.
- D. Cognitive level of functioning (Box 34-2)

## IV. PHYSICAL EXAM

- A. Overview
  - 1. Gather equipment needed for the examination.
  - 2. Use the senses of sight, smell, touch, and hearing to collect data.
  - 3. Assessment includes **inspection, palpation, percussion**, and **auscultation**; these skills are performed one at a time, in this order (except the abdominal assessment).
- B. Assessment techniques
  - 1. **Inspection**
    - a. The first assessment technique, which uses vision and smell senses while observing the client
    - b. Requires good lighting, adequate exposure, and possibly the use of certain instruments such as an otoscope or ophthalmoscope
  - 2. **Palpation**
    - a. Uses the sense of touch; warm the hands before touching the client.

### Box 34-1 Types of Health and Physical Assessments

**Complete assessment:** Includes a complete health history and physical examination and forms a baseline database.

**Focused assessment:** Focuses on a limited or short-term problem, such as the client's complaint.

**Episodic/follow-up assessment:** Focuses on evaluating a client's progress.

**Emergency assessment:** Involves the rapid collection of data, often during the provision of lifesaving measures.

### Box 34-2 The Mental-Status Examination: Cognitive Level of Functioning

**Orientation:** Assess client's orientation to person, place, and time.

**Attention span:** Assess client's ability to concentrate.

**Recent memory:** Assessed by asking the client to recall a recent occurrence (e.g., the means of transportation used to get to the health care agency for the physical assessment).

**Remote memory:** Assessed by asking the client about a verifiable past event (e.g., a vacation).

**New learning:** Used to assess the client's ability to recall unrelated words identified by the nurse; nurse selects four words and asks the client to recall the words 5, 10, and 30 minutes later.

**Judgment:** Determine whether the client's actions or decisions regarding discussions during the interview are realistic.

**Thought processes and perceptions:** The way the client thinks and what the client says should be logical, coherent, and relevant; the client should be consistently aware of reality.

- b. Identify tender areas and palpate them last.
  - c. Start with light palpation to detect surface characteristics, then perform deeper palpation.
  - d. Assess texture, temperature, and moisture of the skin, as well as organ location and size.
  - e. Assess for swelling, vibration or pulsation, rigidity or spasticity, and crepitation.
  - f. Assess for the presence of lumps or masses, as well as the presence of tenderness or pain.
3. **Percussion**
    - a. Involves tapping the client's skin to assess underlying structures and to determine vibrations and sounds related to intensity, duration, pitch, quality, and location.
    - b. Provides information related to the presence of air, fluid, or solid masses as well as organ size, shape and position.
  4. **Auscultation:** Involves listening to sounds produced by the body, such as heart, lung, or bowel sounds

### Box 34-3 Characteristics of Skin Color

**Cyanosis:** Mottled bluish coloration

**Erythema:** Redness

**Pallor:** Pale, whitish coloration

**Jaundice:** Yellow coloration

### Box 34-4 Assessing Capillary Filling Time

Depress the nail bed to produce blanching.

Release and observe for the return of color.

Color will return within 3 seconds if arterial capillary perfusion is normal.

- C. Vital signs
  1. Includes temperature, radial pulse (apical pulse may be measured during the cardiovascular assessment), respirations, blood pressure, pulse oximetry, and presence of pain
  2. Height and weight and nutritional status are also assessed.

## V. BODY SYSTEMS ASSESSMENT

- A. Integumentary system: Involves **inspection** and **palpation** of skin, hair, and nails.
    1. **Subjective data:** Self-care behaviors, history of skin disease, medications being taken, environmental or occupational hazards and exposure to toxic substances, changes in skin color or pigmentation, change in a mole or a sore that does not heal
    2. **Objective data:** Color, temperature (hypothermia or hyperthermia); excessive dryness or moisture; skin turgor; texture (smoothness, firmness); excessive bruising, itching, rash; hair loss (alopecia) or nail abnormalities such as pitting; lesions (may be inspected with a magnifier and light or with the use of a Wood's light [ultraviolet light used in a darkened room]; scars or birthmarks; edema; capillary filling time (Boxes 34-3 and 34-4; Table 34-1)
-  To test skin turgor, pinch a large fold of skin and assess the ability of the skin to return to its place when released. Poor turgor occurs in severe dehydration or extreme weight loss.
3. Client teaching
    - a. Provide information about factors that can be harmful to the skin, such as sun exposure.
    - b. Encourage performing self-examination of the skin monthly.
- B. Head, neck, and lymph nodes: Involves **inspection** and **palpation** of the head, neck, and lymph nodes
    1. Ask the client about headaches, episodes of dizziness (lightheadedness) or vertigo (spinning

**TABLE 34-1** Pitting Edema Scale

| Scale | Description                             | “Measurement”*            |
|-------|---|---------------------------|
| 1 +   | A barely perceptible pit                | 2 mm ( $\frac{3}{32}$ in) |
| 2 +   | A deeper pit, rebounds in a few seconds | 4 mm ( $\frac{9}{32}$ in) |
| 3 +   | A deep pit, rebounds in 10-20 seconds   | 6 mm ( $\frac{1}{4}$ in)  |
| 4 +   | A deeper pit, rebounds in >30 seconds   | 8 mm ( $\frac{5}{16}$ in) |

\*“Measurement” is in quotation marks because depth of edema is rarely actually measured but is included as a frame of reference.

From Wilson, A., & Giddens, J., (2009). *Health assessment for nursing practice* (4th ed., p. 255). St. Louis: Mosby. Descriptions column data from Kirton, C. Assessing edema, *Nursing* 96 26(7):54, 1996. Illustrations from Canobblo, M. (1990). *Cardiovascular disorders*. St. Louis: Mosby.

- sensation), history of head injury, loss of consciousness, seizures, episodes of neck pain, limitations of range of motion, numbness or tingling in the shoulders, arms, or hands, lumps or swelling in the neck, difficulty swallowing, medications being taken, and history of surgery in the head and neck region.
2. Head
    - a. Inspect and palpate: Size, shape, masses or tenderness, and symmetry of the skull
    - b. Palpate temporal arteries, located above the cheekbone between the eye and the top of the ear.
    - c. Temporomandibular joint: Ask the client to open his or her mouth; note any crepitation, tenderness, or limited range of motion.
    - d. Face: Inspect facial structures for shape, symmetry, involuntary movements, or swelling, such as periorbital edema (swelling around the eyes).
  3. Neck
    - a. Inspect for symmetry of accessory neck muscles.
    - b. Assess range of motion.
    - c. Test cranial nerve XI (spinal accessory nerve) to assess muscle strength: Ask the client to rotate the head forcibly against resistance applied to the side of the chin; also ask the client to shrug the shoulders against resistance.
    - d. Palpate the trachea: It should be midline, without any deviations.
    - e. Thyroid gland: Inspect the neck as the client takes a sip of water and swallows (thyroid tissue moves up with a swallow); palpate using an anterior-posterior approach (usually the normal adult thyroid cannot be palpated); if it is enlarged, auscultate for a bruit.
  4. Lymph nodes
    - a. Palpate using a gentle pressure and a circular motion of the finger pads.
      - b. Begin with the preauricular lymph nodes (in front of the ear); move to the posterior auricular lymph nodes and then downward toward the supraclavicular lymph nodes.
      - c. Palpate with both hands, comparing the two sides for symmetry.
      - d. If nodes are palpated, note their size, shape, location, mobility, consistency, and tenderness.
  5. Client teaching: Instruct the client to notify the health care provider if persistent headache, dizziness, or neck pain occurs, if swelling or lumps are noted in the head and neck region, or if a neck or head injury occurs.
 

 Neck movements are never performed if the client has sustained a neck injury or a neck injury is suspected.
  - C. Eyes: Includes **inspection, palpation**, vision-testing procedures, and the use of an ophthalmoscope
    1. **Subjective data:** Difficulty with vision (e.g., decreased acuity, double vision, blurring, blind spots); pain, redness, swelling, watery or other discharge from the eye; use of glasses or contact lenses; medications being taken; history of eye problems
    2. **Objective data**
      - a. Inspect the external eye structures, including eyebrows, for symmetry; eyelashes for even distribution; eyelids for ptosis (drooping); eyeballs for exophthalmos (protrusion) or enophthalmos (sunken).
      - b. Inspect the conjunctiva (should be clear), sclera (should be white), and lacrimal apparatus (check for excessive tearing, redness, tenderness, or swelling); cornea and lens (should be smooth and clear); iris (should

### Box 34-5 Assessing and Documenting Pupillary Responses

#### Pupillary Light Reflex

Darken the room (to dilate the client's pupils) and ask the client to look forward.

Test each eye.

Advance a light in from the side to note constriction of the same-side pupil (direct light reflex) and simultaneous constriction of the other pupil (consensual light reflex).

#### Accommodation

Ask the client to focus on a distant object (dilates the pupil).

Ask the client to shift gaze to a near object held about 3 inches from the nose.

Normal response includes pupillary constriction and convergence of the axes of the eyes.

#### Documenting Normal Findings: PERRLA

P = pupils

E = equal

R = round

RL = reactive to light

A = reactive to accommodation

be flat, with a round regular shape and even coloration); eyelids, and pupils (Box 34-5)

3. Snellen eye chart
  - a. Position the client in a well-lit spot 20 feet from the chart, with the chart at eye level, and ask the client to read the smallest line that he or she can discern.
  - b. Instruct the client to leave on glasses or leave in contact lenses; if the glasses are for reading only, they are removed because they blur distant vision.
  - c. Test one eye at a time
  - d. Record result using the fraction at the end of the last line successfully read on the chart.
  - e. Normal visual acuity is 20/20 (distance in feet at which the client is standing from the chart/distance in feet at which a normal eye could have read that particular line).
4. Near vision
  - a. Use a hand-held vision screener (held about 14 inches from the eye) that contains various sizes of print or ask the client to read from a magazine.
  - b. Test each eye separately with the client's glasses on or contact lenses in.
  - c. Normal result is 14/14 (distance in inches at which the subject holds the card from the eye/distance in inches at which a normal eye could have read that particular line).
5. Confrontation test
  - a. Used to measure peripheral vision and compare the client's peripheral vision with the nurse's (assuming that the nurse's peripheral vision is normal)
  - b. The client covers one eye and looks straight ahead; the nurse, positioned 2 feet away, covers his or her eye opposite the client's covered eye.
  - c. The nurse advances a finger or other small object in from the periphery from several directions; the client should see the object at the same time the nurse does.
6. Corneal light reflex
  - a. Used to assess for parallel alignment of the axes of the eyes
  - b. Client is asked to gaze straight ahead as the nurse holds a light about 12 inches from the client
  - c. The nurse looks for reflection of the light on the corneas in exactly the same spot in each eye
7. Cover test
  - a. Used to check for slight degrees of deviated alignment
  - b. Each eye is tested separately.
  - c. The nurse asks the client to gaze straight ahead and cover one eye.
  - d. The nurse examines the uncovered eye, expecting to note a steady, fixed gaze
8. Six cardinal positions of gaze
  - a. Used to check for muscle weakness in the eyes
  - b. The client is asked to hold the head steady, then follow movement of an object through the positions of gaze.
  - c. The client should follow the object in a parallel manner with the two eyes.
  - d. Assess for nystagmus, an oscillating movement of the eye, best noted around the iris.
9. Color vision
  - a. Ishihara chart is a tool used to assess color vision; it determines the client's ability to distinguish a pattern of color (a number) in a series of color plates.
  - b. The nurse tests each eye separately and asks the client to identify the number that he or she sees on the chart.
  - c. The ability to read the number correctly depends on the normal functioning of color vision.
10. Examination of the internal structures
  - a. An ophthalmoscope is used to inspect the fundus, including the retina, choroids, optic nerve disc, macula, fovea centralis, and retinal vessels.
  - b. The nurse inspects the size, color, and clarity of the disc, the integrity of the vessels, and the appearance of the macula, and fovea and looks for retinal lesions
  - c. Performed in a darkened room

- d. The client's eyeglasses are removed (contact lenses are left in place)
- e. The nurse and the client face each other with the eyes at the same height, the ophthalmoscope light is switched on, and the lens is rotated to 0.
- f. As the client gazes straight ahead with both eyes open, the nurse (standing about 10 inches from the client and about 25 degrees lateral to the client's central line of vision) shines the light on the pupil.
- g. A bright-orange glow (red reflex) can be seen by the nurse; the nurse slowly moves toward the pupil, focusing on the red reflex.
- h. Rotating the lens on the ophthalmoscope, the nurse brings the internal structures into focus.

#### 11. Client teaching

- a. Instruct the client to notify the health care provider if alterations in vision occur or any redness, swelling, or drainage from the eye is noted.
- b. Inform the client of the importance of regular eye examinations.

#### D. Ears: Includes **inspection, palpation**, hearing tests, and the use of an otoscope

1. **Subjective data:** Difficulty hearing, earaches, drainage from the ears, dizziness, ringing in the ears, exposure to environment noise, use of a hearing aid, medications being taken, history of ear problems or infections
2. **Objective data**
  - a. Inspect and palpate the external ear, noting size, shape, symmetry, skin color, and the presence of pain.
  - b. Inspect the external auditory meatus for size, swelling, redness, discharge, and foreign bodies; some cerumen (ear wax) may be present.
3. Conductive and sensorineural hearing loss
  - a. A conductive hearing loss occurs as a result of a physical obstruction to the transmission of sound waves.
  - b. A sensorineural hearing loss occurs as a result of a pathological process in the inner ear or of the sensory fibers that lead to the cerebral cortex.
4. Voice test
  - a. Used to determine whether hearing loss has occurred
  - b. One ear is tested at a time (the ear not being tested is occluded by the client)
  - c. The nurse stands 1 to 2 feet from the client, covers his or her mouth so that the client cannot read the lips, exhales fully, and softly whispers two-syllable words in the direction of the unoccluded ear; the client points a finger up during the test when the

nurse's voice is heard (a ticking watch may also be used to test hearing acuity).

5. Pure-tone audiometry testing: Provides a precise quantitative measure of hearing by assessing the client's ability to hear sounds of varying frequencies (done by a person skilled in performing audiometry testing)
6. Tuning fork tests
  - a. Used to measure hearing on the basis of air conduction or bone conduction; includes the Weber and Rinne tests
  - b. To activate the tuning fork, the nurse holds the base and lightly taps the tines against the other hand, setting the fork in vibration.
7. Weber test
  - a. Stem of the vibrating tuning fork is placed in the midline of the client's skull and the client is asked if the tone sounds the same in both ears or better in one ear.
  - b. The client hears the tone by bone conduction and the sound should be heard equally in both ears.
8. Rinne test
  - a. Stem of the vibrating tuning fork is placed on the client's mastoid process.
  - b. When the client no longer hears the sound, the tuning fork is quickly inverted and placed near the ear canal; the client should still hear a sound.
  - c. Normally the sound is heard twice as long by way of air conduction (near the ear canal) than by way of bone conduction (at the mastoid process).
9. Otoscopic exam
  - a. An otoscope is used; for best visualization, the largest speculum that fits comfortably into the client's ear canal should be used.
  - b. The nurse asks the client to tilt the head slightly away, to the opposite shoulder; next the nurse pulls the pinna up and back (on an adult or older child), holds the otoscope upside down, and inserts the speculum slightly down and forward, approximately half an inch, into the ear canal.
  - c. The normal tympanic membrane is translucent, shiny, and pearly gray.

Before performing an otoscopic exam and inserting the speculum, check the auditory canal for foreign bodies. Instruct the client not to move the head during the examination to avoid damage to the canal and tympanic membrane.

#### 10. Client teaching

- a. Instruct the client to notify the health care provider if an alteration in hearing or ear pain or ringing in the ears occurs, or redness, swelling, or drainage from the ear is noted.

- b. Instruct the client in the proper method of cleaning the ear canal.
  - c. The client should cleanse the ear canal with the corner of a moistened washcloth and should never insert sharp objects or cotton-tipped applicators into the ear canal.
- E. Nose, mouth, and throat:** Includes **inspection** and **palpation**
1. **Subjective data**
    - a. Nose: Ask about discharge or nosebleed (epistaxis); facial or sinus pain; history of frequent colds; altered sense of smell; allergies; medications being taken; history of nose trauma or surgery.
    - b. Mouth and throat: Ask about the presence of sores or lesions; bleeding from the gums or elsewhere; altered sense of taste; toothaches; use of dentures or other appliances; tooth- and mouth-care hygiene habits; at-risk behaviors (e.g., smoking, alcohol consumption); history of infection, trauma, or surgery.
  2. **Objective data**
    - a. External nose should be midline and in proportion to other facial features.
    - b. Patency of the nostrils can be tested by pushing each nasal cavity closed and asking the client to sniff inward through the other nostril.
    - c. Use of a nasal speculum and penlight or a short, wide-tipped speculum attached to an otoscope head is used to inspect for redness, swelling, discharge, bleeding, or foreign bodies; the nasal septum is assessed for deviation.
    - d. The nurse presses the frontal sinuses (located below the eyebrows) and over the maxillary sinuses (located below the cheekbones); the client should feel firm pressure but no pain.
    - e. The external and inner surfaces of the lips are assessed for color, moisture, cracking, or lesions.
    - f. The teeth are inspected for condition and number (should be white, spaced evenly, straight, and clean, free of debris and decay).
    - g. The alignment of the upper and lower jaw is assessed by having the client bite down.
    - h. The gums are inspected for swelling, bleeding, discoloration, and retraction of gingival margins (gums normally appear pink).
    - i. The tongue is inspected for color, surface characteristics, moisture, white patches, nodules, and ulcerations (dorsal surface is normally rough; ventral surface is smooth and glistening, with visible veins).
    - j. The nurse retracts the cheek with a tongue depressor to check for the buccal mucosa for color and the presence of nodules or lesions; normal mucosa is glistening, pink, soft, moist, and smooth.
  - k. Using a penlight and tongue depressor, the nurse inspects the hard and soft palates for color, shape, texture, and defects; the hard palate (roof of the mouth), which is located anteriorly, should be white and dome-shaped, and the soft palate, which extends posteriorly, should be light pink and smooth.
    1. The uvula is inspected for midline location; the nurse asks the client to say “ahhh” and watches for the soft palate and uvula to rise in the midline (this tests one function of cranial nerve X, the vagus nerve).
    - m. Using a penlight and tongue depressor, the nurse inspects the throat for color, presence of tonsils, and the presence of exudate or lesions; cranial nerve XII is tested (the hypoglossal nerve) by asking the client to stick out the tongue (should protrude in the midline).
  3. Client teaching
    - a. Emphasize the importance of hygiene and tooth care, as well as regular dental examinations and the use of fluoridated water or fluoride supplements.
    - b. Encourage the client to avoid at-risk behaviors (e.g., smoking, alcohol consumption).
    - c. Stress the importance of reporting pain or abnormal occurrence (e.g., nodules, lesions, signs of infection).
- F. Lungs**
1. **Subjective data:** Cough; expectoration of sputum; shortness of breath or dyspnea; chest pain on breathing; smoking history; environmental exposure to pollution or chemicals; medications being taken; history of respiratory disease or infection; last tuberculosis test, chest radiograph, pneumonia, and any influenza immunizations including the H1N1 vaccine (H and N refer to *hemagglutinin* and *neuraminidase*, respectively, which are surface antigens, and the number 1 refers to the specific subtype of those antigens).
  2. **Objective data:** Includes **inspection**, **palpation**, **percussion**, and **auscultation**
  3. **Inspection** of the anterior and posterior chest: Note skin color and condition and the rate and quality of respirations, look for lumps or lesions, note the shape and configuration of the chest wall, note the position the client takes to breathe.
  4. **Palpation:** Palpate the entire chest wall, noting skin temperature and moisture and looking for areas of tenderness and lumps, lesions, or masses; assess chest excursion and tactile or vocal fremitus (Box 34-6).
  5. **Percussion**
    - a. Starting at the apices, percuss across the top of the shoulders, moving to the interspaces, making a side-to-side comparison all the way down the lung area (Fig. 34-1).

**Box 34-6 Palpation of the Chest****Chest Excursion**

Posterior: The nurse places the thumbs along the spinal processes at the 10th rib, with the palms in light contact with the posterolateral surfaces.

The nurse's thumbs should be about 2 inches apart, pointing toward the spine, with the fingers pointing laterally

Anterior: The nurse places the hands on the anterolateral wall with the thumbs along the costal margins, pointing toward the xiphoid process.

The nurse instructs the client to take a deep breath after exhaling.

**Normal Findings**

The nurse notes movement of the thumbs.

Chest excursion should be symmetrical, separating the thumbs approximately 2 inches.

**Tactile or Vocal Fremitus**

The nurse places the ball or lower palm of the hand over the chest.

**▲ FIGURE 34-1** Landmarks for chest auscultation and percussion. **A**, Posterior view. **B**, Anterior view. **C**, Lateral view. (From Wilson, A. F., & Giddens, J. F. [2009]. *Health assessment for nursing practice* (4th ed., p. 218). St. Louis: Mosby).

- b. Determine the predominant note; resonance is noted in healthy lung tissue.
  - c. Hyperresonance is noted when excessive air is present and a dull note indicates lung density.
- 6. Auscultation**
- a. Use the flat diaphragm end piece of the stethoscope, hold it firmly against the chest wall, and listen to at least one full respiration in each location (anterior, posterior, and lateral).
  - b. Posterior: Start at the apices and move side to side for comparison (see Fig. 34-1)
  - c. Anterior: Auscultate the lung fields from the apices in the supraclavicular area down

▲ **FIGURE 34-2** Auscultatory sounds. **A**, Anterior thorax. **B**, Posterior thorax. (From Wilson, A. F., & Giddens, J. F. [2009]. *Health assessment for nursing practice* [4th ed., p. 219]. St. Louis: Mosby).

to the sixth rib; avoid **percussion** and **auscultation** over female breast tissue (displace this tissue) because a dull sound will be produced (see Fig. 34-1).

- d. Compare findings on each side.
  7. Normal breath sounds: Three types of breath sounds are considered normal in certain parts of the thorax, including vesicular, bronchovesicular, and bronchial; breath sounds should be clear to **auscultation** (Fig. 34-2).
  8. Abnormal breath sounds: Also known as adventitious sounds (Table 34-2)
  9. Voice sounds (Box 34-7)
    - a. Performed when a pathological lung condition is suspected
    - b. Auscultate over the chest wall; the client is asked to vocalize words or a phrase while the nurse listens to the chest.
    - c. Normal voice transmission is soft and muffled; the nurse can hear the sound but is unable to distinguish exactly what is being said.
- ⚠ When auscultating breath sounds, instruct the client to breathe through the mouth and monitor the client for dizziness.
10. Client teaching
    - a. Encourage the client to avoid exposure to environmental hazards, including smoking (discuss smoking cessation programs as appropriate).
    - b. Client should undergo periodic examinations as prescribed (e.g., chest x-ray study, tuberculosis skin testing).

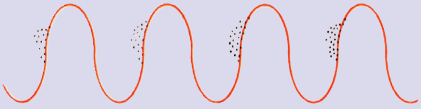

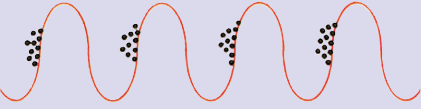

- c. Encourage the client to obtain pneumonia and influenza immunizations.
- d. Health care provider should be notified if client experiences persistent cough, shortness of breath, or other respiratory symptoms.

#### G. Heart and peripheral vascular system

1. **Subjective data:** Chest pain, dyspnea, cough, fatigue, edema, nocturia, leg pain or cramps (claudication), changes in skin color, obesity, medications being taken, cardiovascular risk factors, family history of cardiac or vascular problems, personal history of cardiac or vascular problems
2. **Objective data:** May include **inspection, palpation, percussion, and auscultation**
3. **Inspection:** Inspect the anterior chest for pulsations (apical impulse) created as the left ventricle rotates against the chest wall during systole; not always visible.
4. **Palpation**
  - a. Palpate the apical impulse at the fourth or fifth interspace, or medial to the midclavicular line (not palpable in obese clients or clients with thick chest walls).
  - b. Palpate the apex, left sternal border, and base for pulsations; normally none are present.
5. **Percussion:** May be performed to outline the heart's borders and to check for cardiac enlargement (denoted by resonance over the lung and dull notes over the heart).
6. **Auscultation**
  - a. Areas of the heart (Fig. 34-3)
  - b. Auscultate heart rate and rhythm; check for a pulse deficit (auscultate the apical heartbeat while palpating an artery) if an irregularity is noted.

**TABLE 34-2** Characteristics of Adventitious Sounds

| Adventitious Sounds   | Characteristics  | Clinical Examples   |
|---|--|---|
| Crackles (previously called <i>rales</i> ) fine crackles<br> | Fine, high-pitched crackling and popping noises (discontinuous sounds) heard during the end of inspiration. Not cleared by cough.  | May be heard in pneumonia, heart failure, asthma, and restrictive pulmonary diseases.   |
| Medium crackles<br>  | Medium-pitched, moist sound heard about halfway through inspiration. Not cleared by cough.   | Same as above, but condition is worse.  |
| Coarse crackles<br>  | Low-pitched, bubbling or gurgling sounds that start early in inspiration and extend into the first part of expiration.   | Same as above, but condition is worse or may be heard in terminally ill clients with diminished gag reflex. Also heard in pulmonary edema and pulmonary fibrosis. |
| Wheeze (also called <i>sibilant wheeze</i> )<br>             | High-pitched, musical sound similar to a squeak. Heard more commonly during expiration, but may also be heard during inspiration. Occurs in small airways.   | Heard in narrowed airway diseases such as asthma.   |
| Rhonchi (also called <i>sonorous wheeze</i> )<br>          | Low-pitched, coarse, loud, low snoring or moaning tone. Actually sounds like snoring. Heard primarily during expiration, but may also be heard during inspiration. Coughing may clear.                                   | Heard in disorders causing obstruction of the trachea or bronchus, such as chronic bronchitis.  |
| Pleural friction rub<br>                                   | A superficial, low-pitched, coarse rubbing or grating sound. Sounds like two surfaces rubbing together. Heard throughout inspiration and expiration. Loudest over the lower anterolateral surface. Not cleared by cough. | Heard in individuals with pleurisy (inflammation of the pleural surfaces).  |

From Wilson, A. F., & Giddens, J. F. (2009). *Health assessment for nursing practice* (4th ed., p. 221). St. Louis: Mosby.

### Box 34-7 Voice Sounds

#### Bronchophony

Ask the client to repeat the words “ninety-nine.” Normal voice transmission is soft, muffled, and indistinct.

#### Egophony

Ask the client to repeat a long “ee-ee-ee” sound. Normally the nurse would hear the “ee-ee-ee” sound.

#### Whispered Pectoriloquy

Ask the client to whisper the word “ninety-nine.” Normal voice transmission is faint, muffled, and almost inaudible.

- Assess S1 (“lub”) and S2 (“dub”) sounds, and listen for extra heart sounds, as well as the presence of murmurs (gentle, blowing or swooshing noise).

#### 7. Peripheral vascular system

- Assess adequacy of blood flow to the extremities by palpating arterial pulses for equality and symmetry and checking the condition of the skin and nails.
- Check for pretibial edema and measure calf circumference (see Table 34-1).
- Measure blood pressure.
- Palpate superficial inguinal nodes (using firm but gentle pressure), beginning in the inguinal area and moving down toward the inner thigh.
- An ultrasonic stethoscope may be needed to amplify the sounds of a pulse wave if the pulse cannot be palpated.
- Carotid artery: Located in the groove between the trachea and sternocleidomastoid muscle, medial to and alongside the muscle

▲ **FIGURE 34-3** Auscultation areas of the heart. (From Wilson, A., & Giddens, J. [2009]. *Health assessment for nursing practice* [4th ed., p. 262]. St. Louis: Mosby).

### Box 34-8 Arterial Pulse Points and Grading the Force of Pulses

#### Arteries in the Arms and Hands

Radial pulse: Located at the radial side of the forearm at the wrist

Ulnar pulse: Located on the opposite side of the location of the radial pulse at the wrist

Brachial pulse: Located above the elbow at the antecubital fossa, between the biceps and triceps muscles

#### Arteries in the Legs

Femoral pulse: Located below the inguinal ligament, midway between the symphysis pubis and the anterosuperior iliac spine

Popliteal pulse: Located behind the knee

Dorsalis pedis pulse: Located at the top of the foot, in line with the groove between the extensor tendons of the great and first toes

Posterior tibial pulse: Located inside of the ankle, behind and below the medial malleolus (ankle bone)

#### Grading the Force

4+ = strong and bounding

3+ = full pulse, increased

2+ = normal, easily palpable

1+ = weak, barely palpable

- g. Palpate one carotid artery at a time to avoid compromising blood flow to the brain.
- h. Auscultate each carotid artery for the presence of a bruit (a blowing, swishing sound), which indicates blood flow turbulence; normally a bruit is not present.
- i. Palpate the arteries in the extremities (Box 34-8).

#### 8. Client teaching

- a. Advise client to modify lifestyle for risk factors associated with heart and vascular disease.
- b. Encourage the client to seek regular physical examinations.
- c. Client should seek medical assistance for signs of heart or vascular disease.

#### H. Breasts

1. **Subjective data:** Pain or tenderness, lumps or thickening, swollen axillary lymph nodes, nipple discharge, rash or swelling, medications being taken, personal or family history of breast disease, trauma or injury to the breasts, previous surgery on the breasts, breast self-examination compliance, mammograms as prescribed
2. **Objective data: Inspection and palpation**
3. **Inspection**
  - a. Performed with the client's arms raised above the head, the hands pressed against the hips, and the arms extended straight ahead while the client sits and leans forward
  - b. Assess size and symmetry (one breast is often larger than the other); masses, flattening, retraction, or dimpling; color and venous pattern; size, color, shape, and discharge in the nipple and areola; and the direction in which nipples point.
4. **Palpation**
  - a. Client lies supine, with the arm on the side being examined behind the head and a small pillow under the shoulder.
  - b. The nurse uses the pads of the first three fingers to compress the breast tissue gently against the chest wall, noting tissue consistency.
  - c. **Palpation** is performed systematically ensuring that the entire breast and tail are palpated.
  - d. The nurse notes the consistency of the breast tissue, which normally feels dense, firm, and elastic.
  - e. The nurse gently palpates the nipple and areola and compresses the nipple, noting any discharge.
5. Axillary lymph nodes
  - a. The nurse faces the client and stands on the side being examined, supporting the client's arm in a slightly flexed position, and abducts the arm away from the chest wall.
  - b. The nurse places the free hand against the client's chest wall and high in the axillary hollow, then, with the fingertips, gently presses down, rolling soft tissue over the surface of the ribs and muscles.
  - c. Lymph nodes are normally not palpable.
6. Client teaching
  - a. Encourage and teach the client to perform breast self-examination (BSE) (refer to Chapter 52 for information on performing the BSE).

- b. BSE should be performed 7 to 10 days after the menses; postmenopausal clients or clients who have had a hysterectomy should select a specific day of the month and perform BSE monthly on that day.
- c. Regular physical examinations and mammograms should be obtained as prescribed.
- d. Client should report lumps or masses to the healthcare provider immediately.

#### I. Abdomen

1. **Subjective data:** Changes in appetite or weight, difficulty swallowing, dietary intake, intolerance to certain foods, nausea or vomiting, pain, bowel habits, medications currently being taken, history of abdominal problems or abdominal surgery
2. **Objective data**
  - a. Ask the client to empty the bladder.
  - b. Be sure to warm the hands and the end piece of the stethoscope.
  - c. Examine painful areas last.

 When performing an abdominal assessment, the specific order for assessment techniques is inspection, auscultation, percussion, and palpation.

#### 3. Inspection

- a. Contour: Look down at the abdomen and then across the abdomen from the rib margin to the pubic bone; describe as flat, rounded, concave or protuberant.
- b. Symmetry: Note any bulging or masses.
- c. Umbilicus: Should be midline and inverted
- d. Skin surface: Should be smooth and even
- e. Pulsations from the aorta may be noted in the epigastric area, and peristaltic waves may be noted across the abdomen.

#### 4. Auscultation

- a. Performed before **percussion** and **palpation**, which can increase peristalsis.
- b. Hold the stethoscope lightly against the skin and listen for bowel sounds in all four quadrants; begin in the right lower quadrant (bowel sounds are normally heard here).
- c. Note the character and frequency of normal bowel sounds: high-pitched gurgling sounds occurring irregularly from 5 to 30 times a minute.
- d. Identify as normal, hypoactive, or hyperactive (borborygmus).
- e. Absent sounds: Auscultate for 5 minutes before determining that sounds are absent.
- f. Auscultate over the aorta, renal arteries, iliac arteries, and femoral arteries for vascular sounds or bruits.

#### 5. Percussion

- a. All four quadrants are percussed lightly.
- b. Borders of the liver and spleen are percussed.

- c. Tympany should predominate over the abdomen with dullness over the liver and spleen.
- d. **Percussion** over the kidney at the 12th rib (costovertebral angle) should produce no pain.

#### 6. Palpation

- a. Begin with light **palpation** of all four quadrants, using the fingers to depress the skin about 1 cm; next perform deep **palpation**, depressing 5 to 8 cm.
- b. Palpate the liver and spleen (may not be palpable).
- c. Palpate the aortic pulsation in the upper abdomen slightly to the left of midline; normally it pulsates in a forward direction (pulsation expands laterally if an aneurysm is present).

#### 7. Client teaching

- a. Encourage the client to consume a balanced diet.
- b. Substances that can cause gastric irritation should be avoided.
- c. The regular use of laxatives is discouraged.
- d. Lifestyle behaviors that can cause gastric irritation (e.g., smoking, spicy foods) should be modified.
- e. Regular physical examinations are important.
- f. The client should report gastrointestinal problems to the health care provider.

#### J. Musculoskeletal system

1. **Subjective data:** Joint pain or stiffness; redness, swelling, or warm joints; limited motion of joints; muscle pain, cramps, or weakness; bone pain; limitations in activities of daily living; exercise patterns; exposure to occupational hazards (e.g., heavy lifting, prolonged standing or sitting); medications being taken; history of joint, muscle, or bone injuries; history of surgery of the joints, muscles, or bones
2. **Objective data: inspection and palpation**
3. **Inspection:** Inspect gait and posture, and for cervical, thoracic, and lumbar curves (Box 34-9).
4. **Palpation:** Palpate all bones, joints, and surrounding muscles.
5. Range of motion
  - a. Perform active and passive range-of-motion exercises of each major joint.

#### Box 34-9 Common Postural Abnormalities

Lordosis (swayback): increased lumbar curvature

Kyphosis (hunchback): Exaggeration of the posterior curvature of the thoracic spine

Scoliosis: lateral spinal curvature

- b. Check for pain, limited mobility, spastic movement, joint instability, stiffness, and contractures.
  - c. Normally joints are nontender, without swelling, and move freely.
6. Muscle tone and strength
    - a. Assess during measurement of range of motion.
    - b. Ask client to flex the muscle to be examined and then to resist while applying opposing force against the flexion.
    - c. Assess for increased tone (hypertonicity) or little tone (hypotonicity).
  7. Grading muscle strength (Table 34-3)
  8. Client teaching
    - a. The client should consume a balanced diet, including foods high in calcium and vitamin D.
    - b. Activities that cause muscle strain or stress to the joints should be avoided.
    - c. Encourage the client to maintain a normal weight.
    - d. Participation in a regular exercise program is beneficial.
    - e. The client should contact the health care provider if joint or muscle pain or problems occur or if limitations in range of motion or muscle strength develop.
- K. Neurological system** (refer to Chapter 66)
1. **Subjective data:** Headaches, dizziness or vertigo, tremors, weakness, incoordination, numbness or tingling in any area of the body, difficulty speaking or swallowing, medications being taken, history of seizures, history of head injury or surgery, exposure to environmental or occupational hazards (e.g., chemicals, alcohol, drugs)
  2. **Objective data:** Assessment of cranial nerves, level of consciousness, pupils, motor function, cerebellar function, coordination, sensory function, and reflexes
  3. Note mental and emotional status, behavior and appearance, language ability, and intellectual functioning, including memory, knowledge, abstract thinking, association, and judgment.
4. Vital signs: Check temperature, pulse, respirations, and blood pressure; monitor for blood pressure or pulse changes, which may indicate increased intracranial pressure (see Chapter 66 for abnormal respiratory patterns).
  5. Cranial nerves (Table 34-4)
  6. Level of consciousness
    - a. Assess the client's behavior to determine level of consciousness (e.g., alertness, confusion, delirium, unconsciousness, stupor, coma); assessment becomes increasingly invasive as the client is less responsive.
    - b. Speak to client.
    - c. Assess appropriateness of behavior and conversation.
    - d. Lightly touch the client (as culturally appropriate).
  7. Pupils
    - a. Assess size, equality, and reaction to light (brisk, slow, or fixed) and note any unusual eye movements (check direct light and consensual light reflex).
    - b. This component of the neurological examination may be performed during assessment of the eye.
  8. Motor function
    - a. Assess muscle tone, including strength and equality.
    - b. Assess for voluntary and involuntary movements and purposeful and nonpurposeful movements.
    - c. This component of the neurological examination may be performed during assessment of the musculoskeletal system.
  9. Cerebellar function
    - a. Monitor gait as the client walks in a straight line, heel to toe (tandem walking).
    - b. Romberg test: Client is asked to stand with the feet together and the arms at the sides and to close the eyes and hold the position;

**TABLE 34-3** Criteria for Grading and Recording Muscle Strength

| Functional Level  | Lovett Scale | Grade | Percent of Normal |
|---|--------------|-------|-------------------|
| No evidence of contractility                                  | Zero (0)     | 0     | 0                 |
| Evidence of slight contractility                              | Trace (T)    | 1     | 10                |
| Complete range of motion with gravity eliminated              | Poor (P)     | 2     | 25                |
| Complete range of motion with gravity                         | Fair (F)     | 3     | 50                |
| Complete range of motion against gravity with some resistance | Good (G)     | 4     | 75                |
| Complete range of motion against gravity with full resistance | Normal (N)   | 5     | 100               |

From Wilson, A., & Giddens, J. (2009). *Health assessment for nursing practice* (4th ed., p. 330). St. Louis: Mosby.

**TABLE 34-4** Assessment of the Cranial Nerves

| Cranial Nerve   | Test  |
|---|---|
| Cranial nerve I: Olfactory<br>Sensory<br>Controls the sense of smell  | Have the client close the eyes and occlude one nostril with a finger. Ask the client to identify nonirritating and familiar odors (e.g., coffee, tea, cloves, soap, chewing gum, peppermint). Repeat the test on the other nostril.   |
| Cranial nerve II: Optic<br>Sensory<br>Controls vision   | Assess visual acuity with a Snellen chart and perform an ophthalmoscopic exam. Check peripheral vision by confrontation. Check color vision.  |
| Cranial nerve III: Oculomotor<br>Motor<br>Controls pupillary constriction, upper-eyelid elevation, and most eye movement.<br>Cranial nerve IV: Trochlear<br>Motor<br>Controls downward and inward eye movement.<br>Cranial nerve VI: Abducens<br>Motor<br>Controls lateral eye movement | The motor functions of these nerves overlap; therefore they should be tested together. Inspect the eyelids for ptosis (drooping), then assess ocular movements and note any eye deviation. Test accommodation and direct and consensual light reflexes.   |
| Cranial Nerve V: Trigeminal<br>Sensory and motor<br>Controls sensation in the cornea, nasal and oral mucosa, and facial skin, as well as mastication  | To test motor function, ask the client to clench the teeth and assess the muscles of mastication; then try to open the client's jaws after asking the client to keep them tightly closed. Test the corneal reflex by lightly touching the client's cornea with a cotton wisp (this test may be omitted if the client is alert and blinking normally). Check sensory function by asking the client to close the eyes; lightly touch forehead, cheeks, and chin, noting whether the touch is felt equally on the two sides. |
| Cranial nerve VII: Facial<br>Sensory and motor<br>Controls movement of the face and taste sensation   | Test taste perception on the anterior two thirds of the tongue; the client should be able to taste salty and sweet tastes. Have the client smile, frown, and show the teeth. Ask the client to puff out the cheeks. Attempt to close the client's eyes against resistance.  |
| Cranial nerve VIII: Acoustic<br>Sensory<br>Controls hearing and vestibular function   | Assessing the client's ability to hear tests the cochlear portion. Assessing the client's sense of equilibrium tests the vestibular portion. Check the client's hearing using acuity tests. Observe the client's balance and watch for swaying when he or she is walking or standing. Assessment of sensorineural hearing loss may be done with the Weber or Rinne test.  |
| Cranial nerve IX: Glossopharyngeal<br>Sensory and motor<br>Controls swallowing ability, sensation in the pharyngeal soft palate and tonsillar mucosa, taste perception on the posterior third of the tongue, and salivation<br>Usually cranial nerves IX and X are tested together      | Test taste perception on the posterior one third of the tongue or pharynx; the client should be able to taste bitter and sour tastes. Inspect the soft palate and watch for symmetrical elevation when the client says "aaah." Touch the posterior pharyngeal wall with a tongue depressor to elicit the gag reflex.  |
| Cranial nerve X: Vagus<br>Sensory and motor<br>Controls swallowing and phonation, sensation in the exterior ear's posterior wall, and sensation behind the ear<br>Controls sensation in the thoracic and abdominal viscera<br>Usually cranial nerves IX and X are tested together       | Refer to cranial nerve IX.  |
| Cranial nerve XI: Spinal accessory<br>Motor<br>Controls strength of neck and shoulder muscles   | The nurse palpates and inspects the sternocleidomastoid muscle as the client pushes the chin against the nurse's hand. The nurse palpates and inspects the trapezius muscle as the client shrugs the shoulders against the nurse's resistance.  |
| Cranial nerve XII: Hypoglossal<br>Motor<br>Controls tongue movements involved in swallowing and speech  | Observe the tongue for asymmetry, atrophy, deviation to one side, and fasciculations (uncontrollable twitching). Ask the client to push the tongue against a tongue depressor, then have the client move the tongue rapidly in and out and from side to side.   |

normally the client can maintain posture and balance.

- c. If appropriate, ask the client to perform a shallow knee bend or to hop in place on one leg and then the other.
10. Coordination
    - a. Assess by asking the client to perform rapid alternating movements of the hands (e.g., turning the hands over and patting the knees continuously).
    - b. The nurse asks the client to touch the nurse's finger, then his or her own nose; the client keeps the eyes open and the nurse moves the finger to different spots to ensure that the client's movements are smooth and accurate.
    - c. Heel-to-shin test: Assist the client into a supine position, then ask the client to place the heel on the opposite knee and run it down the shin; normally the client moves the heel down the shin in a straight line.
  11. Sensory function
    - a. Pain: Assess by applying an object with a sharp point and one with a dull point to the client's body in random order; ask the client to identify the sharp and dull feelings.
    - b. Light touch: Brush a piece of cotton over the client's skin at various locations in a random order and ask the client to say when the touch is felt.
    - c. Vibration: Use a tuning fork to test the client's ability to feel vibrations over bony prominences; ask the client to announce when the vibration starts and stops.
    - d. Position sense (kinesthesia): Move the client's finger or toe up or down and ask the client which way it has been moved; this tests the client's ability to perceive passive movement.
    - e. Stereognosis: Tests the client's ability to recognize objects placed in his or her hand
    - f. Graphesthesia: Tests the client's ability to identify a number traced on the client's hand
    - g. Two-point discrimination: Tests the client's ability to discriminate two simultaneous pinpricks on the skin
  12. Deep tendon reflexes
    - a. Includes testing the following reflexes: Biceps, triceps, brachioradialis, patella, achilles
    - b. Limb should be relaxed.
    - c. The tendon is tapped quickly with a reflex hammer, which should cause contraction of muscle.
    - d. Scoring deep tendon reflex activity (Box 34-10).
  13. Plantar reflex
    - a. A cutaneous (superficial) reflex is tested with a pointed but not sharp object.

### Box 34-10 Scoring Deep Tendon Reflex Activity

|    |  |
|----|--|
| 0  | = No response  |
| 1+ | = Sluggish or diminished   |
| 2+ | = Active or expected response  |
| 3+ | = Slightly hyperactive, more brisk than normal; not necessarily pathologic |
| 4+ | = Brisk, hyperactive with intermittent clonus associated with disease      |

Modified from Wilson, A. F., & Giddens, J. F. (2009). *Health assessment for nursing practice* (4th ed., p. 387). St. Louis: Mosby.

- b. The sole of the client's foot is stroked from the heel, up the lateral side, and then across the ball of the foot to the medial side.
- c. The normal response is plantar flexion of all toes.

 **Dorsiflexion of the great toe and fanning of the other toes (Babinski's sign) is abnormal in anyone older than 2 years and indicates the presence of central nervous system disease.**

14. Client teaching
  - a. Client should avoid exposure to environmental hazards (e.g., insecticides, lead).
  - b. High-risk behaviors that can result in head and spinal cord injuries should be avoided.
  - c. Protective devices (e.g., a helmet, body pads) should be worn when participating in high-risk behaviors.
- L. Female genitalia and reproductive tract
  1. **Subjective data:** Urinary difficulties or symptoms such as frequency, urgency, or burning, vaginal discharge, pain, menstrual and obstetrical histories, onset of menopause, medications being taken, sexual activity and the use of contraceptives, history of sexually transmitted infections
  2. **Objective data**
    - a. Use a calm and relaxing approach; the examination is embarrassing for many women and may be a difficult experience for an adolescent.
    - b. Consider the client's cultural background and her beliefs with regard to examination of the genitalia.
    - c. A complete examination will include the external genitalia and a vaginal examination.
    - d. The nurse's role is to prepare the client for the examination and to assist the physician, nurse practitioner, or nurse midwife.
    - e. The client is asked to empty her bladder before the examination.
    - f. The client is placed in the lithotomy position, and a drape is placed across the client

3. External genitalia
  - a. Quantity and distribution of hair
  - b. Characteristics of labia majora and minora (make note of any inflammation, edema, lesions, or lacerations)
  - c. Urethral orifice is observed for color and position.
  - d. Vaginal orifice (introitus) is inspected for inflammation, edema, discoloration, discharge, and lesions.
  - e. The examiner may check Skene's and Bartholin's glands for tenderness or discharge (if discharge is present, color, odor, and consistency are noted and a culture of the discharge is obtained).
  - f. The client is assessed for the presence of a cystocele (a portion of the vaginal wall and bladder prolapse or fall into the orifice anteriorly) or a rectocele (bulging of the posterior wall of the vagina caused by prolapse of the rectum).
4. Speculum examination of the internal genitalia
  - a. Performed by the physician, nurse practitioner, or nurse midwife
  - b. Permits visualization of the cervix and vagina
  - c. Papanicolaou smear: A painless screening test for cervical cancer is done; the specimen is obtained during the speculum examination, and the nurse helps prepare the specimen for laboratory analysis.
5. Client teaching
  - a. Stress the importance of personal hygiene.
  - b. Explain the purpose and recommended frequency of Papanicolaou (Pap) tests.
  - c. Explain the signs of sexually transmitted infections.
  - d. Educate the client on the measures to prevent a sexually transmitted infection.
  - e. Inform the client with a sexually transmitted infection that she must inform her sexual partner of the need for an examination.

#### M. Male genitalia

1. **Subjective data:** Urinary difficulty (e.g., frequency, urgency, hesitancy or straining, dysuria, nocturia), pain, lesions, or discharge on or from the penis, pain or lesions in the scrotum, medications being taken, sexual activity and the use of contraceptives, history of sexually transmitted infections
2. **Objective data**
  - a. Includes assessment (**inspection** and **palpation**) of the external genitalia and inguinal ring and canal
  - b. Client may stand or lie down for this examination.
  - c. Genitalia are manipulated gently to avoid causing erection or discomfort.
  - d. Sexual maturity is assessed by noting the size and shape of the penis and testes, the color

- e. The penis is checked for the presence of lesions or discharge; a culture is obtained if a discharge is present.
- f. The scrotum is inspected for size, shape, and symmetry (normally the left testicle hangs lower than the right) and is palpated for the presence of lumps.
- g. Inguinal ring and canal; **inspection** (asking the client to bear down) and **palpation** are performed to assess for the presence of a hernia.

#### 3. Client teaching

- a. Stress the importance of personal hygiene.
- b. Teach the client how to perform testicular self-examination (TSE); a day of the month is selected and the exam is performed on the same day each month after a shower or bath when the hands are warm and soapy and the scrotum is warm. (Refer to Chapter 52 for information on performing the TSE.)
- c. Explain the signs of sexually transmitted infections.
- d. Educate the client on measures to prevent sexually transmitted infections.
- e. Inform the client with a sexually transmitted infection that he must inform his sexual partner of the need for an examination.

#### N. Rectum and anus

1. **Subjective data:** Usual bowel pattern; any change in bowel habits; rectal pain, bleeding from the rectum, or black or tarry stools; dietary habits; problems with urination; previous screening for colorectal cancer; medications being taken; history of rectal or colon problems; family history of rectal or colon problems
2. **Objective data**
  - a. Examination can detect colorectal cancer in its early stages; in men, the rectal examination can also detect prostate tumors.
  - b. Women may be examined in the lithotomy position after examination of the genitalia.
  - c. A man is best examined by having the client bend forward with his hips flexed and upper body resting over the examination table.
  - d. A nonambulatory client may be examined in the left lateral (Sims') position.
  - e. The external anus is inspected for lumps or lesions, rashes, inflammation or excoriation, scars, or hemorrhoids.
  - f. Digital examination will most likely be performed by the physician or nurse practitioner.
  - g. Digital examination is performed to assess sphincter tone; to check for tenderness, irregularities, polyps, masses, or nodules in the rectal wall; and to assess the prostate gland

- h. The prostate gland is normally firm, without boggy, tenderness, or nodules (hardness or nodules may indicate the presence of a cancerous lesion).
3. Client teaching
- Diet should include high-fiber and low fat foods and plenty of liquids.
  - The client should obtain regular digital examinations.
  - Identify the symptoms of colorectal cancer or prostatic cancer (men).
  - The client should follow the American Cancer Society's guidelines for screening for colorectal cancer.

## VI. DOCUMENTING HEALTH AND PHYSICAL ASSESSMENT FINDINGS

- Documentation of findings may be either written or recorded electronically (depending on agency protocol).
- Whether written or electronic, the documentation is a legal document and a permanent record of the client's health status.
- Principles of documentation need to be followed and data need to be recorded accurately, concisely, completely, legibly, and objectively without bias or opinions; always follow agency protocol for documentation.
- Documentation findings serve as a source of client information for other health care providers.
- Record findings about the client's health history and physical examination as soon as possible after completion of the health assessment.
- Refer to Chapter 7 for additional information about documentation guidelines.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

346. A Spanish-speaking client arrives at the triage desk in the emergency department and states to the nurse, "No speak English, need interpreter." What is the best action for the nurse to take?
- Have one of the client's family members interpret.
  - Have the Spanish speaking triage receptionist interpret.
  - Page an interpreter from the hospital's interpreter services.
  - Obtain a Spanish-English dictionary and attempt to triage the client.
347. A client with a diagnosis of asthma is admitted to the hospital with respiratory distress. What type of adventitious lung sounds would the nurse expect to hear when performing a respiratory assessment on this client?
- Stridor
  - Crackles
  - Wheezes
  - Diminished
348. The nurse is performing a neurological assessment on a client and elicits a positive Romberg's sign. The nurse makes this determination based on which observation?
- An involuntary rhythmic, rapid, twitching of the eyeballs.
  - A dorsiflexion of the ankle and great toe with fanning of the other toes.
  - A significant sway when the client stands erect with feet together, arms at the side, and the eyes closed.
  - A lack of normal sense of position when the client is unable to return extended fingers to a point of reference.
349. The nurse notes documentation that a client is exhibiting Cheyne-Stokes respirations. On assessment of the client, the nurse expects to note which of the following?
- Rhythmic respirations with periods of apnea
  - Regular rapid and deep, sustained respirations
  - Totally irregular respiration in rhythm and depth
  - Irregular respirations with pauses at the end of inspiration and expiration
350. The nurse notes documentation that a client has conductive hearing loss. The nurse understands that this type of hearing loss is caused by which of the following?
- A defect in the cochlea.
  - A defect in the 8th cranial nerve.
  - A physical obstruction to the transmission of sound waves.
  - A defect in the sensory fibers that lead to the cerebral cortex.
351. While performing a cardiac assessment on a client with an incompetent heart valve, the nurse auscultates a murmur. Which of the following best describes the sound of a heart murmur?
- Lub-dub sounds
  - Scratchy, leathery heart noise
  - Gentle, blowing or swooshing noise
  - Abrupt, high-pitched snapping noise
352. The nurse is testing the extraocular movements in a client to assess for muscle weakness in the eyes. The nurse implements which physical

assessment technique to assess for muscle weakness in the eye?

1. Tests the corneal reflexes
2. Tests the six cardinal positions of gaze.
3. Tests visual acuity using a Snellen eye chart
4. Tests sensory function by asking the client to close eyes and then lightly touching the forehead, cheeks, and chin.

**353.** The nurse is instructing a client how to perform a testicular self-examination (TSE). The nurse explains that the best time to perform this exam is:

1. After a shower or bath
2. While standing to void
3. After having a bowel movement
4. While lying in bed before arising

**354.** The nurse is assessing a client for meningeal irritation and elicits a positive Brudzinski's sign. Which finding did the nurse observe?

1. The client rigidly extends the arms with pronated forearms and plantar flexion of the feet.
2. The client flexes a leg at the hip and knee and reports pain in the vertebral column when the leg is extended.

3. The client passively flexes the hip and knee in response to neck flexion and reports pain in the vertebral column.
4. The client's upper arms are flexed and held tightly to the sides of the body and the legs are extended and internally rotated.

### Alternate Item Format: Multiple Response

**355.** The clinic nurse prepares to perform a focused assessment on a client who is complaining of symptoms of a cold, a cough, and lung congestion. Which of the following would the nurse include for this type of assessment? **Select all that apply.**

- 1. Auscultating lung sounds
- 2. Obtaining the client's temperature
- 3. Assessing the strength of peripheral pulses
- 4. Obtaining information about the client's respirations
- 5. Performing a musculoskeletal and neurological examination
- 6. Asking the client about a family history of any illness or disease

## ANSWERS

### 346. 3

**Rationale:** The best action is to have a professional hospital-based interpreter translate for the client. English-speaking family members may not appropriately understand what is asked of them and may paraphrase what the client is actually saying. Also, client confidentiality as well as accurate information may be compromised when a family member or a non-health care provider acts as interpreter.

**Test-Taking Strategy:** Note the strategic word *best*. Initially focus on what the client needs. In this case the client needs and asks for an interpreter. Next keep in mind the issue of confidentiality and making sure that information is obtained in the most efficient and accurate way. This will assist in eliminating options 1, 2, and 4. Review the best nursing actions to take to obtain data from a non-English-speaking client if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Adult Health—Health Assessment/Physical Exam

**Reference:** Jarvis, C. (2008). *Physical examination and health assessment* (5th ed., p. 37). St. Louis: Saunders.

### 347. 3

**Rationale:** Asthma is a respiratory disorder characterized by recurring episodes of dyspnea, constriction of the bronchi, and wheezing. Wheezes are described as high-pitched musical sounds heard when air passes through an obstructed or narrowed lumen of a respiratory passageway. Stridor is a harsh

sound noted with an upper airway obstruction and often signals a life-threatening emergency. Crackles are produced by air passing over retained airway secretions or fluid, or the sudden opening of collapsed airways. Diminished lung sounds are heard over lung tissue where poor oxygen exchange is occurring.

**Test-Taking Strategy:** Note the client's diagnosis and think about the pathophysiology that occurs in this disorder. Recalling that bronchial constriction occurs will assist in directing you to option 3. Also, thinking about the definition of each adventitious lung sound identified in the options will direct you to option 3. Review the characteristics of adventitious lung sounds if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Health Assessment/Physical Exam

**Reference:** Wilson, S., & Giddens, J. (2009). *Health assessment for nursing practice* (4th ed., p. 221). St. Louis: Mosby.

### 348. 3

**Rationale:** In Romberg's test, the client is asked to stand with the feet together and the arms at the sides, and to close the eyes and hold the position; normally the client can maintain posture and balance. A positive Romberg's sign is a vestibular neurological sign that is found when a client exhibits a loss of balance when closing the eyes. This may occur with cerebellar ataxia, loss of proprioception, and loss of vestibular function. A lack of normal sense of position coupled with an inability to return extended fingers to a point of reference is a finding that indicates a problem with coordination. A positive gage

nystagmus evaluation results in an involuntary rhythmic, rapid, twitching of the eyeballs. A positive Babinski's test results in dorsiflexion of the ankle and great toe with fanning of the other toes; if this occurs in anyone older than 2 years it indicates the presence of central nervous system disease.

**Test-Taking Strategy:** Specific knowledge regarding the technique for performing the Romberg test is needed to answer this question. You can easily answer this question if you can recall that the client's balance is tested in this test. Review the procedure for performing Romberg's test and the purpose of the test if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Health Assessment/Physical Exam

**Reference:** Wilson, S., & Giddens, J. (2009). *Health assessment for nursing practice* (4th ed., p. 383). St. Louis: Mosby.

### 349. 1

**Rationale:** Cheyne-Stokes respirations are rhythmic respirations with periods of apnea and can indicate a metabolic dysfunction in the cerebral hemisphere or basal ganglia. Neurogenic hyperventilation is a regular, rapid and deep, sustained respiration that can indicate a dysfunction in the low midbrain and middle pons. Ataxic respirations are totally irregular in rhythm and depth and indicate a dysfunction in the medulla. Apneustic respirations are irregular respirations with pauses at the end of inspiration and expiration and can indicate a dysfunction in the middle or caudal pons.

**Test-Taking Strategy:** Focus on the subject, the characteristics of Cheyne-Stokes respirations. Recalling that periods of apnea occur with this type of respiration will help direct you to correctly answer this question. Review the characteristics of Cheyne-Stokes respirations if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Health Assessment/Physical Exam

**Reference:** Jarvis, C. (2008). *Physical examination and health assessment* (5th ed., p. 469). St. Louis: Saunders.

### 350. 3

**Rationale:** A conductive hearing loss occurs as a result of a physical obstruction to the transmission of sound waves. A sensorineural hearing loss occurs as a result of a pathological process in the inner ear, a defect in the 8th cranial nerve, or a defect of the sensory fibers that lead to the cerebral cortex.

**Test-Taking Strategy:** Focus on the subject, a conductive hearing loss. Noting the relationship of the word *conductive* in the question and *transmission* in option 3 will direct you to this option. Review the causes of a conductive and a sensorineural hearing loss if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Health Assessment/Physical Exam

**Reference:** Jarvis, C. (2008). *Physical examination and health assessment* (5th ed., pp. 370–372). St. Louis: Saunders.

### 351. 3

**Rationale:** A heart murmur is an abnormal heart sound and is described as a gentle, blowing, swooshing sound. Lub-dub sounds are normal and represent the S1 (first heart sound) and S2 (second heart sound), respectively. A pericardial friction rub is described as a scratchy, leathery heart sound. A click is described as an abrupt, high-pitched snapping sound.

**Test-Taking Strategy:** Focus on the subject, characteristics of a murmur. Eliminate option 1 because it describes normal heart sounds. Next use the process of elimination recalling that a murmur occurs as a result of the manner in which the blood is flowing through the cardiac chambers and valves. This will direct you to option 3. Review the characteristics of a murmur if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Health Assessment/Physical Exam

**References:** Jarvis, C. (2008). *Physical examination and health assessment* (5th ed., p. 488). St. Louis: Saunders.

Wilson, S., & Giddens, J. (2009). *Health assessment for nursing practice* (4th ed., p. 264). St. Louis: Mosby.

### 352. 2

**Rationale:** Testing the six cardinal positions of gaze is done to assess for muscle weakness in the eyes. The client is asked to hold the head steady, then to follow movement of an object through the positions of gaze. The client should follow the object in a parallel manner with the two eyes. A Snellen eye chart assesses visual acuity and cranial nerve II (optic). Testing sensory function by having the client close his or her eyes and then lightly touching areas of the face and testing the corneal reflexes assess cranial nerve V (trigeminal).

**Test-Taking Strategy:** Focus on the subject, assessing for muscle weakness in the eyes. Note the relationship between the words *extraocular movements* in the question and *positions of gaze* in the correct option. Review the physical assessment technique for assessing for muscle weakness in the eyes if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Health Assessment/Physical Exam

**Reference:** Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 1078). St. Louis: Saunders.

### 353. 1

**Rationale:** The nurse needs to teach the client how to perform a testicular self-examination (TSE). The nurse should instruct the client to perform the exam on the same day each month. The nurse should also instruct the client that the best time to perform a TSE is after a shower or bath when the hands are warm and soapy and the scrotum is warm. Palpation is easier and the client will be better able to identify any abnormalities. The client would stand to perform the

exam, but it would be difficult to perform the exam while voiding. Having a bowel movement is unrelated to performing the TSE.

**Test-Taking Strategy:** Think about the purpose of the TSE and visualize this assessment technique. Review the instructions for performing the TSE if you had difficulty with this question. Eliminate option 3 because having a bowel movement is unrelated to performing the TSE. Next eliminate options 2 and 4 because it would be difficult to perform this self-exam while lying down or during voiding.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Adult Health—Health Assessment/Physical Exam

**Reference:** Jarvis, C. (2008). *Physical examination and health assessment* (5th ed., p. 727). St. Louis: Saunders.

### 354. 3

**Rationale:** Brudzinski's sign is tested with the client in the supine position. The nurse flexes the client's head (gently moves the head to the chest) and there should be no reports of pain or resistance to the neck flexion. A positive Brudzinski's sign is observed if the client passively flexes the hip and knee in response to neck flexion and reports pain in the vertebral column. Kernig's sign also tests for meningeal irritation and is positive when the client flexes the legs at the hip and knee and complains of pain along the vertebral column when the leg is extended. Decorticate posturing is abnormal flexion and is noted when the client's upper arms are flexed and held tightly to the sides of the body and the legs are extended and internally rotated. Decerebrate posturing is abnormal extension and occurs when the arms are fully extended, forearms pronated, wrists and fingers flexed, jaws clenched, neck extended, and feet plantar-flexed.

**Test-Taking Strategy:** Focus on the subject: a positive Brudzinski's sign. Recalling that a positive sign is elicited if the client reports pain will assist in eliminating options 1 and 4. Next it is necessary to know that a positive Brudzinski's sign is observed if the client passively flexes the hip and knee in response to neck flexion and reports pain in the vertebral column. Review the findings in a positive Brudzinski's sign if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Health Assessment/Physical Exam

**Reference:** Wilson, S., & Giddens, J. (2009). *Health assessment for nursing practice* (4th ed., p. 392). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 355. 1, 2, 4

**Rationale:** A focused assessment focuses on a limited or short-term problem, such as the client's complaint. Because the client is complaining of symptoms of a cold, a cough, and lung congestion, the nurse would focus on the respiratory system and the presence of an infection. A complete assessment includes a complete health history and physical examination and forms a baseline database. Assessing the strength of peripheral pulses relates to a vascular assessment, which is not related to this client's complaints. A musculoskeletal and neurological examination also is not related to this client's complaints. However strength of peripheral pulses and a musculoskeletal and neurological examination would be included in a complete assessment. Likewise, asking the client about a family history of any illness or disease would be included in a complete assessment.

**Test-Taking Strategy:** Note the strategic words *focused assessment*: Noting that the client's symptoms relate to the respiratory system and the presence of an infection will direct you to options 1, 2, and 4. Review the types of health and physical assessments and the components of a focused assessment if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Adult Health—Health Assessment/Physical Exam

**Reference:** Wilson, S., & Giddens, J. (2009). *Health assessment for nursing practice* (4th ed., p. 3). St. Louis: Mosby.

# Care of the Older Client

## I. AGING AND GERONTOLOGY

- A. Aging is the biopsychosocial process of change that occurs in a person between birth and death.
- B. Gerontology is the study of the aging process.

## II. PHYSIOLOGICAL CHANGES

### A. Integumentary system

- 1. Loss of pigment in hair and skin
- 2. Wrinkling of the skin
- 3. Thinning of the epidermis and easy bruising and tearing of the skin (Fig. 35-1)
- 4. Decreased skin turgor, elasticity, and subcutaneous fat
- 5. Increased nail thickness and decreased nail growth
- 6. Decreased perspiration
- 7. Dry, itchy, scaly skin
- 8. Seborrheic dermatitis and keratosis formation (overgrowth and thickening of the skin)

### B. Neurological system

- 1. Slowed reflexes
- 2. Slight tremors and difficulty with fine motor movement
- 3. Loss of balance
- 4. Increased incidence of awakening after sleep onset
- 5. Increased susceptibility to hypothermia and hyperthermia
- 6. Short-term memory decline possible
- 7. Long-term memory usually maintained

### C. Musculoskeletal system

- 1. Decreased muscle mass and strength and atrophy of muscles
- 2. Decreased mobility, range of motion, flexibility, coordination, and stability
- 3. Change of gait, with shortened step and wider base
- 4. Posture and stature changes causing a decrease in height (Fig. 35-2)
- 5. Increased brittleness of the bones
- 6. Deterioration of joint capsule components
- 7. Kyphosis of the dorsal spine (increased convexity in the curvature of the spine)

 The older client is at risk for falls because of the changes that occur in the neurological and musculoskeletal systems.

### D. Cardiovascular system

- 1. Diminished energy and endurance, with lowered tolerance to exercise
- 2. Decreased compliance of the heart muscle, with heart valves becoming thicker and more rigid
- 3. Decreased cardiac output and decreased efficiency of blood return to the heart
- 4. Decreased compensatory response, so less able to respond to increased demands on the cardiovascular system
- 5. Decreased resting heart rate
- 6. Weak peripheral pulses
- 7. Increased blood pressure but susceptibility to postural hypotension

### E. Respiratory system

- 1. Decreased stretch and compliance of the chest wall
- 2. Decreased strength and function of respiratory muscles
- 3. Decreased size and number of alveoli
- 4. The respiratory rate usually remains unchanged
- 5. Decreased depth of respirations and oxygen intake
- 6. Decreased ability to cough and expectorate sputum

### F. Hematological system

- 1. Hemoglobin and hematocrit average levels toward the low end of normal
- 2. Prone to increased blood clotting
- 3. Decreased protein available for protein-bound medications

### G. Immune system

- 1. Tendency for lymphocyte counts to be low with altered immunoglobulin production
- 2. Decreased resistance to infection and disease

### H. Gastrointestinal system

- 1. Decreased need for calories because of lowered basal metabolic rate
- 2. Decreased appetite, thirst, and oral intake
- 3. Decreased lean body weight
- 4. Decreased stomach emptying time
- 5. Increased tendency toward constipation

▲ **FIGURE 35-1** Paper-thin, transparent skin. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care*. [6th ed., p. 465]. St. Louis: Saunders.)

▲ **FIGURE 35-2** A normal spine at age 40 years of age and osteoporotic changes at 60 and 70 years of age. These changes can cause a loss of as much as 6 inches in height and can result in the so-called dowager's hump (far right) in the upper thoracic vertebrae. (From Ignatavicius, D., & Workman, M. [2010]. *Medical-surgical nursing: Patient-centered collaborative care*. [6th ed., p. 1156]. St. Louis: Saunders.)

#### J. Renal system

1. Decreased kidney size, function, and ability to concentrate urine
2. Decreased glomerular filtration rate
3. Decreased capacity of the bladder
4. Increased residual urine and increased incidence of infection and possibly incontinence
5. Impaired medication excretion

#### K. Reproductive system

1. Decreased testosterone production and decreased size of the testes
2. Changes in the prostate gland, leading to urinary problems
3. Decreased secretion of hormones with the cessation of menses
4. Vaginal changes, including decreased muscle tone and lubrication
5. Impotence or sexual dysfunction for both genders; sexual function varies and depends on general physical condition, mental health status, and medications

#### L. Special senses

1. Decreased visual acuity
2. Decreased accommodation in eyes, requiring increased adjustment time to changes in light
3. Decreased peripheral vision and increased sensitivity to glare
4. Presbyopia and cataract formation
5. Possible loss of hearing ability; low-pitched tones are heard more easily
6. Inability to discern taste of food
7. Decreased sense of smell
8. Changes in touch sensation
9. Decreased pain awareness

### III. PSYCHOSOCIAL CONCERNS

- A. Adjustment to deterioration in physical and mental health and well-being
- B. Threat to independent functioning and fear of becoming a burden to loved ones
- C. Adjustment to retirement and loss of income
- D. Loss of skills and competencies developed early in life
- E. Coping with changes in role function and social life
- F. Diminished quantity and quality of relationships and coping with loss
- G. Dependence on governmental and social systems
- H. Access to social support systems
  - I. Costs of health care and medications

### IV. MENTAL HEALTH CONCERNS (Box 35-1)

- A. **Depression:** The increased dependency that older adults may experience can lead to hopelessness, helplessness, lowered sense of self-control, and decreased self-esteem and self-worth; these changes can interfere with daily functioning and lead to **depression**.

6. Increased susceptibility for dehydration

7. Tooth loss

8. Difficulty in chewing and swallowing food

#### I. Endocrine system

1. Decreased secretion of hormones, with specific changes related to each hormone's function
2. Decreased metabolic rate
3. Decreased glucose tolerance, with resistance to insulin in peripheral tissues

**Box 35-1 Mental Health Concerns**

Depression  
Grief  
Isolation  
Suicide

- B.** Grief: Client reacts to the perception of loss, including physical, psychological, social, and spiritual aspects.
- C.** Isolation: Client is alone and desires contact with others but is unable to make that contact.
- D.** Suicide: **Depression** can lead to thoughts of self-harm.

 Any suicide threat from an older client should be taken seriously.

 **V. PAIN****A.** Description

1. Pain can occur from numerous causes and most often occurs from degenerative changes in the musculoskeletal system.
2. The failure to alleviate pain in the older client can lead to functional limitations affecting his or her ability to function independently.

 **B.** Assessment

1. Restlessness
2. Verbal reporting of pain
3. Agitation
4. Moaning
5. Crying

 **C.** Interventions

1. Monitor the client for signs of pain.
2. Identify the pattern of pain.
3. Identify the precipitating factor(s) for the pain.
4. Monitor the impact of the pain on activities of daily living.
5. Provide pain relief through measures such as distraction, relaxation, massage, and biofeedback.
6. Administer pain medication as prescribed, and instruct the client in its use.
7. Evaluate the effects of pain-reducing measures.

 **VI. INFECTION** (Box 35-2)

- A.** Confusion is a common sign of infection in the older adult, especially infection of the urinary tract.
- B.** Carefully monitor the older adult with infection because of the diminished and altered immune response.
- C.** Nonspecific symptoms may indicate illness or infection (see Box 35-2).

 **VII. MEDICATIONS**

- A.** Major problems with prescriptive medications include adverse effects, medication interactions, medication errors, noncompliance, and cost.

**Box 35-2 Nonspecific Symptoms That Possibly Indicate Illness or Infection**

|                              |                     |
|------------------------------|---------------------|
| Apathy                       | Fatigue             |
| Anorexia                     | Incontinence        |
| Changes in functional status | Self-neglect        |
| Confusion                    | Shortness of breath |
| Dyspnea                      | Tachypnea           |
| Falling                      | Vital sign changes  |

- B.** Determine the use of over-the-counter medications. 

**C. Polypharmacy**

1. Routinely monitor the number of prescription and nonprescription medications used and determine whether any can be eliminated or combined.
2. Keep the use of medications to a minimum.
3. Overprescribing medications leads to increased problems with more side effects, increased interaction between medications, replication of medication treatment, diminished quality of life, and increased costs.

- D.** Medication dosages normally are prescribed at one third to one half of normal adult dosages.

- E.** Closely monitor the client for adverse effects and response to therapy because of the increased risk for medication toxicity. 

- F.** Assess for medication interactions in the client taking multiple medications.

- G.** Advise the client to use one pharmacy and notify the consulting physician(s) of the medications taken. 

 A common sign of an adverse reaction to a medication in the older client is an acute change in mental status.

**H. Administration of medications** 

1. The client should be in a sitting position when taking medication.
2. The mouth is checked for dryness because medication may stick and dissolve in the mouth.
3. Liquid preparations can be used if the client has difficulty swallowing tablets.
4. Tablets can be crushed if necessary and given with textured food (nectar, applesauce) if not contraindicated.
5. Enteric-coated tablets are not crushed and capsules are not opened.
6. If administering a suppository, avoid inserting the suppository immediately after removing it from the refrigerator; a suppository may take

a while to dissolve because of decreased body core temperature.

7. When administering parenteral solution or medication, monitor the site, because it may ooze or bleed because of decreased tissue elasticity; an immobile limb is not used for administering parenteral medication.
8. Monitor client compliance with taking prescribed medications.
9. Monitor the client for **safety** in correctly taking medications, including an assessment of their ability to read the instructions and discriminate among the pills and their color and shape.
10. Use a medication cassette to facilitate proper administration of medication.

### VIII. ABUSE OF THE OLDER ADULT

- A. **Abuse** involves physical, emotional, or sexual **abuse** and also can involve **neglect** or economic exploitation.
  - B. Categories of mistreatment to the older client.
    1. Domestic mistreatment takes place in the home of the older adult and is usually carried out by a family member or significant other; this can include physical maltreatment, **neglect**, or abandonment.
    2. Institutional mistreatment takes place when an older adult experiences **abuse** when hospitalized or living somewhere other than home (e.g., long-term care facility).
    3. **Self-neglect** is the choice by a mentally competent individual to avoid medical care or other services that could improve optimal function, lack caring for oneself, and engage in actions that negatively affect his or her personal **safety**; unless declared legally incompetent, an individual has the right to refuse care.
-  **Individuals at most risk for abuse include those who are dependent because of their immobility or altered mental status.**
- C. Factors that contribute to **abuse** and **neglect** include long-standing family violence, caregiver stress, and the individual's increasing dependence on others.
  - D. Abusers tend to be male, engage in substance **abuse**, and have a mental illness or **dementia**; in addition, they tend to depend on the older client for financial assistance or other resources.
  - E. Victims may attempt to dismiss injuries as accidental, and abusers may prevent victims from receiving proper medical care to avoid discovery.
  - F. Victims often are isolated socially by their abusers.
  - G. For additional information on **abuse** of the older client, see Chapter 76.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

356. The nurse is providing medication instructions to an older client who is taking digoxin (Lanoxin) daily. The nurse notes that which age-related body changes could place the client at risk for digoxin toxicity?
  1. Decreased muscle strength and loss of bone density
  2. Decreased cough efficiency and decreased vital capacity
  3. Decreased salivation and decreased gastrointestinal motility
  4. Decreased lean body mass and decreased glomerular filtration rate
357. The nurse employed in a long-term care facility is caring for an older male client. Which nursing action contributes to encouraging autonomy in the client?
  1. Planning his meals
  2. Decorating his room
  3. Scheduling his barber appointments
  4. Allowing him to choose social activities
358. The home care nurse is visiting an older female client whose husband died 6 months ago. Which behavior by the client indicates ineffective coping?
  1. Neglecting her personal grooming
  2. Looking at old snapshots of her family
  3. Participating in a senior citizens' program
  4. Visiting her husband's grave once a month
359. The nurse is providing instructions to a nursing assistant regarding care of an older client with hearing loss. The nurse tells the assistant that clients with a hearing loss:
  1. Are often distracted
  2. Have middle ear changes
  3. Respond to low-pitched tones
  4. Develop moist cerumen production
360. The nurse is providing an educational session to new employees, and the topic is abuse of the older client. The nurse helps the employees identify that which client is most typical of a victim of abuse?
  1. A 75-year-old man who has moderate hypertension
  2. A 68-year-old man who has newly diagnosed cataracts
  3. A 90-year-old woman who has advanced Parkinson's disease
  4. A 70-year-old woman who has early diagnosed Lyme disease

- 361.** The nurse is performing an assessment on an older client who is having difficulty sleeping at night. Which statement, if made by the client, indicates that teaching about improving sleep is necessary?
1. "I swim three times a week."
  2. "I have stopped smoking cigars."
  3. "I drink hot chocolate before bedtime."
  4. "I read for 40 minutes before bedtime."
- 362.** The visiting nurse observes that the older male client is confined by his daughter-in-law to his room. When the nurse suggests that he walk to the den and join the family, he says, "I'm in everyone's way; my daughter-in-law needs me to stay here." The most important action for the nurse to take is to:
1. Say nothing, because it is best for the nurse to remain neutral and wait to be asked for help.
  2. Suggest to the client and daughter-in-law that they consider a nursing home for the client.
  3. Say to the daughter-in-law, "Confining your father-in-law to his room is inhuman."
  4. Suggest appropriate resources to the client and daughter-in-law, such as respite care and a senior citizens' center.
- 363.** The nurse is performing an assessment on an older adult client. Which assessment data would indicate a potential complication associated with the skin of this client?
1. Crusting
  2. Wrinkling
  3. Deepening of expression lines
  4. Thinning and loss of elasticity in the skin
- 364.** The home health nurse is visiting a client for the first time. While assessing the client's medication, it is noted that there are at least 19 prescription and several over-the-counter medications that the client has been taking. Which intervention should the nurse take first?
1. Check for drug-drug interactions.
  2. Determine whether there are any adverse side effects.
  3. Determine whether there are medication duplications.
  4. Call the prescribing physician and report any polypharmacy.

### Alternate Item Format: Multiple Response

- 365.** Which of the following are normal age-related physiological changes? **Select all that apply.**
- 1. Increased heart rate
  - 2. Decline in visual acuity
  - 3. Decreased respiratory rate
  - 4. Decline in long-term memory
  - 5. Increased susceptibility to urinary tract infections
  - 6. Increased incidence of awakening after sleep onset

## ANSWERS

### 356. 4

**Rationale:** The older client is at risk for medication toxicity because of decreased lean body mass and an age-associated decreased glomerular filtration rate. Although options 1, 2, and 3 identify age-related changes that occur in the older client, they are not associated specifically with this risk.

**Test-Taking Strategy:** Use the process of elimination and focus on the subject age-related body changes that could place the client at risk for medication toxicity. Note that option 4 is the only option that addresses renal excretion. If you had difficulty with this question, review the physiological changes associated with aging and those that place the older client at risk for medication toxicity.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Developmental Stages

**References:** Ebersole, P., Hess, P., Touhy, T., Jett, K., & Luggen, A. (2008). *Toward healthy aging* (7th ed., p. 309). St. Louis: Mosby.

Ignatavicius, D., & Workman, M. (2010). *Medical-surgical nursing: Patient-centered collaborative care* (6th ed., p. 19). St. Louis: Saunders.

Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., pp. 510–511). St. Louis: Mosby.

### 357. 4

**Rationale:** Autonomy is the personal freedom to direct one's own life as long as it does not impinge on the rights of others. An autonomous person is capable of rational thought. This individual can identify problems, search for alternatives, and select solutions that allow continued personal freedom as long as others and their rights and property are not harmed. Loss of autonomy, and therefore independence, is a real fear of older clients. Option 4 is the only option that allows the client to be a decision maker.

**Test-Taking Strategy:** Use the process of elimination, focusing on the subject encouraging autonomy. Recalling the definition of autonomy will direct you to the correct option. Remember that giving the client choices is essential to promote independence. Review the concept of autonomy as it relates to the older client if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Caring

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., pp. 9–10, 314, 348). St. Louis: Mosby.

### 358. 1

**Rationale:** Coping mechanisms are behaviors used to decrease stress and anxiety. In response to a death, ineffective coping is manifested by an extreme behavior that in some cases may be harmful to the individual physically or psychologically. Option 1 is indicative of a behavior that identifies an ineffective coping behavior in the grieving process.

**Test-Taking Strategy:** Note the subject, an ineffective coping behavior. Eliminate options 2, 3, and 4 because they are comparable or alike and are positive activities in which the individual is engaging to get on with her life. Review coping mechanisms in response to grief and loss if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Mental Health

**References:** Ebersole, P., Hess, P., Touhy, T., Jett, K., & Luggen, A. (2008). *Toward healthy aging* (7th ed., p. 643). St. Louis: Mosby.

Touhy, T., & Jett, K. (2010). *Ebersole and Hess' gerontological nursing & healthy aging* (3rd ed., pp. 382–383). St. Louis: Mosby.

### 359. 3

**Rationale:** Presbycusis refers to the age-related irreversible degenerative changes of the inner ear that lead to decreased hearing ability. As a result of these changes, the older client has a decreased response to high-frequency sounds. Low-pitched voice tones are heard more easily and can be interpreted by the older client. Options 1, 2, and 4 are not accurate characteristics related to aging.

**Test-Taking Strategy:** Think about the age-related changes that occur in the older client. Recalling that the client with a hearing loss responds to low-pitched tones will direct you to option 3. If you had difficulty with this question, review the characteristics associated with presbycusis and hearing loss.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** Ebersole, P., Hess, P., Touhy, T., Jett, K., & Luggen, A. (2008). *Toward healthy aging* (7th ed., pp. 351–352). St. Louis: Mosby.

### 360. 3

**Rationale:** Elder abuse includes physical, sexual, or psychological abuse, misuse of property, and violation of rights. The typical abuse victim is a woman of advanced age with few social contacts and at least one physical or mental impairment that limits her ability to perform activities of daily living. In addition, the client usually lives alone or with the abuser and depends on the abuser for care.

**Test-Taking Strategy:** Read each option carefully and identify the client who is most defenseless as the result of the disease

process. This will direct you to option 3. If you had difficulty with this question review the characteristics associated with elder abuse.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Mental Health

**Reference:** Ebersole, P., Hess, P., Touhy, T., Jett, K., & Luggen, A. (2008). *Toward healthy aging* (7th ed., p. 453). St. Louis: Mosby.

### 361. 3

**Rationale:** Many nonpharmacological sleep aids can be used to influence sleep. However, the client should avoid caffeinated beverages and stimulants such as tea, cola, and chocolate. The client should exercise regularly, because exercise promotes sleep by burning off tension that accumulates during the day. A 20- to 30-minute walk, swim, or bicycle ride three times a week is helpful. The client should sleep on a bed with a firm mattress. Smoking and alcohol should be avoided. The client should avoid large meals; peanuts, beans, fruit, raw vegetables, and other foods that produce gas; and snacks that are high in fat because they are difficult to digest.

**Test-Taking Strategy:** Note the strategic words *that teaching about improving sleep is necessary*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Options 1, 2, and 4 are positive statements indicating that the client understands the methods of improving sleep. Review the factors that can interfere with sleep in the older client if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** Touhy, T., & Jett, K. (2010). *Ebersole and Hess' gerontological nursing & healthy aging* (3rd ed., p. 155). St. Louis: Mosby.

### 362. 4

**Rationale:** Assisting clients and families to become aware of available community support systems is a role and responsibility of the nurse. Observing that the client has begun to be confined to his room makes it necessary for the nurse to intervene legally and ethically, so option 1 is not appropriate and is passive in terms of advocacy. Option 2 suggests committing the client to a nursing home and is a premature action on the nurse's part. Although the data provided tell the nurse that this client requires nursing care, the nurse does not know the extent of the nursing care required. Option 3 is incorrect and judgmental.

**Test-Taking Strategy:** Note the strategic words *most important action*. Using principles related to the ethical and legal responsibility of the nurse and knowledge of the nurse's role will direct you to option 4. Option 1 avoids the situation, option 2 is a premature action, and option 3 is a nontherapeutic statement. Review the roles and responsibilities of the nurse in caring for the older client if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** Touhy, T., & Jett, K. (2010). *Ebersole and Hess' gerontological nursing & healthy aging* (3rd ed., pp. 452–454). St. Louis: Mosby.

### 363. 1

**Rationale:** The normal physiological changes that occur in the skin of older adults include thinning of the skin, loss of elasticity, deepening of expression lines, and wrinkling. Crusting noted on the skin would indicate a potential complication.

**Test-Taking Strategy:** Note the strategic words *potential complication*. Think about the normal physiological changes that occur in the aging process to direct you to option 1. Review these age-related skin changes if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Developmental Stages

**References:** Copstead-Kirkhorn, L., & Banasik, J. (2010). *Pathophysiology* (4th ed., p. 1227). St. Louis: Mosby.

Perry, A., & Potter, P. (2010). *Clinical nursing skills & techniques* (7th ed., p. 120). St. Louis: Mosby.

### 364. 3

**Rationale:** Polypharmacy is a concern in the older client. Duplication of medications needs to be identified before drug-drug interactions or adverse side effects can be determined because the nurse needs to know what the client is taking. The phone call to the health care provider is the intervention after all other information has been collected.

**Test-Taking Strategy:** Note the strategic word *first*. Also note that the nurse is visiting the client for the first time. Note that options 1, 2, and 3 relate to obtaining data. Therefore, think about the order of action with these options; option 3 is the first action. Options 1, 2, and 4 should be done after possible medication duplication has been identified. Review the interventions related to polypharmacy in the older client if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology

**References:** Ebersole, P., Hess, P., Touhy, T., Jett, K., & Luggen, A. (2008). *Toward healthy aging* (7th ed., pp. 301–302). St. Louis: Mosby.

Touhy, T., & Jett, K. (2010). *Ebersole and Hess' gerontological nursing & healthy aging* (3rd ed., p. 226). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 365. 2, 5, 6

**Rationale:** Anatomical changes to the eye affect the individual's visual ability, leading to potential problems with activities of daily living. Light adaptation and visual fields are reduced. Although lung function may decrease, the respiratory rate usually remains unchanged. Heart rate decreases and heart valves thicken. Age-related changes that affect the urinary tract increase an older client's susceptibility to urinary tract infections. Short-term memory may decline with age, but long-term memory usually is maintained. Change in sleep patterns is a consistent, age-related change. Older persons experience an increased incidence of awakening after sleep onset.

**Test-Taking Strategy:** Specific knowledge regarding normal age-related changes is needed to answer this question. Read each characteristic carefully and think about the physiological changes that occur with aging to select the correct items. Review the normal age-related changes if you had difficulty with this question.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Fundamental Skills—Developmental Stages

**Reference:** Potter, P., & Perry, A. (2009). *Fundamentals of nursing* (7th ed., p. 198). St. Louis: Mosby.

# UNIT VII

## Pediatric Nursing

### PYRAMID TERMS

**abuse** Nonaccidental physical injury or the nonaccidental act of omission of care by a parent or person responsible for a child; includes neglect, physical, sexual, or emotional maltreatment.

**active immunity** A form of long-term acquired antibody protection that develops naturally after an initial infection or exposure to antigens, or artificially after a vaccination.

**atresia** Congenital absence or closure of a body orifice.

**attenuated vaccines** Vaccines derived from microorganisms or viruses; their virulence has been weakened as a result of passage through another host.

**crackles** Audible high-pitched crackling or popping sounds heard during lung auscultation; result from fluid in the airways, and are not cleared by coughing (formerly referred to as “rales”).

**chronological age** Age in years.

**cyanosis** The bluish color that results in tissues, nail beds, and mucous membranes when tissues are deprived of adequate amounts of oxygen.

**developmental age** Age based on a child’s maturational progress. It is determined by standardized resources such as body size, physical and psychological functioning, motor skills, and aptitude tests.

**functional age** The age equivalent at which a child actually is able to perform specific self-care or related tasks.

**growth** Measurable physical and physiological body changes that occur over time.

**grunting** The sound made by forced expiration, which is the body’s attempt to improve oxygenation when hypoxemia is present.

**hereditary** Refers to the transmission of genetic characteristics from parent to offspring.

**inactivated vaccines** Vaccines that contain killed microorganisms.

**nasal flaring** A widening of the nares to enable an infant or child to take in more oxygen; a serious indicator of air hunger.

**passive immunity** A form of acquired immunity that occurs artificially through injection or is acquired naturally as the result of antibody transfer through the placenta to a fetus or through colostrum to an infant; is not permanent and does not last as long as active immunity.

**prodromal** Pertaining to early symptoms that mark the onset of a disease.

**puberty** The period of time during which the adolescent experiences a growth spurt, develops secondary sex characteristics, and achieves reproductive maturity.

**regurgitation** An abnormal backward flow of body fluid.

**retraction** An abnormal movement of the chest wall during inspiration in which the skin appears to be drawn in between the ribs, and above and/or below the clavicle, and scapula; indicates respiratory difficulty.

**shunt** Movement of blood or body fluid through an abnormal anatomical or surgically created opening.

**stenosis** The narrowing or constriction of an opening.

**stridor** A shrill harsh sound heard during inspiration, expiration, or both, produced by the flow of air through a narrowed segment of the respiratory tract.

**vaccine** A suspension of attenuated or killed microorganisms administered to induce active immunity to infectious disease.

**wheezing** High-pitched musical whistle sounds heard with or without a stethoscope as air is compressed through narrowed or obstructed airways because of swelling, secretions, or tumors.

## PYRAMID TO SUCCESS

Pyramid Points focus on growth and development, safety, and age-appropriate measures to ensure a safe and hazard-free environment for the child, protection of the child and the prevention of accidents, and on acute disorders that can occur in children. The focus is on nutrition, specific feeding techniques, positioning techniques, and interventions that will provide and maintain adequate airway, breathing, and circulation patterns in the child. Additionally, neglect and abuse of a child is a focus. On the NCLEX-RN examination, be alert to the age of the child if the age is presented in a question. If an age is presented in the question, think about the specific growth and development characteristics of the age group to answer the question correctly.

## CLIENT NEEDS

### Safe and Effective Care Environment

- Considering issues related to informed consent regarding minors
- Ensuring environmental safety, including home safety and personal safety, related to the developmental age of the child
- Establishing priorities
- Instituting measures related to the spread and control of infectious agents, particularly regarding communicable diseases
- Maintaining confidentiality
- Preventing accidents
- Providing continuity of care
- Providing protective measures
- Protecting the child and other contacts to prevent illness
- Upholding parent and child rights

### Health Promotion and Maintenance

- Ensuring that immunization schedules are up to date
- Focusing on developmental stages when planning care

- Performing physical assessment techniques specific to the pediatric client
- Preventing disease in the pediatric population
- Providing health promotion programs for the pediatric client
- Providing instructions to the child and parents regarding care at home

### Psychosocial Integrity

- Assessment for child neglect and abuse
- Communicating with the pediatric client
- Considering concepts of family dynamics when planning care
- Considering cultural, religious, and spiritual beliefs when planning care
- Considering end-of-life issues and grief and loss in the pediatric population
- Identifying family and support systems for the child
- Providing play therapies

### Physiological Integrity

- Following medication administration procedures
- Following nutritional guidelines for the pediatric population
- Identifying comfort measures appropriate for the child
- Maintaining sensitivity for intrusive procedures needed for the pediatric client
- Managing childhood illnesses
- Monitoring elimination patterns
- Monitoring for age-appropriate normal body structure and function
- Monitoring for infectious diseases of the pediatric client
- Monitoring for potential alterations in body systems from disease
- Monitoring for responses to treatments
- Providing for consistent rest and sleep patterns
- Responding to medical emergencies

# Neurological, Cognitive, and Psychosocial Disorders

## I. ATTENTION-DEFICIT/HYPERACTIVITY DISORDER

### A. Description

1. Behavior disorder characterized by developmentally inappropriate degrees of inattention, overactivity, and impulsivity
2. Childhood problems include lowered intellectual development, some minor physical abnormalities, sleeping disturbances, behavioral or emotional disorders, and difficulty in social relationships.
3. Early diagnosis is important to prevent impaired emotional and psychological development.
4. Diagnosis is established based on self-reports, parent and teacher reports, and use of assessment tools.

### B. Assessment

1. Fidgets with hands or feet or squirms in the seat
2. Easily distracted with external or internal stimuli
3. Difficulty with following through on instructions
4. Poor attention span
5. Shifts from one uncompleted activity to another
6. Talks excessively
7. Interrupts or intrudes on others
8. Engages in physically dangerous activities without considering the possible consequences

### C. Interventions

1. Provide parents with information about the disorder and treatment plan; encourage support groups for parents.
2. Treatment includes behavioral therapy, medication, maintaining a consistent environment, and appropriate classroom placement.
3. Behavioral therapy focuses on preventing undesirable behavior.
4. Maintain a consistent home and classroom environment, and provide environmental and physical safety measures.
5. Promote self-esteem.
6. Stimulant medications may be prescribed; possible side effects include appetite suppression and weight loss, nervousness, tics, insomnia, and increased blood pressure.

7. Instruct the child and parents about medication administration and the need for regular follow-up.

## II. AUTISM

### A. Description

1. A severe form of an autism spectrum disorder (pervasive developmental disorder)
2. Symptoms are usually noticed by the parents by 3 years of age.
3. The cause of the disorder is not specifically known; however, it has been linked to a wide range of antepartum, intrapartum, and postpartum conditions and exposure to hazardous chemicals; genetic predisposition is also linked to the disorder.
4. The disorder is accompanied by intellectual and social behavioral deficits, and the child exhibits peculiar and bizarre characteristics with social interactions, communication, and behaviors.
5. Diagnosis is established based on symptoms and the use of several screening tools.

### B. Assessment

1. Social
  - a. Abnormal or lack of comfort-seeking behaviors
  - b. Abnormal or lack of social play
  - c. Impairment in peer relationships
  - d. Lack of awareness of the existence or feelings of others
  - e. Abnormal or lack of imitation of others
2. Communication
  - a. Lack of, impaired, or abnormal speech such as producing a monotone voice or echolalia
  - b. Abnormal nonverbal communication (does not use gestures to communicate)
  - c. Lack of imaginative play
3. Behavior
  - a. Persistent preoccupation or attachment to objects; range of interests restricted
  - b. Self-injurious behaviors
  - c. Must maintain routine; any environmental change produces marked distress
  - d. Produces repetitive body movements such as rocking or head banging

### C. Interventions

1. Determine the child's routines, habits, and preferences and maintain consistency as much as possible.
2. Determine the specific ways in which the child communicates and use these methods.
3. Avoid placing demands on the child.
4. Evaluate the child for safety.
5. Implement safety precautions as necessary for self-injurious behaviors such as head banging.
6. Initiate referrals to special programs as required.
7. Provide support to parents.

⚠️ Ensuring a safe environment for a child with autism is a priority.

## III. CEREBRAL PALSY

### A. Description

1. Disorder characterized by impaired movement and posture resulting from an abnormality in the extrapyramidal or pyramidal motor system
2. The most common clinical type is spastic cerebral palsy, which represents an upper motor neuron type of muscle weakness.
3. Less common types of cerebral palsy are athetoid, ataxic, and mixed.

### B. Assessment

1. Extreme irritability and crying
2. Feeding difficulties
3. Abnormal motor performance
4. Alterations of muscle tone; stiff and rigid arms or legs
5. Delayed developmental milestones
6. Persistence of primitive infantile reflexes (Moro, tonic neck) after 6 months (most primitive reflexes disappear by 3 to 4 months of age)
7. Abnormal posturing, such as opisthotonos (exaggerated arching of the back) (Fig. 36-1)
8. Seizures may occur

▲ **FIGURE 36-1** Abnormal posturing: opisthotonos. (From Mosby's dictionary of medicine, nursing & health professions [8th ed., p. 1328]. [2009]. St. Louis: Mosby, Farrar 1992.)

### C. Interventions

1. The goal of management is early recognition and interventions to maximize the child's abilities.
2. A multidisciplinary team approach is implemented to meet the many needs of the child.
3. Therapeutic management includes physical therapy, occupational therapy, speech therapy, education, and recreation.
4. Assess the child's developmental level and intelligence.
5. Encourage early intervention and participation in school programs.
6. Prepare for using mobilizing devices to help prevent or reduce deformities.
7. Encourage communication and interaction with the child on his or her developmental level, rather than **chronological age** level.
8. Provide a safe environment by removing sharp objects, using a protective helmet if the child falls frequently, and implementing seizure precautions if necessary.
9. Provide safe, appropriate toys for the child's age and developmental level.
10. Position the child upright after meals.
11. Medications may be prescribed to relieve muscle spasms, which cause intense pain; antiseizure medications may also be prescribed.
12. Provide the parents with information about the disorder and treatment plan; encourage support groups for parents.

## IV. CHILD ABDUCTION

### A. Description

1. Child abduction is the kidnapping of a child (or infant) by an older person.
2. Occurrences
  - a. A stranger may kidnap a child for criminal or mischievous purposes.
  - b. A stranger may kidnap a child (or infant) to bring up him or her as that person's own child.
  - c. A parent removes or retains a child from the other parent's care (often in the course of or after divorce proceedings).
3. Because of the increased independence that occurs in the preschool-age child, parents are less able to provide the constant protection they once did when the child reaches this age; interventions (including teaching the child) that ensure protection are necessary.

### B. Interventions

1. Instruct the parents to teach a child basic guidelines about personal safety that include the following:
  - a. Do not go anywhere alone.
  - b. Always tell an adult where he or she is going and when he or she will return.
  - c. Say *no* if he or she feels uncomfortable with a situation.

**Box 36-1 Child Neglect and Abuse: Assessment Findings****Neglect**

Inadequate weight gain  
 Poor hygiene  
 Consistent hunger  
 Inconsistent school attendance  
 Constant fatigue  
 Reports of lack of child supervision  
 Delinquency

**Physical Abuse**

Unexplained bruises, burns, or fractures  
 Bald spots on the scalp  
 Apprehensive child  
 Extreme aggressiveness or withdrawal  
 Fear of parents  
 Lack of crying (older infant, toddler, or young preschool child) when approached by a stranger

**Emotional Abuse**

Speech disorders

Habit disorders such as sucking, biting, and rocking  
 Psychoneurotic reactions  
 Learning disorders  
 Suicide attempts

**Sexual Abuse**

Difficulty walking or sitting  
 Torn, stained, or bloody underclothing  
 Pain, swelling, or itching of genitals  
 Bruises, bleeding, or lacerations in genital or anal area  
 Unwillingness to change clothes or unwillingness to participate in gym activities  
 Poor peer relations

**Shaken Baby Syndrome**

External signs of trauma are usually absent  
 Ophthalmoscopic examination reveals retinal hemorrhages  
 Full bulging fontanels and head circumference greater than expected

- d. Do not talk with strangers or get into their cars.
  - e. Do not help anyone look for a lost dog or cat and do not accept candy from a stranger.
  - f. If lost in a store, do not wander around looking for the parent; go at once to a clerk or guard.
2. Children need to learn their full name, address, and parent's name.
  3. Watch for posttraumatic stress disorder in any child who has experienced an abduction.

3. If shaken baby syndrome is suspected, monitor the infant for a decrease in level of consciousness, which can indicate increased intracranial pressure (ICP).
4. Report a case of suspected **abuse**; nurses are legally required to report all cases of suspected child **abuse** to the appropriate local or state agency.
5. Place the child in an environment that is safe, preventing further injury.
6. Document information related to the suspected **abuse** in an objective manner.
7. Assess parents' strengths and weaknesses, normal coping mechanisms, and presence or absence of support systems.
8. Assist the family in identifying stressors, support systems, and resources.
9. Refer the family to appropriate support groups.

 Nurses are legally required to report all cases of suspected child abuse to the appropriate local or state agency.

 **V. CHILD ABUSE****A. Description**

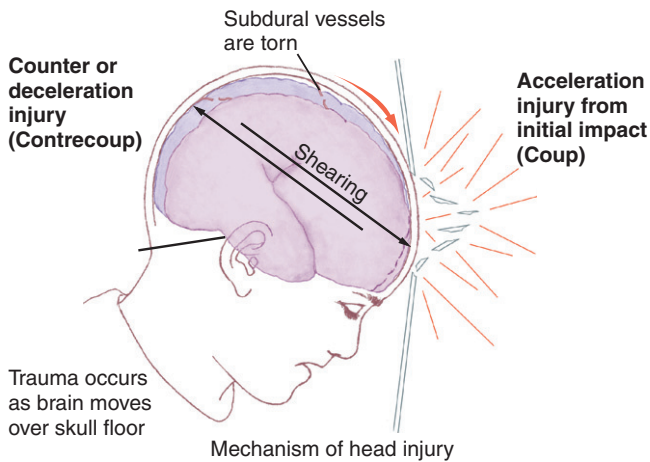

1. **Abuse** is the nonaccidental physical injury or the nonaccidental act of omission of care by a parent or person responsible for a child; **abuse** comprises neglect and physical, sexual, and emotional maltreatment.
2. Neglect can be in the form of physical or emotional neglect and involves the deprivation of basic needs, supervision, medical care, or education and failure to meet a child's needs for attention and affection.
3. Sexual **abuse** can involve incest, molestation, exhibitionism, pornography, prostitution, or pedophilia; findings associated with sexual **abuse** may not be easily apparent in a child.
4. Shaken baby syndrome is caused by the violent shaking of an infant younger than 1 year and results in intracranial (usually subdural hemorrhage) trauma; this can lead to cerebral edema and death.

 **B. Assessment (Box 36-1)** **C. Interventions**

1. Support the child during a thorough physical assessment.
2. Assess injuries.

 **VI. HEAD INJURY****A. Description**

1. Head injury is the pathological result of any mechanical force to the skull, scalp, meninges, or brain (Fig. 36-2).
  - a. Open head injury occurs when there is a fracture of the skull or penetration of the skull by an object.
  - b. Closed head injury is the result of blunt trauma (this is more serious than an open head injury because of the chance of increased ICP in a "closed" vault); this type of injury can also be caused by shaken baby syndrome.

▲ **FIGURE 36-2** Mechanism of head injury. (From Marcoux, K. [2005]. Management of increased intravascular pressure in the critically ill child. *AACU Clinical Issues* 16[2], 212–213. Reprinted with permission.)

2. Manifestations depend on the type of injury and the subsequent amount of increased ICP.

#### B. Assessment: Increased ICP

⚠ The child's level of consciousness provides the earliest indication of an improvement or deterioration of the neurological condition.

##### 1. Early signs

- a. Slight change in vital signs
- b. Slight change in level of consciousness
- c. Infant: Irritability, high-pitched cry, bulging fontanel, increased head circumference, dilated scalp veins, Macewen's sign (cracked-pot sound on percussion of the head), setting sun sign (sclera visible above the iris)
- d. Child: Headache, nausea, vomiting, visual disturbances (diplopia), seizures

##### 2. Late signs

- a. Decrease in level of consciousness
- b. Bradycardia
- c. Decreased motor and sensory responses
- d. Alteration in pupil size and reactivity
- e. Decorticate (flexion) posturing: Adduction of the arms at the shoulders; arms are flexed on the chest with the wrists flexed and the hands fisted, and the lower extremities are extended and adducted; seen with severe dysfunction of cerebral cortex (Fig. 36-3)
- f. Decerebrate (extension) posturing: Rigid extension and pronation of the arms and the legs; sign of dysfunction at the level of the midbrain (see Fig. 36-3)
- g. Cheyne-Stokes respirations
- h. Coma

A

B

▲ **FIGURE 36-3** A, Decorticate (flexion) posturing. B, Decerebrate (extension) posturing. (From Hockenberry, M., & Wilson, D. [2009]. *Wong's essentials of pediatric nursing* [8th ed., p. 979]. St. Louis: Mosby.)

#### C. Interventions

⚠ Immobilize the neck and spine after a head injury if a cervical or other spinal injury is suspected. When a spinal cord injury is ruled out, elevate the head of the bed 15 to 30 degrees, if not contraindicated and as prescribed, to facilitate venous drainage.

1. Monitor the airway; administer oxygen as prescribed.
2. Assess injuries. (See Chapter 66 for information on spinal cord injuries.)
3. Position the client so that the head is maintained midline to avoid jugular vein compression, which can increase ICP.
4. Monitor vital signs and neurological function (assess level of consciousness closely).
5. Keep stimuli to a minimum; attempt to minimize crying in an infant.
6. Withhold sedating medications during the acute phase of the injury so that changes in levels of consciousness can be assessed.
7. Initiate seizure precautions (Box 36-2).
8. Monitor for decreased responsiveness to pain (a significant sign of altered level of consciousness).
9. Maintain NPO status or provide clear liquids, if prescribed, until it is determined that vomiting will not occur.
10. Monitor prescribed intravenous fluids carefully to avoid aggravating any cerebral edema and to minimize the possibility of overhydration.
11. Monitor for a fluid or electrolyte alteration (could indicate injury to the hypothalamus or posterior pituitary)

**Box 36-2 Seizure Precautions**

Raise side rails when child is sleeping or resting.  
 Pad side rails and other hard objects.  
 Place waterproof mattress or pad on bed or crib.  
 Instruct child to wear or carry medical identification.  
 Instruct child in precautions to take during potentially hazardous activities.  
 Instruct child to swim with a companion.  
 Instruct child to use a protective helmet and padding when engaged in bicycle riding, skateboarding, and in-line skating.  
 Alert caregivers to need for any special precautions.

12. Assess wounds and dressings for the presence of drainage, and monitor for nose or ear drainage, which could indicate leakage of cerebrospinal fluid (CSF).
13. Administer tepid sponge baths or place the child on a hypothermia blanket as prescribed if hyperthermia occurs.
14. Avoid suctioning through the nares because of the possibility of the catheter entering the brain through a fracture, which places the child at high risk for a secondary infection.
15. As prescribed, administer acetaminophen (Tylenol) for headache, anticonvulsants for seizures, and antibiotics if a laceration is present; prepare to administer prophylactic tetanus toxoid.
16. A corticosteroid or osmotic diuretic may be prescribed to reduce cerebral edema.
17. Monitor for signs of brainstem involvement (Box 36-3).
18. Monitor for signs of epidural hematoma: Asymmetrical pupils (one dilated, nonreactive pupil) may indicate a neurosurgical emergency that requires evacuation of the hematoma.

 Drainage from the nose or ear needs to be tested for the presence of glucose. Drainage that is positive for glucose (as tested with reagent strips) indicates leakage of CSF. The physician must be notified immediately if the drainage tests positive for glucose.

**VII. HYDROCEPHALUS****A. Description**

1. An imbalance of CSF absorption or production caused by malformations, tumors, hemorrhage, infections, or trauma
2. Results in head enlargement and increased ICP

**B. Types (Box 36-4)****C. Assessment**

1. Infant
  - a. Increased head circumference

**Box 36-3 Signs of Brainstem Involvement**

Deep, rapid, or intermittent and gasping respirations  
 Wide fluctuations or noticeable slowing of pulse  
 Widening pulse pressure or extreme fluctuations in blood pressure  
 Sluggish, dilated, or unequal pupils  
*Notify physician immediately if these signs develop!*

**Box 36-4 Types of Hydrocephalus****Communicating**

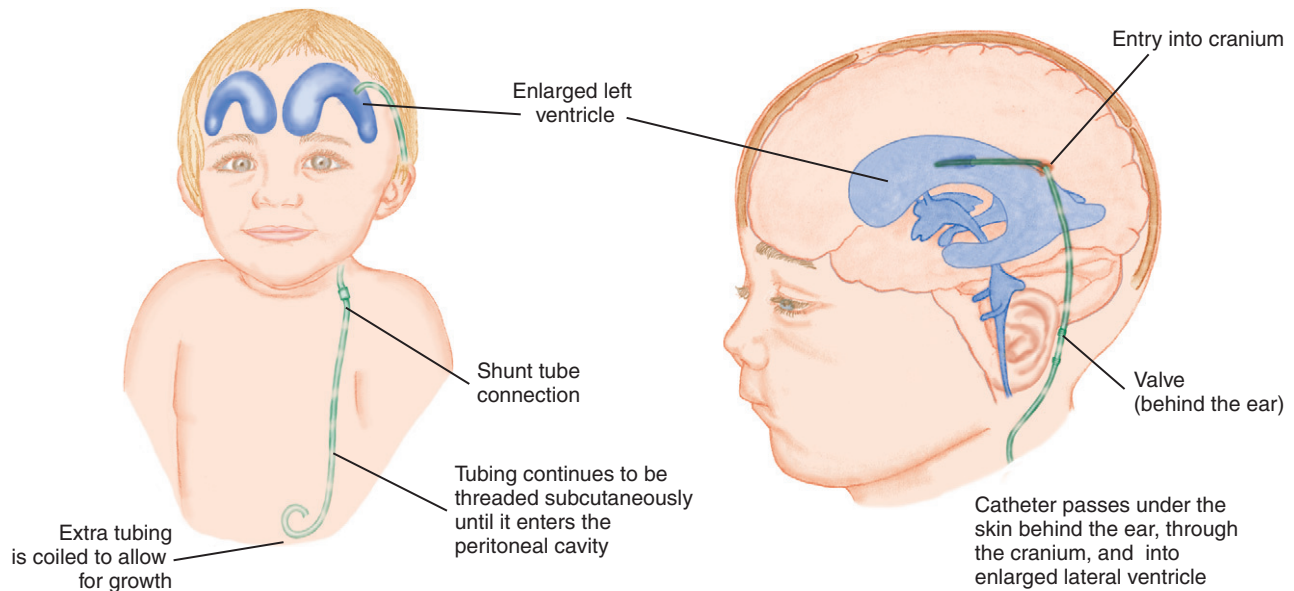

Hydrocephalus occurs as a result of impaired absorption within the subarachnoid space.

Interference of the cerebrospinal fluid in the ventricular system does not occur.

**Noncommunicating**

Obstruction of cerebrospinal fluid flow in the ventricular system does occur.

- a. Thin, widely separated bones of the head that produce a cracked-pot sound (Macewen's sign) on percussion
- c. Anterior fontanel tense, bulging, and nonpulsating
- d. Dilated scalp veins
- e. Frontal bossing
- f. Setting sun eyes
2. Child
  - a. Behavior changes, such as irritability and lethargy
  - b. Headache on awakening
  - c. Nausea and vomiting
  - d. Ataxia
  - e. Nystagmus
3. Late signs: High, shrill cry and seizures
- D. Surgical interventions
  1. The goal of surgical treatment is to prevent further CSF accumulation by bypassing the blockage and draining the fluid from the ventricles to a location where it may be reabsorbed.
  2. In a ventriculoperitoneal **shunt**, the CSF drains into the peritoneal cavity from the lateral ventricle (Fig. 36-4).
  3. In a ventriculoatrial **shunt**, CSF drains into the right atrium of the heart from the lateral ventricle, bypassing the obstruction (used in older children and in children with pathological conditions of the abdomen).
  4. **Shunt** revision may be necessary as the child grows.
  5. An alternative to **shunt** placement is endoscopic third ventriculostomy, in which a small opening in the floor of the third ventricle is made that allows CSF to bypass the fourth ventricle and return to the circulation to be absorbed; this treatment may not be appropriate for some types of hydrocephalus.

▲ **FIGURE 36-4** Ventriculoperitoneal shunt. (From McKinney, E., James, S., Murray, S., & Ashwill, J. [2009]. *Maternal-child nursing* [3rd ed.]. St. Louis: Saunders.)

#### E. Preoperative interventions

1. Monitor intake and output; give small, frequent feedings as tolerated until preoperative NPO status is prescribed.
2. Reposition the head frequently and use special devices such as an egg crate mattress under the head to prevent pressure sores.
3. Prepare the child and family for diagnostic procedures and surgery.

#### F. Postoperative interventions

1. Monitor vital signs and neurological signs.
2. Position the child on the unoperated side to prevent pressure on the **shunt** valve.
3. Keep the child flat as prescribed to avoid rapid reduction of intracranial fluid.
4. Observe for increased ICP; if increased ICP occurs, elevate the head of the bed to 15 to 30 degrees to enhance gravity flow through the **shunt**.
5. Measure head circumference.
6. Monitor for signs of infection and assess dressings for drainage.
7. Monitor intake and output.
8. Provide comfort measures and administer medications as prescribed.
9. Instruct parents on how to recognize **shunt** infection or malfunction.
10. In an infant, irritability, a high shrill cry, lethargy, and feeding poorly may indicate **shunt** malfunction or infection.
11. In a toddler, headache and a lack of appetite are the earliest common signs of **shunt** malfunction.
12. In older children, an indicator of **shunt** malfunction is an alteration in the child's level of consciousness.

▲ **!** A high shrill cry in an infant can be a sign of increased ICP.

### VIII. LATCHKEY CHILDREN

#### A. Description

1. Children who do not have adult supervision before or after school hours; they are left to care for themselves during these times
2. Occurs when children are members of a single-parent family or both parents work and need to leave the home before children are brought to school
3. This situation induces a stress-provoking environment for the children and places the children at risk for injury and delinquent behavior.

#### B. Interventions

1. Identify the latchkey child.
2. Encourage the parent to teach the child about self-care and self-help skills.
3. Inform the parent about available community resources such as after-school programs for children.

### IX. MENINGITIS

#### A. Description

1. Meningitis is an infectious process of the central nervous system caused by bacteria or viruses that may be acquired as a primary disease or as a result of complications of neurosurgery, trauma, infection of the sinuses or ears, or systemic infections.
2. Diagnosis of bacterial meningitis is made by testing CSF obtained by lumbar puncture; the fluid is cloudy with increased pressure, increased white blood cell count, elevated protein, and decreased glucose levels.

3. Bacterial meningitis can be caused by various organisms, most commonly *Haemophilus influenzae* type b, *Streptococcus pneumoniae*, or *Neisseria meningitidis*; meningococcal meningitis occurs in epidemic form and can be transmitted by droplets from nasopharyngeal secretions.
4. Viral meningitis is associated with viruses such as mumps, paramyxovirus, herpesvirus, and enterovirus.

#### B. Assessment

1. Signs and symptoms vary, depending on the type, the age of the child, and the duration of the preceding illness.
2. Fever, chills, headache
3. Vomiting, diarrhea
4. Poor feeding or anorexia
5. Nuchal rigidity
6. Poor or high shrill cry
7. Altered level of consciousness, such as lethargy or irritability
8. Bulging anterior fontanel in an infant
9. Positive Kernig's sign (inability to extend the leg when the thigh is flexed anteriorly at the hip) and Brudzinski's sign (neck flexion causes adduction and flexion movements of the lower extremities) in children and adolescents
10. Muscle or joint pain (meningococcal infection and *H. influenzae* infection)
11. Petechial or purpuric rashes (meningococcal infection)
12. Ear that chronically drains (pneumococcal meningitis)

#### C. Interventions

1. Provide respiratory isolation precautions and maintain it for at least 24 hours after antibiotics are initiated.
2. Administer antibiotics and antipyretics as prescribed (administer antibiotics as soon as they are prescribed after lumbar puncture); antiseizure medications may also be prescribed.
3. Perform neurological assessment and monitor for seizures; assess for the complication of inappropriate antidiuretic hormone secretion, causing fluid retention (cerebral edema) and dilutional hyponatremia.
4. Assess for changes in level of consciousness and irritability.
5. Monitor for a purpuric or petechial rash and for signs of thromboemboli.
6. Assess nutritional status; monitor intake and output.
7. Monitor for hearing loss.
8. Determine close contacts of the child with meningitis because the contacts need prophylactic treatment.

9. Pneumococcal conjugate **vaccine** is recommended for all children beginning at age 2 months to protect against meningitis; streptococcal pneumococci can cause many bacterial infections including meningitis (see Chapter 48 for information on **vaccines**).

## X. MENTAL RETARDATION

### A. Description

1. In mental retardation, a child manifests subaverage intellectual functioning along with deficits in adaptive skills.
2. Down syndrome is a congenital condition that results in moderate to severe retardation and has been linked to an extra group G chromosome, chromosome 21 (trisomy 21).

### B. Assessment

1. Deficits in cognitive skills and level of adaptive functioning
2. Delays in fine and gross motor skills
3. Speech delays
4. Decreased spontaneous activity
5. Nonresponsiveness
6. Irritability
7. Poor eye contact during feeding

### C. Interventions

1. Medical strategies are focused on correcting structural deformities and treating associated behaviors.
2. Implement community and educational services using a multidisciplinary approach.
3. Promote care skills as much as possible.
4. Assist with communication and socialization skills.
5. Facilitate appropriate play time.
6. Initiate safety precautions as necessary.
7. Assist the family with decisions regarding care.
8. Provide information regarding support services and community agencies.

## XI. NEAR-DROWNING

### A. Description

1. Survival of at least 24 hours after submersion in a fluid medium
2. Hypoxia and asphyxiation is the primary problem because it results in extensive cell damage; cerebral cells sustain irreversible damage after 4 to 6 minutes of submersion.
3. Additional problems include aspiration and hypothermia.
4. Outcome is predicted based on the length of submersion in nonicy water; outcome may be good if submersion was for less than 5 minutes and the child exhibits neurological responsiveness, reactive pupils, and a normal cardiac rhythm.

5. A child who was submerged for more than 10 minutes and does not respond to cardiopulmonary life support measures within 25 minutes has an extremely poor prognosis (severe neurological impairment or death).

#### B. Interventions

1. Provide ventilatory and circulatory support; if the child has had a severe cerebral insult, endotracheal intubation and mechanical ventilation may be required.
2. Monitor respiratory status because respiratory compromise and cerebral edema may occur 24 hours after the incident.
3. Monitor for aspiration pneumonia.
4. Monitor neurological status closely; if spontaneous purposeful movement and normal brainstem function are not apparent 24 hours after the event, the child most likely has sustained severe neurological deficits.
5. Teach parents to provide adequate supervision of infants and small children around water to prevent accidents.

### XII. REYE'S SYNDROME

#### A. Description

1. Reye's syndrome is an acute encephalopathy that follows a viral illness and is characterized pathologically by cerebral edema and fatty changes in the liver; a definitive diagnosis is made by liver biopsy.
2. The exact cause is unclear; it most commonly follows a viral illness such as influenza or varicella.
3. Administration of aspirin and non-aspirin-containing salicylates is not recommended for children with a febrile illness or children with varicella or influenza because of its association with Reye's syndrome.
4. Acetaminophen (Tylenol) is considered the medication of choice for pediatric clients.
5. Early diagnosis and aggressive treatment are important; the goal of treatment is to maintain effective cerebral perfusion and control increasing ICP.

#### B. Assessment

1. History of systemic viral illness 4 to 7 days before the onset of symptoms
2. Fever
3. Nausea and vomiting
4. Signs of altered hepatic function such as lethargy
5. Progressive neurological deterioration

#### C. Interventions

1. Provide rest and decrease stimulation in the environment.
2. Assess neurological status.
3. Monitor for altered level of consciousness and signs of increased ICP.

4. Monitor for signs of altered hepatic function and results of liver function studies.
5. Monitor intake and output.
6. Monitor for signs of bleeding and signs of impaired coagulation, such as a prolonged bleeding time.

### XIII. SEIZURE DISORDERS

#### A. Description (see Chapter 66 for additional information on seizures)

1. Excessive and unorganized neuronal discharges in the brain that activate associated motor and sensory organs
2. Classified as generalized, partial, or unclassified, depending on the area of the brain involved
3. Types of generalized seizures include tonic-clonic, absence, myoclonic, and atonic.
4. Partial seizures arise from a specific area in the brain and cause limited symptoms; types include simple partial and complex partial.

#### B. Assessment

1. Obtain information from the parents about the time of onset, precipitating events, and behavior before and after the seizure.
2. Determine the child's history related to seizures.
3. Ask the child about the presence of an aura (a warning sign of impending seizure).
4. Monitor for apnea and **cyanosis**.
5. Postseizure: The child is disoriented and sleepy.

#### C. Seizure precautions (see Box 36-2)

#### D. Interventions (Box 36-5)

#### E. Anticonvulsant medications (see Chapter 67 for information on medications)

#### Box 36-5 Interventions for Seizures

Ensure airway patency.

Have suction equipment and oxygen available.

Time the seizure episode.

If the child is standing or sitting, ease the child down to the floor and place the child in a side-lying position.

Place a pillow or folded blanket under the child's head; if no bedding is available, place your own hands under the child's head or place the child's head in your own lap.

Loosen restrictive clothing.

Remove eyeglasses from the child if present.

Clear the area of any hazards or hard objects.

Allow the seizure to proceed and end without interference.

If vomiting occurs, turn the child to one side as a unit.

Do not restrain the child, place anything in the child's mouth, or give any food or liquids to the child.

Prepare to administer medications as prescribed.

Remain with the child until the child fully recovers.

Observe for incontinence, which may have occurred during the seizure.

Document the occurrence.

 Never place anything, including an airway device or a padded tongue blade, into the mouth of a child experiencing a seizure.

#### XIV. SPINA BIFIDA

##### A. Description

1. This central nervous system defect results from failure of the neural tube to close during embryonic development.
2. Associated deficits include sensorimotor disturbance, dislocated hips, talipes equinovarus (clubfoot), and hydrocephalus.
3. Defect closure is performed soon after birth.

##### B. Types

1. Spina bifida occulta
  - a. Posterior vertebral arches fail to close in the lumbosacral area.
  - b. Spinal cord remains intact and usually is not visible.
  - c. Meninges are not exposed on the skin surface.
  - d. Neurological deficits are not usually present.
2. Spina bifida cystica
  - a. Protrusion of the spinal cord or its meninges or both occurs.
  - b. Defect results in incomplete closure of the vertebral and neural tubes, resulting in a sac-like protrusion in the lumbar or sacral area, with varying degrees of nervous tissue involvement.
  - c. Defect can include meningocele, myelomeningocele, lipomeningocele, and lipomeningomyelocele.
3. Meningocele
  - a. Protrusion involves meninges and a sac-like cyst that contains CSF in the midline of the back, usually in the lumbosacral area.
  - b. Spinal cord is not involved.
  - c. Neurological deficits are usually not present.
4. Myelomeningocele
  - a. Protrusion of the meninges, CSF, nerve roots, and a portion of the spinal cord occurs.
  - b. The sac (defect) is covered by a thin membrane prone to leakage or rupture.
  - c. Neurological deficits are evident.

##### C. Assessment

1. Depends on the spinal cord involvement
2. Visible spinal defect
3. Flaccid paralysis of the legs
4. Altered bladder and bowel function
5. Hip and joint deformities
6. Hydrocephalus

##### D. Interventions

1. Evaluate the sac and measure the lesion.
2. Perform neurological assessment.
3. Monitor for increased ICP, which might indicate developing hydrocephalus.

4. Measure head circumference; assess anterior fontanel for fullness.
5. Protect the sac; cover with a sterile, moist (normal saline), nonadherent dressing to maintain the moisture of the sac and contents.
6. Change the dressing covering the sac on a regular schedule or whenever it becomes soiled because of the risk of infection; diapering may be contraindicated until the defect has been repaired.
7. Use aseptic technique to prevent infection.
8. Assess the sac for redness, clear or purulent drainage, abrasions, irritation, and signs of infection.
9. Early signs of infection include elevated temperature (axillary), irritability, lethargy, and nuchal rigidity.
10. Place in a prone position to minimize tension on the sac and the risk of trauma; the head is turned to one side for feeding.
11. Assess for physical impairments such as hip and joint deformities.
12. Prepare the child and family for surgery.
13. Administer antibiotics preoperatively and postoperatively, as prescribed, to prevent infection.
14. Teach the parents and eventually the child about long-term home care.
  - a. Positioning, feeding, skin care, and range-of-motion exercises
  - b. Instituting a bladder elimination program and performing clean intermittent catheterization technique
  - c. Administering antispasmodics (that act on the smooth muscle of the bladder) as prescribed to increase bladder capacity and improve continence
  - d. Implement a bowel program including a high-fiber diet, increased fluids, and suppositories as needed.
  - e. The child is at high risk for allergy to latex and rubber products because of the frequent exposure to latex during implementation of care measures.

#### MORE QUESTIONS ON THE CD!

##### Practice Questions

- 366.** A nurse is caring for a child recently diagnosed with cerebral palsy, and the parents of the child ask the nurse about the disorder. The nurse bases her response on the understanding that cerebral palsy is:

1. An infectious disease of the central nervous system
  2. An inflammation of the brain as a result of a viral illness
  3. A congenital condition that results in moderate to severe retardation
  4. A chronic disability characterized by impaired muscle movement and posture
- 367.** A nurse performs an admission assessment on a child and suspects physical abuse. Based on this suspicion, the primary legal nursing responsibility is which of the following?
1. Refer the family to the appropriate support groups.
  2. Assist the family in identifying resources and support systems.
  3. Report the case in which the abuse is suspected to the local authorities.
  4. Document the child's physical assessment findings accurately and thoroughly.
- 368.** A mother arrives at an emergency department with her 5-year-old child and states that the child fell off a bunk bed. A head injury is suspected, and a nurse checks the child's airway status and assesses the child for signs of increased intracranial pressure (ICP). Which of the following is a late sign of increased ICP in this child?
1. Nausea
  2. Bradycardia
  3. Bulging fontanel
  4. Dilated scalp veins
- 369.** A nurse is assigned to care for an 8-year-old child with a diagnosis of a basilar skull fracture. The nurse reviews the physician's prescriptions and contacts the physician to question which prescriptions?
1. Suction as needed.
  2. Obtain daily weight.
  3. Provide clear liquid intake.
  4. Maintain a patent intravenous line.
- 370.** A nurse is caring for an infant with a diagnosis of hydrocephalus. Preoperatively, a priority nursing intervention is to:
1. Test the urine for protein.
  2. Reposition the infant frequently.
  3. Provide a stimulating environment.
  4. Assess blood pressure every 15 minutes.
- 371.** A nurse is reviewing the record of a child with increased intracranial pressure and notes that the child has exhibited signs of decerebrate posturing. On assessment of the child, the nurse expects to note which of the following if this type of posturing is present?
1. Flaccid paralysis of all extremities
  2. Adduction of the arms at the shoulders
  3. Rigid extension and pronation of the arms and legs
  4. Abnormal flexion of the upper extremities and extension and adduction of the lower extremities
- 372.** A child is diagnosed with Reye's syndrome. A nurse develops a nursing care plan for the child and includes which intervention in the plan?
1. Assessing hearing loss
  2. Monitoring urine output
  3. Changing body position every 2 hours
  4. Providing a quiet atmosphere with dimmed lighting
- 373.** A nurse develops a plan of care for a child at risk for tonic-clonic seizures. In the plan of care, the nurse identifies seizure precautions and documents that which item(s) need to be placed at the child's bedside?
1. Emergency cart
  2. Tracheotomy set
  3. Padded tongue blade
  4. Suctioning equipment and oxygen
- 374.** A lumbar puncture is performed on a child suspected to have bacterial meningitis, and cerebrospinal fluid (CSF) is obtained for analysis. A nurse reviews the results of the CSF analysis and determines that which of the following results would verify the diagnosis?
1. Clear CSF, decreased pressure, and elevated protein level
  2. Clear CSF, elevated protein, and decreased glucose levels
  3. Cloudy CSF, elevated protein, and decreased glucose levels
  4. Cloudy CSF, decreased protein, and decreased glucose levels
- 375.** A nurse is planning care for a child with acute bacterial meningitis. Based on the mode of transmission of this infection, which of the following should be included in the plan of care?
1. Maintain enteric precautions.
  2. Maintain neutropenic precautions.
  3. No precautions are required as long as antibiotics have been started.
  4. Maintain respiratory isolation precautions for at least 24 hours after the initiation of antibiotics.

### Alternate Item Format: Multiple Response

- 376.** A nurse is developing a plan of care for a child who is at risk for seizures. Which interventions apply if the child has a seizure? Select all that apply.
- 1. Time the seizure.

- 2. Restrain the child.
- 3. Stay with the child.
- 4. Place the child in a prone position.
- 5. Move furniture away from the child.
- 6. Insert a padded tongue blade in the child's mouth.

## ANSWERS

### 366. 4

**Rationale:** Cerebral palsy is a chronic disability characterized by impaired movement and posture resulting from an abnormality in the extrapyramidal or pyramidal motor system. Meningitis is an infectious process of the central nervous system. Encephalitis is an inflammation of the brain that occurs as a result of viral illness or central nervous system infection. Down syndrome is an example of a congenital condition that results in moderate to severe retardation.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 2 first, noting that they are comparable or alike. Next, note the relationship between the words *palsy* in the question and *impaired muscle movement* in option 4. If you had difficulty with this question, review the characteristics associated with cerebral palsy.

**Level of Cognitive Ability:** Understanding

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Neurological/Musculoskeletal

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1480). St. Louis: Saunders. Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 609). St. Louis: Mosby.

### 367. 3

**Rationale:** Abuse is the nonaccidental physical injury or the nonaccidental act of omission of care by a parent or person responsible for a child. It includes neglect and physical, sexual, and emotional maltreatment. The primary legal nursing responsibility when child abuse is suspected is to report the case. All states and provinces in North America have laws for mandatory reporting of child maltreatment. Suspected child abuse should be reported to the local authorities. Although documentation of assessment findings, assisting the family, and referring the family to appropriate resources and support groups are important, the primary legal responsibility is to report the suspected case.

**Test-Taking Strategy:** Use the process of elimination, noting the strategic words *primary* and *legal*. In addition to the many implications associated with child abuse, abuse is a crime. With this in mind, option 3, reporting the case of abuse, is the primary responsibility. If you had difficulty with this question, review the responsibilities of the nurse when child abuse is suspected.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Neurological/Musculoskeletal

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 486). St. Louis: Mosby.

### 368. 2

**Rationale:** Head injury is the pathological result of any mechanical force to the skull, scalp, meninges, or brain. A head injury can cause bleeding in the brain and result in increased intracranial pressure (ICP). Late signs of increased ICP include a significant decrease in level of consciousness, bradycardia, decreased motor and sensory responses, alterations in pupil size and reactivity, posturing, Cheyne-Stokes respirations, and coma. A bulging fontanel and dilated scalp veins are early signs of increased ICP and would be noted in an infant, not a 5-year-old child. Nausea is an early sign of increased ICP.

**Test-Taking Strategy:** Use the process of elimination, and note the age of the child and the strategic word *late*. Options 3 and 4 can be eliminated first because these signs would be noted in an infant, not a 5-year-old child. Focusing on the strategic word *late* will direct you to option 2 from the remaining options. If you had difficulty with this question, review the early and late signs of increased ICP in an infant and in a child.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Neurological/Musculoskeletal

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 976). St. Louis: Mosby.

### 369. 1

**Rationale:** A basilar skull fracture is a type of head injury. Nasotracheal suctioning is contraindicated in a child with a basilar skull fracture. Because of the nature of the injury, there is a high risk of secondary infection and the probability of the catheter entering the brain through the fracture. Fluid balance is monitored closely by daily weight, intake and output measurement, and serum osmolality determination to detect early signs of water retention, excessive dehydration, and states of hypertonicity or hypotonicity. The child is maintained on NPO status or restricted to clear liquids until it is determined that vomiting will not occur. An intravenous line is maintained to administer fluids or medications if necessary.

**Test-Taking Strategy:** Note the strategic words *question which prescription*. Eliminate options 2, 3, and 4 because they are comparable or alike in that they address the subject of fluids. Remember that nasotracheal suctioning is contraindicated in a child with a skull fracture because of the risk of infection. If you had difficulty with this question, review the care of a child with a skull fracture.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Neurological/Musculoskeletal  
**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 992). St. Louis: Mosby.

### 370. 2

**Rationale:** Hydrocephalus occurs as a result of an imbalance of cerebrospinal fluid absorption or production that is caused by malformations, tumors, hemorrhage, infections, or trauma. It results in head enlargement and increased intracranial pressure. In infants with hydrocephalus, the head grows at an abnormal rate, and if the infant is not repositioned frequently, pressure ulcers can occur on the back and side of the head. An egg crate mattress under the head is also a nursing intervention that can help prevent skin breakdown. Proteinuria is not specific to hydrocephalus. Stimulus should be kept at a minimum because of the increase in intracranial pressure. It is not necessary to check the blood pressure every 15 minutes.

**Test-Taking Strategy:** Focus on the child's diagnosis. Eliminate option 4 because of the words *15 minutes*. From the remaining options, recall that because of the severe head enlargement, the nursing intervention that has priority is to reposition the infant frequently to prevent development of pressure areas. Review the complications associated with hydrocephalus if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Neurological/Musculoskeletal  
**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1478). St. Louis: Saunders.

### 371. 3

**Rationale:** Decerebrate (extension) posturing is characterized by the rigid extension and pronation of the arms and legs. Option 1 is incorrect. Options 2 and 4 describe decorticate (flexion) posturing.

**Test-Taking Strategy:** Focus on the data in the question. Recalling the clinical manifestations associated with decerebrate posturing will direct you to the correct option. Remember that decerebrate posturing is characterized by the rigid extension and pronation of the arms and legs. Review the characteristics of decorticate and decerebrate posturing if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Neurological/Musculoskeletal  
**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 979). St. Louis: Mosby.

### 372. 4

**Rationale:** Reye's syndrome is an acute encephalopathy that follows a viral illness and is characterized pathologically by cerebral edema and fatty changes in the liver. A definitive diagnosis is made by liver biopsy. In Reye's syndrome, supportive care is directed toward monitoring and managing

cerebral edema. Decreasing stimuli in the environment by providing a quiet environment with dimmed lighting would decrease the stress on the cerebral tissue and neuron responses. Hearing loss and urine output are not affected. Changing the body position every 2 hours would not affect the cerebral edema directly. The child should be positioned with the head elevated to decrease the progression of the cerebral edema and promote drainage of cerebrospinal fluid.

**Test-Taking Strategy:** Think about the pathophysiology associated with Reye's syndrome. Recalling that cerebral edema is a concern for a child with Reye's syndrome will direct you to option 4. If you had difficulty with this question, review the appropriate plan of nursing care for a child with Reye's syndrome.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Child Health—Neurological/Musculoskeletal  
**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 1004). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1499). St. Louis: Saunders.

### 373. 4

**Rationale:** A seizure results from the excessive and unorganized neuronal discharges in the brain that activate associated motor and sensory organs. A type of generalized seizure is a tonic-clonic seizure. This type of seizure causes rigidity of all body muscles, followed by intense jerking movements. Because increased oral secretions and apnea can occur during and after the seizure, oxygen and suctioning equipment are placed at the bedside. A tracheotomy is not performed during a seizure. No object, including a padded tongue blade, is placed into the child's mouth during a seizure. An emergency cart would not be left at the bedside, but would be available in the treatment room or nearby on the nursing unit.

**Test-Taking Strategy:** Use the process of elimination and note the strategic words *need to be placed at the child's bedside*. Eliminate option 2 knowing that a tracheotomy is not performed. Next, recalling that no object is placed into the mouth of a child experiencing a seizure assists in eliminating option 3. From the remaining options, focus on the primary concern during seizure activity. This will direct you to option 4. If you had difficulty with this question, review the plan of care associated with seizure precautions.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Child Health—Neurological/Musculoskeletal  
**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 1015). St. Louis: Mosby.

### 374. 3

**Rationale:** Meningitis is an infectious process of the central nervous system caused by bacteria and viruses; it may be acquired as a primary disease or as a result of complications of neurosurgery, trauma, infection of the sinus or ears, or systemic infections. Meningitis is diagnosed by testing cerebrospinal fluid obtained by lumbar puncture. In the case of

bacterial meningitis, findings usually include an elevated pressure; turbid or cloudy cerebrospinal fluid; and elevated leukocyte, elevated protein, and decreased glucose levels.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the diagnostic findings in meningitis. Eliminate options 1 and 2 first because clear cerebrospinal fluid is not likely to be found in an infectious process such as meningitis. From this point, recall that an elevated protein level indicates a possible diagnosis of meningitis to direct you to the correct option. If you had difficulty with this question, review the diagnostic findings associated with a diagnosis of meningitis.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Child Health—Neurological/Musculoskeletal

**References:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1494). St. Louis: Saunders.

Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., pp. 281–282). St. Louis: Mosby.

### 375. 4

**Rationale:** Meningitis is an infectious process of the central nervous system caused by bacteria and viruses; it may be acquired as a primary disease or as a result of complications of neurosurgery, trauma, infection of the sinus or ears, or systemic infections. A major priority of nursing care for a child suspected to have meningitis is to administer the prescribed antibiotic as soon as it is ordered. The child also is placed on respiratory isolation precautions for at least 24 hours while culture results are obtained and the antibiotic is having an effect. Enteric precautions and neutropenic precautions are not associated with the mode of transmission of meningitis. Enteric precautions are instituted when the mode of transmission is through the gastrointestinal tract. Neutropenic precautions are instituted when a child has a low neutrophil count.

**Test-Taking Strategy:** Use the process of elimination and knowledge regarding the mode of transmission of meningitis. Eliminate options 1 and 2 first because enteric and

neutropenic precautions are unrelated to the mode of transmission. Recalling that it takes about 24 hours for antibiotics to reach a therapeutic blood level will assist in directing you to option 4. If you had difficulty with this question, review the mode of transmission of meningitis.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Child Health—Neurological/Musculoskeletal

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 1001). St. Louis: Mosby.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 376. 1, 3, 5

**Rationale:** A seizure is a disorder that occurs as a result of excessive and unorganized neuronal discharges in the brain that activate associated motor and sensory organs. During a seizure, the child is placed on his or her side in a lateral position. Positioning on the side prevents aspiration because saliva drains out the corner of the child's mouth. The child is not restrained because this could cause injury to the child. The nurse would loosen clothing around the child's neck and ensure a patent airway. Nothing is placed into the child's mouth during a seizure because this action may cause injury to the child's mouth, gums, or teeth. The nurse would stay with the child to reduce the risk of injury and allow for observation and timing of the seizure.

**Test-Taking Strategy:** Visualize this clinical situation. Recalling that airway patency and safety is the priority will assist in determining the appropriate interventions. Review care of the child experiencing a seizure if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Neurological/Musculoskeletal

**Reference:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 1014). St. Louis: Mosby.

# Eye, Ear, and Throat Disorders

## I. STRABISMUS

### A. Description

1. Called “squint” or “lazy eye”
2. Condition in which the eyes are not aligned because of lack of coordination of the extraocular muscles
3. Most often results from muscle imbalance or paralysis of extraocular muscles, but also may result from a congenital defect
4. Amblyopia (reduced visual acuity) may occur if not treated early because the brain receives two messages as a result of the unparallel visual axes.
5. Permanent loss of vision can occur if not treated early.
6. This condition may be normally found in a young infant, but should not be present after about age 4 months.
7. Treatment of the condition depends on the cause.

### B. Assessment

1. Crossed eyes
2. Squinting; tilts the head or closes one eye to see
3. Loss of binocular vision
4. Impairment of depth perception
5. Frequent headaches
6. Diplopia; photophobia

### C. Interventions

1. Corrective lenses may be indicated.
2. Instruct the parents regarding patching (occlusion therapy) of the “good” eye to strengthen the weak eye.
3. Prepare for surgery to realign the weak muscles as prescribed if nonsurgical interventions are unsuccessful; this is usually performed before age 2 years.
4. Instruct the parents about the need for follow-up visits.

## II. CONJUNCTIVITIS

### A. Description

1. Also known as “pinkeye”; an inflammation of the conjunctiva
2. Conjunctivitis usually is caused by allergy, infection, or trauma.

3. Bacterial or viral conjunctivitis is extremely contagious.

### B. Assessment

1. Itching, burning, or scratchy eyelids
2. Redness
3. Edema
4. Discharge

**!** Chlamydial conjunctivitis is rare in older children; if diagnosed in a child who is not sexually active, the child should be assessed for possible sexual abuse.

### C. Interventions

1. Instruct in infection control measures such as good handwashing and not sharing towels and washcloths.
2. Administer antibiotic or antiviral eye drops or ointment as prescribed if infection is present (severe infection may require therapy with systemic antibiotics).
3. Instruct the child and parents about the administration of the prescribed medications.
4. Instruct the parents that the child should be kept home from school or day care until antibiotics have been administered for 24 hours.
5. Instruct about the use of cool compresses to lessen irritation and wearing dark glasses if photophobia occurs.
6. Instruct the child to avoid rubbing the eye to prevent injury.
7. Instruct a child who is wearing contact lenses to discontinue wearing them and to obtain new lenses to eliminate the chance of reinfection that can occur from the use of the old lenses.
8. Instruct an adolescent that eye makeup should be discarded and replaced.

## III. OTITIS MEDIA

### A. Description

1. An inflammatory disorder usually caused by an infection of the middle ear occurring as a result of a blocked eustachian tube, which prevents normal drainage; can be acute or chronic.

2. Otitis media is a common complication of an acute respiratory infection (most commonly from respiratory syncytial virus or influenza).
3. Infants and children have eustachian tubes that are shorter, wider, and straighter, which makes them more prone to otitis media.

#### B. Prevention

1. Feed infants in upright position, to prevent reflux.
2. Maintain routine immunizations.
3. Encourage breast-feeding for at least the first 6 months of life.
4. Avoid exposure to tobacco smoke and allergens.

#### C. Assessment

1. Fever
2. Acute onset of ear pain
3. Crying, irritability, lethargy
4. Loss of appetite
5. Rolling of head from side to side
6. Pulling on or rubbing the ear
7. Purulent ear drainage may be present
8. Red, opaque, bulging, immobile tympanic membrane on otoscopic examination
9. Signs of hearing loss (indicative of chronic otitis media)

#### D. Interventions

1. Encourage fluid intake (may be difficult if the child is in pain).
2. Instruct the child to avoid chewing as much as possible during the acute period because chewing increases pain.
3. Provide local heat or cold as prescribed to relieve discomfort, and have the child lie with the affected ear down.
4. Instruct the parents in the appropriate procedure to clean drainage from the external ear canal with sterile swabs or gauze; frequent cleansing and the application of moisture barriers may be prescribed to prevent ear excoriation from the drainage.
5. Instruct the parents in the administration of analgesics or antipyretics such as acetaminophen (Tylenol) or ibuprofen (Motrin) to decrease fever and pain.
6. Instruct the parents in the administration of antibiotics if prescribed, emphasizing that the prescribed period of administration is necessary to eliminate infective organisms.
7. Instruct the parents that screening for hearing loss may be necessary.
8. Instruct the parents about the procedure for administering ear medications such as topical pain relief drops if prescribed.

**!** To administer ear medications in a child younger than age 3, pull the ear lobe down and back. In a child older than 3 years, pull the pinna up and back.

#### E. Myringotomy

##### 1. Description

- a. A surgical incision into the tympanic membrane to provide drainage of the purulent middle ear fluid; may be done by a laser-assisted procedure
- b. Tympanoplasty tubes may be inserted into the middle ear to allow continued drainage and to equalize pressure and allow ventilation of the middle ear.

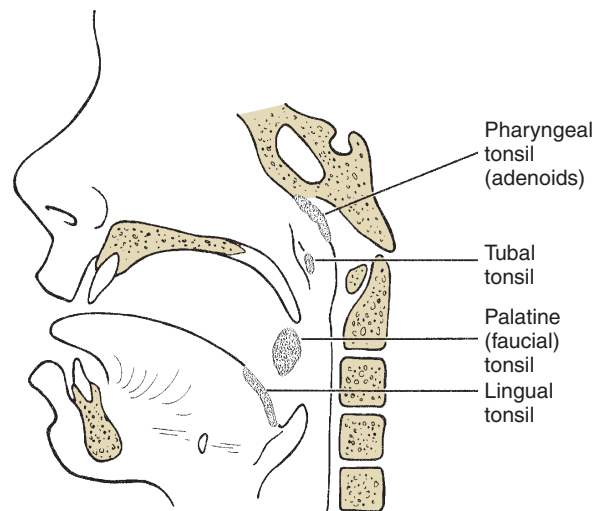

##### 2. Postoperative interventions

- a. Instruct the parents and child to keep the ears dry.
- b. The client should wear earplugs while bathing, shampooing, and swimming (diving and submerging under water are not allowed).
- c. Parents can administer an analgesic such as acetaminophen (Tylenol) or ibuprofen (Motrin) to relieve discomfort after insertion of tympanoplasty tubes.
- d. Parents should be taught that the child should not blow his or her nose for 7 to 10 days after surgery.
- e. Instruct the parents that if the tubes fall out, it is not an emergency, but the physician should be notified; inform the parents of the appearance of the tubes (tiny, white, spool-shaped tubes).

#### IV. TONSILLITIS AND ADENOIDITIS

##### A. Description

1. Tonsillitis refers to inflammation and infection of the tonsils, which is lymphoid tissue located in the pharynx (Fig. 37-1).
2. Adenoiditis refers to inflammation and infection of the adenoids (pharyngeal tonsils), located on the posterior wall of the nasopharynx.

**▲ FIGURE 37-1** Location of various tonsillar masses. (From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. [2010]. *Maternal child nursing care* [4th ed., p. 1312]. St. Louis: Mosby.)

3. Tonsillectomy (surgical removal of the tonsils) and adenoidectomy (surgical removal of the adenoids) may be necessary.

**B. Assessment**

1. Persistent or recurrent sore throat
2. Enlarged, bright red tonsils that may be covered with white exudate
3. Difficulty in swallowing
4. Mouth breathing and an unpleasant mouth odor
5. Fever
6. Cough
7. Enlarged adenoids may cause nasal quality of speech, mouth breathing, hearing difficulty, snoring, or obstructive sleep apnea.

**C. Preoperative interventions**

1. Assess for signs of active infection.
2. Assess bleeding and clotting studies because the throat is vascular.
3. Prepare the child for a sore throat postoperatively, and inform the child that he or she will need to drink liquids.
4. Assess for any loose teeth to decrease the risk of aspiration during surgery.

**D. Interventions postoperatively**

1. Position the child prone or side-lying to facilitate drainage.
2. Have suction equipment available, but do not suction unless there is an airway obstruction.
3. Monitor for signs of bleeding (frequent swallowing may indicate bleeding); if bleeding occurs, turn the child to the side and notify the physician.
4. Discourage coughing, clearing the throat, or nose blowing to prevent bleeding.
5. Provide an ice collar or analgesics (rectally or intravenously) for discomfort.
6. Administer antiemetics to prevent vomiting if prescribed.
7. Provide clear, cool, noncitrus and noncarbonated fluids (crushed ice, ice pops).
8. Avoid red, purple, or brown liquids, which simulate the appearance of blood if the child vomits.
9. Avoid milk products such as milk, ice cream, and pudding initially because they coat the throat causing the child to cough to clear the throat.
10. Soft foods may be prescribed 1 to 2 days postoperatively.
11. Do not give the child any straws, forks, or sharp objects that can be put into the mouth.
12. Mouth odor, slight ear pain, and a low-grade fever may occur for a few days postoperatively, but the parents should be instructed to notify

the physician if bleeding, persistent earache, or fever occurs.

13. Instruct the parents to keep the child away from crowds until healing has occurred; usually the child is able to resume normal activities after 1 to 2 weeks postoperatively.

**V. EPISTAXIS (NOSEBLEEDS)**

**A. Description**

1. The nose, especially the septum, is a highly vascular structure, and bleeding usually results from direct trauma, foreign bodies, and nose picking or from mucosal inflammation.
2. Recurrent epistaxis and severe bleeding may indicate an underlying disease.

**B. Interventions**

1. See Priority Nursing Actions.
2. If bleeding cannot be controlled, packing or cauterization of the bleeding vessel may be prescribed.

**PRIORITY NURSING ACTIONS!**

**Actions to Take if a Child Has a Nosebleed**

1. Remain calm and keep the child calm and quiet.
2. Have the child sit up and lean forward (not lying down).
3. Apply continuous pressure to the nose with the thumb and forefinger for at least 10 minutes.
4. Insert cotton or wadded tissue into each nostril, and apply ice or a cold cloth to the bridge of the nose if bleeding persists.

If a nosebleed occurs in a child, it is important for the nurse to remain calm; otherwise, the child becomes agitated and it is difficult to get the child to cooperate with the necessary interventions. The child should be assisted to a sitting up and leaning forward position to prevent aspiration of blood. The child should not be placed in a lying down position. Nosebleeds usually originate in the anterior part of the nasal septum and can be controlled by applying pressure to the soft lower portion of the nose with the thumb and forefinger for at least 10 minutes. If bleeding persists, cotton or wadded tissue should be placed into each nostril, and ice or a cold cloth should be applied to the bridge of the nose. If bleeding does persist, the physician needs to be notified, and the nose may require packing by the physician. After the nosebleed has been stopped, petroleum or a water-soluble jelly may be inserted into each nostril to prevent crusting of old blood and to lessen the likelihood of the child picking at the crusted lesions and restarting the bleeding. Repeated bleeding episodes that last longer than 30 minutes may be an indication of the need for evaluation of a bleeding disorder.

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1507). St. Louis: Mosby.

## MORE QUESTIONS ON THE CD!

### Practice Questions

- 377.** After a tonsillectomy, a child begins to vomit bright red blood. The initial nursing action is to:
1. Notify the physician.
  2. Maintain NPO status.
  3. Turn the child to the side.
  4. Administer the prescribed antiemetic.
- 378.** A day care nurse is observing a 2-year-old child and suspects that the child may have strabismus. Which observation made by the nurse might indicate this condition?
1. The child has difficulty hearing.
  2. The child consistently tilts the head to see.
  3. The child consistently turns the head to see.
  4. The child does not respond when spoken to.
- 379.** The mother of a 6-year-old child arrives at a clinic because the child has been experiencing scratchy, red, and swollen eyes. The nurse notes a discharge from the eyes and sends a culture to the laboratory for analysis. Chlamydial conjunctivitis is diagnosed. Based on this diagnosis, the nurse determines that which of the following requires further investigation?
1. Possible trauma
  2. Possible sexual abuse
  3. Presence of an allergy
  4. Presence of a respiratory infection
- 380.** A nurse prepares a teaching plan for a mother of a child diagnosed with bacterial conjunctivitis. Which of the following, if stated by the mother, indicates a need for further teaching?
1. "I need to wash my hands frequently."
  2. "I need to clean the eye as prescribed."
  3. "It is okay to share towels and washcloths."
  4. "I need to give the eye drops as prescribed."
- 381.** A nurse is reviewing the laboratory results for a child scheduled for tonsillectomy. The nurse determines that which laboratory value is most significant to review?
1. Creatinine level
  2. Prothrombin time
  3. Sedimentation rate
  4. Blood urea nitrogen level
- 382.** A nurse is preparing to care for a child after a tonsillectomy. The nurse documents on the plan of care to place the child in which appropriate position?
1. Supine
  2. Side-lying
  3. High Fowler's
  4. Trendelenburg's
- 383.** After a tonsillectomy, a nurse reviews the physician's postoperative prescriptions. Which of the following physician's prescriptions does the nurse question?
1. Monitor for bleeding.
  2. Suction every 2 hours.
  3. Give no milk or milk products.
  4. Give clear, cool liquids when awake and alert.
- 384.** A nurse is caring for a child after a tonsillectomy. The nurse monitors the child, knowing that which of the following indicates that the child is bleeding?
1. Frequent swallowing
  2. A decreased pulse rate
  3. Complaints of discomfort
  4. An elevation in blood pressure
- 385.** Antibiotics are prescribed for a child with otitis media who underwent a myringotomy with insertion of tympanostomy tubes. The nurse provides discharge instructions to the parents regarding the administration of the antibiotics. Which statement, if made by the parents, indicates that they understood the instructions?
1. "Administer the antibiotics until they are gone."
  2. "Administer the antibiotics if the child has a fever."
  3. "Administer the antibiotics until the child feels better."
  4. "Begin to taper the antibiotics after 3 days of a full course."

### Alternate Item Format: Multiple Response

- 386.** A child has been diagnosed with acute otitis media of the right ear. Which interventions should the nurse include in the plan of care? **Select all that apply.**
- 1. Provide a soft diet.
  - 2. Position the child on the left side.
  - 3. Administer an antihistamine twice daily.
  - 4. Irrigate the right ear with normal saline every 8 hours.
  - 5. Administer acetaminophen (Tylenol) for fever every 4 hours as prescribed and as needed.
  - 6. Instruct the parents about the need to administer the antibiotics for the full course of prescribed therapy.

**ANSWERS****377. 3**

**Rationale:** After tonsillectomy, if bleeding occurs, the nurse immediately turns the child to the side to prevent aspiration and then notifies the physician. NPO status would be maintained, and an antiemetic may be prescribed; however, the initial nursing action would be to turn the child to the side.

**Test-Taking Strategy:** Note the strategic word *initial* in the event query. Although all the options may be appropriate to maintain physiological integrity, the initial action is to turn the child to the side to prevent aspiration. Review the initial action to take if a postoperative child vomits if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership and Management—Delegating/Prioritizing

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 764). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1184). St. Louis: Saunders.

**378. 2**

**Rationale:** Strabismus is a condition in which the eyes are not aligned because of lack of coordination of the extraocular muscles. The nurse may suspect strabismus in a child when the child complains of frequent headaches, squints, or tilts the head to see. Other manifestations include crossed eyes, closing one eye to see, diplopia, photophobia, loss of binocular vision, or impairment of depth perception. Options 1, 3, and 4 are not indicative of this condition.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1 and 4 first because they are comparable or alike. To select from the remaining options, recall that this is a condition in which the eyes are not aligned because of lack of coordination of the extraocular muscles. Review the signs of strabismus if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1561). St. Louis: Saunders.

**379. 2**

**Rationale:** Conjunctivitis is an inflammation of the conjunctiva. A diagnosis of chlamydial conjunctivitis in a child who is not sexually active should signal the health care provider to assess the child for possible sexual abuse. Allergy, infection, and trauma can cause conjunctivitis, but the causative organism is not likely to be chlamydia.

**Test-Taking Strategy:** Note the age of the child and the organism that is identified in the question. This will assist in directing you to option 2. Options 1, 3, and 4 can be recognized as the common causes of conjunctivitis. These options are comparable or alike in that they relate to a physiological problem. Review the causes of chlamydial conjunctivitis if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1563). St. Louis: Saunders.

**380. 3**

**Rationale:** Conjunctivitis is an inflammation of the conjunctiva. Bacterial conjunctivitis is highly contagious, and the nurse should teach infection control measures. These include good handwashing and not sharing towels and washcloths. Options 1, 2, and 4 are correct treatment measures.

**Test-Taking Strategy:** Note the strategic words *need for further teaching*. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Options 1, 2, and 4 can be eliminated by recalling that bacterial conjunctivitis is highly contagious. If you had difficulty with this question, review infection control measures for bacterial conjunctivitis.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Integumentary/AIDS/Infectious Diseases

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1563). St. Louis: Saunders.

**381. 2**

**Rationale:** A tonsillectomy is the surgical removal of the tonsils. Because the tonsillar area is so vascular, postoperative bleeding is a concern. Prothrombin time, partial thromboplastin time, platelet count, hemoglobin and hematocrit, white blood cell count, and urinalysis are performed preoperatively. The prothrombin time results would identify a potential for bleeding. Creatinine level, sedimentation rate, and blood urea nitrogen would not determine the potential for bleeding.

**Test-Taking Strategy:** Focus on the surgical procedure and the subject of the question. The subject of the question relates to the potential for bleeding. Options 1 and 4 can be eliminated because they relate to kidney function. Similarly, option 3 can be eliminated because it is unrelated to the subject of the question. Review preoperative care of the child scheduled for tonsillectomy if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1183). St. Louis: Saunders.

**382. 2**

**Rationale:** A tonsillectomy is the surgical removal of the tonsils. The child should be placed in a prone or side-lying position after the surgical procedure to facilitate drainage. Options 1, 3, and 4 would not achieve this goal.

**Test-Taking Strategy:** Focus on the surgical procedure and visualize each of the positions described in the options. Keeping in mind that the goal is to facilitate drainage will direct you to option 2. Review positioning procedures after tonsillectomy if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 764). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1184). St. Louis: Saunders.

### 383. 2

**Rationale:** A tonsillectomy is the surgical removal of the tonsils. After tonsillectomy, suction equipment should be available, but suctioning is not performed unless there is an airway obstruction because of the risk of trauma to the surgical site. Monitoring for bleeding is an important nursing intervention after any type of surgery. Milk and milk products are avoided initially because they coat the throat, cause the child to clear the throat, and increase the risk of bleeding. Clear, cool liquids are encouraged.

**Test-Taking Strategy:** Focus on the subject, the prescription that the nurse questions. Option 1 can be eliminated first because this is a nursing action, not a medical prescription. From the remaining options, consider the anatomical location of the surgery. This should direct you to option 2. Review postoperative care after tonsillectomy if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 764). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1184). St. Louis: Saunders.

### 384. 1

**Rationale:** A tonsillectomy is the surgical removal of the tonsils. Frequent swallowing, restlessness, a fast and thready pulse, and vomiting bright red blood are signs of bleeding. An elevated blood pressure and complaints of discomfort are not indications of bleeding.

**Test-Taking Strategy:** Use the concepts related to the signs of shock to assist in answering this question. These concepts should assist in eliminating options 2 and 4. From the remaining options, recalling that discomfort is expected and does not indicate bleeding will direct you to option 1. Review the signs of bleeding after tonsillectomy if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 764). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1183). St. Louis: Saunders.

### 385. 1

**Rationale:** A myringotomy is the insertion of tympanoplasty tubes into the middle ear to promote drainage of purulent middle ear fluid and to equalize pressure and keep the ear aerated. The nurse must instruct parents regarding the administration of antibiotics. Antibiotics need to be taken as prescribed, and the full course needs to be completed. Options 2, 3, and 4 are incorrect. Antibiotics are not tapered, but are administered for the full course of therapy.

**Test-Taking Strategy:** Note the strategic words *understood the instructions*. Use the process of elimination and recall that antibiotics must be taken for the full course, regardless of whether the child is feeling better. This will assist in directing you to option 1. Review concepts related to the administration of antibiotics if you had difficulty with this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 767). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1181). St. Louis: Saunders.

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 386. 1, 5, 6

**Rationale:** Acute otitis media is an inflammatory disorder caused by an infection of the middle ear. The child often has fever, pain, loss of appetite, and possible ear drainage. The child also is irritable and lethargic and may roll the head or pull on or rub the affected ear. Otitoscopic examination may reveal a red, opaque, bulging, and immobile tympanic membrane. Hearing loss may be noted particularly in chronic otitis media. The child's fever should be treated with acetaminophen (Tylenol) or ibuprofen (Motrin). The child is positioned on his or her affected side to facilitate drainage. A soft diet is recommended during the acute stage to avoid pain that can occur with chewing. Antibiotics are prescribed to treat the bacterial infection and should be administered for the full prescribed course. The ear should not be irrigated with normal saline because it can exacerbate the inflammation further. Antihistamines are not usually recommended as a part of therapy.

**Test-Taking Strategy:** Focus on the child's diagnosis and note the strategic words, *acute* and *right ear*. Think about the pathophysiology associated with the disorder and the associated manifestations to select the correct options. Review the interventions and the treatment for acute otitis media if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., pp. 766–767). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1181). St. Louis: Saunders.

# Respiratory Disorders

## I. EPIGLOTTITIS

### A. Description

1. Bacterial form of croup
2. Inflammation of the epiglottis occurs, which may be caused by *Haemophilus influenzae* type b or *Streptococcus pneumoniae*; children immunized with *H. influenzae* type b (Hib **vaccine**) are at less risk for epiglottitis.
3. Occurs most frequently in children 2 to 8 years old, but can occur from infancy to adulthood
4. Onset is abrupt, and the condition occurs most often in the winter.
5. Considered an emergency situation because it can progress rapidly to severe respiratory distress

### B. Assessment

1. High fever
2. Sore, red, and inflamed throat (large, cherry red, edematous epiglottis) and pain on swallowing (Fig. 38-1)
3. Absence of spontaneous cough
4. Drooling
5. Agitation
6. Muffled voice
7. **Retractions** and child struggles to breathe
8. Inspiratory **stridor** aggravated by the supine position
9. Tachycardia
10. Tachypnea progressing to more severe respiratory distress (hypoxia, hypercapnia, respiratory acidosis, decreased level of consciousness)
11. Tripod positioning: While supporting the body with the hands, the child leans forward, thrusts the chin forward and opens the mouth in an attempt to widen the airway

### C. Interventions

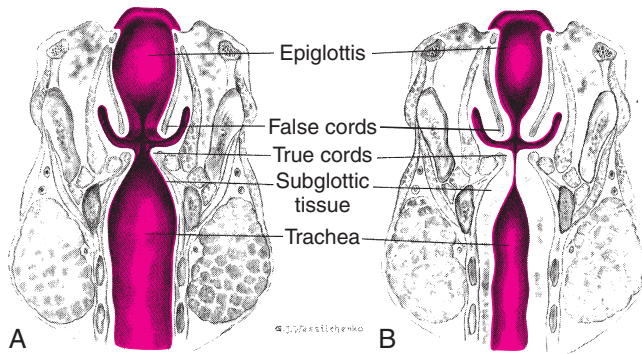

1. Maintain a patent airway.
2. Assess respiratory status and breath sounds, noting **nasal flaring**, the use of accessory muscles, **retractions**, and the presence of **stridor**.
3. Assess temperature by the axillary route, not the oral route.
4. Monitor pulse oximetry.

5. Prepare the child for lateral neck films to confirm the diagnosis (accompany the child to the radiology department).
6. Maintain NPO status.
7. Do not leave the child unattended.
8. Avoid placing the child in a supine position because this position would affect the respiratory status further.
9. Do not restrain the child or take any other measure that may agitate the child.
10. Administer intravenous fluids as prescribed; insertion of an intravenous line may need to be delayed until an adequate airway is established because this procedure may agitate the child.
11. Administer intravenous antibiotics as prescribed; these are usually followed by oral antibiotics.
12. Administer analgesics and antipyretics (acetaminophen [Tylenol] or ibuprofen [Motrin]) to reduce fever and throat pain as prescribed.
13. Administer corticosteroids to decrease inflammation and reduce throat edema as prescribed.
14. Nebulized epinephrine (racemic epinephrine) may be prescribed for severe cases (causes mucosal vasoconstriction and reduces edema); heliox (mixture of helium and oxygen) may also be prescribed to reduce mucosal edema.
15. Provide cool mist oxygen therapy as prescribed; high humidification cools the airway and decreases swelling.
16. Have resuscitation equipment available, and prepare for endotracheal intubation or tracheotomy for severe respiratory distress.
17. Ensure that the child is up to date with immunizations, including Hib conjugate **vaccine** (see Chapter 48).

**!** If epiglottitis is suspected, no attempts should be made to visualize the posterior pharynx, obtain a throat culture, or take an oral temperature. Otherwise, spasm of the epiglottis can occur leading to complete airway occlusion.

▲ **FIGURE 38-1** A, Normal larynx. B, Obstruction and narrowing resulting from edema of croup. (From Hockenberry, M., & Wilson, D. [2007]. *Wong's nursing care of infants and children* [8th ed.]. St. Louis: Mosby.)

## II. LARYNGOTRACHEOBRONCHITIS

### A. Description

1. Inflammation of the larynx, trachea, and bronchi
2. Most common type of croup; may be viral or bacterial and most frequently occurs in children younger than 5 years
3. Common causative organisms include parainfluenzae virus types 1 and 2, respiratory syncytial virus (RSV), *Mycoplasma pneumoniae*, and influenza.
4. Characterized by gradual onset that may be preceded by an upper respiratory infection

### B. Assessment (Box 38-1)

### C. Interventions

1. Maintain a patent airway.
2. Assess respiratory status and monitor pulse oximetry; monitor for **nasal flaring**, **sternal retraction**, and inspiratory **stridor** (Fig. 38-2).
3. Monitor for adequate respiratory exchange; monitor for pallor or **cyanosis**.
4. Elevate the head of the bed and provide rest.
5. Provide humidified oxygen via a cool air or mist tent as prescribed for a hospitalized child (Table 38-1).
6. Instruct the parents to use a cool air vaporizer at home; other measures include having the child breathe in the cool night air or the air from an open freezer or taking the child to a cool basement or garage.
7. Provide and encourage fluid intake; intravenous fluids may be prescribed to maintain hydration status if the child is unable to take fluids orally.
8. Administer analgesics as prescribed to reduce fever.
9. Teach the parents to avoid administering cough syrups or cold medicines, which may dry and thicken secretions.
10. Administer corticosteroids if prescribed to reduce inflammation and edema.

### Box 38-1 Progression of Symptoms in Laryngotracheobronchitis

#### Stage I

- Low-grade fever
- Hoarseness
- Seal bark and brassy cough (croup cough)
- Inspiratory stridor
- Fear
- Irritability and restlessness

#### Stage II

- Continuous respiratory stridor
- Retractions
- Use of accessory muscles
- Crackles and wheezing
- Labored respirations

#### Stage III

- Continued restlessness
- Anxiety
- Pallor
- Diaphoresis
- Tachypnea
- Signs of anoxia and hypercapnia

#### Stage IV

- Intermittent cyanosis progressing to permanent cyanosis
- Apneic episodes progressing to cessation of breathing

Modified from Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care*. (4th ed., p. 1320). St. Louis: Mosby.

▲ **FIGURE 38-2** Location of retractions. (From Hockenberry, M., & Wilson, D. [2007]. *Wong's nursing care of infants and children* [8th ed.]. St. Louis: Mosby.)

11. Administer nebulized epinephrine (racemic epinephrine) as prescribed; this may be prescribed for children with severe disease experiencing **stridor** at rest, **retractions**, or difficulty breathing.
12. Administer antibiotics as prescribed, noting that they are not indicated unless a bacterial infection is present.

**TABLE 38-1** Advantages and Disadvantages of Oxygen Delivery Systems

| Systems                | Advantages  | Disadvantages  |
|------------------------|---|--|
| Oxygen mask            | Various sizes available; delivers higher O <sub>2</sub> concentration than cannula<br>Able to provide a predictable concentration of oxygen (with Venturi mask) whether child breathes through nose or mouth            | Skin irritation<br>Fear of suffocation<br>Accumulation of moisture on face<br>Possibility of aspiration of vomitus<br>Difficulty in controlling O <sub>2</sub> concentrations (except with Venturi mask)                     |
| Nasal cannula          | Provides low-moderate O <sub>2</sub> concentration (22%-40%)<br>Child able to eat and talk while getting O <sub>2</sub><br>Possibility of more complete observation of child because nose and mouth remain unobstructed | Must have patent nasal passages<br>May cause abdominal distention and discomfort or vomiting<br>Difficulty controlling O <sub>2</sub> concentrations if child breathes through mouth<br>Inability to provide mist if desired |
| Oxygen tent            | Provides lower O <sub>2</sub> concentrations (F <sub>IO<sub>2</sub></sub> up to 0.3-0.5)<br>Child able to receive desired inspired O <sub>2</sub> concentrations, even while eating                                     | Necessity for tight fit around bed to prevent leakage of oxygen<br>Cool and wet tent environment<br>Poor access to child; inspired O <sub>2</sub> levels fall when tent is entered   |
| Oxygen hood, face tent | Provides high O <sub>2</sub> concentrations (F <sub>IO<sub>2</sub></sub> up to 1.00)<br>Free access to child's chest for assessment   | High-humidity environment<br>Need to remove child for feeding and care   |

From Hockenberry, M., & Wilson, D. (2007). *Wong's nursing care of infants and children* (8th ed.). St. Louis: Mosby.

13. Heliox (mixture of helium and oxygen) may be prescribed; this medication reduces the work of breathing, reduces airway turbulence, and helps to relieve airway obstruction.
14. Have resuscitation equipment available.
15. Provide appropriate reassurance and education to the parents or caregivers.

 Isolation precautions should be implemented for a hospitalized child with an upper respiratory infection until the cause of the infection is known.

### III. BRONCHITIS

#### A. Description

1. Inflammation of the trachea and bronchi; may be referred to as tracheobronchitis
2. Usually occurs in association with an upper respiratory infection
3. Is usually a mild disorder; causative agent is most often viral

#### B. Assessment

1. Fever
2. Dry, hacking, and nonproductive cough that is worse at night and becomes productive in 2 to 3 days

#### C. Interventions

1. Treat symptoms as necessary.
2. Monitor for respiratory distress.
3. Provide cool, humidified air to the child.
4. Encourage increased fluid intake; child may drink beverages that he or she likes as long as the respiratory status is stable.
5. Administer antipyretics for fever as prescribed.

6. Cough suppressants may be prescribed to promote rest.

### IV. BRONCHIOLITIS AND RESPIRATORY SYNCYTIAL VIRUS (RSV)

#### A. Description

1. Bronchiolitis is an inflammation of the bronchioles that causes production of thick mucus that occludes bronchiole tubes and small bronchi.
2. RSV causes an acute viral infection and is a common cause of bronchiolitis (other organisms that cause bronchiolitis include adenoviruses, parainfluenza viruses, and human metapneumovirus).
3. RSV, although not airborne, is highly communicable and is usually transferred by direct contact with respiratory secretions.
4. RSV occurs primarily in the winter and spring.
5. RSV is rarer in children older than 2 years, with a peak incidence at approximately 6 months of age.
6. At-risk children include children older than 1 year of age who have a chronic or disabling condition.
7. Identification of the virus is done via testing of nasal or nasopharyngeal secretions.
8. Prevention measures include encouraging breast-feeding; avoiding tobacco smoke exposure; using good handwashing techniques; and administering palivizumab (Synagis), a monoclonal antibody, to high-risk infants. Palivizumab is administered via intramuscular injection monthly for a 5-month period (usually from November to March).

#### B. Assessment (Box 38-2)

### Box 38-2 Assessment: Respiratory Syncytial Virus

#### Initial Manifestations

Rhinorrhea  
 Eye or ear drainage  
 Pharyngitis  
 Coughing  
 Sneezing  
 Wheezing  
 Intermittent fever

#### Manifestations as Disease Progresses

Increased coughing and wheezing  
 Signs of air hunger  
 Tachypnea and retractions  
 Periods of cyanosis

#### Manifestations in Severe Illness

Tachypnea more than 70 breaths/min  
 Decreased breath sounds and poor air exchange  
 Listlessness  
 Apneic episodes

Modified from Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1322). St. Louis: Mosby.

#### C. Interventions

1. For a child with bronchiolitis, interventions are aimed at treating symptoms and include airway maintenance, cool humidified air and oxygen, adequate fluid intake, and medications.
2. For a hospitalized child with RSV, isolate the child in a single room or place in a room with another child with RSV.
3. Ensure that nurses caring for a child with RSV do not care for other high-risk children.
4. Use contact and standard precautions during care; using good handwashing techniques and wearing gloves and gowns are necessary.
5. Monitor airway status and maintain a patent airway.
6. For most effective airway maintenance, position the child at a 30- to 40-degree angle with the neck slightly extended to maintain an open airway and decrease pressure on the diaphragm.
7. Provide cool, humidified oxygen as prescribed.
8. Monitor pulse oximetry levels.
9. Encourage fluids; fluids administered intravenously may be necessary until the acute stage has passed.
10. Periodic suctioning may be necessary if nasal secretions are copious; use of a bulb syringe for suctioning may be effective. Suctioning should be done before feeding to promote comfort and adequate intake.
11. Administer ribavirin (Virazole), an antiviral medication, if prescribed (administered via the inhalation route).

 Cough suppressants are administered with caution because they can interfere with the clearance of respiratory secretions.

## V. PNEUMONIA

### A. Description

1. Inflammation of the pulmonary parenchyma or alveoli or both caused by a virus, mycoplasmal agents, bacteria, or aspiration of foreign substances.
2. The causative agent usually is introduced into the lungs through inhalation or from the bloodstream.
3. Viral pneumonia occurs more frequently than bacterial pneumonia, is seen in children of all ages, and often is associated with a viral upper respiratory infection.
4. Primary atypical pneumonia, usually caused by *Mycoplasma pneumoniae* or *Chlamydia pneumoniae*, occurs most often in the fall and winter months and is more common in crowded living conditions; it is most often seen in children 5 to 12 years old.
5. Bacterial pneumonia is often a serious infection requiring hospitalization when pleural effusion or empyema accompanies the disease; hospitalization is also necessary for children with staphylococcal pneumonia (*Streptococcus pneumoniae* is a common cause).
6. Aspiration pneumonia occurs when food, secretions, liquids, or other materials enter the lung and cause inflammation and a chemical pneumonitis. Classic symptoms include an increasing cough or fever with foul-smelling sputum, deteriorating results on chest x-rays, and other signs of airway involvement.
7. Prevention of viral and bacterial pneumonia includes immunization of infants and children with pneumococcal **vaccine** (see Chapter 48).

### B. Viral pneumonia

1. Assessment
  - a. Acute or insidious onset
  - b. Symptoms range from mild fever, slight cough, and malaise to high fever, severe cough, and diaphoresis.
  - c. Nonproductive or productive cough of small amounts of whitish sputum
  - d. Wheezes or fine **crackles**
2. Interventions
  - a. Treatment is symptomatic.
  - b. Administer oxygen with cool humidified air as prescribed.
  - c. Increase fluid intake.
  - d. Administer antipyretics for fever as prescribed.
  - e. Administer chest physiotherapy and postural drainage as prescribed.

-  **C. Primary atypical pneumonia**
1. Assessment
    - a. Acute or insidious onset
    - b. Fever (lasting several days to 2 weeks), chills, anorexia, headache, malaise, and myalgia (muscle pain)
    - c. Rhinitis; sore throat; and dry, hacking cough
    - d. Nonproductive cough initially progressing to production of seromucoid sputum that becomes mucopurulent or blood-streaked
  2. Interventions
    - a. Treatment is symptomatic.
    - b. Recovery generally occurs in 7 to 10 days.
-  **D. Bacterial pneumonia**
1. Assessment
    - a. Acute onset
    - b. Infant: Irritability, lethargy, poor feeding; abrupt fever (may be accompanied by seizures); respiratory distress (air hunger, tachypnea, and circumoral **cyanosis**)
    - c. Older child: Headache, chills, abdominal pain, chest pain, meningeal symptoms (meningism)
    - d. Hacking, nonproductive cough
    - e. Diminished breath sounds or scattered **crackles**
    - f. With consolidation, decreased breath sounds are more pronounced.
    - g. As the infection resolves, the cough becomes productive, and the child expectorates purulent sputum; coarse **crackles** and **wheezing** are noted.
  2. Interventions
    - a. Antibiotic therapy is initiated as soon as the diagnosis is suspected; in a hospitalized infant or child, intravenous antibiotics are usually prescribed.
    - b. Administer oxygen for respiratory distress as prescribed, and monitor oxygen saturation via pulse oximetry.
    - c. Place the child in a cool mist tent as prescribed; cool humidification moistens the airways and assists in temperature reduction.
    - d. Suction mucus from the infant using a bulb syringe to maintain a patent airway if the infant is unable to handle secretions.
    - e. Administer chest physiotherapy and postural drainage every 4 hours as prescribed.
    - f. Promote bed rest to conserve energy.
    - g. Encourage the child to lie on the affected side (if pneumonia is unilateral) to splint the chest and reduce the discomfort caused by pleural rubbing.
    - h. Encourage fluid intake (administer cautiously to prevent aspiration); intravenously administered fluids may be necessary.
    - i. Administer antipyretics for fever and bronchodilators as prescribed.
    - j. Monitor temperature frequently because of the risk for febrile seizures.
    - k. Institute isolation precautions with pneumococcal or staphylococcal pneumonia (according to agency policy).
      - l. Administer cough suppressant as prescribed before rest times and meals if the cough is disturbing.
    - m. Continuous closed chest drainage may be instituted if purulent fluid is present (usually noted in *Staphylococcus* infections).
    - n. Fluid accumulation in the pleural cavity may be removed by thoracentesis; thoracentesis also provides a means for obtaining fluid for culture and for instilling antibiotics directly into the pleural cavity.
-  **! Children with a respiratory disorder should be monitored for weight loss and for signs of dehydration. Signs of dehydration include a sunken fontanel, nonelastic skin turgor, decreased and concentrated urinary output, dry mucous membranes, and decreased tear production.**
- VI. ASTHMA**
- A. Description**
1. Asthma is a chronic inflammatory disease of the airways (see Chapter 58).
  2. Asthma is classified based on disease severity; management includes medications, environmental control of allergens, and child and family education.
  3. The allergic reaction in the airways caused by the precipitant can result in an immediate reaction with obstruction occurring, and it can result in a late bronchial obstructive reaction several hours after the initial exposure to the precipitant.
  4. Mast cell release of histamine leads to a bronchoconstrictive process, bronchospasm, and obstruction.
  5. Diagnosis is made based on the child's symptoms, history and physical examination, chest radiograph, and laboratory tests (Box 38-3).
  6. Precipitants may trigger an asthma attack (Box 38-4).
  7. Status asthmaticus is an acute asthma attack, and the child displays respiratory distress despite vigorous treatment measures; this is a medical emergency that can result in respiratory failure and death if not treated.
- B. Assessment**
1. Child has episodes of dyspnea, **wheezing**, breathlessness, chest tightness, and cough, particularly at night or in the early morning or both. 

### Box 38-3 Laboratory Tests to Assist in Diagnosing Asthma

Pulmonary function tests: Spirometry testing assesses presence and degree of disease and can determine response to treatment.

Peak expiratory flow rate measurement: Measures maximum flow of air that can be forcefully exhaled in 1 second; child uses a peak expiratory flowmeter to determine a “personal best value” that can be used for comparison at other times, such as during and after an asthma attack.

Bronchoprovocation testing: Testing that is done to identify inhaled allergens; mucous membranes are directly exposed to suspected allergen in increasing amounts.

Skin testing: Done to identify specific allergens.

Exercise challenges: Exercise is used to identify the occurrence of exercise-induced bronchospasm.

Radioallergosorbent test: Blood test used to identify a specific allergen.

Chest radiograph: May show hyperexpansion of the airways.

Note: Some tests place the child at risk for an asthma attack; testing should be done under close supervision.

### Box 38-4 Precipitants Triggering an Asthma Attack

#### Allergens

Outdoor: trees, shrubs, weeds, grasses, molds, pollen, air pollution, spores

Indoor: dust, dust mites, mold, cockroach antigen

Irritants: tobacco smoke, wood smoke, odors, sprays

Exposure to occupational irritants

Exercise

Cold air

Changes in weather or temperature

Environmental change: moving to a new home, starting a new school

Colds and infections

Animals: cats, dogs, rodents, horses

Medications: aspirin, nonsteroidal anti-inflammatory drugs, antibiotics,  $\beta$ -blockers

Strong emotions: fear, anger, laughing, crying

Conditions: gastroesophageal reflux disease, tracheoesophageal fistula

Food additives: sulfite preservatives

Foods: nuts, milk and other dairy products

Endocrine factors: menses, pregnancy, thyroid disease

From Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1335). St. Louis: Mosby.

#### 2. Acute asthma attacks

- a. Episodes include progressively worsening shortness of breath, cough, **wheezing**, chest tightness, decreases in expiratory airflow secondary to bronchospasm, mucosal edema, and mucus plugging; air is trapped behind occluded or narrow airways, and hypoxemia can occur.
- b. The attack begins with irritability, restlessness, headache, feeling tired, or chest tightness; just before the attack, the child may present with itching localized at the front of the neck or over the upper part of the back.
- c. Respiratory symptoms include a hacking, irritable, nonproductive cough caused by bronchial edema.

- d. Accumulated secretions stimulate the cough; the cough becomes rattling, and there is production of frothy, clear, gelatinous sputum.
  - e. The child experiences **retractions**.
  - f. Hyperresonance on percussion of the chest is noted.
  - g. Breath sounds are coarse and loud, with **crackles**, coarse rhonchi, and inspiratory and expiratory **wheezing**; expiration is prolonged.
  - h. Child may be pale or flushed, and the lips may have a deep, dark red color that may progress to **cyanosis** (also observed in the nail beds and skin, especially around the mouth).
  - i. Restlessness, apprehension, and diaphoresis occur.
  - j. Child speaks in short, broken phrases.
  - k. Younger children assume the tripod sitting position; older children sit upright, with the shoulders in a hunched-over position, the hands on the bed or a chair, and the arms braced to facilitate the use of the accessory muscles of breathing (child refuses to lie down).
  - l. Exercise-induced attack: Cough, shortness of breath, chest pain or tightness, **wheezing**, and endurance problems occur during exercise.
  - m. Severe spasm or obstruction: Breath sounds and **wheezing** cannot be heard (silent chest), and cough is ineffective (represents a lack of air movement).
  - n. Ventilatory failure and asphyxia: Shortness of breath, with air movement in the chest restricted to the point of absent breath sounds, is noted; this is accompanied by a sudden increase in the respiratory rate.
- C. Interventions:** Acute episode (see Priority Nursing Actions)

### PRIORITY NURSING ACTIONS!

#### Actions to Take in the Event of an Acute Asthma Attack

1. Assess airway patency and respiratory status.
2. Administer humidified oxygen by nasal cannula or face mask.
3. Administer quick-relief (rescue) medications.
4. Initiate an intravenous (IV) line.
5. Prepare the child for a chest radiograph if prescribed.
6. Prepare to obtain a blood sample for determining arterial blood gas levels if prescribed.

In the event of an acute asthma attack, several interventions are necessary. First, the nurse assesses airway status to ensure airway patency. If the airway is not patent, emergency interventions such as endotracheal intubation may be necessary. The nurse also quickly assesses the child's respiratory status. If the airway is patent, the nurse administers oxygen by nasal cannula or mask as prescribed. Quick-relief (rescue) medications are administered as prescribed to treat the symptoms. An IV line is initiated so that IV medications can be administered if prescribed.

The nurse prepares the child for a chest x-ray to assess airway status and to assist in ruling out a respiratory infection. Blood samples are obtained, and an arterial blood gas may be obtained. When the laboratory results are obtained, the nurse administers medications as prescribed to correct dehydration, acidosis, or electrolyte imbalances. During the episode and during treatment, the nurse continuously monitors respiratory status, pulse oximetry, and color. The nurse also needs to be alert to decreased wheezing or a silent chest, which may signal the inability to move air.

**References:** Hockenberry, M., & Wilson, D. (2007). *Wong's essentials of pediatric nursing* (8th ed., p. 790). St. Louis: Mosby. McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1204). St. Louis: Saunders.

#### D. Medications

1. Quick-relief medications (rescue medications): Used to treat symptoms and exacerbations (Box 38-5)
2. Long-term control medications (preventer medications): Used to achieve and maintain control of inflammation (Box 38-6)
3. Nebulizer, metered-dose inhaler (MDI): May be used to administer medications; if the child has difficulty using the MDI, medication can be administered by nebulization (medication is mixed with saline and then nebulized with compressed air by a machine).
4. If the MDI is used to administer a corticosteroid, a spacer should be used to prevent yeast infections in the child's mouth.
5. The child's **growth** patterns need to be monitored when corticosteroids are prescribed.

#### Box 38-5 Quick-Relief Medications (Rescue Medications)

Short-acting  $\beta_2$  agonists (for bronchodilation)  
 Anticholinergics (for relief of acute bronchospasm)  
 Systemic corticosteroids (for anti-inflammatory action to treat reversible airflow obstruction)

#### Box 38-6 Long-Term Control (Preventer Medications)

Corticosteroids (for anti-inflammatory action)  
 Antiallergic medications (to prevent an adverse response on exposure to an allergen)  
 Nonsteroidal anti-inflammatory drugs (for anti-inflammatory action)  
 Long-acting  $\beta_2$  agonists (for long-acting bronchodilation)  
 Leukotriene modifiers (to prevent bronchospasm and inflammatory cell infiltration)  
 Monoclonal antibody (blocks binding of IgE to mast cells to inhibit inflammation)

#### E. Chest physiotherapy

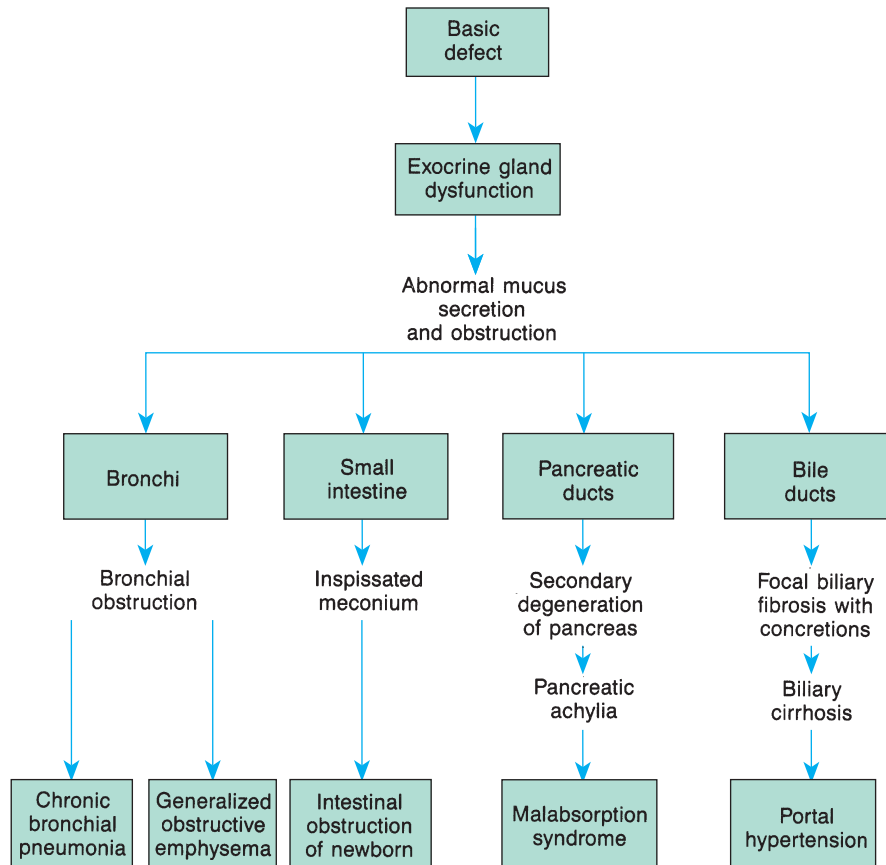

1. Includes breathing exercises, clapping and vibration procedures with postural drainage, and suctioning when necessary
2. Chest physiotherapy strengthens the respiratory musculature and produces more efficient breathing patterns.
3. Chest physiotherapy is not recommended during an acute exacerbation.

#### F. Allergen control

1. Testing may be done to identify allergens.
2. Teach the child and parents about measures to prevent and reduce exposure to allergens (see Box 38-4)

#### G. Home care measures

1. Instruct the family in measures to eliminate environmental allergens.
2. Avoid extremes of environmental temperature; in cold temperatures, instruct the child to breathe through the nose, not the mouth, and to cover the nose and mouth with a scarf.
3. Avoid exposure to individuals with a respiratory infection.
4. Instruct the child and family in how to recognize early symptoms of an asthma attack.
5. Teach the child and family how to administer medications as prescribed.
6. Teach the child and family how to use a nebulizer, MDI, or peak expiratory flowmeter.
7. Instruct the child and family about the importance of home monitoring of the peak expiratory flow rate; a decrease in the expiratory flow rate may indicate impending infection or exacerbation.

▲ **FIGURE 38-3** Various effects of exocrine gland dysfunction in cystic fibrosis. (From Hockenberry, M., & Wilson, D. [2007]. *Wong's nursing care of infants and children* [8th ed.]. St. Louis: Mosby.)

8. Instruct the child in the cleaning of devices used for inhaled medications (yeast infections can occur with the use of aerosolized corticosteroids).
9. Encourage adequate rest, sleep, and a well-balanced diet.
10. Instruct the child in the importance of adequate fluid intake to liquefy secretions.
11. Assist in developing an exercise program.
12. Instruct the child in the procedure for respiratory treatments and exercises as prescribed.
13. Encourage the child to cough effectively.
14. Encourage the parents to keep immunizations up to date; annual influenza vaccinations are recommended for children 6 months of age and older.
15. Inform other health care providers and school personnel of the asthma condition.
16. Allow the child to take control of self-care measures based on age appropriateness.

## VII. CYSTIC FIBROSIS

### A. Description (Fig. 38-3)

1. A chronic multisystem disorder (autosomal recessive trait disorder) characterized by exocrine gland dysfunction

2. The mucus produced by the exocrine glands is abnormally thick, tenacious, and copious, causing obstruction of the small passageways of the affected organs, particularly in the respiratory, gastrointestinal, and reproductive systems.
3. Common symptoms are associated with pancreatic enzyme deficiency and pancreatic fibrosis caused by duct blockage, progressive chronic lung disease as a result of infection, and sweat gland dysfunction resulting in increased sodium and chloride sweat concentrations.
4. An increase in sodium and chloride in sweat and saliva forms the basis for one diagnostic test, the sweat chloride test (Box 38-7).
5. Cystic fibrosis is a progressive and incurable fibrosis, and respiratory failure is a common cause of death; organ transplantations may be an option to increase survival rates.

### B. Respiratory system

1. Symptoms are produced by the stagnation of mucus in the airway, leading to bacterial colonization and destruction of lung tissue.
2. Emphysema and atelectasis occur as the airways become increasingly obstructed.

**Box 38-7 Quantitative Sweat Chloride Test**

Production of sweat is stimulated (pilocarpine iontophoresis), sweat is collected, and sweat electrolytes are measured (more than 75 mg of sweat is needed).

Normally, sweat chloride concentration is less than 40 mEq/L.

Chloride concentration greater than 60 mEq/L is a positive test result (higher than 40 mEq/L is diagnostic in infants younger than 3 months of age).

Chloride concentrations of 40 to 60 mEq/L are highly suggestive of cystic fibrosis and require a repeat test.

3. Chronic hypoxemia causes contraction and hypertrophy of the muscle fibers in pulmonary arteries and arterioles, leading to pulmonary hypertension and eventual cor pulmonale.
4. Pneumothorax from ruptured bullae and hemoptysis from erosion of the bronchial wall occur as the disease progresses.
5. Other respiratory symptoms
  - a. **Wheezing** and cough
  - b. Dyspnea
  - c. **Cyanosis**
  - d. Clubbing of the fingers and toes
  - e. Barrel chest
  - f. Repeated episodes of bronchitis and pneumonia

 **C. Gastrointestinal system**

1. Meconium ileus in the newborn is the earliest manifestation.
2. Intestinal obstruction (distal intestinal obstructive syndrome) caused by thick intestinal secretions can occur; signs include pain, abdominal distention, nausea, and vomiting.
3. Stools are frothy and foul-smelling.
4. Deficiency of the fat-soluble vitamins A, D, E, and K, which can result in easy bruising, bleeding, and anemia, occurs.
5. Malnutrition and failure to thrive is a concern.
6. Demonstration of hypoalbuminemia can occur from diminished absorption of protein, resulting in generalized edema.
7. Rectal prolapse can result from the large, bulky stools and increased intra-abdominal pressure.
8. Pancreatic fibrosis can occur and places the child at risk for diabetes mellitus.

 **D. Integumentary system**

1. Abnormally high concentrations of sodium and chloride in sweat is noted.
2. Parents report that the infant tastes “salty” when kissed.
3. Dehydration and electrolyte imbalances can occur, especially during hyperthermic conditions.

**E. Reproductive system**

1. Cystic fibrosis can delay **puberty** in girls.

2. Fertility can be inhibited by the highly viscous cervical secretions, which act as a plug and block sperm entry.
3. Males are usually sterile, caused by the blockage of the vas deferens by abnormal secretions or by failure of normal development of duct structures.

**F. Diagnostic tests**

1. Quantitative sweat chloride test is positive (see Box 38-7).
2. Newborn screening may be done in some states and may consist of immunoreactive trypsinogen analysis and direct DNA analysis for mutant genes.
3. Chest x-ray reveals atelectasis and obstructive emphysema.
4. Pulmonary function tests provide evidence of abnormal small airway function.
5. Stool, fat, enzyme analysis: A 72-hour stool sample is collected to check the fat or enzyme (trypsin) content, or both (food intake is recorded during the collection).

**G. Interventions: Respiratory system**

1. Goals of treatment include preventing and treating pulmonary infection by improving aeration, removing secretions, and administering antibiotic medications.
2. Monitor respiratory status including lung sounds and the presence and characteristics of a cough.
3. Chest physiotherapy (percussion and postural drainage) on awakening and in the evening (more frequently during pulmonary infection) needs to be done every day to maintain pulmonary hygiene; chest physiotherapy should not be performed before or immediately after a meal.
4. A Flutter Mucus Clearance Device (a small, hand-held plastic pipe with a stainless steel ball on the inside) facilitates the removal of mucus and may be prescribed; store away from small children because if the device separates, the steel ball poses a choking hazard.
5. Hand-held percussors or a special vest device that provides high-frequency chest wall oscillation may be prescribed to help loosen secretions.
6. A positive expiratory pressure mask may be prescribed; use of this mask forces secretion to the upper airway for expectoration.
7. The child should be taught the forced expiratory technique (huffing) to mobilize secretions for expectoration.
8. Bronchodilator medication by aerosol may be prescribed; the medication opens the bronchi for easier expectoration (administered before chest physiotherapy when the child has

reactive airway disease or is **wheezing**). Medications that decrease the viscosity of mucus may also be prescribed.

9. A physical exercise program with the aim of stimulating mucus expectoration and establishing an effective breathing pattern should be instituted.
10. Aerosolized or intravenous antibiotics may be prescribed and administered at home through a central venous access device.
11. Oxygen may be prescribed during acute episodes; monitor closely for oxygen narcosis (signs include nausea and vomiting, malaise, fatigue, numbness and tingling of extremities, substernal distress) because a child with cystic fibrosis may have chronic carbon dioxide retention.
12. Monitor for hemoptysis; more than 250 mL in 24 hours for an older child (less for a younger child) needs to be reported to the health care provider and treated immediately.
13. Hemoptysis may be controlled with measures such as bedrest, antibiotics if an infection is present, blood replacement therapy, and vitamin K; if hemoptysis persists, the site of bleeding may need to be cauterized.

#### H. Interventions: Gastrointestinal system

1. A child with cystic fibrosis requires a high-calorie, high-protein, and well-balanced diet to meet energy and **growth** needs; multivitamins and vitamins A, D, E, and K are also administered.
2. Monitor weight and for failure to thrive.
3. Monitor stool patterns and for signs of intestinal obstruction.
4. The goal of treatment for pancreatic insufficiency is to replace pancreatic enzymes; pancreatic enzymes are administered within 30 minutes of eating and administered with all meals and all snacks (enzymes should not be given if the child is NPO).
5. The amount of pancreatic enzymes administered depends on the physician's preference and usually is adjusted to achieve normal **growth** and a decrease in the number of stools to two or three daily (additional enzymes are needed if the child is consuming high-fat foods).
6. Enteric-coated pancreatic enzymes should not be crushed or chewed; capsules can be taken apart and the contents can be sprinkled on a small amount of food for administration.
7. Monitor for constipation, intestinal obstruction, and rectal prolapse.
8. Monitor for signs of gastroesophageal reflux; place the infant in an upright position after eating, and teach the child to sit upright after eating.

#### I. Additional interventions

1. Monitor blood glucose levels and for signs of diabetes mellitus.
2. Ensure adequate salt intake and fluids that provide an adequate supply of electrolytes during extremely hot weather and when the child has a fever.
3. Monitor bone **growth** in the child.
4. Monitor for signs of retinopathy or nephropathy.
5. Provide emotional support to the parents, particularly when the child is diagnosed; parents will be fearful and uncertain about the disorder and the care involved.
6. Provide support to the child as he or she transitions through the stages of **growth**.
7. Teach the child and parents about the care involved and encourage independence in the child for self-care as age-appropriate.

#### J. Home care

1. Home care involves educating the parents and the child about all of the aspects of care for the disorder.
2. Informing the parents and child about the signs of complications and actions to take and that the importance of follow-up care is crucial.
3. Instruct the parents to ensure that the child receives the recommended immunizations on schedule; additionally, annual influenza vaccinations are recommended for children 6 months of age and older.
4. Inform the child and parents about the Cystic Fibrosis Foundation.

 An alteration in respiratory status can be a frightening experience for the child and parents. A calm and reassuring nursing approach assists in reducing fear.

## VIII. SUDDEN INFANT DEATH SYNDROME (SIDS)

### A. Description

1. SIDS refers to unexpected death of an apparently healthy infant younger than 1 year for whom an investigation of the death and a thorough autopsy fails to show an adequate cause of death.
2. Several theories are proposed regarding the cause of SIDS, but the exact cause is unknown.
3. SIDS most frequently occurs during winter months.
4. Death usually occurs during sleep periods, but not necessarily at night.
5. SIDS most frequently affects infants 2 to 3 months of age.
6. Incidence is higher in boys.
7. Incidence is higher in Native Americans, African Americans, and Hispanics and in lower socioeconomic groups.

8. Incidence has been found to be lower in breastfed infants and infants sleeping with a pacifier
9. High-risk conditions for SIDS
  - a. Prone position
  - b. Use of soft bedding, sleeping in a noninfant bed such as a sofa
  - c. Overheating (thermal stress)
  - d. Cosleeping
  - e. Mother who smoked cigarettes or abused substances during pregnancy
  - f. Exposure to tobacco smoke after birth

#### B. Assessment

1. Infant is apneic, blue, and lifeless.
2. Frothy blood-tinged fluid is in the nose and mouth.
3. Infant may be found in any position, but typically is found in a disheveled bed, with blankets over the head, and huddled in a corner.
4. Infants may appear to have been clutching bedding.
5. Diaper may be wet and full of stool.

#### C. Prevention and interventions

1. Infants should be placed in the supine position for sleep.
2. Mother needs to be taught about the risk factors: cigarette smoking and substance **abuse** during pregnancy; use of soft bedding, sleeping in a noninfant bed such as a sofa, overheating (thermal stress), cosleeping, exposure to tobacco smoke after birth; stuffed animals or other toys should be removed from the crib while the infant is sleeping.
3. Teach the parents to monitor for positional plagiocephaly caused by the supine sleeping

position; signs include flattened posterior occiput and development of a bald spot in the posterior occiput area.

4. To assist in preventing positional plagiocephaly, teach the parents to alter head position during sleep, avoid excessive time in infant seats and bouncers, and place the infant in a prone position while awake (monitor the infant when in the prone position).
5. If SIDS occurs, the parents need a great deal of support as they grieve and mourn, especially because the event was sudden, unexpected, and unexplained.

### IX. FOREIGN BODY ASPIRATION

#### A. Description (Fig. 38-4)

1. Swallowing and aspiration of a foreign body into the air passages
2. Most inhaled foreign bodies lodge in the main stem or lobar bronchus.
3. Most common offending foods are round in shape and include items such as hot dogs, candy, peanuts, popcorn, or grapes.

#### B. Assessment

1. Initially, choking, gagging, coughing, and **retractions** are general findings.
2. If the condition worsens, **cyanosis** may occur.
3. Laryngotracheal obstruction leads to dyspnea, **stridor**, cough, and hoarseness.
4. Bronchial obstruction produces paroxysmal cough, **wheezing**, asymmetrical breath sounds, and dyspnea.

▲ **FIGURE 38-4** Mechanisms of airway obstruction by a foreign body (FB). (From Hockenberry, M., & Wilson, D. [2007]. *Wong's nursing care of infants and children* [8th ed.]. St. Louis: Mosby.)

5. If any obstruction progresses, unconsciousness and asphyxiation may occur.
6. Partial obstructions may occur without symptoms.
7. Distressed child cannot speak, becomes cyanotic, and collapses.

### C. Interventions

1. Emergency care (see Chapter 18)
2. Nonemergency management entails removal by endoscopy.
  - a. After endoscopy, the child receives high-humidity air.
  - b. Observe for signs and symptoms of airway edema.
3. Prevention
  - a. Keep small objects including rubber balloons out of reach of small children.
  - b. Avoid giving small children small, round food items.
4. Parent, day care provider, babysitter education
  - a. Teach about the hazards of aspiration.
  - b. Discuss potential situations in which small items may be aspirated.
  - c. Teach about the symptoms of aspiration.
  - d. Teach how to perform emergency care measures.

## X. TUBERCULOSIS

### A. Description

1. Tuberculosis is a contagious disease caused by *Mycobacterium tuberculosis*, an acid-fast bacillus (see Chapter 58).
2. Multidrug-resistant strains of *M. tuberculosis* occur because of child or family noncompliance with therapeutic regimens.
3. The route of transmission of *M. tuberculosis* is through inhalation of droplets from an individual with active tuberculosis.
4. There is an increased incidence in urban low-income areas, nonwhite racial or ethnic groups, and first-generation immigrants from endemic countries.
5. Most children are infected by a family member or by another individual with whom they have frequent contact, such as a babysitter.

### B. Assessment

1. Child may be asymptomatic or develop symptoms such as malaise, fever, cough, weight loss, anorexia, and lymphadenopathy.
2. Specific symptoms related to the site of infection, such as the lungs, brain, or bone, may be present.
3. With increased time, asymmetrical expansion of the lungs, decreased breath sounds, **crackles**, and dullness to percussion develop.

### C. Mantoux test (Box 38-8)

1. The test produces a positive reaction 2 to 10 weeks after the initial infection.

2. The test determines whether a child has been infected and has developed a sensitivity to the protein of the tubercle bacillus; a positive reaction does not confirm the presence of active disease (exposure versus presence).
3. After a child reacts positively, the child will always react positively; a positive reaction in a previously negative child indicates that the child has been infected since the last test.
4. Tuberculosis testing should not be done at the same time as measles immunization (viral interference from the measles **vaccine** may cause a false-negative result).

### D. Sputum culture

1. A definitive diagnosis is made by showing the presence of mycobacteria in a culture.
2. Chest x-rays are supplemental to sputum cultures and are not definitive alone.
3. Because an infant or young child often swallows sputum rather than expectorates it, gastric washings (aspiration of lavaged contents from the fasting stomach) may be done to obtain a specimen; the specimen is obtained in the early morning before breakfast.

### E. Interventions

#### 1. Medications

- a. A 9-month course of isoniazid (INH) may be prescribed to prevent a latent infection from progressing to clinically active tuberculosis and to prevent initial infection in children in high-risk situations; a 12-month course may be prescribed for a child infected with human immunodeficiency virus (HIV).
- b. Recommendation for a child with clinically active tuberculosis may include combination administration of isoniazid, rifampin (Rifadin), and pyrazinamide daily for 2 months, and then isoniazid and rifampin twice weekly for 4 months.
- c. Inform the parents and child that bodily fluids including urine may turn an orange-red color with some tuberculosis medications.

### Box 38-8 Mantoux Test Interpretation

Induration measuring 15 mm or more is considered to be a positive reaction in children 4 years or older who do not have any risk factors.

Induration measuring 10 mm or more is considered to be a positive reaction in children younger than 4 years and in children with chronic illness or at high risk for exposure to tuberculosis.

Induration measuring 5 mm or more is considered to be positive for the highest risk groups, such as children with immunosuppressive conditions or human immunodeficiency virus infection.

- d. Directly observed therapy may be necessary for some children.
2. Place children with active disease who are contagious on respiratory isolation until medications have been initiated, sputum cultures show a diminished number of organisms, and cough is improving; this includes use of a personally fitted air-purifying N95 or N100 respirator (mask) by the nurse caring for the child.
3. Stress the importance of adequate rest and adequate diet.
4. Instruct the child and family about measures to prevent the transmission of tuberculosis.
5. Case finding and follow-up with known contacts is crucial to decrease the number of cases of individuals with active tuberculosis.

### MORE QUESTIONS ON THE CD!

#### Practice Questions

- 387.** A 10-year-old child with asthma is treated for acute exacerbation in the emergency department. A nurse caring for the child monitors for which of the following, knowing that it indicates a worsening of the condition?
1. Warm, dry skin
  2. Decreased wheezing
  3. Pulse rate of 90 beats/min
  4. Respirations of 18 breaths/min
- 388.** The mother of an 8-year-old child being treated for right lower lobe pneumonia at home calls the clinic nurse. The mother tells the nurse that the child complains of discomfort on the right side and that the ibuprofen (Motrin) is not effective. The nurse should tell the mother to:
1. Increase the dose of the ibuprofen.
  2. Increase the frequency of the ibuprofen.
  3. Encourage the child to lie on the left side.
  4. Encourage the child to lie on the right side.
- 389.** A new mother expresses concern to a nurse regarding sudden infant death syndrome (SIDS). She asks the nurse how to position her new infant for sleep. The nurse appropriately tells the mother that the infant should be placed on the:
1. Side or prone
  2. Back or prone
  3. Stomach with the face turned
  4. Back rather than on the stomach
- 390.** A clinic nurse is providing instructions to a mother of a child with cystic fibrosis regarding the immunization schedule for the child. Which statement would the nurse make to the mother?
1. "The immunization schedule will need to be altered."
  2. "The child should not receive any hepatitis vaccines."
  3. "The child will receive all the immunizations except for the polio series."
  4. "The child will receive the recommended basic series of immunizations along with a yearly influenza vaccination."
- 391.** An emergency department nurse is caring for a child diagnosed with epiglottitis. Assessing the child, the nurse monitors for which indication that the child may be experiencing airway obstruction?
1. The child exhibits nasal flaring and bradycardia.
  2. The child is leaning forward, with the chin thrust out.
  3. The child has a low-grade fever and complains of a sore throat.
  4. The child is leaning backward, supporting himself or herself with the hands and arms.
- 392.** A child with laryngotracheobronchitis (croup) is placed in a cool mist tent. The mother becomes concerned because the child is frightened, consistently crying and trying to climb out of the tent. The appropriate nursing action is to:
1. Tell the mother that the child must stay in the tent.
  2. Call the physician and obtain a prescription for a mild sedative.
  3. Place a toy in the tent to make the child feel more comfortable.
  4. Let the mother hold the child and direct the cool mist over the child's face.
- 393.** A nurse is caring for an infant with bronchiolitis, and diagnostic tests have confirmed respiratory syncytial virus (RSV). Based on this finding, which of the following is the appropriate nursing action?
1. Initiate strict enteric precautions.
  2. Move the infant to a room with another child with RSV.
  3. Leave the infant in the present room because RSV is not contagious.
  4. Inform the staff that they must wear a mask, gloves, and a gown when caring for the child.
- 394.** A clinic nurse reads the results of a Mantoux test on a 3-year-old child. The results indicate an area of induration measuring 10 mm. The nurse would interpret these results as:
1. Positive
  2. Negative

3. Inconclusive
4. Definitive and requiring a repeat test

- 395.** The mother of a hospitalized 2-year-old child with viral laryngotracheobronchitis (croup) asks a nurse why the physician did not prescribe antibiotics. The appropriate response is:
1. "The child may be allergic to antibiotics."
  2. "The child is too young to receive antibiotics."
  3. "Antibiotics are not indicated unless a bacterial infection is present."
  4. "The child still has the maternal antibodies from birth and does not need antibiotics."

### Alternate Item Format: Multiple Response

- 396.** A nurse is preparing for the admission of an infant with a diagnosis of bronchiolitis caused

by respiratory syncytial virus (RSV). Which interventions would the nurse include in the plan of care? **Select all that apply.**

- 1. Place the infant in a private room.
- 2. Ensure that the infant's head is in a flexed position.
- 3. Wear a mask at all times when in contact with the infant.
- 4. Place the infant in a tent that delivers warm humidified air.
- 5. Position the infant side-lying, with the head lower than the chest.
- 6. Ensure that nurses caring for the infant with RSV do not care for other high-risk children.

## ANSWERS

### 387. 2

**Rationale:** Asthma is a chronic inflammatory disease of the airways. Decreased wheezing in a child with asthma may be interpreted incorrectly as a positive sign when it may actually signal an inability to move air. A "silent chest" is an ominous sign during an asthma episode. With treatment, increased wheezing actually may signal that the child's condition is improving. Warm, dry skin indicates an improvement in the child's condition because the child is normally diaphoretic during exacerbation. The normal pulse rate in a 10-year-old is 70 to 110 beats/min. The normal respiratory rate in a 10-year-old is 16 to 20 breaths/min.

**Test-Taking Strategy:** Use the process of elimination and note the strategic word *worsening* in the question. Options 3 and 4 can be eliminated because they are normal vital signs. From the remaining options, recall that a "silent chest" is an ominous sign during an asthma episode and indicates severe bronchial spasm or obstruction. Review the clinical manifestations of severe bronchial spasm or obstruction in a child with asthma if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Content Area:** Critical Care

**Reference:** Swearingen, P. (2008). *All-in-one care planning resource: Medical-surgical, pediatric, maternity, & psychiatric nursing care plans* (2nd ed., p. 577). St. Louis: Mosby.

### 388. 4

**Rationale:** Pneumonia is an inflammation of the pulmonary parenchyma or alveoli or both caused by a virus, mycoplasmal agents, bacteria, or aspiration of foreign substances. Splinting of the affected side by lying on that side may decrease discomfort. It would be inappropriate to advise the mother to increase the dose or frequency of the ibuprofen. Lying on the left side would not be helpful in alleviating discomfort.

**Test-Taking Strategy:** Use the process of elimination. Options 1 and 2 can be eliminated because the nurse does not adjust the dose or frequency of medications. Recalling the principles related to splinting an incision in the postoperative client will assist in directing you to option 4 because these principles can be applied in this situation. Review care of a child with pneumonia if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1196). St. Louis: Saunders.

### 389. 4

**Rationale:** Sudden infant death syndrome (SIDS) is the unexpected death of an apparently healthy infant younger than 1 year for whom an investigation of the death and a thorough autopsy fails to show an adequate cause of death. Several theories are proposed regarding the cause, but the exact cause is unknown. Nurses should encourage parents to place the infant on the back (supine) for sleep. Infants in the prone position (on the stomach) may be unable to move their heads to the side, increasing the risk of suffocation. The infant may have the ability to turn to a prone position from the side-lying position.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1, 2, and 3 because they are comparable or alike. Remember that the infant needs to be placed on his or her back. Review positioning of the healthy infant for sleep and the preventive measures for SIDS if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1008). St. Louis: Mosby.

### 390. 4

**Rationale:** Cystic fibrosis is a chronic multisystem disorder (autosomal recessive trait disorder) characterized by exocrine gland dysfunction. The mucus produced by the exocrine glands is abnormally thick, tenacious, and copious, causing obstruction of the small passageways of the affected organs, particularly in the respiratory, gastrointestinal, and reproductive systems. Adequately protecting children with cystic fibrosis from communicable diseases by immunization is essential. In addition to the basic series of immunizations, a yearly influenza immunization is recommended for children with cystic fibrosis. Options 1, 2, and 3 are incorrect.

**Test-Taking Strategy:** Use the process of elimination. Eliminate options 1, 2, and 3 because they are comparable or alike indicating that the immunization schedule will be adjusted in some way. Recalling the importance of protection from communicable diseases, particularly in children with a disorder such as cystic fibrosis, will assist in directing you to option 4. Review the immunization schedule for a child with cystic fibrosis if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1352). St. Louis: Mosby.

### 391. 2

**Rationale:** Epiglottitis is a bacterial form of croup. A primary concern is that it can progress to acute respiratory distress. Clinical manifestations suggestive of airway obstruction include tripod positioning (leaning forward while supported by arms, chin thrust out, mouth open), nasal flaring, the use of accessory muscles for breathing, and the presence of stridor. Option 4 is an incorrect position. Options 1 and 3 are incorrect because epiglottitis causes a high fever and tachycardia.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 1 first because tachycardia rather than bradycardia would occur in a child experiencing respiratory distress. Eliminate option 3 next, knowing that a high fever occurs with epiglottitis. From the remaining options, visualize the descriptions in each and determine which position would best assist a child experiencing respiratory distress. Review the manifestations of epiglottitis and airway obstruction if you had difficulty with this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Critical Care

**References:** Hockenberry, M., & Wilson, D. (2009). *Wong's essentials of pediatric nursing* (8th ed., p. 771). St. Louis: Mosby.

McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1190). St. Louis: Saunders.

### 392. 4

**Rationale:** Laryngotracheobronchitis (croup) is the inflammation of the larynx, trachea, and bronchi and is the most common type of croup. Cool mist therapy may be prescribed to liquefy secretions and to assist in breathing. If the use of a tent or hood is causing distress, treatment may be more effective if the child is held by the parent and a cool mist is directed toward the child's face. A mild sedative would not be administered to the child. Crying would increase hypoxia and aggravate laryngospasm, which may cause airway obstruction. Options 1 and 3 would not alleviate the child's fear.

**Test-Taking Strategy:** Focus on the subject of the question, the child's fear. Options 1, 2, and 3 are comparable or alike in that they do not address the fear. Option 4 is the option that addresses the subject of the question. Review care of a child in a mist tent if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Caring

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** McKinney, E., James, S., Murray, S., & Ashwill, J. (2009). *Maternal-child nursing* (3rd ed., p. 1188). St. Louis: Saunders.

### 393. 2

**Rationale:** Respiratory syncytial virus (RSV) is a highly communicable disorder and is not transmitted via the airborne route. The virus usually is transferred by the hands. Use of contact and standard precautions during care is necessary. Using good handwashing techniques and wearing gloves and gowns are also necessary. Masks are not required. An infant with RSV is isolated in a single room or placed in a room with another child with RSV. Enteric precautions are unnecessary.

**Test-Taking Strategy:** Use the process of elimination, recalling the method of viral transmission. Remember that the virus is not transmitted via the airborne route and is usually transferred by the hands. An infant with RSV is isolated in a single room or placed in a room with another child with RSV. Review the nursing care required for an infant with RSV if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1323). St. Louis: Mosby.

### 394. 1

**Rationale:** Induration measuring 10 mm or more is considered to be a positive result in children younger than 4 years of age and in children with chronic illness or at high risk for exposure to tuberculosis. A reaction of 5 mm or more is considered to be a positive result for the highest risk groups, such as a child with an immunosuppressive condition or a child with human immunodeficiency virus (HIV) infection. A reaction of 15 mm or more is positive in children 4 years or older without any risk factors.

**Test-Taking Strategy:** Use the process of elimination. Options 3 and 4 are comparable or alike and can be eliminated first. From the remaining options, focus on the data in the question and note the child's age to assist in directing you to option 1. If you had difficulty with this question, review the analysis of the Mantoux test in children.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., p. 1329). St. Louis: Mosby.

### 395. 3

**Rationale:** Laryngotracheobronchitis (croup) is the inflammation of the larynx, trachea, and bronchi and is the most common type of croup. It can be viral or bacterial. Antibiotics are not indicated in the treatment of croup unless a bacterial infection is present. Options 1, 2, and 4 are incorrect. In addition, no supporting data in the question indicate that the child may be allergic to antibiotics.

**Test-Taking Strategy:** Use the process of elimination. Eliminate option 1 because no supporting data are in the question regarding the potential for allergies. Noting the strategic word *viral* in the question and noting the age of the child will assist in eliminating options 2 and 4. Review the indications for the use of antibiotics in a child with croup if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

## ALTERNATE ITEM FORMAT: MULTIPLE RESPONSE

### 396. 1, 6

**Rationale:** Respiratory syncytial virus (RSV) is a highly communicable disorder and is not transmitted via the airborne route. The virus usually is transferred by the hands. Use of contact and standard precautions during care (wearing gloves and a gown) reduce nosocomial transmission of RSV. A mask is unnecessary. Additionally, it is important to ensure that nurses caring for a child with RSV do not care for other high-risk children to prevent the transmission of the infection. An infant with RSV should be isolated in a private room or in a room with another infant with RSV infection. The infant should be positioned with the head and chest at a 30- to 40-degree angle and the neck slightly extended to maintain an open airway and decrease pressure on the diaphragm. Cool humidified oxygen is delivered to relieve dyspnea, hypoxemia, and insensible water loss from tachypnea.

**Test-Taking Strategy:** Recalling the mode of transmission of RSV will assist in determining that the infant needs to be placed in a private room or in a room with another infant with RSV infection and that contact precautions need to be maintained. Recalling the need to maintain a patent airway (edema and the accumulation of mucus obstruct the bronchioles) will assist in determining that the infant needs to be observed closely, the infant's head should be elevated, and the infant should receive cool humidified oxygen. Review care of a child with bronchiolitis and RSV if you had difficulty with this question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Child Health—Eye/Ear/Throat/Respiratory/Cardiovascular

# Cardiovascular Disorders

## I. CONGESTIVE HEART FAILURE (CHF)

### A. Description

- 1. CHF (Box 39-1) is the inability of the heart to pump a sufficient amount of oxygen to meet the metabolic needs of the body.
- 2. In infants and children, inadequate cardiac output most commonly is caused by congenital heart defects (**shunt**, obstruction, or a combination of both) that produce an excessive volume or pressure load on the myocardium.
- 3. In infants and children, a combination of left-sided and right-sided heart failure is usually present.
- 4. The goals of treatment are to improve cardiac function, remove accumulated fluid and sodium, decrease cardiac demands, improve tissue oxygenation, and decrease oxygen consumption.

### B. Assessment of early signs

- 1. Tachycardia, especially during rest and slight exertion
- 2. Tachypnea
- 3. Profuse scalp diaphoresis, especially in infants
- 4. Fatigue and irritability
- 5. Sudden weight gain
- 6. Respiratory distress

### C. Interventions

- 1. Monitor for early signs of CHF.
- 2. Monitor for respiratory distress (count respirations for 1 minute).
- 3. Monitor apical pulse (count apical pulse for 1 minute), and monitor for dysrhythmias.
- 4. Monitor temperature for hyperthermia and for other signs of infection, particularly respiratory infection.
- 5. Monitor strict intake and output; weigh diapers as appropriate for most accurate output.
- 6. Monitor daily weight to assess for fluid retention; a weight gain of 0.5 kg (1 lb) in 1 day is caused by the accumulation of fluid.
- 7. Monitor for facial or peripheral dependent edema, auscultate lung sounds, and report abnormal findings indicating excessive fluid in the body.

- 8. Elevate the head of the bed in a semi-Fowler's position.
- 9. Maintain a neutral thermal environment to prevent cold stress in infants.
- 10. Provide rest and decrease environmental stimuli.
- 11. Administer cool humidified oxygen as prescribed, using an oxygen hood for young infants and a nasal cannula or face mask for older infants and children.
- 12. Organize nursing activities to allow for uninterrupted sleep.
- 13. Maintain adequate nutritional status.
- 14. Feed when hungry and soon after awakening, conserving energy and oxygen supply.
- 15. Provide small, frequent feedings, conserving energy and oxygen supply.
- 16. Administer sedation as prescribed during the acute stage to promote rest.
- 17. Administer digoxin (Lanoxin) as prescribed.
  - a. Assess apical heart rate for 1 minute before administration.
  - b. Hold digoxin if the apical pulse is less than 90 to 110 beats/min in infants and young children and less than 70 beats/min in older children, as prescribed.
  - c. Be aware that infants rarely receive more than 1 mL (50 mcg or 0.05 mg) of digoxin in one dose.
- 18. Monitor digoxin levels and for signs of digoxin toxicity, including anorexia, poor feeding, nausea, vomiting, bradycardia, and dysrhythmias.
  - a. Normal digoxin level is 0.5 to 2 ng/mL.
  - b. Digoxin toxicity is present when level is greater than 2 ng/mL.
- 19. Administer angiotensin-converting enzyme inhibitors as prescribed.
  - a. Monitor for hypotension, renal dysfunction, and cough when angiotensin-converting enzyme inhibitors are administered.
  - b. Assess blood pressure; serum protein, albumin, blood urea nitrogen, and creatinine levels; white blood cell count; urine output; urinary specific gravity; and urinary protein level.

### Box 39-1 Signs and Symptoms of Congestive Heart Failure

#### Left-Sided Failure

Crackles and wheezes  
Cough  
Dyspnea  
Grunting (infants)  
Head bobbing (infants)  
Nasal flaring  
Orthopnea  
Periods of cyanosis  
Retractions  
Tachypnea

#### Right-Sided Failure

Ascites  
Hepatosplenomegaly  
Jugular vein distention  
Oliguria  
Peripheral edema, especially dependent edema, and periorbital edema  
Weight gain

20. Administer diuretics such as furosemide (Lasix) as prescribed.
  - a. Monitor for signs and symptoms of hypokalemia (serum potassium level  $<3.5$  mEq/L), including muscle weakness and cramping, confusion, irritability, restlessness, and inverted T waves or prominent U waves on the electrocardiogram.
  - b. If signs and symptoms of hypokalemia are present and the child is also being administered digoxin, monitor closely for digoxin toxicity because hypokalemia potentiates digoxin toxicity.
21. Administer potassium supplements and provide dietary sources of potassium as prescribed.
  - a. Supplemental potassium should be given only if indicated by serum potassium levels and if adequate renal function is evident and is usually necessary when administering a non-potassium-sparing diuretic such as furosemide (Lasix).
  - b. Encourage foods that the child will eat that are high in potassium, as appropriate, such as bananas, baked potato skins, and peanut butter.
22. Monitor serum electrolyte levels, particularly the potassium level (normal level is 3.5 to 5.1 mEq/L).
23. Limit fluid intake as prescribed in the acute stage.
24. Monitor for signs and symptoms of dehydration, including sunken fontanel, nonelastic skin turgor, dry mucous membranes, decreased tear production, decreased urine output, and concentrated urine.
25. Monitor sodium levels as prescribed.
  - a. Normal level is 135 to 145 mEq/L.
  - b. Many infant formulas have slightly more sodium than breast milk.
26. Instruct the parents regarding the description of the diagnosis and administration of medications (Box 39-2).

### Box 39-2 Home Care Instructions for Administering Digoxin (Lanoxin)

Administer as prescribed.

Administer 1 hour before or 2 hours after feedings.

Use a calendar to mark off the dose administered.

Do not mix medication with foods or fluid.

If a dose is missed and more than 4 hours has elapsed, withhold the dose and give the next dose at the scheduled time; if less than 4 hours has elapsed, administer the missed dose.

If the child vomits, do not administer a second dose.

If more than two consecutive doses have been missed, notify the physician; do not increase or double the dose for missed doses.

If the child has teeth, give water after the medication; if possible, brush the teeth to prevent tooth decay from the sweetened liquid.

Monitor for signs of toxicity, such as poor feeding or vomiting.

If the child becomes ill, notify the physician.

Keep the medication in a locked cabinet.

Call the poison control center immediately if accidental overdose occurs.

27. Instruct the parents in cardiopulmonary resuscitation (CPR) (see Chapter 18).

 The parents should be provided with a medication guide for any medication prescribed for the infant or child. Additionally, the nurse needs to review the instructions in the guide and provide an opportunity for the parents to demonstrate medication administration procedures.

## II. DEFECTS WITH INCREASED PULMONARY BLOOD FLOW (Box 39-3)

### A. Description

1. Intracardiac communication along the septum or an abnormal connection between the great arteries allows blood to flow from the high-pressure left side of the heart to the low-pressure right side of the heart.
2. The infant typically shows signs and symptoms of CHF.

### B. Atrial septal defect (ASD)

1. ASD is an abnormal opening between the atria that causes an increased flow of oxygenated blood into the right side of the heart.
2. Right atrial and ventricular enlargement occurs.
3. Infant may be asymptomatic or may develop CHF.
4. Signs and symptoms of decreased cardiac output may be present (Box 39-4).
5. Types
  - a. ASD 1 (ostium primum): Opening is at the lower end of the septum.
  - b. ASD 2 (ostium secundum): Opening is near the center of the septum.

**Box 39-3 Defects with Increased Pulmonary Blood Flow**

Atrial septal defect  
 Atrioventricular canal defect  
 Patent ductus arteriosus  
 Ventricular septal defect

**Box 39-4 Signs and Symptoms of Decreased Cardiac Output**

Decreased peripheral pulses  
 Exercise intolerance  
 Feeding difficulties  
 Hypotension  
 Irritability, restlessness, lethargy  
 Oliguria  
 Pale, cool extremities  
 Tachycardia

c. ASD 3 (sinus venosus defect): Opening is near the junction of the superior vena cava and the right atrium.

**6. Management**

- Defect may be closed during a cardiac catheterization.
- Open repair with cardiopulmonary bypass may be performed and usually is performed before school age.

**C. Atrioventricular canal defect**

- The defect results from incomplete fusion of the endocardial cushions.
- The defect is the most common cardiac defect in Down syndrome.
- A characteristic murmur is present.
- The infant usually has mild to moderate CHF, with **cyanosis** increasing with crying.
- Signs and symptoms of decreased cardiac output may be present.
- Management can include pulmonary artery banding for infants with severe symptoms (palliative) or complete repair via cardiopulmonary bypass.

**D. Patent ductus arteriosus**

- Patent ductus arteriosus is failure of the fetal ductus arteriosus (artery connecting the aorta and the pulmonary artery) to close within the first weeks of life.
- A characteristic machinery-like murmur is present.
- An infant may be asymptomatic or may show signs of CHF.
- A widened pulse pressure and bounding pulses are present.
- Signs and symptoms of decreased cardiac output may be present.

**Box 39-5 Obstructive Defects**

Aortic stenosis  
 Coarctation of the aorta  
 Pulmonary stenosis

**6. Management**

- Indomethacin (Indocin), a prostaglandin inhibitor, may be administered to close a patent ductus in premature infants and some newborns.
- The defect may be closed during cardiac catheterization, or the defect may require surgical management.

**E. Ventricular septal defect (VSD)**

- VSD is an abnormal opening between the right and left ventricles.
- Many VSDs close spontaneously during the first year of life in children having small or moderate defects.
- A characteristic murmur is present.
- Signs and symptoms of CHF are commonly present.
- Signs and symptoms of decreased cardiac output may be present.
- Management
  - Closure during cardiac catheterization may be possible.
  - Open repair may be done with cardiopulmonary bypass.

**III. OBSTRUCTIVE DEFECTS (Box 39-5)****A. Description**

- Blood exiting a portion of the heart meets an area of anatomical narrowing (**stenosis**), causing obstruction to blood flow.
- The location of narrowing is usually near the valve of the obstructive defect.
- Infants and children exhibit signs of CHF.
- Children with mild obstruction may be asymptomatic.

**B. Aortic stenosis**

- Aortic **stenosis** is a narrowing or stricture of the aortic valve, causing resistance to blood flow from the left ventricle into the aorta, resulting in decreased cardiac output, left ventricular hypertrophy, and pulmonary vascular congestion.
- Valvular **stenosis** is the most common type and usually is caused by malformed cusps, resulting in a bicuspid rather than a tricuspid valve, or fusion of the cusps.
- A characteristic murmur is present.
- Infants with severe defects show signs of decreased cardiac output.
- Children show signs of exercise intolerance, chest pain, and dizziness when standing for long periods.

6. Management
  - a. Dilation of the narrowed valve may be done during cardiac catheterization.
  - b. Surgical aortic valvotomy (palliative) may be done; a valve replacement may be required at a second procedure.

**C. Coarctation of the aorta**

1. Coarctation of the aorta is localized narrowing near the insertion of the ductus arteriosus.
2. Blood pressure is higher in the upper extremities than the lower extremities; bounding pulses in the arms, weak or absent femoral pulses, and cool lower extremities may be present.
3. Signs of CHF may occur in infants.
4. Signs and symptoms of decreased cardiac output may be present.
5. Children may experience headaches, dizziness, fainting, and epistaxis resulting from hypertension.
6. Management of the defect may be done via balloon angioplasty in children; restenosis can occur.
7. Surgical management
  - a. Mechanical ventilation and medications to improve cardiac output are often necessary before surgery.
  - b. Resection of the coarcted portion with end-to-end anastomosis of the aorta or enlargement of the constricted section using a graft may be required.
  - c. Because the defect is outside the heart, cardiopulmonary bypass is not required, and a thoracotomy incision is used.

 **With coarctation of the aorta, the blood pressure is higher in the upper extremities than the lower extremities. Additionally, bounding pulses in the arms, weak or absent femoral pulses, and cool lower extremities may be present.**

**D. Pulmonary stenosis**

1. Pulmonary **stenosis** is narrowing at the entrance to the pulmonary artery.
2. Resistance to blood flow causes right ventricular hypertrophy and decreased pulmonary blood flow; the right ventricle may be hypoplastic.
3. Pulmonary **atresia** is the extreme form of pulmonary **stenosis** in that there is total fusion of the commissures and no blood flows to the lungs.
4. A characteristic murmur is present.
5. Infants or children may be asymptomatic.
6. Newborns with severe narrowing are cyanotic.
7. If pulmonary **stenosis** is severe, CHF occurs.
8. Signs and symptoms of decreased cardiac output may occur.
9. Management: Dilation of the narrowed valve may be done during cardiac catheterization.

**Box 39-6 Defects with Decreased Pulmonary Blood Flow**

Tetralogy of Fallot  
Tricuspid atresia

10. Surgical management

- a. In infants: Transventricular (closed) valvotomy procedure
- b. In children: Pulmonary valvotomy with cardiopulmonary bypass

**IV. DEFECTS WITH DECREASED PULMONARY BLOOD FLOW (Box 39-6)**

**A. Description**

1. Obstructed pulmonary blood flow and an anatomical defect (ASD or VSD) between the right and left sides of the heart are present.
2. Pressure on the right side of the heart increases, exceeding pressure on the left side, which allows desaturated blood to **shunt** right to left, causing desaturation in the left side of the heart and in the systemic circulation.
3. Typically hypoxemia and **cyanosis** appear.

**B. Tetralogy of Fallot**

1. Tetralogy of Fallot includes four defects—VSD, pulmonary **stenosis**, overriding aorta, and right ventricular hypertrophy.
2. If pulmonary vascular resistance is higher than systemic resistance, the **shunt** is from right to left; if systemic resistance is higher than pulmonary resistance, the **shunt** is left to right.

3. Infants

- a. An infant may be acutely cyanotic at birth or may have mild **cyanosis** that progresses over the first year of life as the pulmonic **stenosis** worsens.
- b. A characteristic murmur is present.

- c. Acute episodes of **cyanosis** and hypoxia (hypercyanotic spells), called blue spells or tet spells, occur when the infant's oxygen requirements exceed the blood supply, such as during periods of crying, feeding, or defecating.

4. Children: With increasing **cyanosis**, squatting, clubbing of the fingers, and poor **growth** may occur.

- a. Squatting is a compensatory mechanism to facilitate increased return of blood flow to the heart for oxygenation.
- b. Clubbing is an abnormal enlargement in the distal phalanges seen in the fingers.

5. Surgical management: Palliative **shunt**

- a. The **shunt** increases pulmonary blood flow and increases oxygen saturation in infants who cannot undergo primary repair.

- b. The **shunt** provides blood flow to the pulmonary arteries from the left or right subclavian artery.
- 6. Surgical management: Complete repair
  - a. Complete repair usually is performed in the first year of life.
  - b. The repair requires a median sternotomy and cardiopulmonary bypass.
- C. Tricuspid **atresia**
  1. Tricuspid **atresia** is failure of the tricuspid valve to develop.
  2. No communication exists from the right atrium to the right ventricle.
  3. Blood flows through an ASD or a patent foramen ovale to the left side of the heart and through a VSD to the right ventricle and out to the lungs.
  4. The defect often is associated with pulmonic **stenosis** and transposition of the great arteries.
  5. The defect results in complete mixing of unoxygenated and oxygenated blood in the left side of the heart, resulting in systemic desaturation, pulmonary obstruction, and decreased pulmonary blood flow.
  6. **Cyanosis**, tachycardia, and dyspnea are seen in the newborn.
  7. Older children exhibit signs of chronic hypoxemia and clubbing.
  8. Management: If the ASD is small, the defect may be closed during cardiac catheterization; otherwise, surgery is needed.

 **Clubbing is symptomatic of chronic hypoxia. Peripheral circulation is diminished and oxygenation of vital organs and tissues is compromised.**

## V. MIXED DEFECTS (Box 39-7)

### A. Description

1. Fully saturated systemic blood flow mixes with the desaturated blood flow, causing a desaturation of the systemic blood flow.
2. Pulmonary congestion occurs and cardiac output decreases.
3. Signs of CHF are present; symptoms vary with the degree of desaturation.

### B. Hypoplastic left heart syndrome

1. Underdevelopment of the left side of the heart occurs, resulting in a hypoplastic left ventricle and aortic **atresia**.
2. Mild **cyanosis** and signs of CHF occur until the ductus arteriosus closes; then progressive deterioration with **cyanosis** and decreased cardiac output are seen, leading to cardiovascular collapse.
3. The defect is fatal in the first few months of life without intervention.
4. Surgical treatment
  - a. Surgical treatment is necessary; transplantation in the newborn period may be considered.

## Box 39-7 Mixed Defects

Hypoplastic left heart syndrome  
 Total anomalous pulmonary venous connection  
 Transposition of the great arteries or transposition of the great vessels  
 Truncus arteriosus

- b. In the preoperative period, the newborn requires mechanical ventilation and a continuous infusion of prostaglandin E<sub>1</sub> to maintain ductal patency, ensuring adequate systemic blood flow.
- C. Transposition of the great arteries or transposition of the great vessels
  1. The pulmonary artery leaves the left ventricle, and the aorta exits from the right ventricle.
  2. No communication exists between the systemic and pulmonary circulation.
  3. Infants with minimal communication are severely cyanotic and depressed at birth.
  4. Infants with large septal defects or a patent ductus arteriosus may be less severely cyanotic, but may have symptoms of CHF.
  5. Cardiomegaly is evident a few weeks after birth.
  6. Nonsurgical management
    - a. Prostaglandin E<sub>1</sub> may be initiated to increase blood mixing temporarily if systemic and pulmonary mixing are inadequate.
    - b. Balloon atrial septostomy during cardiac catheterization may be performed to increase mixing and to maintain cardiac output over a longer period.
  7. Surgical management: The arterial switch procedure re-establishes normal circulation with the left ventricle acting as the systemic pump and creation of a new aorta.
- D. Total anomalous pulmonary venous connection
  1. The defect is a failure of the pulmonary veins to join the left atrium.
  2. The defect results in mixed blood being returned to the right atrium and shunted from the right to the left through an ASD.
  3. The right side of the heart hypertrophies, whereas the left side of the heart may remain small.
  4. Signs and symptoms of CHF develop.
  5. **Cyanosis** worsens with pulmonary vein obstruction; when obstruction occurs, the infant's condition deteriorates rapidly.
  6. Surgical management
    - a. Corrective repair is performed in early infancy.
    - b. The pulmonary vein is anastomosed to the left atrium, the ASD is closed, and the anomalous pulmonary venous connection is ligated.

**E. Truncus arteriosus**

1. Truncus arteriosus is failure of normal septation and division of the embryonic bulbar trunk into the pulmonary artery and the aorta, resulting in a single vessel that overrides both ventricles.
2. Blood from both ventricles mixes in the common great artery, causing desaturation and hypoxemia.
3. A characteristic murmur is present.
4. The infant exhibits moderate to severe CHF and variable **cyanosis**, poor **growth**, and activity intolerance.
5. Surgical management: Corrective surgical repair is performed in the first few months of life.

**VI. INTERVENTIONS: CARDIOVASCULAR DEFECTS**

- A. Monitor for signs of a defect in the infant or child (see descriptions of defects earlier).
- B. Monitor vital signs closely.
- C. Monitor respiratory status for the presence of **nasal flaring**, use of accessory muscles, and other signs of impending respiratory distress, and notify the physician if any changes occur.
- D. Auscultate breath sounds for **crackles**, rhonchi, or **wheezes**.
- E. If respiratory effort is increased, place the child in a reverse Trendelenburg position, elevating the head and upper body, to decrease the work of breathing.
- F. Administer humidified oxygen as prescribed.
- G. Provide endotracheal tube and ventilator care as prescribed.
- H. Monitor for hypercyanotic spells and intervene immediately if they occur (see Priority Nursing Actions).
  - I. Assess for signs of CHF, such as periorbital edema or dependent edema in the hands and feet.
  - J. Assess peripheral pulses.
  - K. Maintain fluid restriction if prescribed.
  - L. Monitor intake and output, and notify the physician if a decrease in urine output occurs.
- M. Obtain daily weight.
- N. Provide adequate nutrition (high calorie requirements) as prescribed.
- O. Administer medications as prescribed.
- P. Plan interventions to allow maximal rest for the child; keep the child as stress-free as possible.
- Q. Prepare the child and parents for cardiac catheterization, if appropriate.

**VII. CARDIAC CATHETERIZATION****A. Description**

1. Invasive diagnostic procedure to determine cardiac defects.
2. Provides information about oxygen saturation of blood in great vessels and heart chambers.
3. May be done for diagnostic, interventional, or electrophysiological reasons.
4. May be carried out on an outpatient basis.

**PRIORITY NURSING ACTIONS!****Actions to Take if a Hypercyanotic Spell Occurs in an Infant**

1. Place the infant in a knee-chest position.
2. Administer 100% oxygen.
3. Administer morphine sulfate.
4. Administer fluids intravenously.
5. Document occurrence, actions taken, and the infant's response.

Hypercyanotic spells are also known as tet spells or blue spells and occur in infants or children with certain types of heart defects. The infant or child becomes acutely cyanotic and hyperpneic because of the sudden infundibular spasm. These spells may occur as a result of stressful procedures or from feeding, crying, or defecation. If a spell occurs, the nurse needs to provide a calm and comforting approach while immediately placing the infant in the knee-chest position; this assists breathing and increases oxygenation to body tissues. Oxygen is administered by face mask or blow by. Morphine sulfate is administered as prescribed subcutaneously or through an existing intravenous line (morphine sulfate helps reduce the infundibular spasm). Intravenous fluids are administered to replace fluids and to keep the infant well hydrated and to keep the hematocrit and blood viscosity within acceptable limits. Depending on the infant's response, a repeated dose of morphine sulfate may be prescribed. Finally, the nurse documents the occurrence, actions taken, and the infant's response.

**Reference:** Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care* (4th ed., pp. 1465-1466). St. Louis: Mosby.

5. Risks include hemorrhage from the entry site, clot formation and subsequent blockage distally, and transient dysrhythmias.
  6. General anesthesia is usually unnecessary.
  7. See Chapter 60.
- B. Preprocedure nursing interventions**
1. Assess accurate height and weight because this helps with the selection of the correct catheter size.
  2. Obtain a history of the presence of allergic reactions to iodine.
  3. Assess for symptoms of infection, including a diaper rash.
  4. Assess and mark bilateral pulses, such as the dorsalis pedis and posterior tibial.
  5. Assess baseline oxygen saturation.
  6. Familiarize the parents and child with hospital procedures and equipment.
  7. Educate the child, if age appropriate, and the parents about the procedure.
  8. Allow the parents and child to verbalize feelings and concerns regarding the procedure and the disorder.

**Box 39-8 Home Care After Cardiac Surgery**

Omit play outside for several weeks.

Avoid activities in which the child could fall and be injured, such as bike riding, for 2 to 4 weeks.

Avoid crowds for 2 weeks after discharge.

Follow a no-added-salt diet if prescribed.

Do not add any new foods to the infant's diet (if an allergy exists to the new food, the manifestations may be interpreted as a postoperative complication).

Do not place creams, lotions, or powders on the incision until completely healed.

The child may return to school usually the third week after discharge, starting with half-days.

The child should not participate in physical education for 2 months.

Instruct the parents to discipline the child normally.

Instruct the parents about the importance of the 2-week follow-up.

Avoid immunizations, invasive procedures, and dental visits for 2 months; following this time period, the immunization schedule and dental visits need to be resumed.

Advise the parents regarding the importance of a dental visit every 6 months after age 3 years and to inform the dentist of the cardiac problem so that antibiotics can be prescribed if necessary.

Instruct the parents to call the physician if coughing, tachypnea, cyanosis, vomiting, diarrhea, anorexia, pain, or fever occur, or any swelling, redness, or drainage occurs at the site of the incision.

-  **C. Postprocedure nursing interventions**
1. Monitor findings on the cardiac monitor and oxygen saturation for 4 hours after procedure.
  2. Assess pulses below the catheter site for equality and symmetry.
  3. Assess the temperature and color of the affected extremity and report coolness, which may indicate arterial obstruction.
  4. Monitor vital signs frequently, usually every 15 minutes four times, every half-hour four times, and then every hour four times.
  5. Assess the pressure dressing for intactness and signs of hemorrhage.
  6. Check the bed sheets under the extremity for blood, which may indicate bleeding from the entry site.
  7. If bleeding is present, apply continuous, direct pressure at the cardiac catheter entry site and report it immediately.
  8. Immobilize the affected extremity in a flat position for at least 4 to 6 hours for venous entry site and 6 to 8 hours for arterial entry site as prescribed.
  9. Hydrate the child via the oral or intravenous route or both routes as prescribed.
  10. Administer acetaminophen (Tylenol) or ibuprofen (Motrin) for pain or discomfort as prescribed.
  11. Prepare the parents and child, if appropriate, for surgery.
-  **D. Discharge teaching for the child and parents**
1. Remove the dressing on the day after the procedure and cover it with a Band-Aid for 2 or 3 days as prescribed.
  2. Keep the site clean and dry.
  3. Avoid tub baths for 2 to 3 days.
  4. Observe for redness, edema, drainage, bleeding, and fever, and report any of these signs immediately.
  5. Avoid strenuous activity, if applicable.
  6. The child may return to school, if appropriate.
  7. Provide a diet as tolerated.
  8. Administer acetaminophen or ibuprofen for pain, discomfort, or fever.
  9. Keep follow-up appointment with primary care provider.
- VIII. CARDIAC SURGERY**
- A. Postoperative interventions**
1. Monitor vital signs frequently, especially temperature, and notify the physician if fever occurs.
  2. Monitor for signs of sepsis, such as fever, chills, diaphoresis, lethargy, and altered levels of consciousness.
  3. Maintain strict aseptic technique.
  4. Monitor lines, tubes, or catheters that are in place, and monitor for signs and symptoms of infection.
  5. Assess for signs of discomfort, such as irritability, restlessness, changes in heart rate, respiratory rate, and blood pressure.
  6. Administer pain medications as prescribed.
  7. Administer antibiotics and antipyretics as prescribed.
  8. Promote rest and sleep periods.
  9. Facilitate parent-child contact as soon as possible.
- B. Postoperative home care (Box 39-8)**
- IX. RHEUMATIC FEVER**
- A. Description**
1. Rheumatic fever is an inflammatory autoimmune disease that affects the connective tissues of the heart, joints, subcutaneous tissues, and blood vessels of the central nervous system.
  2. The most serious complication is rheumatic heart disease, which affects the cardiac valves, particularly the mitral valve.
  3. Rheumatic fever manifests 2 to 6 weeks after an untreated or partially treated group A beta-hemolytic streptococcal infection of the upper respiratory tract.

### Box 39-9 Jones Criteria for Diagnosis of Rheumatic Fever

#### Major Criteria

Carditis  
Arthralgia  
Chorea  
Erythema marginatum  
Subcutaneous nodules

#### Minor Criteria

Fever  
Arthralgia  
Elevated erythrocyte sedimentation rate or positive C-reactive protein level  
Prolonged P-R interval on electrocardiogram

*Note:* For making a diagnosis, two major or one major and two minor manifestations must be accompanied by supporting evidence of a preceding streptococcal infection (positive throat culture for group A streptococcus and an elevated or increasing antistreptolysin O titer).

4. Jones criteria are used to help determine the diagnosis (Box 39-9).

#### B. Assessment (Fig. 39-1)

1. Fever: Low-grade fever that spikes in the late afternoon
2. Elevated antistreptolysin O titer
3. Elevated erythrocyte sedimentation rate
4. Elevated C-reactive protein level
5. Aschoff bodies (lesions): Found in the heart, blood vessels, brain, and serous surfaces of the joints and pleura

**!** Assessment of a child with suspected rheumatic fever includes inquiring about a recent sore throat because rheumatic fever manifests 2 to 6 weeks after an untreated or partially treated group A beta-hemolytic streptococcal infection of the upper respiratory tract.

#### C. Interventions

1. Assess vital signs.
2. Control joint pain and inflammation with massage and alternating hot and cold applications as prescribed.
3. Provide bed rest during the acute febrile phase.
4. Limit physical exercise in a child with carditis.
5. Administer antibiotics (penicillin) as prescribed.
6. Administer salicylates and anti-inflammatory agents as prescribed; these medications should not be administered before the diagnosis is confirmed because the medications mask the polyarthrititis.
7. Initiate seizure precautions if the child is experiencing chorea.
8. Instruct the parents about the importance of follow-up and the need for antibiotic prophylaxis for dental work, infection, and invasive procedures.

**▲ FIGURE 39-1** Clinical manifestations of rheumatic fever. (From McKinney, E., James, S., Murray, S., & Ashwill, J. [2009]. *Maternal-child nursing* [3rd ed.]. St. Louis: Saunders.)

9. Advise the child to inform the parents if anyone in school develops a streptococcal throat infection.

## X. KAWASAKI DISEASE

### A. Description

1. Kawasaki disease is also known as mucocutaneous lymph node syndrome and is an acute systemic inflammatory illness.
2. The cause is unknown, but may be associated with an infection from an organism or toxin.
3. Cardiac involvement is the most serious complication; aneurysms can develop.

### B. Assessment

1. Acute stage
  - a. Fever
  - b. Conjunctival hyperemia
  - c. Red throat
  - d. Swollen hands, rash, and enlargement of cervical lymph nodes

### Box 39-10 Parent Education for Kawasaki Disease

Follow-up care is essential to recovery.
